### Hashes for Anaconda-1.5.0-MacOSX-x86\_64.sh

All installer files are available at <https://repo.anaconda.com/archive/>.

You can verify the data integrity of the Anaconda installer files by [running a local program to generate their MD5 or SHA-256 cryptographic hashes](#) and checking the output to be sure it matches the hashes (or “checksums”) below.

If the MD5 or SHA-256 hash that you generate does not match the one here, the file may not have downloaded completely. Please download it again and re-check. If repeated downloads produce the same result, please [contact us](#) to report the problem, including the file name, whether you used MD5 or SHA-256, the hash you generated, and the hash on the site.

## Updating from older versions

You can easily update Anaconda to the latest version.

- Windows: Open the Start Menu and choose Anaconda Prompt.
- macOS or Linux: Open a terminal window.

Enter these commands:

```
conda update conda
conda update anaconda=VersionNumber
```

## More information

The below content provides more details about what is happening when you update Anaconda.

`Conda update anaconda=versionNumber` grabs the specific release of the Anaconda metapackage, for example `conda update anaconda=2019.10`. That metapackage represents a pinned state that has undergone testing as a collection. Read more about [metapackages](#).

There is a special “custom” version of the Anaconda metapackage that has all the package dependencies, but none of them are constrained. The “custom” version is lower in version ordering than any actual release number. `Conda update anaconda=versionNumber` may remove packages if the new metapackage that is replacing your old one has removed packages. As of conda 4.7, when a package loses its connection to the set of specs that have been requested in the past, it gets removed.

See all of the [available Anaconda versions](#).

`Conda update --all` will unpin everything. This updates all packages in the current environment to the latest version. In doing so, it drops all the version constraints from the history and tries to make everything as new as it can.

This has the same behavior with removing packages. If any packages are orphaned by an update, they are removed. `Conda update --all` may not be able to make everything the latest versions because you may have conflicting constraints in your environment.

With Anaconda 2019.07's newer Anaconda metapackage, `conda update --all` will make the metapackage go to the custom version in order to update other specs.

`Conda update --all` will only update the selected environment. If you have other environments you'd like to update, you can update them in the command line:

```
conda update -n myenv --all
```

When you use `conda update pkgName` or `conda install pkgName`, conda may not be able to update or install that package without changing something else you specified in the past.

In the case of the Anaconda metapackage, when you say `conda update ipython` but you have Anaconda 2019.03, conda can and should “downgrade” Anaconda to the “custom” version so that iPython can be updated.

When conda cannot fulfill the request for the latest package available, it usually means that newer packages exist for your spec but are in conflict. To force the change, you can try `conda install pkg=newversion`.

## Uninstalling Anaconda

To uninstall Anaconda, you can do a simple remove of the program. This will leave a few files behind, which for most users is just fine. See Option A.

If you also want to remove all traces of the configuration files and directories from Anaconda and its programs, you can download and use the Anaconda-Clean program first, then do a simple remove. See Option B.

1. Option A. Use simple remove to uninstall Anaconda:

- **Windows**

- Use Windows Explorer to delete the `envs` and `pkgs` folders prior to running the uninstall in the root of your installation.
- In the Control Panel, choose Add or Remove Programs or Uninstall a program, and then select Python 3.6 (Anaconda) or your version of Python.

- **macOS**

- Open the Terminal.app or iTerm2 terminal application, and then remove your entire Anaconda directory, which has a name such as `anaconda2`, `anaconda3`, or `~/opt`. Enter `rm -rf ~/anaconda3` to remove the directory.

- **Linux**

- Open a terminal window, and then remove your entire Anaconda directory, which has a name such as `anaconda2` or `anaconda3`, by entering `rm -rf ~/anaconda3`.

2. Option B. Full uninstall using Anaconda-Clean and simple remove.

---

**Note:** Anaconda-Clean must be run before simple remove.

---

- Install the Anaconda-Clean package from Anaconda Prompt (terminal on Linux or macOS):

```
conda install anaconda-clean
```

- In the same window, run one of these commands:

- Remove all Anaconda-related files and directories with a confirmation prompt before deleting each one:

```
anaconda-clean
```

- Or, remove all Anaconda-related files and directories without being prompted to delete each one:

```
anaconda-clean --yes
```

Anaconda-Clean creates a backup of all files and directories that might be removed in a folder named `.anaconda_backup` in your home directory. Also note that Anaconda-Clean leaves your data files in the `AnacondaProjects` directory untouched.

- After using Anaconda-Clean, follow the instructions above in Option A to uninstall Anaconda.

### Removing Anaconda path from `.bash_profile`

If you use Linux or macOS, you may also wish to check the `.bash_profile` file in your home directory for a line such as:

```
export PATH="/Users/jsmith/anaconda3/bin:$PATH"
```

---

**Note:** Replace `/Users/jsmith/anaconda3/` with your actual path.

---

This line adds the Anaconda path to the `PATH` environment variable. It may refer to either Anaconda or Miniconda. After uninstalling Anaconda, you may delete this line and save the file.

### Silent mode install

You can use *silent mode* to automatically accept default settings and have no screen prompts appear during installation.

### Using Anaconda on older operating systems

We recommend upgrading your operating system. Most OS that are no longer supported in the latest Anaconda are no longer getting security updates. Upgrading your OS allows you to get the latest packages, performance improvements, bug fixes, etc.

To use Anaconda on older operating systems, download from our [archive](#). You will not be able to use `conda` to update or install packages beyond the Anaconda version noted in the table below, unless you limit it to versions available at the time that particular version of Anaconda was released. You can see what was available by checking the [package table archives](#).

Table 32: Outdated operating system support

| Operating system        | How to install Anaconda   |
|-------------------------|---|
| macOS 10.9              | <p>Use the command line or graphical installers for Anaconda versions 5.1 and earlier. Download from our <a href="#">archive</a>.</p> <hr/> <p><b>Note:</b> Qt and other packages released after Anaconda Distribution 5.1 (February 15th, 2018) may not work on macOS 10.9, so it may be necessary to not update certain packages beyond this point.</p> <hr/> |
| macOS 10.7 and 10.8     | Use the command line installers for Anaconda versions 4.2 and earlier.  |
| macOS 10.5 and 10.6     | <p>Use the command line installers for Anaconda versions 1.8 and earlier.</p> <hr/> <p><b>Note:</b> These installer files end in <code>.sh</code>, not <code>.pkg</code>.</p> <hr/>   |
| Windows XP              | Use Anaconda versions 2.2 and earlier.  |
| Centos5 (or equivalent) | Use Anaconda versions 4.3 and earlier.  |

### Installing Anaconda on a non-networked machine (air gap)

1. Obtain a local copy of the appropriate Anaconda installer for the non-networked machine. You can copy the Anaconda installer to the target machine using many different methods including a portable hard drive, USB drive or CD.
2. After copying the installer to the non-networked machine, follow the detailed installation instructions for your operating system.

### Other ways to get Anaconda or Miniconda

You can find the official [Anaconda or Miniconda AMIs](#) on the AWS Marketplace.

You can find the official [Anaconda and Miniconda Docker images](#) on Docker Hub.

If you have a CDH cluster, you can [install the Anaconda parcel](#) using Cloudera Manager. The Anaconda parcel provides a static installation of Anaconda, based on Python 2.7, that can be used with Python and PySpark jobs on the cluster.

### Troubleshooting

If you experience errors during the installation process, review our [Troubleshooting topics](#).

### 3.2.2 User guide

Use the following resources to learn how to use Anaconda Distribution, including Anaconda Navigator and conda.

#### Just starting out?

If you're new to Anaconda, follow the directions at [Getting started with Anaconda](#) to write your first Python project using Anaconda. Use the navigation tabs at the bottom of the page to go through the user guide in order.

#### New to Navigator?

Read the [Navigator user guide](#) to learn how to use Anaconda's graphical user interface. Get an [overview of the interface](#) and take your first steps using Navigator at [Getting started with Navigator](#).

#### Interested in conda?

[Conda](#) is an open source package management system and environment management system included in Anaconda and Miniconda. Learn [how to get started with conda](#).

#### Ready to dive deeper?

Explore what you can do with Anaconda. The [tasks page](#) shows you how to [install conda packages](#), [switch between environments](#), [use IDEs](#), and more.

#### Ready to contribute to Anaconda?

See [How to contribute to Anaconda](#) by helping resolve issues, improve documentation, add to feedstocks, and contribute code.

#### Additional resources

- [Anaconda cheatsheet](#)

- [Frequently asked questions](#)

## Getting started with Anaconda

Anaconda Distribution contains [conda](#) and [Anaconda Navigator](#), as well as Python and hundreds of scientific [packages](#). When you installed Anaconda, you installed all these too.

Conda works on your command line interface such as Anaconda Prompt on Windows and terminal on macOS and Linux.

Navigator is a desktop graphical user interface that allows you to launch applications and easily manage conda packages, environments, and channels without using command-line commands.

You can try both conda and Navigator to see which is right for you to manage your packages and environments. You can even switch between them, and the work you do with one can be viewed in the other.

Try this simple programming exercise, with [Navigator](#) and the [command line](#), to help you decide which approach is right for you.

When you're done, see [What's next?](#).

## Your first Python program: Hello, Anaconda!

Use Anaconda Navigator to launch an application. Then, create and run a simple Python program with Spyder and Jupyter Notebook.

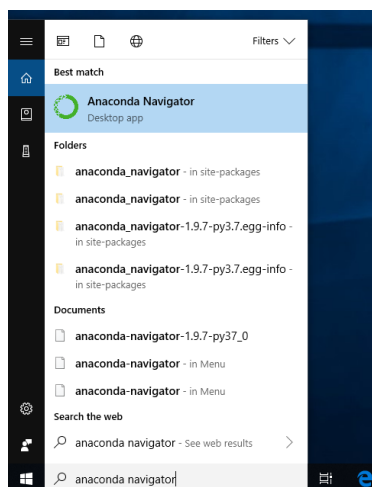

## Open Navigator

Choose the instructions for your operating system.

- [Windows](#)
- [macOS](#)
- [Linux](#)

### Windows

From the Start menu, click the Anaconda Navigator desktop app.

### macOS

Open Launchpad, then click the Anaconda Navigator icon.

### Linux

Open a terminal window and type `anaconda-navigator`.

### Run Python in Spyder IDE (integrated development environment)

---

**Tip:** Navigator's Home screen displays several applications for you to choose from. For more information, see links at the bottom of this page.

---

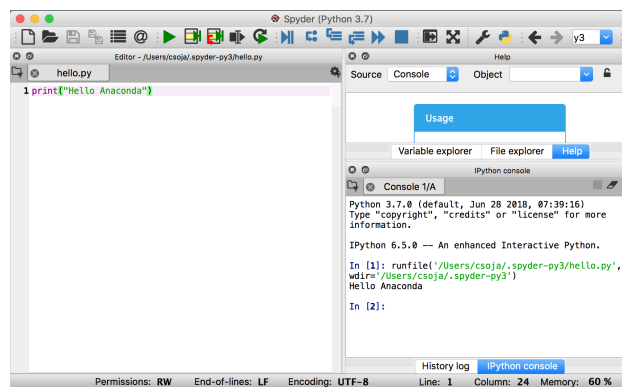

1. On Navigator's Home tab, in the Applications pane on the right, scroll to the Spyder tile and click the Install button to install Spyder.

---

**Note:** If you already have Spyder installed, you can jump right to the Launch step.

---

2. Launch Spyder by clicking Spyder's Launch button.
3. In the new file on the left, delete any placeholder text, then type or copy/paste `print ("Hello Anaconda")`.
4. In the top menu, click File - Save As and name your new program `hello.py`.
5. Run your new program by clicking the triangle Run button.
6. You can see your program's output in the bottom right Console pane.

## Close Spyder

From Spyder's top menu bar, select Spyder - Quit Spyder (In macOS, select Python - Quit Spyder).

## Run Python in a Jupyter Notebook

1. On Navigator's Home tab, in the Applications pane on the right, scroll to the Jupyter Notebook tile and click the Install button to install Jupyter Notebook.

---

**Note:** If you already have Jupyter Notebook installed, you can jump right to the Launch step.

---

2. Launch Jupyter Notebook by clicking Jupyter Notebook's Launch button.

This will launch a new browser window (or a new tab) showing the [Notebook Dashboard](#).

3. On the top of the right hand side, there is a dropdown menu labeled "New". Create a new Notebook with the Python version you installed.
4. Rename your Notebook. Either click on the current name and edit it or find rename under File in the top menu bar. You can name it to whatever you'd like, but for this example we'll use MyFirstAnacondaNotebook.
5. In the first line of the Notebook, type or copy/paste `print("Hello Anaconda")`.
6. Save your Notebook by either clicking the save and checkpoint icon or select File - Save and Checkpoint in the top menu.
7. Run your new program by clicking the Run button or selecting Cell - Run All from the top menu.

## Close Jupyter Notebook

1. From Jupyter Notebooks top menu bar, select File - Close and Halt.
2. Click the Quit button at the upper right of the Notebook Dashboard and close the window or tab.

## Close Navigator

From Navigator's top menu bar, select Anaconda Navigator - Quit Anaconda-Navigator.

### Write a Python program using Anaconda Prompt or terminal

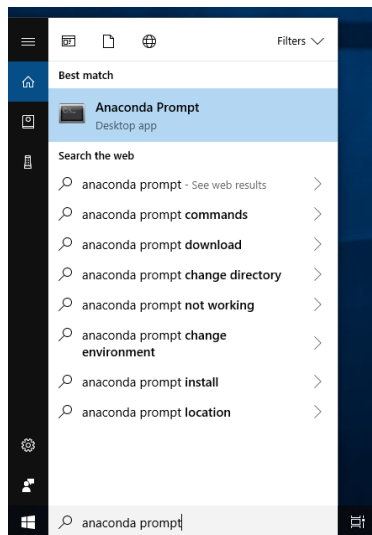

#### Open Anaconda Prompt

Choose the instructions for your operating system.

- *Windows*
- *macOS*
- *Linux*

#### Windows

From the Start menu, search for and open “Anaconda Prompt”:

#### macOS

Open Launchpad, then click the terminal icon.

#### Linux

Open a terminal window.

#### Start Python

At Anaconda Prompt (terminal on Linux or macOS), type `python` and press Enter.

The `>>>` means you are in Python.

#### Write a Python program

At the `>>>`, type `print("Hello Anaconda!")` and press Enter.

When you press enter, your program runs. The words “Hello Anaconda!” print to the screen. You’re programming in Python!

## Exit Python

On Windows press CTRL-Z and press Enter. On macOS or Linux type `exit()` and press Enter.

## Optional: Launch Spyder or Jupyter Notebook from the command line

1. At the Anaconda Prompt (terminal on Linux or macOS), type `spyder` and press Enter. Spyder should start up just like it did when you launched it from Anaconda Navigator.
2. Close Spyder the same way you did in the previous exercise.
3. At the Anaconda Prompt (terminal on Linux or macOS), type `jupyter-notebook` and press Enter.

Jupyter Notebook should start up just like it did when you launched it from Anaconda Navigator. Close it the same way you did in the previous exercise.

- *IntelliJ*

### Anaconda Navigator

*Desktop Portal to Data Science*

### Installation

#### System requirements

Operating systems: Navigator supports the same operating systems that the Anaconda Distribution supports. These include:

- Windows Vista and newer, 32-bit or 64-bit.
- macOS, 64-bit.
- Ubuntu 14.04, 32-bit or 64-bit.

Python: Versions 2.7, 3.4, 3.5, and 3.6.

To use Navigator in *online mode*, you must be able to reach these sites, so you may need to add them to a whitelist in your network's firewall settings.

- <https://repo.anaconda.com> (or for older versions of Navigator and Conda, <https://repo.anaconda.com> )
- <https://conda.anaconda.org> for conda-forge and other channels on Anaconda Cloud (anaconda.org)
- <https://vscode-update.azurewebsites.net/> for updating Visual Studio Code
- [google-public-dns-a.google.com](https://google-public-dns-a.google.com) (8.8.8.8:53) to check internet connectivity with [Google Public DNS](#)

### Installing Navigator

Navigator is automatically installed when you install *Anaconda* version 4.0.0 or higher.

If you have *Miniconda* or an older version of Anaconda installed, you can install Navigator from an Anaconda Prompt by running the command `conda install anaconda-navigator`.

To start Navigator, see *Getting Started*.

## Uninstalling Navigator

To uninstall Anaconda Navigator, open the Anaconda Prompt (terminal on macOS or Linux), and enter this command:

```
conda remove anaconda-navigator
```

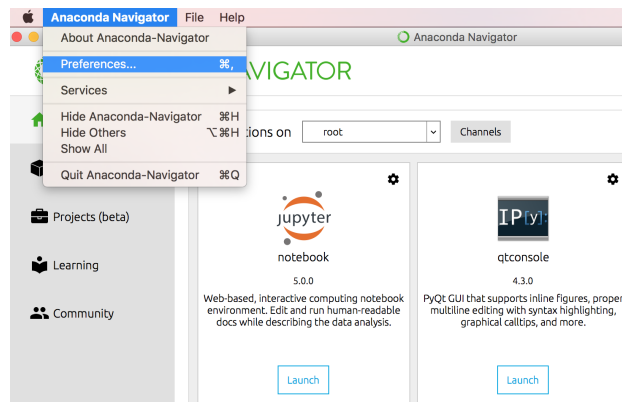

To uninstall all of Anaconda see [Uninstalling Anaconda](#).

## Configuring Navigator to work with a local Anaconda Repository

If you're an Anaconda Enterprise subscriber, you can configure Navigator to search for packages in your local Anaconda Repository instead of searching on [Anaconda.org](https://anaconda.org).

To configure Navigator to search in a local Anaconda Repository:

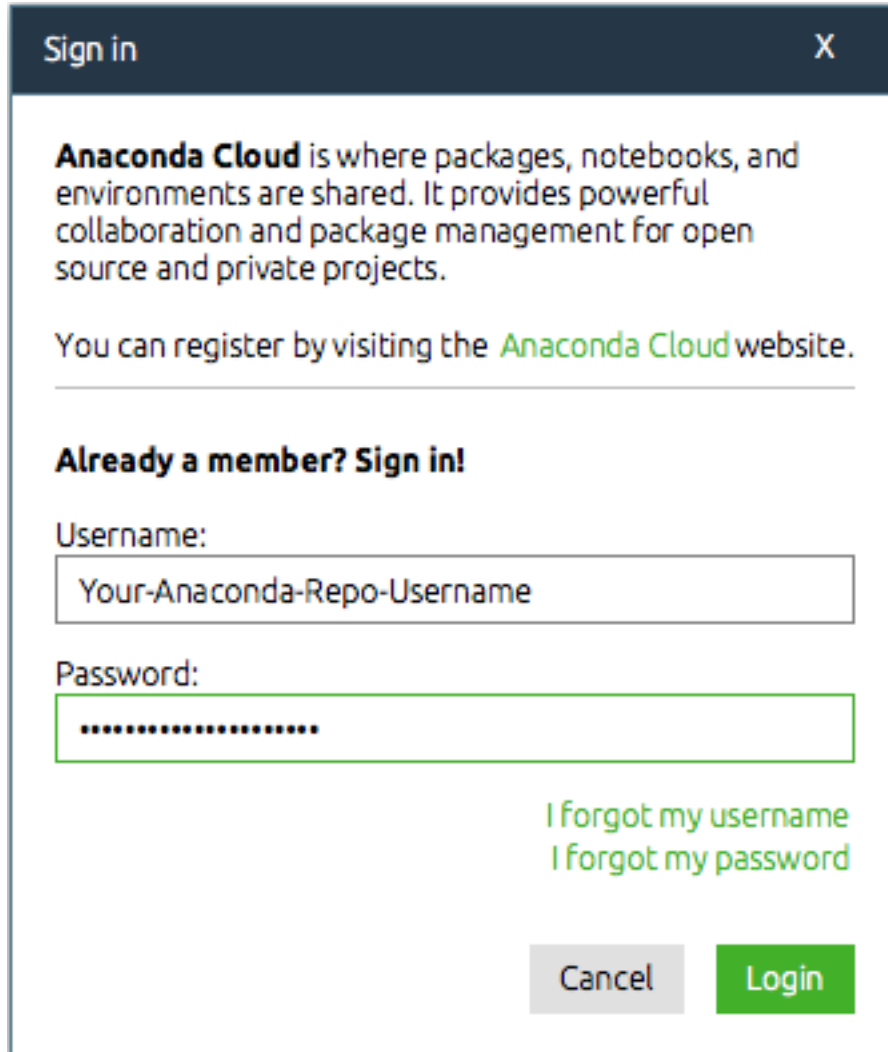

1. In the top menu bar's **Anaconda Navigator** menu (on macOS it's **File**), select Preferences.

2. In the Anaconda API domain field, type the address of your local Anaconda Repository.

3. Click the Apply button.
4. At the top of the Navigator window, click the Sign in to Anaconda Cloud button.
5. In the Username and Password fields, type your Anaconda Repository username and password.

A screenshot of the 'Sign in' dialog box in Anaconda Cloud. The dialog has a dark blue header with the text 'Sign in' and a close button 'X'. The main content area is white and contains the following text: 'Anaconda Cloud is where packages, notebooks, and environments are shared. It provides powerful collaboration and package management for open source and private projects.' followed by 'You can register by visiting the Anaconda Cloud website.' Below this is a section titled 'Already a member? Sign in!' with two input fields: 'Username:' containing 'Your-Anaconda-Repo-Username' and 'Password:' containing a series of dots. To the right of the password field are two links: 'I forgot my username' and 'I forgot my password'. At the bottom right are two buttons: 'Cancel' (grey) and 'Login' (green).

**Sign in** X

**Anaconda Cloud** is where packages, notebooks, and environments are shared. It provides powerful collaboration and package management for open source and private projects.

You can register by visiting the [Anaconda Cloud](#) website.

---

**Already a member? Sign in!**

Username:

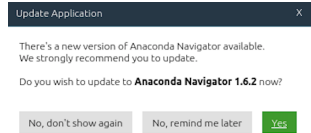

Password:

[I forgot my username](#)  
[I forgot my password](#)

6. Click the Login button.

## Updating Navigator

Every time Navigator starts, it checks whether a new version is available. If one is available, a dialog box is displayed that allows you to upgrade to a new Navigator version or keep your current version.

---

**Note:** We recommend that you keep Navigator updated to the latest version.

---

## Alternate method

If you prefer, you may update Navigator manually.

Open the Anaconda prompt (Terminal on Linux or macOS):

Run this command to deactivate conda:

```
conda deactivate
```

Then run this command to update Navigator:

```
conda update anaconda-navigator
```

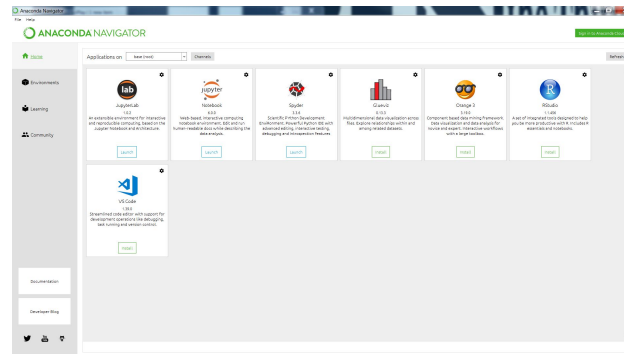

## User guide

The Navigator user guide.

## Overview

This page describes the tabs, menus, and buttons in the Anaconda Navigator window.

- *Online and offline modes*
- *Home tab*
- ***Environments** tab*
- ***Learning** tab*
- ***Community** tab*
- ***File** menu*
- ***Help** menu*
- *Navigator window buttons*

The tabs in the left column represent the main components in Navigator. Click a tab to open it.

**Tip:** To learn more about terms used in Anaconda, see the [Glossary](#).

## Online and offline modes

Normally Navigator is used online so that it can download and install packages.

In online mode, Navigator must be able to reach these sites, so they may need to be whitelisted in your network's firewall settings.

- <https://repo.anaconda.com>
- <https://conda.anaconda.org> for conda-forge and other channels on Anaconda Cloud (anaconda.org)
- <https://vscode-update.azurewebsites.net/> for updating Visual Studio Code
- [google-public-dns-a.google.com](https://google-public-dns-a.google.com) (8.8.8.8:53) to check internet connectivity with [Google Public DNS](#)

If Navigator detects that internet access is not available, it automatically enables offline mode and displays this message:

### Offline mode

Some of the functionality of Anaconda Navigator will be limited. Conda environment creation will be subject to the packages currently available on your package cache.

**Offline mode** is indicated to the left of the login/logout button on the top right corner of the main application window. Offline mode will be disabled automatically when internet connectivity is restored.

You can also manually force **Offline mode** by enabling the setting on the application preferences.”

In the Preferences dialog, select “Enable offline mode” to enter offline mode even if internet access is available.

Using Navigator in offline mode is equivalent to using the command line conda commands `create`, `install`, `remove`, and `update` with the flag `--offline` so that conda does not connect to the internet.

## Home tab

The **Home** tab, shown in the image above, displays all of the available applications that you can manage with Navigator.

The first time you open Navigator, the following popular graphical Python applications are already installed or are available to install:

- JupyterLab
- Jupyter notebook
- Orange data visualization
- Spyder IDE
- Glueviz multidimensional data visualization
- R Studio IDE
- VS Code

You can also [build your own Navigator applications](#).

In each application box, you can:

- Launch the application—Click its Launch button.
- Install an application—Click its Install button.
- Update, remove, or install a specific version of an application—Click the gear icon in the top right corner of the application box.

Applications are installed in the active environment, which is displayed in the “Applications on” list. To install an application in a specific environment, first select the environment in the list, then click the application’s Install button. You can also create a new environment on the **Environments** tab, then return to the **Home** tab to install packages in the new environment.

## Licensed applications

Some applications require licenses. To see the status of all licensed applications and add new licenses, on the **Help** menu, select License Manager. For more information, see [tutorials/manage-licenses](#).

## Environments tab

The **Environments** tab allows you to manage installed *environments*, *packages*, and *channels*.

The left column lists your environments. Click an environment to activate it.

With Navigator, like with conda, you can create, export, list, remove, and update environments that have different versions of Python and/or packages installed. Switching or moving between environments is called *activating the environment*. Only one environment is active at any point in time. For more information, see [Managing environments](#).

The right column lists packages in the current environment. The default view is Installed packages. To change which packages are displayed, click the arrow next to the list, then select Not Installed, Upgradeable, or All packages. For more information, see [Managing packages](#).

anaconda/img/nav-envs.png

Channels are locations where Navigator or conda looks for packages. Click the Channels button to open the Channels Manager. For more information, see [Managing channels](#).

### Learning tab

On the **Learning** tab you can learn more about Navigator, the Anaconda platform and open data science. Click the Documentation, Training, Webinars, or Video buttons, then click any item to open it in a browser window.

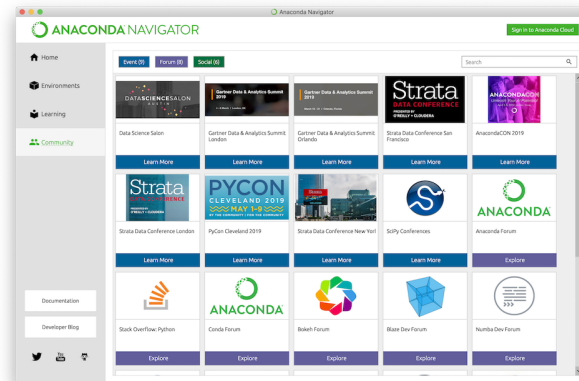

anaconda/img/nav-learning.png

## Community tab

On the **Community** tab you can learn more about events, free support forums, and social networking relating to Navigator. Click the Events, Forum, or Social buttons, then click any item to open it in a browser window.

**Tip:** To get help with Anaconda and Navigator from the community, join the [Anaconda forum](#).

## File menu

The Navigator **File** menu (**Anaconda Navigator** on macOS) contains the following options:

- About—displays information about Navigator, including a link for bug reports and feature requests. (In Linux this is in the Help menu.)
- Preferences—allows you to set your Navigator preferences. In the Preferences window you can:
  - Reset the Anaconda API domain to point to a local Anaconda repository instead of Anaconda Cloud.
  - Enable or disable SSL verification.
  - Optionally set a certificate to verify SSL connections
  - Toggle the option to provide personally non-identifiable information to help improve the product.
  - Enable or disable offline mode.
  - Hide the offline mode dialog box.
  - Hide the Quit dialog box when exiting the program.
  - Hide the Update dialog box when starting the program.
  - Hide the Close running applications dialog, which normally displays when exiting the program if there are still running applications that were launched from Navigator.
  - Modify Navigator’s display with Enable High DPI scaling option. This option can be useful if Navigator isn’t displaying correctly on some high DPI screens.
  - Show application startup error messages

---

**Tip:** Click the Reset to defaults button to change preferences back to their default values.

---

anaconda/img/nav-preferences.png

- Services (macOS only)—links to your computer’s system preferences menu.
- Hide Anaconda Navigator (macOS only)—hides the Navigator window.
- Hide Others (macOS only)—hides all windows except the Navigator window.
- Show All (macOS only)—shows all windows including the Navigator window.
- Quit Anaconda Navigator—exits Navigator.

### Help menu

The **Help** menu contains the following options:

- Search—links to your computer’s Help (Windows and macOS only).
- Online Documentation—links to this documentation, which you can read in any web browser. You can also open the documentation by clicking the Documentation button at the bottom left of the Navigator window.
- Logs viewer—allows you to review the logs of all actions performed in Navigator in the current session. This option displays a list of log files, including `navigator.log`, which contains Navigator application logs, and `condamanager.log`, which contains logs written by the conda-manager component.

---

**Note:** A new log file is created every time you run Navigator, with a sequential number appended to the file name. More recent log files have higher numbers.

---

## Navigator window buttons

- Sign in to Anaconda Cloud—displayed at the top right. Click to sign into Anaconda Cloud (Anaconda.org) and enable searching for packages on it. After you have logged in, the button label changes to “Signed in as [username].”
- Documentation—displayed at the bottom left. Click to open Navigator documentation in a browser.
- Developer Blog—displayed at the bottom left. Click to read what our developers have to say about Navigator development.
- Social media—displayed at the bottom left. Click to see our Twitter, YouTube, and GitHub pages.

## Getting started with Navigator

Anaconda Navigator is a graphical user interface to the conda package and environment manager.

This 10-minute guide to Navigator will have you navigating the powerful conda program in a web-like interface without having to learn command line commands.

SEE ALSO: [Getting started with conda](#) to learn how to use conda. Compare the Getting started guides for each to see which program you prefer.

## Before you start

You should have already *installed Anaconda*.

## Contents

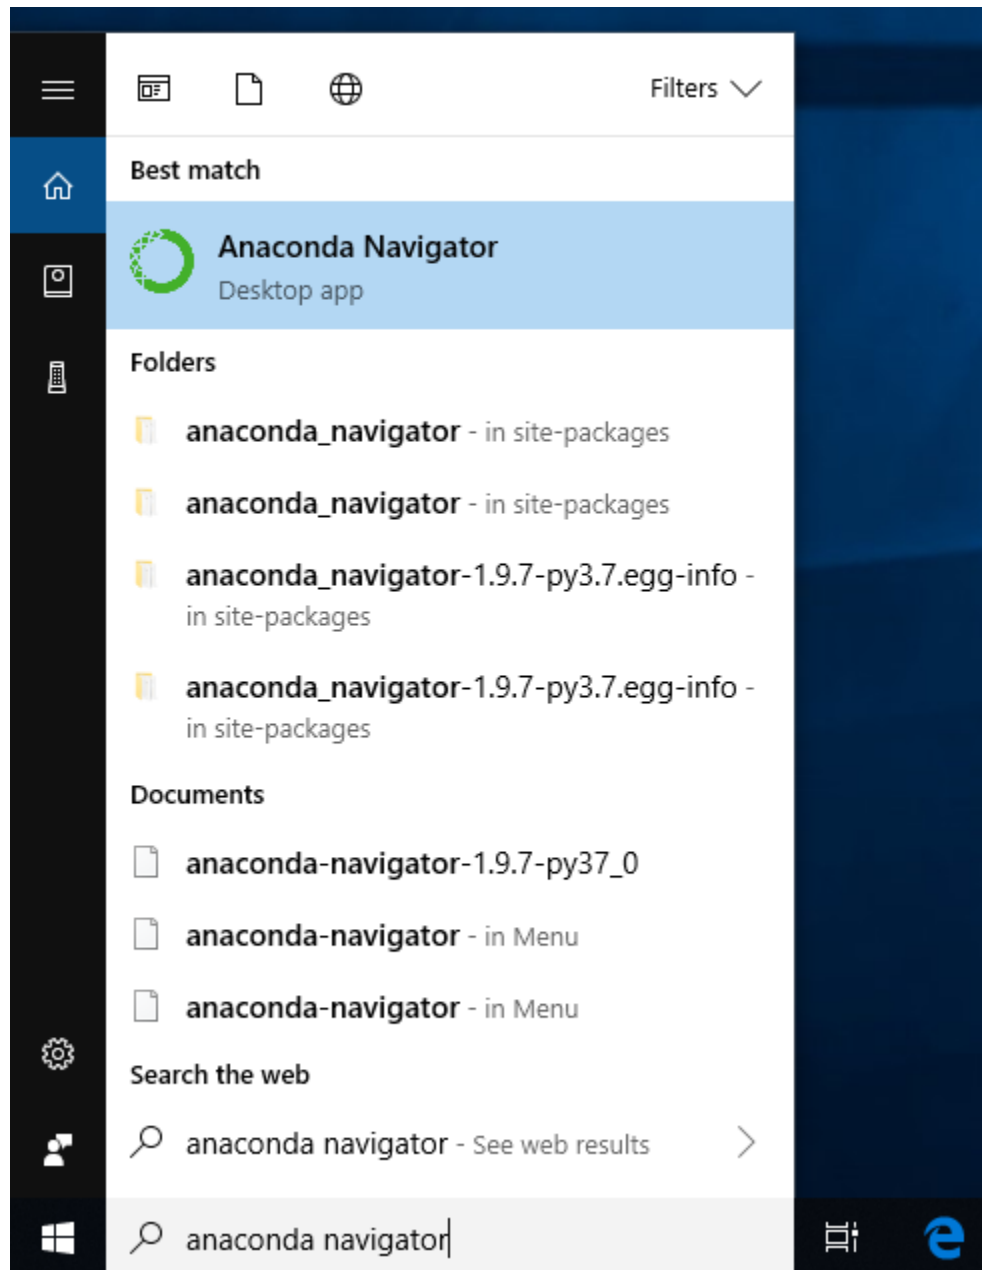

- *Starting Navigator* on Windows, macOS, or Linux. 1 MINUTE
- *Managing Navigator*. Verify that Anaconda is installed and check that Navigator is updated to the current version. 1 MINUTE
- *Managing environments*. Create environments and move easily between them. 3 MINUTES
- *Managing Python*. Create an environment that has a different version of Python. 2 MINUTES
- *Managing packages*. Find packages available for you to install. Install packages. 3 MINUTES

TOTAL TIME: 10 MINUTES

## Starting Navigator

### Windows

- From the Start menu, click the Anaconda Navigator desktop app.
- Or from the Start menu, search for and open “Anaconda Prompt” and type the command `anaconda-navigator`.

### MacOS

- Open Launchpad, then click the Anaconda-Navigator icon.
- Or open Launchpad and click the terminal icon. Then in terminal, type `anaconda-navigator`.

### Linux

- Open a terminal window and type `anaconda-navigator`.

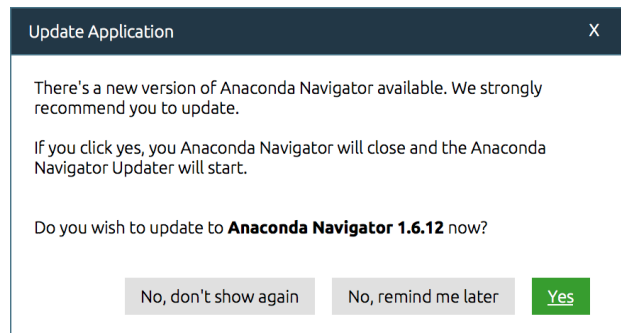

## Managing Navigator

Verify that Anaconda is installed and running on your system.

- When Navigator starts up, it verifies that Anaconda is installed.
- If Navigator does not start up, go back to Anaconda installation and make sure you followed all the steps.

Check that Navigator is updated to the current version.

- When you start Navigator, it automatically checks for a new version. If Navigator finds a new version, you will see a dialog box like this:

Click the “Yes” button to update Navigator to the current version.

---

**Tip:** We recommend that you always keep Navigator updated to the latest version.

---

## Managing Environments

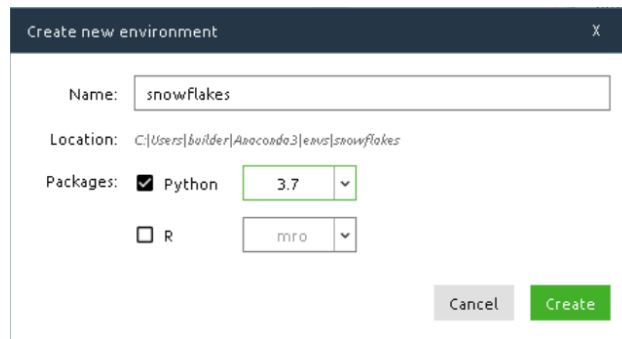

Navigator uses conda to create separate environments containing files, packages, and their dependencies that will not interact with other environments.

Create a new environment named `snowflakes` and install a package in it:

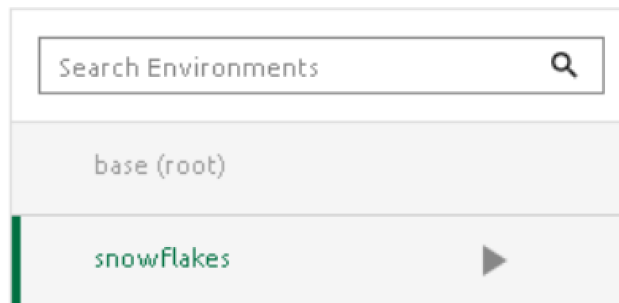

1. In Navigator, click the **Environments** tab, then click the Create button. The **Create new environment** dialog box appears.

2. In the **Environment** name field, type a descriptive name for your environment.

3. Click **Create**. Navigator creates the new environment and activates it.

Now you have two environments, the default environment `base (root)`, and `snowflakes`.

4. Switch between them (activate and deactivate environments) by clicking the name of the environment you want to use.

---

**Tip:** The active environment is the one with the arrow next to its name.

---

5. Return to the other environment by clicking its name.

## Managing Python

When you create a new environment, Navigator installs the same Python version you used when you downloaded and installed Anaconda. If you want to use a different version of Python, for example Python 3.5, simply create a new environment and specify the version of Python that you want in that environment.

Create a new environment named “snakes” that contains Python 3.5:

1. In Navigator, click the **Environments** tab, then click the Create button.

The Create new environment dialog box appears.

2. In the Environment name field, type the descriptive name “snakes” and select the version of Python you want to use from the Python Packages box (3.6, 3.7, or 2.7). Select a different version of Python than is in your other environments, base or snowflakes.
3. Click the Create button.
4. Activate the version of Python you want to use by clicking the name of that environment.

## Managing packages

In this section, you check which packages you have installed, check which are available, and look for a specific package and install it.

1. To find a package you have already installed, click the name of the environment you want to search. The installed packages are displayed in the right pane.
2. You can change the selection of packages displayed in the right pane at any time by clicking the drop-down box above it and selecting Installed, Not Installed, Updateable, Selected, or All.

3. Check to see if a package you have not installed named “beautifulsoup4” is available from the Anaconda repository (must be connected to the Internet). On the Environments tab, in the Search Packages box, type `beautifulsoup4`, and from the Search Subset box select All or Not Installed.

4. To install the package into the current environment, check the checkbox next to the package name, then click the bottom Apply button.

The newly installed program is displayed in your list of installed programs.

| Not installed                                    | Channels | Update index...  | Search Packages   |
|--|----------|--|---|
| Name   | T        | Description  | Version   |
| <input type="checkbox"/> _ipyw_jlab_nb_ex...     |          | A configuration metapackage for enabling anaconda-bundled jupyter extensions | 0.1.0   |
| <input checked="" type="checkbox"/> _mutex_mxnet |          |  | 0.0.40  |
| <input type="checkbox"/> _nb_ext_conf            |          |  | 0.4.0   |
| <input type="checkbox"/> _py-xgboost-mutex       |          |  | 2.0   |
| <input checked="" type="checkbox"/> _r-mutex     |          |  | 1.0.0   |
| <input type="checkbox"/> _r-xgboost-mutex        |          |  | 2.0   |
| <input type="checkbox"/> _tflow_1100_select      |          |  | 0.0.2   |
| 1783 packages available                          |          | 2 packages selected  | <input type="button" value="Apply"/> <input type="button" value="Clear"/> |

## More information

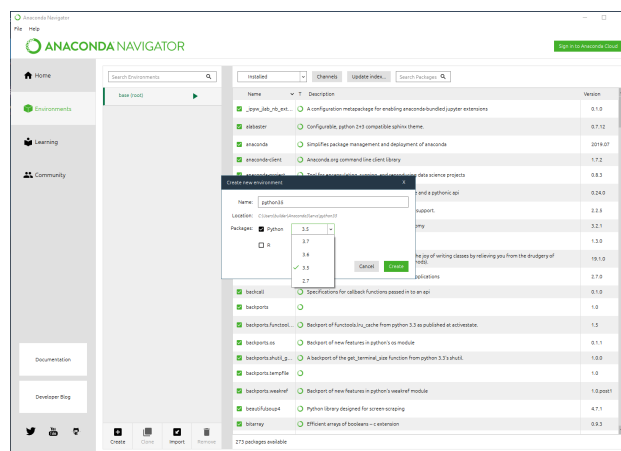

- Full documentation—<https://docs.anaconda.com/anaconda/navigator/>
- Free community support—<https://groups.google.com/a/anaconda.com/forum/#!forum/anaconda>
- Paid support options—<https://www.anaconda.com/support/>
- Training—<https://www.anaconda.com/training/>

## Tutorials

General tasks:

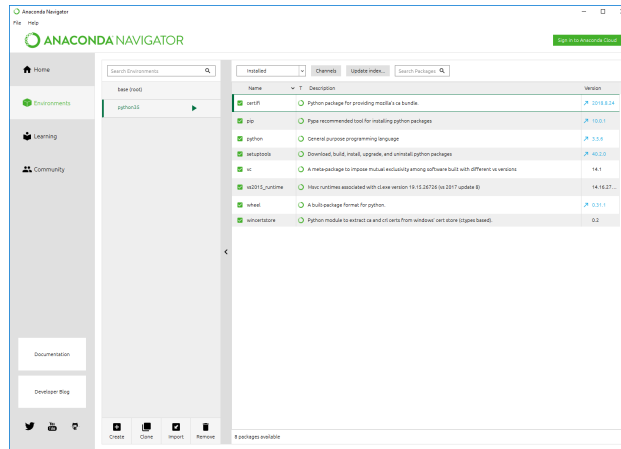

### Creating a Python 3.5 environment from Anaconda2 or Anaconda3

1. In Navigator, click the Environments tab, then click the Create button. The Create new environment dialog box appears.
2. In the Environment name field, type a descriptive name for your environment.

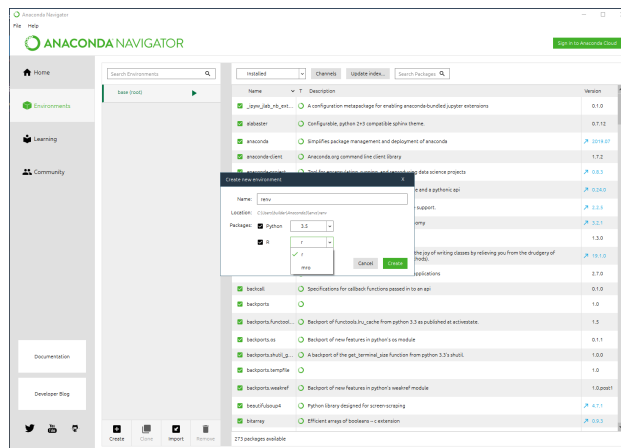

3. In the Packages list select “Python” and in the Python version list select “3.5”.

- Click the Create button.
- Navigator creates the new environment and activates it, as shown by the highlighted green bar. All actions take place in the active environment.

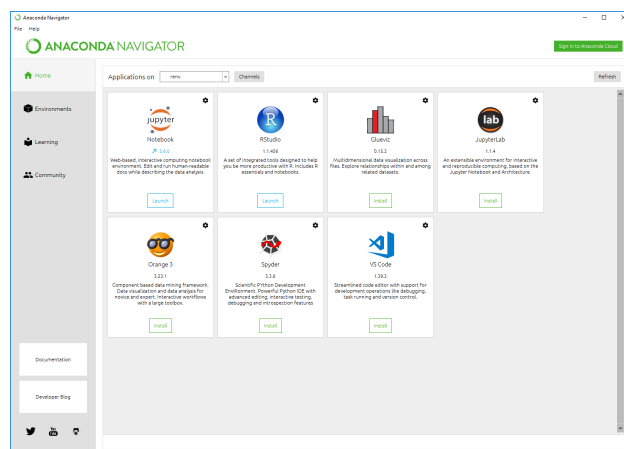

## Creating an R environment and running RStudio

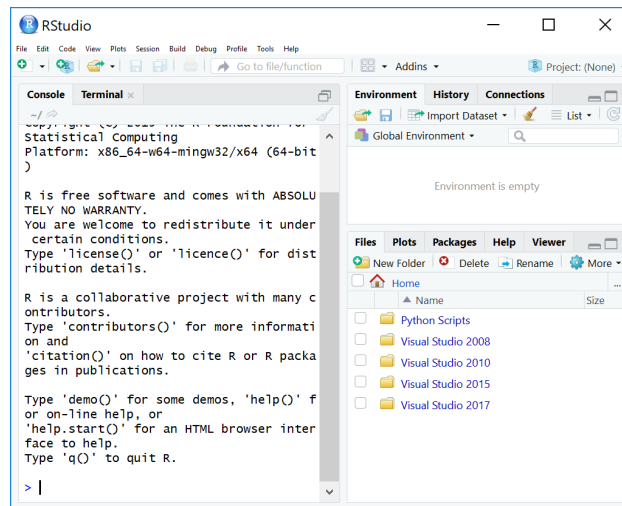

- In Navigator, click the Environments tab, then click the Create button. The Create new environment dialog box appears.
- In the Environment name field, type a descriptive name for your environment.

- In the Packages list, select “R”.
- On the drop-down menu, select mro to install Microsoft R Open with the packages mro-base and r-essentials. If you prefer, you may instead select r to install R with the packages r-base and r-essentials. For more information please see [Using R language with Anaconda](#).
- Click the Create button.
- Navigator creates the new environment and activates it, as shown by the highlighted green bar. All actions take place in the active environment.
- With the new environment active, click the Home button and then click the Install button on the RStudio application.

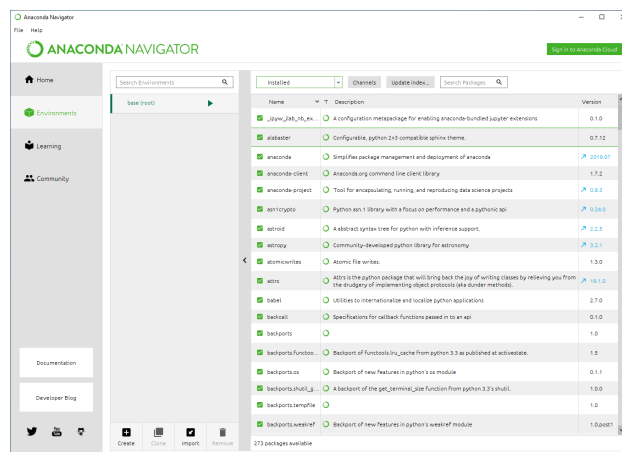

8. Click Launch to run RStudio from Navigator.
9. You will see RStudio running from Navigator.

## Managing environments

- *Searching for an environment*
- *Creating a new environment*
- *Using an environment*
- *Cloning an environment*
- *Importing an environment*
- *Removing an environment*
- *Advanced environment management*

On the **Environments** tab, the left column displays your environments.

## Searching for an environment

In the Search Environments box, type all or part of the environment name.

## Creating a new environment

1. At the bottom of the environments list, click the Create button.
2. In the Create Environment dialog box, type a descriptive name for the new environment.
3. Select Python, R, or both for a mixed environment.
4. If applicable, choose a Python version for the new environment.
5. Click the Create button.

When you install an R language environment, the <https://anaconda.org/r> channel is automatically added and made active and a new channel automatically appears in conda.rc.

## Using an environment

1. In the environments list, click the environment name.
2. Click the arrow button next to the name. The activation options dialog appears.
3. Select one of the following options for opening the environment: terminal, Python interpreter, IPython Console, or Jupyter Notebook.

---

**Note:** Some of these options may not be available if they were not installed in the environment.

---

## Cloning an environment

1. Click the name of the environment you want to clone.
2. At the bottom of the environments list, click the Clone button.
3. Type a descriptive name for the new environment.

## Importing an environment

Each environment has a YAML-formatted configuration file. If someone has given you an environment file that you want to use, for example my-environment-file.yml, and you have saved it to your computer, you can import it into Navigator.

1. At the bottom of the environments list, click the Import button.
2. In the Import dialog box, type a descriptive name for the new environment.
3. Click the file folder icon to browse to the YAML file, or type the file name, including its path.
4. Click the Import button.

### Removing an environment

1. In the environments list, click the environment you want to remove.
2. At the bottom of the list, click the Remove button.

### Advanced environment management

Navigator provides a convenient graphical interface for managing conda environments, channels, and packages. But if you're comfortable working with Anaconda prompt (terminal on Linux or macOS), you can access additional, advanced management features. To learn more, see [Managing environments with conda](#).

### Managing packages

- *Filtering the packages table*
- *Finding a package*
- *Installing a package*
- *Updating a package*
- *Installing a different package version*
- *Removing a package*
- *Advanced package management*

On the Navigator **Environments** tab, the packages table in the right column lists the packages included in the environment selected in the left column.

---

**Note:** Packages are managed separately for each environment. Changes you make to packages only apply to the active environment.

---

---

**Tip:** Click a column heading in the table to sort the table by package name, description, or version.

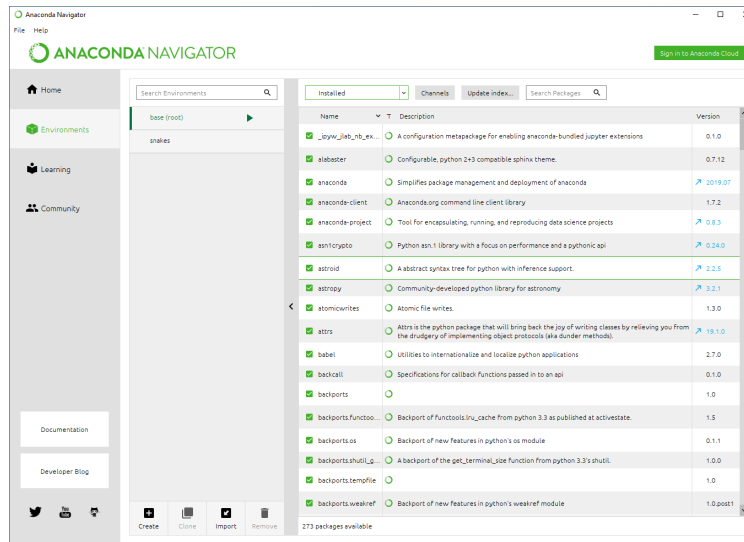

---

---

**Tip:** The Update Index button updates the packages table with all packages that are available in any of the enabled channels.

---

## Filtering the packages table

By default, only Installed packages are shown in the packages table. To filter the table to show different packages, click the arrow next to Installed, then select which packages to display: Installed, Not installed, Updatable, Selected, or All.

---

**Note:** Selecting the Updatable filter lists packages that are installed and have updates available.

---

## Finding a package

In the Search Packages box, type the name of the package.

## Installing a package

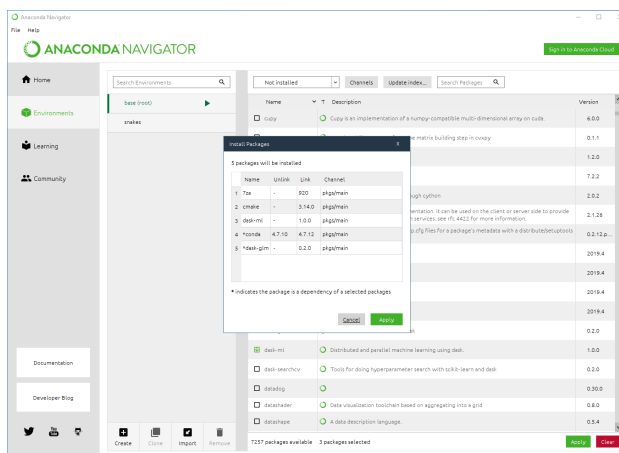

1. Select the Not Installed filter to list all packages that are available in the environment's channels but are not installed.

---

**Note:** Only packages that are compatible with your current environment are listed.

---

2. Select the name of the package you want to install.
3. Click the Apply button.
4. Review the Install Packages information.

You can filter your packages to be installed by Name, Unlink, Link, and Channel. Unlink indicates what is being removed. Link is what is being installed in place of the package that is unlinked. Channel shows from where the package is being installed.

Packages are in a cache and they rely on other packages using hard links, which essentially point to a package instead of copying it to the environment. Unlink removes the hard link to that package. If the package you are trying to install is a dependency of other packages, the Link column will show the hard link to the package version that is being created in order to install your selected package.

---

**Tip:** If after installing a new package it doesn't appear in the packages table, select the **Home** tab, then click the Refresh button to reload the packages table.

---

## Updating a package

1. Select the Updatable filter to list all installed packages that have updates available.
  2. Click the checkbox next to the package you want to update, then in the menu that appears select Mark for Update.
- OR
- In the Version column, click the blue up arrow that indicates there is a newer version available.

3. Click the Apply button.

## Installing a different package version

1. Click the checkbox next to the package whose version you want to change.

2. In the menu that appears, select Mark for specific version installation.  
If other versions are available for this package, they are displayed in a list.
3. Click the package version you want to install.
4. Click the Apply button.

### Removing a package

1. Click the checkbox next to the package you want to remove.
2. In the menu that appears, select Mark for removal.
3. Click the Apply button.

### Advanced package management

Navigator provides a convenient graphical interface for managing conda environments, channels, and packages. But if you're comfortable working with Anaconda Prompt (terminal on Linux or macOS), you can access additional, advanced management features. To learn more, see [Managing packages with conda](#).

### Managing channels

- *Adding a channel*
- *Deleting a channel*

Channels are locations where Navigator and conda look for packages.

You can search and browse packages and channels on [Anaconda Cloud](#).

---

**Note:** Navigator and conda only search for packages in active channels. You can temporarily disable a channel by making it inactive.

---

EXAMPLE: Let's say you want to look for packages on the "Milagro" channel of Anaconda Cloud. All three of these channel variations will look for packages in the same place on Cloud:

- By URL—<https://anaconda.org/milagro>.
- By conda URL—<https://conda.anaconda.org/milagro>.
- By name—milagro.

On the **Environment** tab, click the Channels button to open the Channels Manager.

### Adding a channel

1. Click the Add button.
2. Type or paste the channel name, the URL, or the conda URL.

---

**Note:** A URL can also contain an access token parameter and value. A URL will automatically be transformed to a conda URL.

---

3. Click the Save button.

### Deleting a channel

1. Click the trash can icon next to the channel name.
2. Click the Update Channels button.

### Building Anaconda Navigator applications

- *Who is this for?*
- *Before you start*
- *Create skeleton recipe*
- *Modify Requirements*
- *App entry in meta.yaml*
- *Build*
- *Upload to Anaconda Cloud*
- *Configure Anaconda Navigator*
- *Troubleshooting*

---

- *Additional Information*

---

This tutorial will build an Anaconda Navigator Application (app) of the Bokeh server application.

The conda build recipe for Bokeh will be generated by conda skeleton. Three modifications to the files in the build recipe are required to declare the package as an app. We'll build Bokeh to launch a static Bokeh server. The package is built and uploaded to your Anaconda Cloud channel. Finally, after adding the channel in Anaconda Navigator, the app will appear on the Home pane.

## Who is this for?

This tutorial is for Windows, OS X, and Linux users who wish to generate an Anaconda Navigator app conda package from a PyPI package. Prior knowledge of conda-build or conda recipes is recommended.

## Before you start

---

**Note:** Applications to be built for Anaconda Navigator should have a graphical user interface. Not all conda packages have graphical interfaces.

---

You should already have installed Miniconda or Anaconda. Install conda-build:

```
conda install conda-build
```

It is recommended that you use the latest versions of conda and conda-build. To upgrade both packages run:

```
conda upgrade conda
conda upgrade conda-build
```

You will also need an account on Anaconda Cloud. Your username will be referred to as your Anaconda Cloud channel.

## Create skeleton recipe

First, in your user home directory, run the conda skeleton command:

```
conda skeleton pypi bokeh
```

This creates a directory named bokeh and creates the meta.yaml. Use the `ls` command on OS X or Linux or the `dir` command on Windows to verify that this file has been created.

## Modify Requirements

In a text editor, add a test requirements section to include the dependency pytest.

```
test:
  requires:
    - pytest
```

At this point, the full recipe will look like this:

```

{% set name = "bokeh" %}
{% set version = "1.1.0" %}

package:
  name: "{{ name|lower }}"
  version: "{{ version }}"

source:
  url: https://pypi.io/packages/source/{{ name[0] }}/{{ name }}/{{ name }}-{{
↪version }}.tar.gz
  sha256: 70c944ccb99faea9c1bc2b77caba4dbcd884e083fc32511efbd6f895d7cb6832

build:
  number: 0
  entry_points:
    - bokeh = bokeh.__main__:main
  script: "{{ PYTHON }}" -m pip install . --no-deps --ignore-installed -vv "

requirements:
  host:
    - jinja2 >=2.7
    - numpy >=1.7.1
    - packaging >=16.8
    - pillow >=4.0
    - pip
    - python
    - python-dateutil >=2.1
    - pyyaml >=3.10
    - six >=1.5.2
    - tornado >=4.3

run:
  - jinja2 >=2.7
  - numpy >=1.7.1
  - packaging >=16.8
  - pillow >=4.0
  - python
  - python-dateutil >=2.1
  - pyyaml >=3.10
  - six >=1.5.2
  - tornado >=4.3

test:
  requires:
    - pytest

imports:
  - bokeh
  - bokeh._testing
  - bokeh._testing.plugins
  - bokeh._testing.util
  - bokeh.application
  - bokeh.application.handlers
  - bokeh.application.handlers.tests
  - bokeh.application.tests
  - bokeh.client

```

(continues on next page)

(continued from previous page)

```
- bokeh.client.tests
- bokeh.colors
- bokeh.colors.tests
- bokeh.command
- bokeh.command.subcommands
- bokeh.command.subcommands.tests
- bokeh.command.tests
- bokeh.core
- bokeh.core.property
- bokeh.core.property.tests
- bokeh.core.tests
- bokeh.core.validation
- bokeh.document
- bokeh.document.tests
- bokeh.embed

  doc_url:
  dev_url:

extra:
  recipe-maintainers:
    - your-github-id-here
```

### App entry in meta.yaml

To declare a conda package as an app, the app parameter must be added to the meta.yaml file. The app section will contain three keys: entry, summary, and type.

In the app section, the entry tag defines how the package is to be launched by Anaconda Navigator. For the Bokeh IDE, separate entry tags are required for Windows, OS X, and Linux operating systems.

In your text editor, open the meta.yaml file and add the following lines. On Windows and Linux the entry tag is:

```
app:
  entry: bokeh .                                [win]

  entry: bokeh .                                [linux]
```

For OS X, a launch script must also be provided. In a text editor, create a new file in the conda build recipe directory called bokeh\_mac.command. The contents of this file are:

```
DIR=$(dirname $0)
$DIR/bokeh ${HOME}
```

To make sure that the file gets installed, create a new file called build.sh and add these lines to the build.sh script. Remove the script key under the build section in the meta.yaml.

```
$PYTHON -m pip install . --no-deps --ignore-installed -vv
if [ `uname` == Darwin ]

then
    cp $RECIPE_DIR/bokeh_mac.command $PREFIX/bin

fi
```

Create a new file called build.bat. Include the following:

```
%PYTHON% -m pip install . --no-deps --ignore-installed -vv
```

Then in meta.yaml add this line to the app section. entry:

```
open ${PREFIX}/bin/bokeh_mac.command [osx]
```

The completed app section should look like this:

```
app:
  entry: bokeh static                                [win]
  entry: bokeh static                                [linux]
  entry: open ${PREFIX}/bin/bokeh_mac.command [osx]
  summary: Bokeh
  type: web
```

---

**Note:** The app icon defaults to the Anaconda logo.

---

### Build

Now that you have the conda build recipe ready, you can use the conda-build tool to create the package. You will have to build and upload the Bokeh package separately on Windows, OS X, and Linux machines in order for the package

to be available on all platforms. If you're already in the Bokeh directory, you can type `conda build .` in your terminal. Otherwise type: `conda-build bokeh`.

When `conda-build` is finished, it displays the exact path and filename of the conda package. See the [Troubleshooting](#) section if the `conda-build` command fails.

Windows example file path: `C:\Users\jsmith\miniconda\conda-bld\win-64\bokeh-0.4.4-py35_0.tar.bz2`

OS X example file path: `/Users/jsmith/miniconda/conda-bld/osx-64/bokeh-0.4.4-py35_0.tar.bz2`

Linux example file path: `/home/jsmith/miniconda/conda-bld/linux-64/bokeh-0.4.4-py35_0.tar.bz2`

---

**Note:** Your path and filename will vary depending on your installation and operating system.

---

Save the path and filename information for the next step.

## Upload to Anaconda Cloud

Now you can upload the new local packages to Anaconda Cloud. First log in to Anaconda Cloud from your terminal application: `anaconda login`

You will be asked for your Anaconda Cloud account name and password. If the login was successful you will see output like the following:

```
Using Anaconda Cloud api site https://api.anaconda.org
Username: jsmith
jsmith's Password:
login successful
```

---

**Note:** This step must be done in the root conda environment.

---

Now that you are logged into your channel, you can upload the Bokeh conda package as follows:

Windows users: `anaconda upload C:\Users\jsmith\Miniconda\conda-bld\win-64\bokeh-0.4.4-py35_0.tar.bz2`

Linux and OS X users: `anaconda upload /home/jsmith/miniconda/conda-bld/linux-64/bokeh-0.4.4-py35_0.tar.bz2`

---

**Note:** Change your path and filename to the exact path and filename you saved in Step 2. Your path and filename will vary depending on your installation and operating system.

---

For more information about Anaconda Cloud, see the [Anaconda Cloud documentation](#) page.

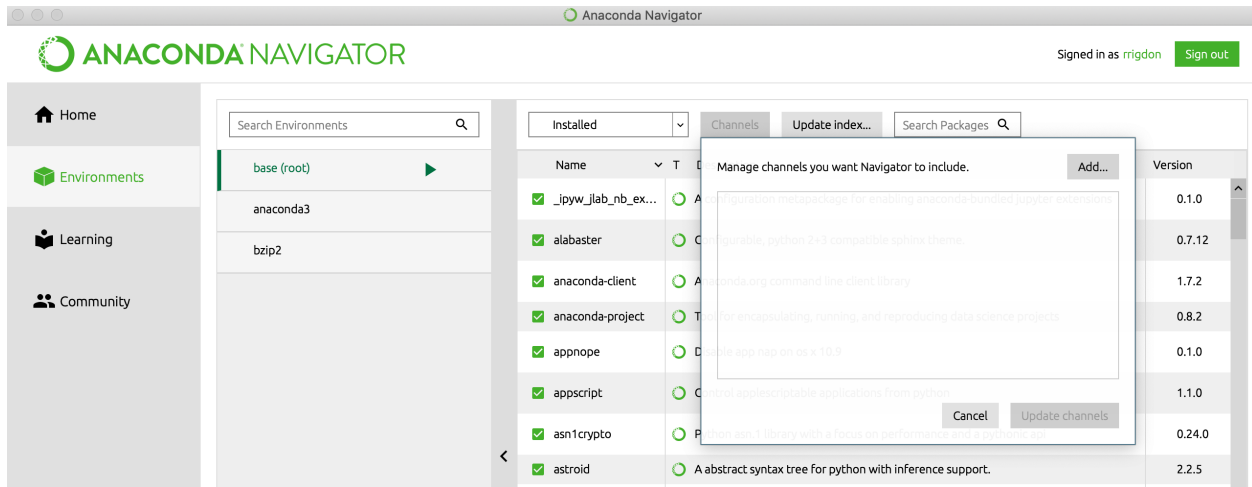

## Configure Anaconda Navigator

Now that the Bokeh package has been uploaded to your Anaconda Cloud channel, you need to add the channel to Anaconda Navigator.

Launch the Anaconda Navigator app. In Windows and Linux it will be available from the Start Menu. On OS X, you can find it either on the Desktop or through Spotlight.

Open the Environments pane on the far left.

To add your channel, first click the Channel button. Second, click the Add button. Third, type in the URL to your Anaconda Cloud channel: <https://conda.anaconda.org/CHANNEL> Replace CHANNEL with your Anaconda Cloud username.

Finally, click the Update Channels button.

The last step is to close and restart Anaconda Navigator. The Bokeh app will be displayed on the Home pane.

## Troubleshooting

### A. Conda build fails

If the conda recipe fails to build consult the [Troubleshooting](#) guide.

### B. App does not appear on the home pane

Check that the conda package has been uploaded to your Anaconda Cloud channel. Check that your channel has been added to the Channels list.

You may have to remove your `.anaconda/navigator` directory and restart Navigator. On Windows, OS X, and Linux this directory is in your Home directory.

### C. App does not launch

If after installing the application it does not launch, check that it works correctly on the command line with the following command: `conda run bokeh`

If Bokeh starts correctly then you may have to remove your `.anaconda/navigator` directory and restart Navigator.

On Windows, OS X, and Linux this directory is in your Home directory.

## Additional Information

See the [conda skeleton pypi reference page](#) for more options.

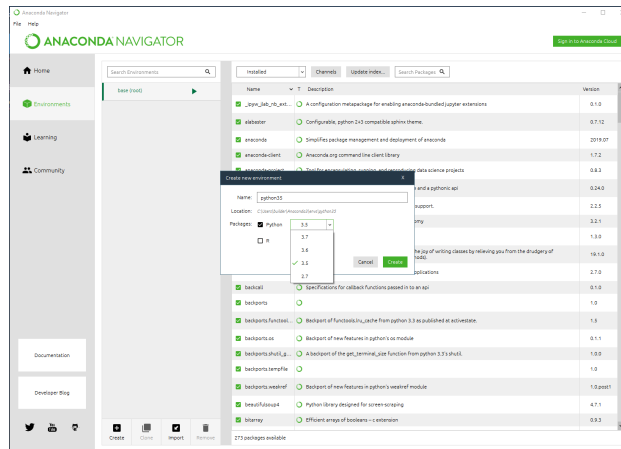

For more information about adding Start Menu entries in Windows, see the [menuinst](#) documentation.

## Using multiple versions of Python with Navigator

With Navigator you can have different versions of Python on your computer and easily switch between them by keeping them in different **environments**.

To use a different version of Python than the one you are currently using, set up a new environment:

1. In Navigator, click the Environments tab, then click the Create button. The Create new environment dialog box appears.
2. In the Environment name field, type a descriptive name for your environment.

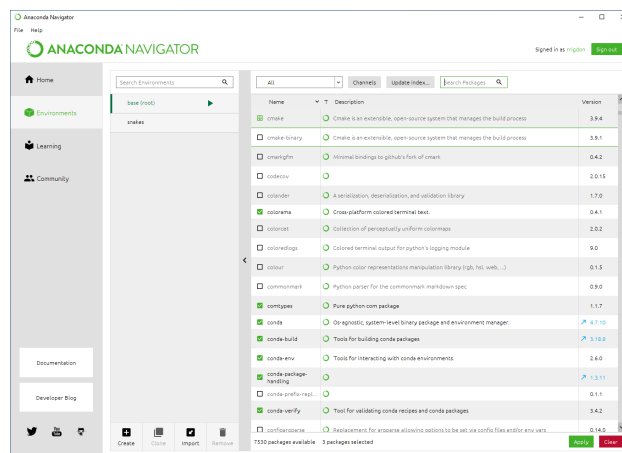

3. In the Packages list select “Python” and in the Python version list select the version you want to use.
4. Click the Create button.
5. Navigator creates the new environment and activates it, as shown by the highlighted green bar. All actions take place in the active environment.

## Searching Anaconda Cloud

To search Anaconda Cloud using Anaconda Navigator:

1. If you haven’t already, sign into Anaconda Cloud by clicking the top right sign-in button. If you don’t yet have an account, you can create one.
2. In Navigator, click the left Environments tab.
3. In the list at the top left of the packages area, select All to search All packages on Anaconda Cloud.
4. In the Search Packages box, type the name of the package you want to search for on Anaconda Cloud.

All packages with that text string are displayed in the Search Results.

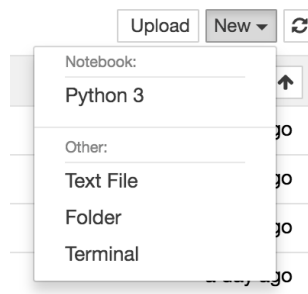

For more information on installing and using the packages you find on Anaconda Cloud, see [Package installation for Anaconda](#).

Specific examples:

### Displaying BioPython help text

After installing a package, you can confirm that the package was installed correctly by opening a Jupyter Notebook in that environment, importing the package and displaying its help text. In this example we will use the BioPython package.

1. [Start Navigator](#).
2. To install the BioPython package, follow the instructions in [Managing packages](#).
3. Click the icon to open a Jupyter Notebook.
4. In the Jupyter Notebook, click the New button and select your installed Python version.

5. Copy and paste the following code into the first cell:

```
import Bio
help(Bio)
```

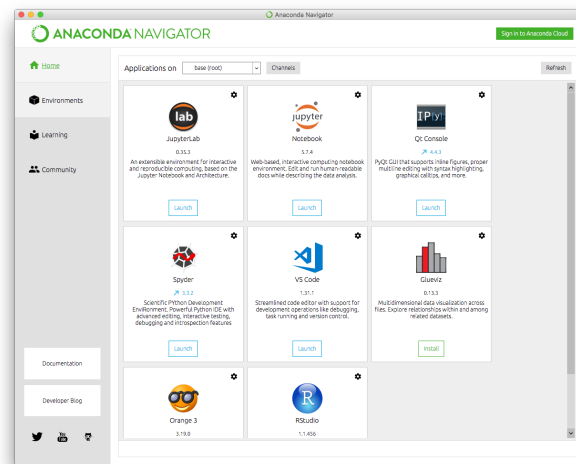

6. To run the code, in the menu bar, click Cell then select Run Cells, or use the keyboard shortcut Ctrl-Enter.  
The BioPython help text is displayed.

### Using the R programming language in Jupyter Notebook

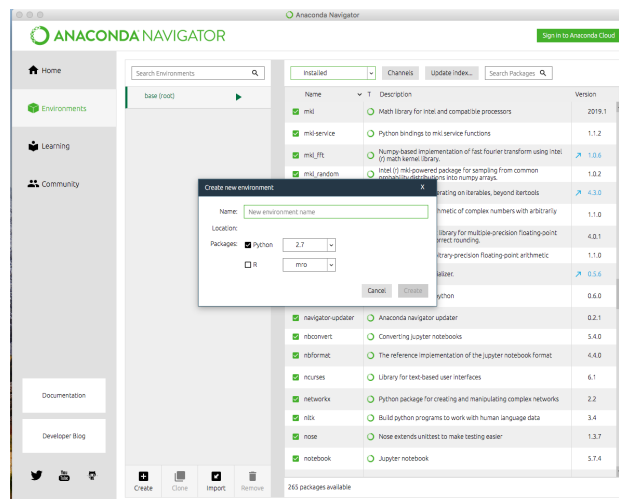

R is a popular programming language for statistics.

To install and run R in a Jupyter Notebook:

1. *Start Navigator.*

2. To install the R language and r-essentials packages, select **Environments** to create an new environment. Click **Create**.

Name the environment “r-tutorial”. Next to Packages, select Python 3.7 and R. Select **r** from the dropdown menu. Click **Create**.

3. *Open the environment with the R package* using the Open with Jupyter Notebook option.

4. To create a new notebook for the R language, in the Jupyter Notebook menu, select **New**, then select **R**.

5. We will use dplyr to read and manipulate Fisher's Iris multivariate data set in this tutorial. Copy and paste the following code into the first cell:

```
library(dplyr)
iris
```

6. To run the code, in the menu bar, click **Cell** then select **Run Cells**, or use the keyboard shortcut Ctrl-Enter.
7. The iris data table is displayed.
8. Using ggplot, we can create a scatter plot comparing sepal length and width of three iris species. Click + to open a second cell, then copy and paste the following code into the second cell:

```
library(ggplot2)
ggplot(data=iris, aes(x=Sepal.Length, y=Sepal.Width, color=Species)) + geom_
  point(size=3)
```

(continues on next page)

(continued from previous page)

9. To run the code, in the menu bar, click **Cell** then select **Run Cells**, or use the keyboard shortcut Ctrl-Enter.

For more resources on using R with Anaconda, see [Using R language with Anaconda](#).

**Tip:** For more information and to see the example code, see the [Anaconda Developer Blog](#).

## Installing and running Pandas

Pandas is a common Python tool for data manipulation and analysis. This task explains how to use Navigator to set up and begin working with Pandas in your choice of terminal, Python, IPython, or Jupyter Notebook. The steps are similar for *installing and opening* nearly any package.

1. *Start Navigator*.
2. Click the **Environments** tab.
3. Click the Create button. When prompted, enter a descriptive name for the environment, such as “Pandas.”
4. Select a Python version to run in the environment.
5. Click OK.

The new environment appears in the environments list.

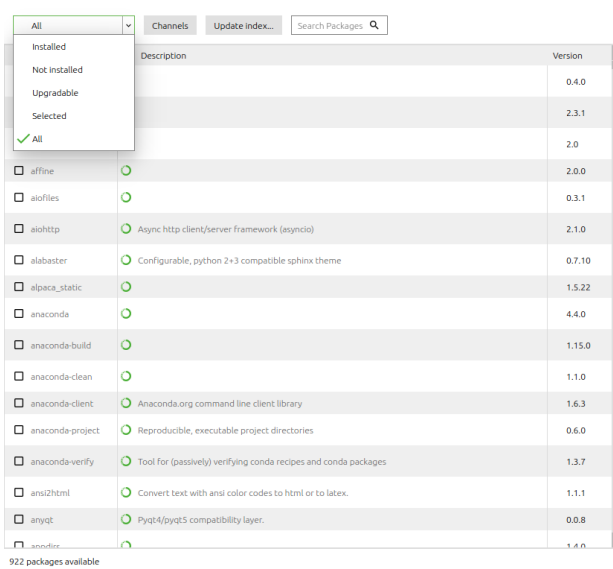

6. Click the name of the new environment to activate it.

The environment is highlighted with a green background.

7. In the list above the packages table, select All to filter the table to show all packages in all channels.

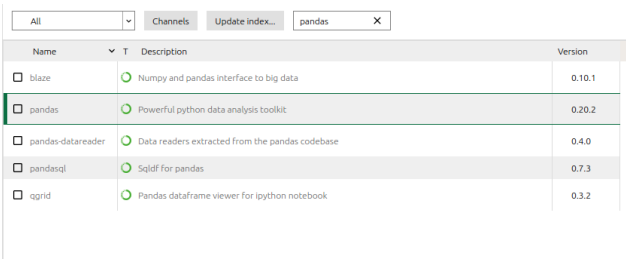

8. In the Search Packages box, type Pandas.

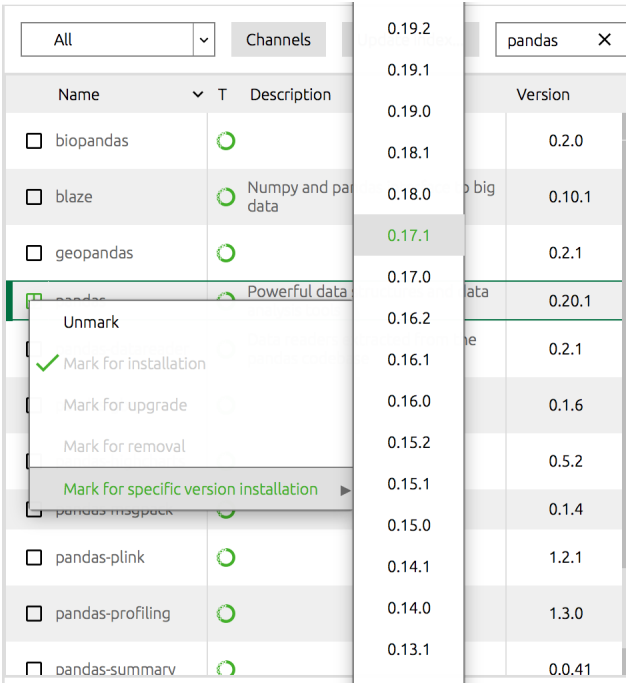

Pandas appears as a package available for installation.

9. Select the checkbox in front of the Pandas package name.

10. In the menu that appears, select Mark for specific version installation.

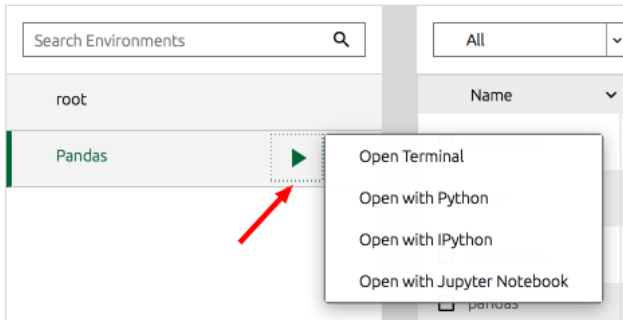

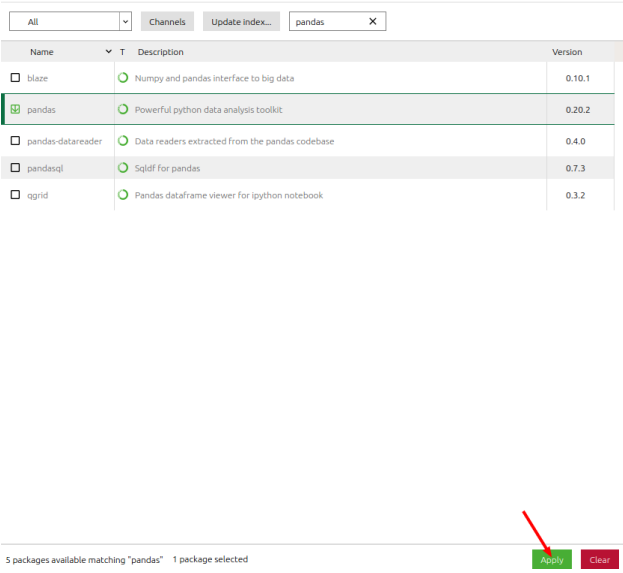

11. In the list that appears, select the Pandas version you want to install.

12. Click the Apply button.

A progress bar appears below the Packages pane while Pandas and its dependencies are installed.

- 13. To begin using your new environment, click the **Environments** tab.
- 14. Click the arrow button next to the Pandas environment name.
- 15. In the list that appears, select the tool to use to open Pandas: Terminal, Python, IPython or Jupyter Notebook.

### Troubleshooting

#### Navigator error on start up

This is often the result of a corrupted `.condarc` file. To resolve, delete the `.condarc` file and restart Navigator.

1. Find the `.condarc` file

In Anaconda Prompt or the terminal, enter the command `conda info`. The output will tell you the location of your `.condarc` file(s). You can also search for “.condarc” on your computer.

The `.condarc` file is frequently found in:

- macOS: `/Users/Username`
- Linux: `~/.condarc`
- Windows: `C:\Users\Username`

2. Optional: Save custom configurations

If you had custom configuration in your `.condarc` file before it was corrupted, save the information so you can add that configuration back to the new file.

3. Delete the `.condarc` file

4. Restart Navigator

#### Issues launching or initializing

If you are having problems launching Anaconda Navigator, follow [these steps](#).

If you cannot launch the Anaconda Navigator desktop app, you can still launch it from the terminal or an Anaconda Prompt with `anaconda-navigator`.

If you have permissions issues, there may be a problem with the licenses directory, `.continuum`. Open a terminal or Anaconda Prompt and delete the `.continuum` directory. Run `rm -rf ~/.continuum` on macOS and Linux and `rd /s .continuum` on Windows.

Then relaunch Navigator from the desktop app, terminal, or Anaconda Prompt.

If removing the licenses directory does not resolve the issue, manually update Navigator from a terminal or an Anaconda Prompt:

```
conda update anaconda-navigator
```

If you have updated Navigator and still have problems, remove Anaconda Navigator, then reinstall from terminal or Anaconda Prompt:

```
conda remove anaconda-navigator
conda install anaconda-navigator
```

If none of the above work, please reset Anaconda Navigator configuration back to default values:

```
anaconda-navigator --reset
```

### Access denied error

This is caused by a lock file that sometimes gets stuck and isn't removed when it should be.

In Anaconda Prompt or a terminal, run:

```
conda update conda
conda update anaconda-navigator
conda update navigator-updater
anaconda-navigator --reset
```

The last command is the key to fixing the issue as it removes the lock file causing the problem.

### Navigator buttons are missing

If your Navigator buttons are missing, try the following:

- Run “Update Index” from the Environments tab of Navigator
- Quit and restart Navigator
- If still broken, confirm that your `.condarc` file is not *corrupt*. Specifically confirm that your channel settings contain “defaults”
- If it's still broken, try running `conda search python` from the command line. This will download a fresh copy of the repodata, which should resolve the problem.
- If none of the above options work, [open an issue](#) detailing the error

### RStudio fails to install in Navigator 1.6.2 if special characters are in install path

This is a known issue in Navigator 1.6.2 on Windows 7 64-bit.

### Help and support

Anaconda Navigator is copyright 2016-2017 Anaconda®, Inc. It may be copied and distributed freely only as part of an Anaconda or Miniconda installation.

For free community support for Anaconda and Navigator, join the [Anaconda Mailing List](#).

For Anaconda installation or technical support options, visit our [support offerings](#) page.

### Training and consulting

Training and consulting is available for all Anaconda products, including Navigator. For more information, please contact your account representative or email [sales@anaconda.com](mailto:sales@anaconda.com).

### Reporting bugs

Please report bugs on the [Anaconda GitHub issue tracker](#).

### Release notes

#### 1.9 – October 2, 2018

- Add support for **Offline Mode** for all environment related actions.
- Add support for custom configuration of main windows links.
- Numerous bug fixes and performance enhancements.

#### 1.8 – February 28, 2018

- **Remove “Projects” tab.**
- Support environment names with spaces on Windows.
- Improve switching between Anaconda API domains.
- Better integration with Visual Studio Code.
- Numerous bug fixes and performance enhancements.

#### 1.7 – February 13, 2018

- Add R and MRO documentation tiles.
- Add custom spinner.
- Better handling of Access Denied errors.
- Better integration with Visual Studio Code.
- Numerous bug fixes and performance enhancements.

#### 1.6 – May 19, 2017

- Better logging for application launches
- Package list can be filtered by “to be installed”
- Selecting an environment on the Home or Environments tab now selects it on both
- Numerous bug fixes and performance enhancements

#### 1.5 – March 2, 2017

- New Projects tab for working with Anaconda Projects, still in beta status
- Added Navigator Updater and increased visibility of available updates
- Numerous bug fixes and performance enhancements

## 1.4 – January 31, 2017

- Navigator is out of beta status.

The word “Beta” no longer appears in the title bar.

- R Studio available from the Navigator **Home** tab.

R Studio is an open-source integrated development environment (IDE) for the R programming language. R Studio has been added to the R channel and can now be installed and launched from the Navigator **Home** tab. To install and launch R Studio, in the R Studio pane, click the Install button, then click the Launch button.

- Orange app returns to the **Home** tab.

Orange app was removed from version 1.3 due to compatibility issues that have since been resolved. Orange app is pre-installed starting from version 1.4, so you can click the Launch button to launch it, with no need to install it first.

- Option to disable or enable SSL verification.

From the top menu bar, select Preferences, select or clear the Enable SSL verification checkbox, then click the Apply button.

- Support for Anaconda Fusion licenses.

Navigator now supports packages that require a license, including Anaconda Fusion. Installing Anaconda Fusion now automatically downloads a Fusion trial license from [Anaconda Cloud](#). This license is generated once per user, so if a user uninstalls Fusion and reinstalls it, the user receives the original license. Trial licenses require users to register for a free account on Anaconda Cloud.

- Correct display of “no arch” packages.

When Navigator installs “no arch” packages, they now appear correctly on the **Environments** tab.

- Friendly warning about updating channels for long-term users.

If users have created `.condarc` files that try to access `binstar.org`—the original name of `anaconda.org`—Navigator now warns that `binstar.org` channels are outdated.

## 1.3 – September 27, 2016

- License Manager dialog.

You can now easily upload licenses for applications that require them.

- Applications per environment.

You can install applications to any environment. To do this, on the **Home** tab, click the **Applications** menu, then select the environment in which you want to install an application. If an environment is not selected, applications are installed by default in the root environment.

- One-click updates and installs.

You can install a new package or update an installed package in the active environment. See [Managing packages](#).

- Clearer indication of option to delete a search filter.

On the **Environments** tab, when the packages are filtered by a user-defined search string, hovering over the X button now turns the cursor into an arrow and the X turns red, to emphasize that clicking the X will clear the search string.

- Channels now support tokens.

The Channel manager now supports security tokens. See [Adding a channel](#).

- Channel name copy and paste support.
- Navigator in a specific environment.

Installing Navigator in an environment other than root now makes that environment the default upon Navigator startup, both for the **Home** tab and the **Environments** tab.

- Table pre-filtering according to Python version.

To avoid unnecessary conflicts, the table that displays a filtered view of packages—according to the Installed, Not Installed, Upgradeable and Downgradable filter values—does not display packages that are incompatible with the installed version of Python.

- Dialog size restore.

Upon restart, the application window's last size and location are preserved, instead of the window's being maximized upon startup.

### 1.2 – August 1, 2016

- Improved conda rc support.

Navigator now reads from and writes to the conda configuration file (`.condarc`). In previous releases, updates made within Navigator to the conda configuration were not reflected in the `.condarc` file, and vice versa. Starting from version 1.2, when you add channels inside Navigator, the `.condarc` file is updated, and if `.condarc` is updated outside Navigator, Navigator correctly reads the available channels.

- Improved channels support.

You can now *manage the channels* on Anaconda Cloud that you want Navigator to consider active. Active channels are included when you search for packages and other assets.

- R environment creation support.

Navigator now allows you to *install a standalone R language environment or a mixed Python and R environment*.

- Conda environment file import.

Navigator now allows you to *import environment.yml files*.

- Updates for Enterprise users.

---

**Note:** You cannot use an Enterprise version of Anaconda Cloud with Navigator.

---

- Simplified preferences.

Preference options are simplified so that only one URL is needed to set up the API. Changing this value affects the URL setting of the anaconda-client configuration.

---

**Note:** Changing the *URL setting in the CLI* affects the value displayed in the preferences.

---

- Proxy.

When using Navigator behind a proxy, the settings must be manually set inside the conda configuration file. See the [conda proxy documentation](#).

## Glossary

### Anaconda

A downloadable, free, open source, high-performance, optimized Python and R distribution with 100+ packages and the option to easily install an additional 620+ popular open source packages for data science, including advanced and scientific analytics. Anaconda includes *Anaconda Navigator* and *conda* management utilities. Available for Windows, macOS and Linux. All versions are supported by the development community.

### Anaconda Cloud

A web-based repository hosting service in the cloud. *Packages* created locally can be published to your *channel* on Anaconda Cloud to be shared with the public. Paid subscriptions to Anaconda Cloud can designate packages as private, to be shared only with authorized users. Anaconda Cloud is Anaconda's repository product made available to the public. Anaconda repository is also available for purchase by companies that wish to maintain their own on-site version of Anaconda Cloud. See [Anaconda business subscriptions](#).

### Anaconda Enterprise

Anaconda version that includes enterprise technical support, indemnification for a select number of open source packages, collaborative notebooks, high performance scalability, Hadoop, interactive visualization, governance and security. See [Anaconda business subscriptions](#).

### Anaconda Navigator

A desktop graphical user interface (GUI) included in all versions of *Anaconda* that allows you to easily manage *conda packages*, *environments*, *channels* and notebooks without the need to use the *command line interface (CLI)*.

### Anaconda Repository

A private enterprise server on your network where open source and proprietary packages may be stored and retrieved for installation on a local computer. Anaconda Repository is different from [Anaconda Cloud](#) or the [default conda repository](#). The Anaconda Repository is used to govern access to data science assets including packages and notebooks.

### Channels

The locations of the repositories where conda looks for packages, often on Anaconda Cloud (Anaconda.org). Channels may also go to a private location on a remote or local repository that you or your organization manage.

### Command line interface (CLI)

A program in which commands are entered as text, one line at a time, for a computer to execute. This is done in the Anaconda Prompt in Windows, and in a terminal in macOS and Linux. Conda is executed in a CLI. Contrast with *Graphical User Interface (GUI)*.

### Conda

A package and environment manager program that is packaged with *Anaconda* and run in a CLI. Using conda, you can install and update *conda packages* and their dependencies, and switch between *conda environments* on your local computer. Contrast to *Anaconda Navigator*.

### Conda environment

A folder or directory that contains a specific collection of *conda packages* and their dependencies, so they can be maintained and run independently without interfering with each other. Environments in Anaconda Navigator are conda environments.

EXAMPLE: It can be useful to create one environment for packages that run on Python 2, and another for packages that run on Python 3.

Changes to one environment do not affect other environments.

EXAMPLE: If you upgrade a program in one environment, this will not upgrade the same program in another environment.

### Conda package

An archive file that contains everything that a software program needs in order to be installed and run, so you do not have to manually find and install each dependency separately. This can include system-level libraries, Python modules, executable programs and other components. Managed with *conda* or *Anaconda Navigator*. Packages in Anaconda Navigator are conda packages.

### Conda repository

A cloud-based repository that contains 720+ open source certified packages that are easily installed locally via the `conda install` command. Can be viewed directly at <https://repo.anaconda.com/pkg/> and used within *Anaconda Navigator* when downloading and installing packages from their Environments tab, or by using *conda* commands in a *Command Line Interface*.

### Graphical user interface (GUI)

A program with graphic images, icons and menus in which commands are entered by clicking with a mouse and/or entering text in edit boxes. *Anaconda Navigator* is a graphical user interface that overlays the conda utility.

### Miniconda

A minimal installer for conda that is run from a command line interface (CLI). Like Anaconda, Miniconda is a free software package that includes the conda package and environment manager, but Miniconda does not include Anaconda, Anaconda Navigator, or any packages other than those dependencies needed to install it. After Miniconda is installed, additional conda packages may be installed directly from the command line interface with the command `conda install`. See also *Anaconda* and *conda*.

## Package manager

A collection of software tools that automates the process of installing, updating, configuring, and removing computer programs on a computer. Also known as a package management system. *Anaconda Navigator* includes the conda package manager with a GUI overlay for ease of use.

## Packages

Software program files and information about the software, such as its name, the specific version and a description, bundled into a file that can be installed and managed by a package manager.

## R packages

*Conda packages* that install and run the R computer language. Examples include R Essentials, a bundle of 80 popular open source software programs written in the R computer language. To learn more, see <http://conda.pydata.org/docs/r-with-conda.html>.

## Repository

Any storage location from which software or software assets may be retrieved and installed on a local computer. See also: *Anaconda Repository* and *conda repository*.

Review this page to learn what Anaconda Navigator is. When you're ready to start working in Navigator, check out the user guide topics:

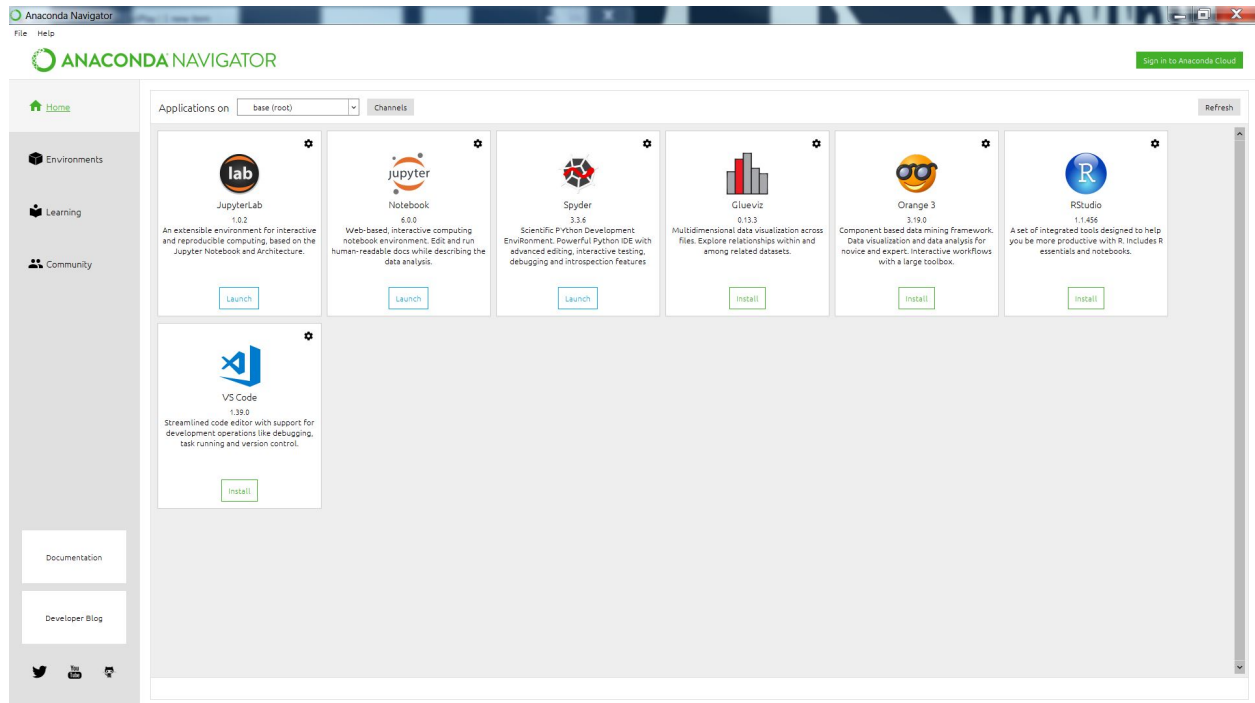

*Overview* | *Getting started with Navigator* | *Tutorials* | *Troubleshooting* | *Release notes*

## What is Anaconda Navigator?

Anaconda Navigator is a desktop graphical user interface (GUI) included in Anaconda® distribution that allows you to launch applications and easily manage conda packages, environments, and channels without using command-line commands. Navigator can search for packages on Anaconda Cloud or in a local Anaconda Repository. It is available for Windows, macOS, and Linux.

To get Navigator, get the Navigator Cheat Sheet and *install Anaconda*.

The *Getting started with Navigator* section shows how to start Navigator from the shortcuts or from a terminal window.

## Why use Navigator?

In order to run, many scientific packages depend on specific versions of other packages. Data scientists often use multiple versions of many packages and use multiple environments to separate these different versions.

The command-line program `conda` is both a package manager and an environment manager. This helps data scientists ensure that each version of each package has all the dependencies it requires and works correctly.

Navigator is an easy, point-and-click way to work with packages and environments without needing to type `conda` commands in a terminal window. You can use it to find the packages you want, install them in an environment, run the packages, and update them – all inside Navigator.

## What applications can I access using Navigator?

The following applications are available by default in Navigator:

- JupyterLab
- Jupyter Notebook
- Spyder
- VSCode
- Glueviz
- Orange 3 App
- RStudio

Advanced `conda` users can also *build their own Navigator applications*.

## How can I run code with Navigator?

The simplest way is with Spyder. From the Navigator Home tab, click Spyder, and write and execute your code.

You can also use Jupyter Notebooks the same way. Jupyter Notebooks are an increasingly popular system that combine your code, descriptive text, output, images, and interactive interfaces into a single notebook file that is edited, viewed, and used in a web browser.

## Navigator user guide

- [Overview](#)
- [Getting started with Navigator](#)
- [Tutorials](#)
- [Troubleshooting](#)
- [Release notes](#)

---

**Note:** We do not support macOS<10.12 for Anaconda Navigator.

---

## Tasks

### Installing conda packages

For more information about using the conda package manager in Anaconda Prompt (terminal on Linux or macOS), see the [conda documentation](#).

You can also use the graphical interface [Anaconda Navigator](#) to install conda packages with just a few clicks.

Open an Anaconda Prompt (terminal on Linux or macOS) and follow these instructions.

### Installing a conda package

Enter the command:

```
conda install package-name
```

---

**Note:** Replace `package-name` with your package name.

---

### Installing specific versions of conda packages

Include the desired version number or its prefix after the package name:

```
conda install package-name=2.3.4
```

---

**Note:** Replace `package-name` with your package name. Replace `2.3.4` with the desired version number.

---

To specify only a major version, run:

```
conda install package-name=2
```

---

**Note:** Replace `package-name` with your package name. Replace `2` with the desired version number.

---

These commands install into the environment that is currently active. To install into a named environment, run:

```
conda install package-name=2.3.4 -n some-environment
```

---

**Note:** Replace `package-name` with your package name. Replace `2.3.4` with the desired version number. Replace `some-environment` with your environment name.

---

If the package is specific to a Python version, conda uses the version installed in the current or named environment. For details on versions, dependencies and channels, see [Conda FAQ](#) and [Conda Troubleshooting](#).

### Installing packages on a non-networked (air gapped) computer

To directly install a conda package from your local computer, run:

```
conda install /package-path/package-filename.tar.bz2
```

---

**Note:** Replace `package-path` and `package-filename.tar.bz2` with your actual path and filename.

---

Conda installs packages into the `anaconda/pkgs` directory.

To install a `.tar` file containing many conda packages, run the following command:

```
conda install /packages-path/packages-filename.tar
```

---

**Note:** Replace `package-path` and `package-filename.tar` with your actual path and filename.

---

If conda cannot find the file, try using an absolute path name instead of a relative path name.

---

**Note:** Installing packages directly from the file does not resolve dependencies. If your installed package does not work, it may have missing dependencies that need to be resolved manually.

---

### Switching between Python 2 and Python 3 environments

You can easily maintain separate environments for Python 2 programs and Python 3 programs on the same computer, without worrying about the programs interacting with each other. Switching to an environment is called activating it.

#### Summary

1. Create a Python 2 environment

2. Create a Python 3 environment
3. Activate and use the Python 2 environment
4. Deactivate the Python 2 environment
5. Activate and use the Python 3 environment
6. Deactivate the Python 3 environment

Create a Python 2 environment named py2, install Python 2.7:

```
conda create --name py2 python=2.7
```

Create a new environment named py3, install Python 3.5:

```
conda create --name py3 python=3.5
```

Now you have two environments to work with. You can install packages and run programs as desired in either one.

Activate and use the Python 2 environment

WINDOWS:

```
activate py2
```

LINUX, macOS:

```
source activate py2
```

Use your py2 environment to install packages and run programs as desired. When finished, deactivate the environment

WINDOWS:

```
deactivate
```

macOS, LINUX:

```
source deactivate
```

Activate and use the Python 3 environment

WINDOWS:

```
activate py3
```

LINUX, macOS:

```
source activate py3
```

Use the py3 environment to install and run programs as desired. When finished, deactivate the environment

WINDOWS:

```
deactivate
```

macOS, LINUX:

```
source deactivate
```

### Configuring a shared package cache

If you have your own installation of Anaconda or Miniconda on your system, you can improve the speed at which packages are installed or new environments are created and save disk space by setting up the configuration to use a shared package cache.

Normal installation sets a package cache relative to the install directory. This can be found with the following command listed under package cache:

```
conda info
```

The normal path to the package cache is:

**Windows** - C:\Users\username\Anaconda{2,3}\pkgs

**macOS** - ~/opt/anaconda{2,3}

**Linux** - /home/username/anaconda{2,3}/pkgs

Each user has their own package cache so when a package is installed, the package is put into their own cache and not shared with anyone else.

The benefit of a shared package cache is that once a particular version of a package has already been downloaded by a user it will not be downloaded again and stored in a separate cache. This saves disk usage and speeds up the install as it does not need to download the package again.

### Shared package cache setup

Create a directory on your system where the shared users have read and write access.

Then for each user who will have access, edit the .condarc file found in their home directory.

**Windows** - C:\Users\username\.condarc

**macOS and Linux** - /home/username/.condarc

Edit the .condarc with the following entry, specifying the full path to the shared directory:

```
pkgs_dirs:
- /path/to/shared_directory
```

Verify the package cache by running `conda info` again.

### Using R language with Anaconda

With Anaconda, you can easily install the R programming language and over 400 commonly used R packages for data science. You can also create and share your own custom R packages.

---

**Note:** When using `conda` to install R packages, you will need to add `r-` before the regular package name. Anaconda R packages are prefixed with “r-”. For instance, if you want to install `rbokeh`, you will need to use `conda install r-bokeh` or for `rJava`, type `conda install r-rjava`.

---

The R Essentials bundle contains approximately 80 of the most popular R packages for data science, including the `IRKernel`, `dplyr`, `shiny`, `ggplot2`, `tidyr`, `caret`, and `nnet`. It is used as an example in the following guides.

R is the default interpreter installed into new environments. You can specify the R interpreter with the `r-base` package. Unless you change the R interpreter, `conda` will continue to use the default interpreter in each environment.

To run the commands below on Windows, use Start - Anaconda Prompt. On macOS or Linux, open a terminal.

## Updating R packages

- Update all of the packages and their dependencies with one command:

```
conda update r-caret
```

- If a new version of a package is available in the R channel, you can use `conda update` to update specific packages.

## Creating and sharing custom R bundles

Creating and sharing custom R bundles is similar to creating and sharing conda packages.

EXAMPLE: Create a simple custom R bundle metapackage named “Custom-R-Bundle” that contains several popular programs and their dependencies:

```
conda metapackage custom-r-bundle 0.1.0 --dependencies r-irkernel jupyter r-ggplot2 r-  
→dplyr --summary "My custom R bundle"
```

Share the new metapackage by uploading it to your channel on [Anaconda Cloud](#):

```
conda install anaconda-client  
anaconda login  
anaconda upload custom-r-bundle-0.1.0-0.tar.bz2
```

Anyone can now access your custom R bundle from any computer:

```
conda install -c <your anaconda.org username> custom-r-bundle
```

## Creating an environment with R

1. [Download and install Anaconda](#).
2. Create a new conda environment with all the r-essentials conda packages built from CRAN:

```
conda create -n r_env r-essentials r-base
```

3. Activate the environment:

```
conda activate r_env
```

4. List the packages in the environment:

```
conda list
```

The list shows that the package r-base is installed and r is listed in the build string of the other R packages in the environment.

Anaconda Navigator, the Anaconda graphical package manager and application launcher, creates R environments by default.

### Creating a new environment with R

When creating a new environment, you can use R by explicitly including `r-base` in your list of packages.

With conda 4.6:

```
conda create -n r-environment r-essentials r-base
conda activate r-environment
```

### Mirroring the R channel

Many Anaconda Enterprise customers maintain a local mirror of the R channel.

When mirroring the R channel for the first time, clean the existing packages by running the command `anaconda-server-sync-conda` with the option `--clean`.

### Uninstalling R Essentials

To uninstall the R Essentials package, run: `conda remove r-essentials`

---

**Note:** This removes only R Essentials and disables R language support. Other R language packages are not removed.

---

### Using MRO with Anaconda

If you prefer to use the Microsoft R Open (MRO) platform with Anaconda, as opposed to R, you can switch the default R interpreter from R to MRO. To get MRO, you need to explicitly include `mro-base`. Anaconda will maintain an archive of MRO packages but will not update MRO packages. Support for MRO packages will be on a case-by-case basis.

If you are using MRO, it is recommended to migrate to R. Follow the [migration directions](#).

### Switch the default R interpreter from R to MRO

Run `conda info` and check your version of conda. If your version of conda is below 4.6, run `conda update conda` to update conda to the latest version.

Run:

```
conda config --system --set pinned_packages _r-mutex==anacondar*
```

The default R interpreter will switch from R to MRO.

To learn more about how to use MRO with Anaconda, see [Using MRO language with Anaconda](#).

### Resources

Here are our more popular resources on using Anaconda with the R programming language:

- [R Language packages available for use with Anaconda](#)—There are hundreds of R language packages now available and several ways to get them.

- *Navigator tutorial*—Use the R programming language with Anaconda Navigator. The Anaconda Navigator graphical interface (GUI) makes it easy for even new users to use and run the R language in a Jupyter Notebook.
- *Using R packages with Anaconda and Cloudera CDH*—Anaconda Scale provides resource management tools to easily deploy Anaconda across a cluster. It helps you manage multiple conda environments and packages, including Python and R language, on bare-metal or cloud-based clusters.
- *Webinar: Anaconda for R Users*—Download the slides from the webinar to see how Anaconda makes package, dependency and environment management easy with R language and other Open Data Science languages.

## Using MRO language with Anaconda

Microsoft R Open (MRO) is the enhanced distribution of R from Microsoft, a complete and free open source platform for statistical analysis and data science.

MRO was previously the default R interpreter in Anaconda. As of 2019 releases, Anaconda defaults to internal builds of R, henceforth the “Anaconda R ecosystem.” Learn more about how to use R with Anaconda.

Anaconda maintains an archive of MRO packages but will not update MRO packages. Support for MRO packages will be on a case-by-case basis.

If you are using MRO, it is recommended to migrate to R. Follow the migration directions below.

## Migrate MRO conda environments to use Anaconda R

If you have an MRO-based conda environment and you want to shift over to Anaconda R to fix library errors or for updates, using conda will fail:

```
conda install r-base
```

Using conda will result in unsatisfiable errors because the MRO packages in your environment will conflict with Anaconda R counterparts. They’re not compatible and the metadata is designed to prevent this coexistence. You can create a new environment but that could require more effort depending on how many dependencies you have.

To resolve this, use the [MRO-migrator tool](#). This tool removes all MRO-specific packages then updates the remaining packages to use Anaconda R instead of MRO. The remove-update cycle takes care of the unsatisfiability.

**Warning:** There’s minimal error handling in this tool. If your environment is not readily reproducible, back it up before running this tool.

To use the MRO-migrator tool, run its command line:

```
mro-migrator ~/miniconda3/envs/your-r-env
```

The default behavior lists which MRO-only packages will be removed. The tool does not change anything by default. To perform a migration, pass the `--execute` flag:

```
mro-migrator --execute ~/miniconda3/envs/your-r-env
```

## MRO-supported operating systems

64-bit systems only for all operating systems - Windows, macOS and Linux.

Windows 7.0 SP1, Windows 8.1, Windows 10, Windows Server 2008 R2 SP1, and Windows Server 2012.

Linux - CentOS, Red Hat Enterprise Linux, Debian, and Ubuntu.

When using MRO conda packages, starting the R interactive interpreter shows Microsoft R Open in the startup message. Anaconda Navigator, the Anaconda graphical package manager and application launcher, also creates R environments by default. You may instead select MRO when creating a new conda environment from within Navigator.

### Microsoft R Client

Microsoft R Client is a free, community-supported data science tool for high-performance analytics built on top of MRO. Additionally, R Client introduces the powerful ScaleR technology and its proprietary functions to benefit from parallelization and remote computing.

Microsoft R Client is available as a conda package (`r-mrclient`). Users of Windows or RHEL-7/CentOS7/Ubuntu 14.04 and above also have the option to conda install the MicrosoftML R package for machine learning (`r-mrclient-mml`) and the pre-trained models for sentiment analysis and image detection (`r-mrclient-mlm`).

### Creating a new environment with MRO instead of R

When creating a new environment, you can use MRO and not R by explicitly including `mro-base` in your list of packages.

With conda 4.6.4:

```
conda create -n mro-environment r-essentials mro-base
conda activate mro-environment
```

### Switch an environment from R to MRO

We recommend using R as your default interpreter in Anaconda, however the directions below show you how to switch an environment from R to MRO.

### Activate the environment containing R

If you use conda 4.4 or later, run:

```
conda install mro-base
```

If you use conda 4.3, run:

```
conda remove --force r-base _r-mutex
conda install mro-base
```

The environment's R interpreter will switch from R to MRO.

**mro-basics:** The MRO Basics metapackage contains everything in the Microsoft MRO installers. It does not include `r-mrclient`, `r-mrclient-mml` or `r-mrclient-mlm`.

**r-mrclient:** Microsoft R Client is a free, community-supported, data science tool for high performance analytics.

**r-mrclient-mml:** MicrosoftML provides state-of-the-art fast, scalable machine learning algorithms and transforms for R. Depends on `r-mrclient`.

**r-mrclient-mlm:** MicrosoftML Machine Learning Models are pre-trained machine learning models for sentiment analysis and image detection. Depends on `r-mrclient-mml`.

## Using PyCharm

PyCharm is an IDE that integrates with IPython Notebook, has an interactive Python console, and supports [Anaconda](#) as well as multiple scientific packages. PyCharm supports creating virtual environments for Python with conda.

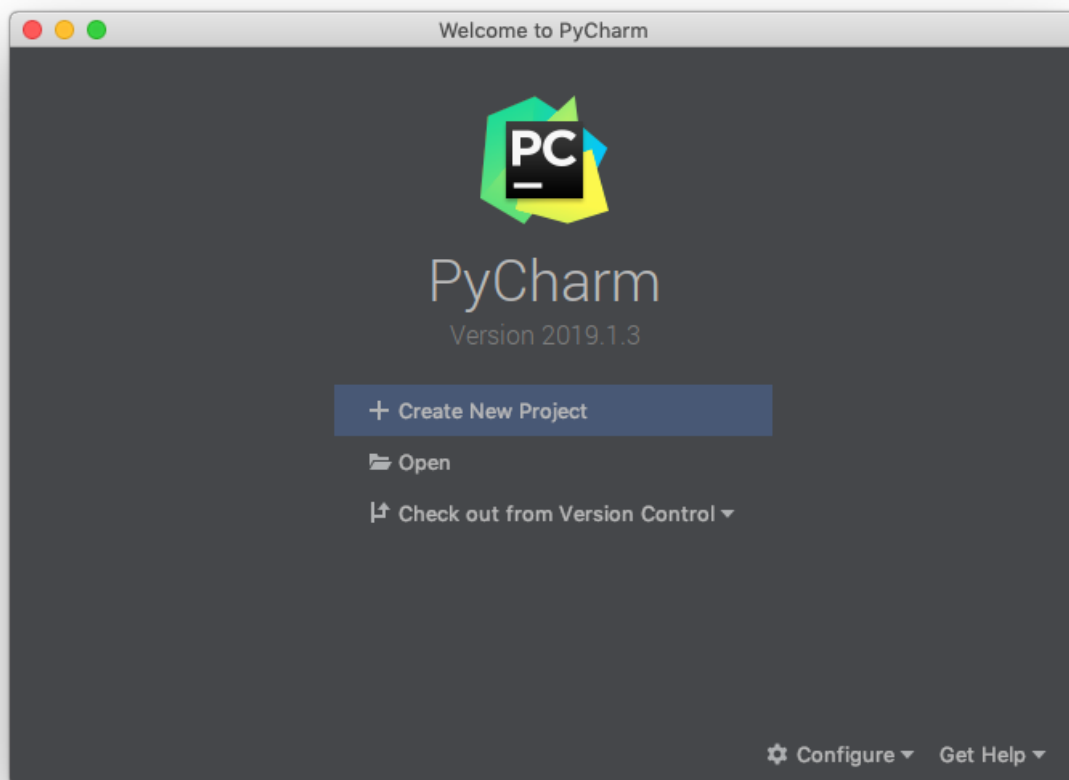

- *Configuring a conda environment in PyCharm*
- *Adding a package to a project*
- *Adding a repository to a project*

## Configuring a conda environment in PyCharm

1. In the Settings/Preferences dialog (,), select Project: <project name> | Project Interpreter.

2. Alternatively, from the Welcome screen, select Configure.

3. Select Preferences.

4. Select Project Interpreter.
5. In the Project Interpreter page, click the gear icon and select Add.
6. In the left-hand pane of the Add Python Interpreter dialog box, select Conda Environment. The following actions depend on whether the conda environment existed before.

**7. If New environment is selected:**

1. Specify the location of the new conda environment in the text field or click the folder icon and find location in your file system.

---

**Note:** The directory where the new conda environment should be located must be empty.

---

2. Select the Python version from the drop-down list.
3. Specify the location of the conda executable file in the text field or click the ellipsis and find the location in the conda installation directory.
4. If needed, select the Make available to all projects check box.

**8. If Existing environment is selected:**

1. Specify the required interpreter: use the drop-down list or click and find one in your file system (for example, C:\Users\jetbrains\Anaconda3\python.exe).
  2. Select the check box Make available to all projects (if needed).
9. Click OK to complete the task.

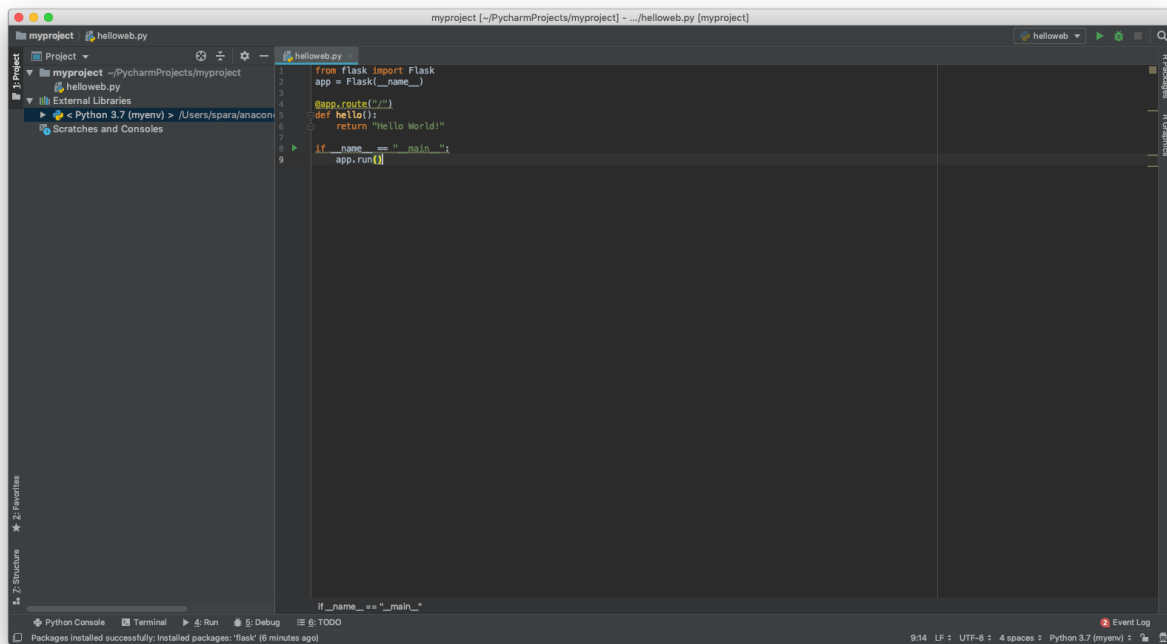

### Adding a package to a project

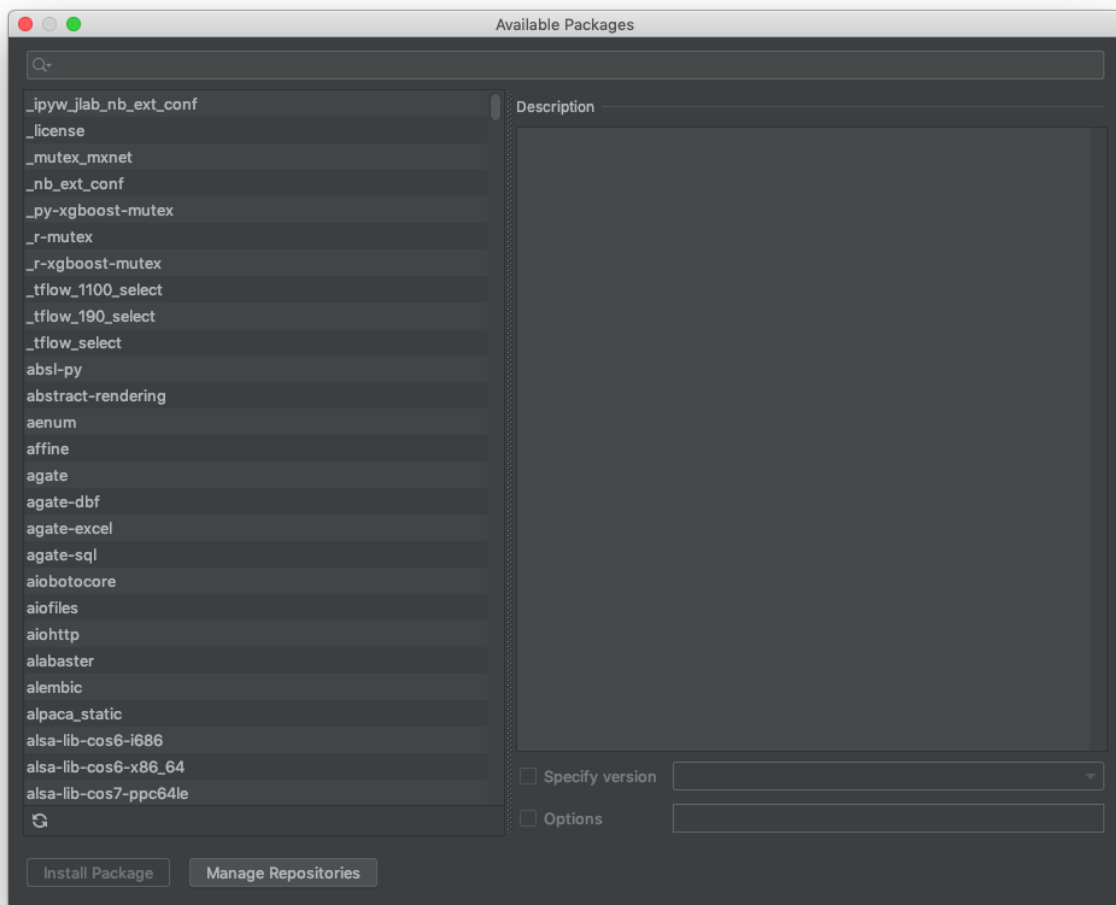

The project uses the flask package which is available on the Anaconda defaults channel.

1. To add flask, select Preferences (,).
2. Select + to display the packages available in the defaults channel.
3. The packages in the defaults channel are displayed. Type “flask” into the search bar and select Install.
4. After flask is installed, it will be displayed in the project environment.

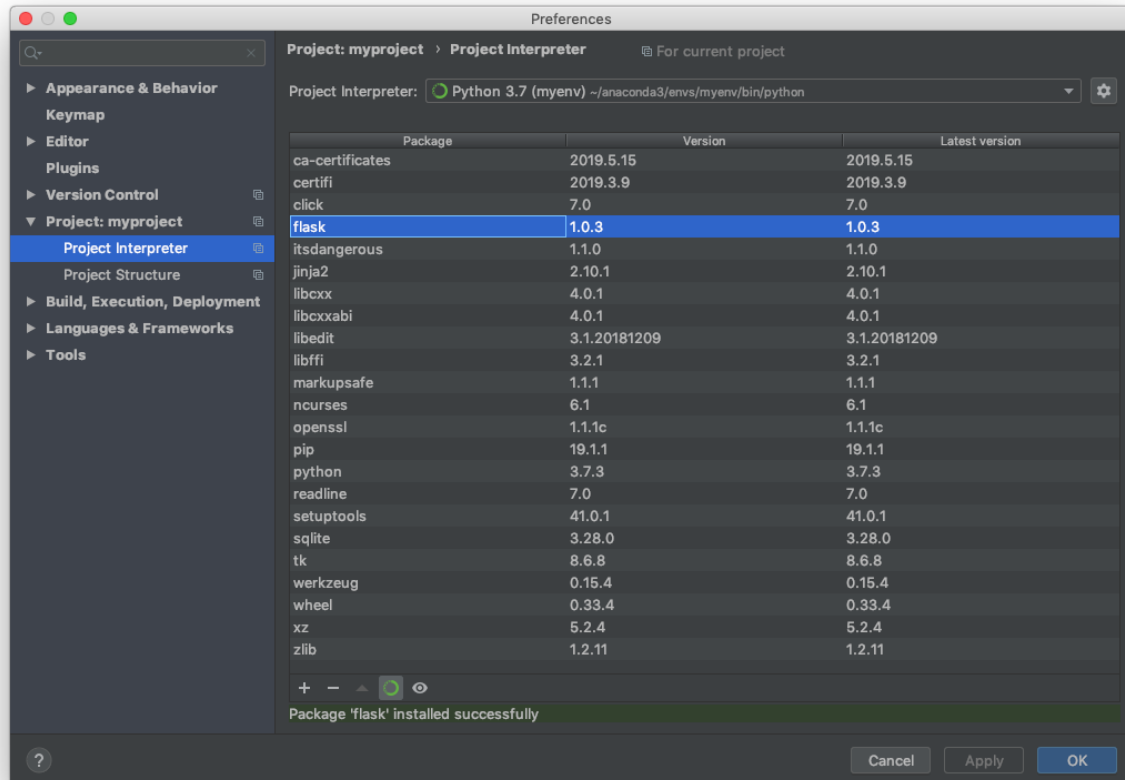

### Adding a repository to a project

This project uses the bottle package which is available on the [conda-forge channel](#).

1. To add the conda-forge channel, select Preferences (⌘,).

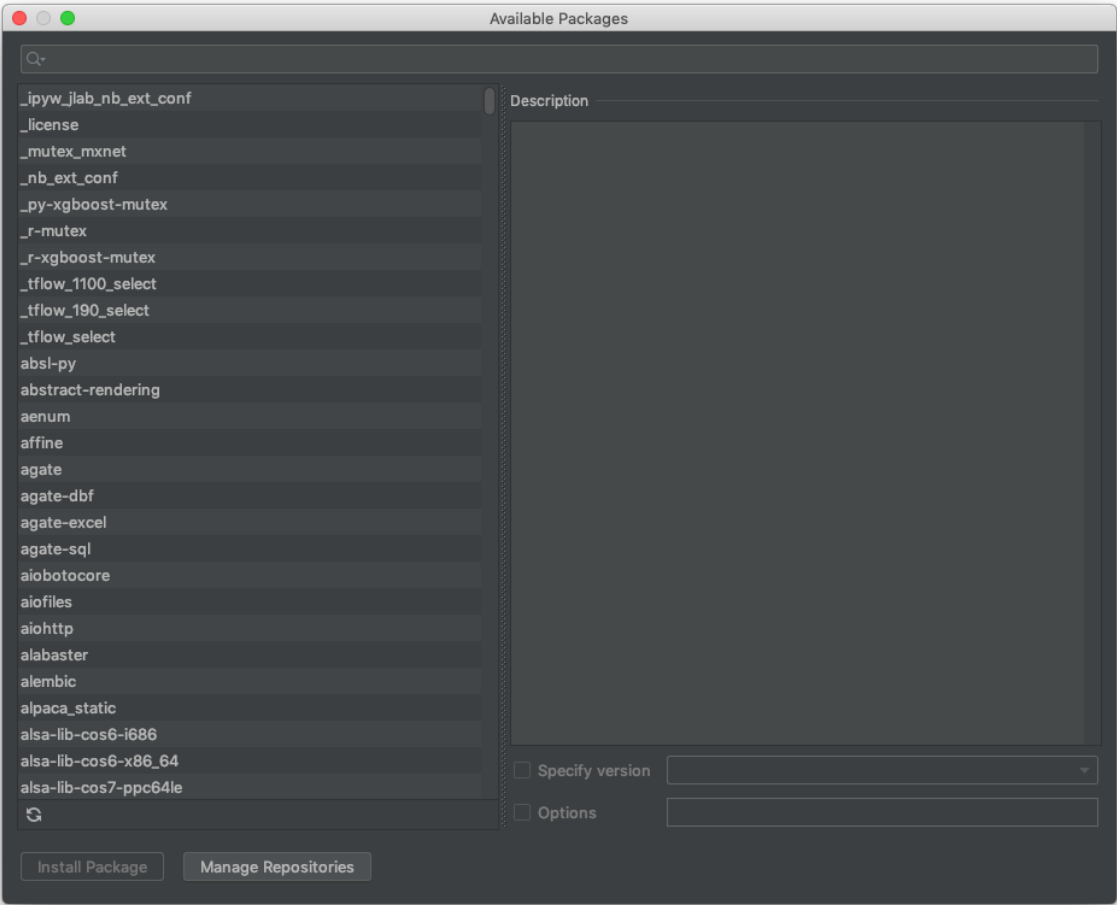

2. Select + to display the packages available in the defaults channel.
3. To add a repository, select Manage Repositories, select +, and enter “conda-forge”. Select OK.

The packages from both defaults and conda-forge will be displayed.

4. Type “bottle” into the search bar and select Install.
5. After bottle is installed, it will be displayed in the project environment.

## TensorFlow

Anaconda makes it easy to install TensorFlow, enabling your data science, machine learning, and artificial intelligence workflows.

This page shows how to install [TensorFlow](#) with the conda package manager included in Anaconda and Miniconda.

TensorFlow with conda is supported on 64-bit Windows 7 or later, 64-bit Ubuntu Linux 14.04 or later, 64-bit CentOS Linux 6 or later, and macOS 10.10 or later.

The instructions are the same for all operating systems.

No `apt install` or `yum install` commands are required.

1. Download and install [Anaconda](#) or the smaller [Miniconda](#).
2. On Windows open the Start menu and open an Anaconda Command Prompt. On macOS or Linux open a terminal window. (On macOS or Linux, use the default bash shell.)
3. Choose a name for your TensorFlow environment, such as “tf”.
4. To install the current release of CPU-only TensorFlow, recommended for beginners:

```
conda create -n tf tensorflow
conda activate tf
```

Or, to install the current release of GPU TensorFlow on Linux or Windows:

```
conda create -n tf-gpu tensorflow-gpu
conda activate tf-gpu
```

TensorFlow is now installed and ready to use.

## CUDA versions

GPU TensorFlow uses CUDA. On Windows only CUDA 9.0 is supported. On Linux CUDA 8.0, 9.0, and 9.2 are supported, and 9.2 is the default.

To install GPU TensorFlow with a non-default CUDA version such as 8.0:

```
conda create -n tf-gpu-cuda8 tensorflow-gpu cudatoolkit=8.0
conda activate tf-gpu-cuda8
```

## Python 2

We recommend Python 3, but it is possible to use TensorFlow with Python 2 on Linux or macOS.

CPU-only Tensorflow on Python 2 on Linux or macOS:

```
conda create -n tf-2 tensorflow python=2
conda activate tf-2
```

GPU TensorFlow on Python 2 on Linux:

```
conda create -n tf-2-gpu tensorflow python=2
conda activate tf-2-gpu
```

## Nightly builds

Advanced users may wish to install the latest nightly build of TensorFlow. These nightly builds are unstable, and are only available as pip packages on PyPI.

To install the nightly build of CPU-only TensorFlow:

```
conda create -n tf-n python
conda activate tf-n
pip install tf-nightly
```

Or, to install the nightly build of GPU TensorFlow on Linux or Windows:

```
conda create -n tf-n-gpu python
conda activate tf-n-gpu
pip install tf-nightly-gpu
```

Nightly build of CPU-only TensorFlow on Python 2 on Linux or macOS:

```
conda create -n tf-2-n python=2
conda activate tf-2-n
pip install tf-nightly
```

Nightly build of GPU TensorFlow on Python 2 on Linux:

```
conda create -n tf-2-n-gpu python=2
conda activate tf-2-n-gpu
pip install tf-nightly-gpu
```

## Cloudera CDH

Cloudera provides Apache Hadoop-based software, support and services, as well as training to business customers. Their open source Apache Hadoop distribution, CDH (Cloudera Distribution Including Apache Hadoop), targets enterprise-class deployments of that technology.

There are two methods of using Anaconda on an existing cluster with [Cloudera CDH](#), Cloudera's distribution including Apache Hadoop:

- Use the Anaconda parcel for Cloudera CDH. The following procedure describes how to install the Anaconda parcel on a CDH cluster using Cloudera Manager. The Anaconda parcel provides a static installation of Anaconda, based on Python 2.7, that can be used with Python and PySpark jobs on the cluster.
- Use Anaconda Scale, which provides additional functionality, including the ability to manage multiple conda environments and packages, including Python and R, alongside an existing CDH cluster. For more information, see [Using Anaconda with Cloudera CDH](#).

See the blog post [Self-service Open Data Science: Custom Anaconda parcels for Cloudera](#).

To install the Anaconda parcel:

1. In the Cloudera Manager Admin Console, in the top navigation bar, click the Parcels icon.
2. At the top right of the parcels page, click the Edit Settings button.
3. In the Remote Parcel Repository URLs section, click the plus symbol, and then add the following repository URL for the Anaconda parcel:

```
https://repo.anaconda.com/pkg/misc/parcels/
```

4. At the top of the page, click the Save Changes button.
5. In the top navigation bar, click the Parcels icon to return to the list of available parcels, where you should see the latest version of the Anaconda parcel that is available.
6. To the right of the Anaconda parcel listing, click the Download button.
7. After the parcel is downloaded, click the Distribute button to distribute the parcel to all of the cluster nodes.
8. After the parcel is distributed, click the Activate button to activate the parcel on all of the cluster nodes.
9. When prompted, confirm the activation.

After the parcel is activated, Anaconda is available on all of the cluster nodes.

You can submit Spark jobs along with the `PYSPARK_PYTHON` environment variable that refers to the location of Anaconda. For example, enter the following command all on one line:

```
PYSPARK_PYTHON=/opt/cloudera/parcels/Anaconda/bin/  
python spark-submit pyspark_script.py
```

**Note:** The line break in the example above is for readability only. Enter the command all on one line.

**Note:** The repository URL shown above installs the most recent version of the Anaconda parcel. To install an older version of the Anaconda parcel, add the following repository URL to the Remote Parcel Repository URLs in Cloudera manager, and then follow the above steps with your desired version of the Anaconda parcel.

```
https://repo.anaconda.com/pkg/misc/parcels/archive/
```

Anaconda builds new Cloudera parcels at least once a year each spring and also offers custom parcel creation for our enterprise customers. The Anaconda parcel provided at the repository URL shown above is based on Python 2.7. To use the Anaconda parcel with other versions of Python or with additional packages, contact [sales@anaconda.com](mailto:sales@anaconda.com) for more information about custom Anaconda parcel builds or other enterprise solutions for using Anaconda with cluster computing.

Anaconda Workgroup and Anaconda Enterprise subscribers can also use Anaconda Repository to *create and distribute their own custom Anaconda parcels for Cloudera Manager*.

For more information about managing Cloudera parcels, see the [Cloudera documentation](#).

## Amazon AWS

Amazon Web Services (AWS) is a collection of cloud-computing services that make up a cloud-computing platform offered by Amazon.com.

To see the currently available official Anaconda or Miniconda AMIs please go to [AWS marketplace](#)

### Docker

Docker is an open platform for developers and system administrators to build, ship and run distributed applications, whether on laptops, data center virtual machines or the cloud. Anaconda, Inc. provides Anaconda and Miniconda Docker images.

Read the [official Docker documentation](#) and specifically the information related to [Docker images](#).

Begin by browsing the available Anaconda images [on our Docker profile](#).

To obtain a fully working Anaconda image:

1. In a terminal window, run this command to display a list of available images:

```
docker search continuumio
```

2. Pull the desired image:

```
docker pull continuumio/miniconda
```

3. Create a container using the image:

```
docker run -t -i continuumio/miniconda /bin/bash
```

This gives you direct access to the container where the conda tool is already available.

4. Test the container:

```
conda info
```

You now have a fully working Anaconda image.

To install and launch the Jupyter Notebook, execute the following command all on one line from the host machine:

```
docker run -i -t -p 8888:8888 continuumio/miniconda /bin/bash
-c "/opt/conda/bin/conda install jupyter -y --quiet && mkdir
/opt/notebooks && /opt/conda/bin/jupyter notebook
--notebook-dir=/opt/notebooks --ip='*' --port=8888
--no-browser"
```

---

**Note:** Line breaks in the example above are for readability only. Enter the command all on one line.

---

To access the Jupyter notebook open <http://localhost:8888> in your browser, or open <http://<DOCKER-MACHINE-IP>:8888> if you are using a Docker Machine VM.

---

**Note:** Replace <DOCKER-MACHINE-IP> with your Docker Machine VM IP address.

---

## Using IDEs

Data science is a team sport, so we have built the Anaconda platform to be language-agnostic as well as extensible.

You can use the following IDEs with Anaconda:

- *Eclipse and PyDev*
- *IDLE*
- *IntelliJ*
- *Ninja IDE*
- *Python Tools for Visual Studio (PTVS)*
- *Python for Visual Studio Code*
- *Spyder*
- *Sublime Text*
- *Microsoft Visual Studio Code (VS Code)*
- *Wing IDE*

---

**Note:** IDEs often require you to specify the path to your Python interpreter. See [Finding your Anaconda Python interpreter path](#).

---

*Microsoft Excel*—Anaconda on Windows comes ready to bring the power of Python into Excel. Use one of the many packages included in Anaconda or connect to an outside integration tool.

## Eclipse and PyDev

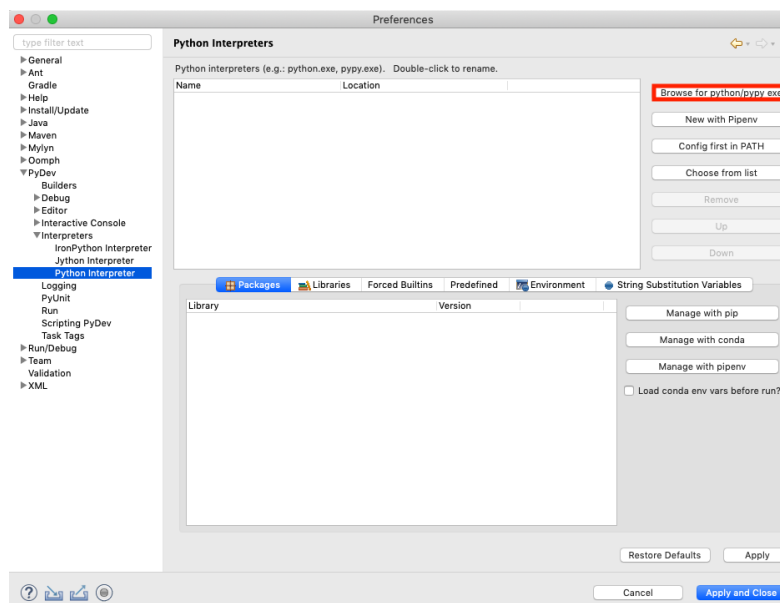

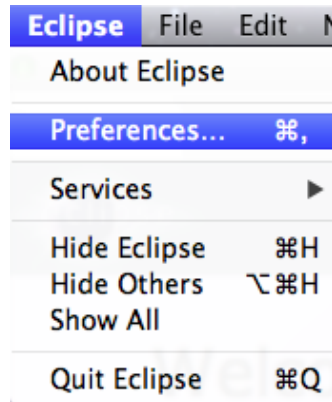

Eclipse is an open source platform that provides an array of convenient and powerful code-editing and debugging tools. PyDev is a Python IDE that runs on top of Eclipse.

If you do not already have Eclipse and PyDev installed:

- Download Eclipse and read the [Eclipse resources](#).
- You may need to install the latest [Java JDK/JRE](#) before installing PyDev in order for PyDev to show up in the Eclipse Preferences menu after PyDev installation.
- Install PyDev.

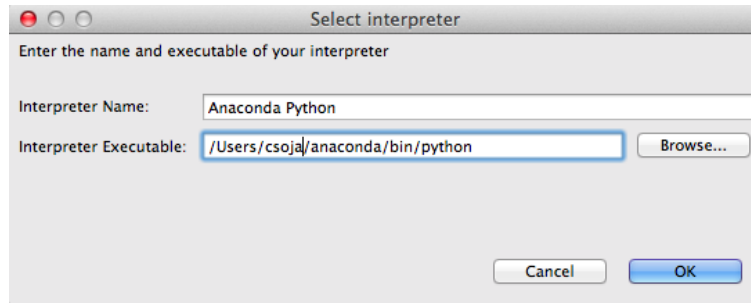

After you have Eclipse, PyDev, and Anaconda installed, set Anaconda Python as your default:

1. Open the Eclipse Preferences window:
2. In the PyDev list, select Interpreters, and then select Python Interpreter.
3. Click the Browse for python/pypy exe button:

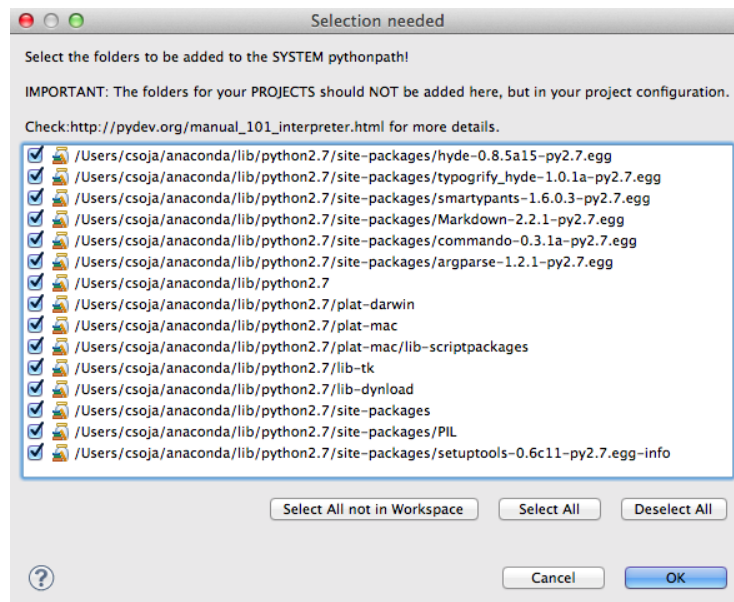

4. In the Interpreter Name box, type Anaconda Python.
5. Browse to your *Anaconda Python interpreter path*. The interpreter you choose is related to your environment, so Eclipse will have access to all of the packages in that environment. To add new packages, you may need to `conda install package-name` in your Anaconda Prompt or terminal.
6. Click the OK button:

7. In the next window, select the folders to add to the SYSTEM Python path:

1. Select all the folders:

2. Click the OK button.

The Python Interpreters window now displays Anaconda Python:

3. Click the Apply and Close button.

You are now ready to use Anaconda Python with your Eclipse and PyDev installation.

## IDLE

IDLE is a very small and simple cross-platform IDE that is included free with Python and is released under the open source Python Software Foundation License.

Anaconda and Miniconda include IDLE.

To use IDLE:

1. Find the IDLE program file:

EXAMPLES for Miniconda with Python 3 and user name “jsmith”:

- On macOS, the full path may be `/Users/jsmith/miniconda3/bin/idle3.5`
- On Windows, the full path may be `C:\Users\jsmith\Miniconda3\Scripts\idle`

2. Run IDLE from file explorer or from the command line by entering the full path.

---

**Tip:** You can make a shortcut to the IDLE program file on your desktop.

---

## IntelliJ

IntelliJ IDEA Community Edition is the open source version of [IntelliJ IDEA](#), an IDE (Integrated Development Environment) for Java, Groovy, and other programming languages such as Scala or Clojure. It is made by JetBrains, maker of PyCharm Python IDE.

### Before you start

You should have both Miniconda and IntelliJ installed and working.

### Set up IntelliJ using Miniconda

Find location of Miniconda Python executable:

```
which python
```

The system responds with your path to Python. You need this in the next step.

### Within IntelliJ

1. Go to `File > Project Structure > Platform Settings > SDKs`
2. Click the Add (+) icon
3. Choose `Python SDK`
4. Enter location of Miniconda Python executable `/Users/UserName/miniconda3/bin/python`

---

**Note:** Substitute your actual path to Miniconda that you found in the previous step.

---

5. Go to `File > Project Settings > Project > Project SDK`
6. Select from the drop-down: `Python 3.6.0 (~/.miniconda3/bin/python...)`
7. Go to `Run > Debug`
8. Click the Add (+) icon
9. Select `Python` and then enter the following:  
Name: `MyProject`  
Script: `/Users/UserName/MyProject/my_file.py`  
Use Specified Interpreter: `Python 3.6.0 (~/.miniconda3/bin/python...)`

For more information, see the [IntelliJ IDEA documentation](#).

## Ninja IDE

Ninja IDE is a cross-platform, free, open source IDE specially designed for Python application development.

To use Anaconda Python with the Ninja IDE:

1. In the **Project** menu, select Open Project Properties:

2. On the **Project Execution** tab, in the Python Custom Interpreter box, enter *the Anaconda Python interpreter path* to select Anaconda Python:

3. Verify the setup with a test script:

- a. To create the test script, enter this code:

```
import sys
print(sys.version)
```

- b. Run your test script.

In the command output, your Anaconda Python version is listed:

For more information, see the [Ninja-IDE documentation](#).

## Python Tools for Visual Studio (PTVS)

Python Tools for Visual Studio is a free, open source plugin that turns Visual Studio into a Python IDE.

If you have installed Anaconda as your default Python installation and installed PTVS, your Visual Studio installation is already set to use Anaconda's Python interpreter in PTVS.

To verify this, create a new Python project and then check whether Anaconda is the Python that it uses.

To create a new Python project:

1. In the **File** menu, select New, and then select Project. The keyboard shortcut is Ctrl-Shift-N.
2. Select Python Application:

To check which Python the project uses:

1. From the **Tools** menu, select Python Tools, and then select Python Interactive. The keyboard shortcut is Alt+I:

2. In the **Python Interactive** window, type `import sys` and then press Enter.
3. Type `sys.version` and then press Enter.

If PTVS is using Anaconda, your Anaconda Python version is displayed. In the example below, it is Anaconda 1.5.0 (64-bit):

```
Python 64-bit 2.7 Interactive
Python interactive window. Type $help for a list of commands.
>>> import sys
>>> sys.version
'2.7.5 |Anaconda 1.5.0 (64-bit)| (default, Jul 1 2013, 12:37:52) [MSC v.1500 64 bit (AMD64)]'
>>>
```

If PTVS does not automatically discover Anaconda, see the [official PTVS documentation](#), especially the section on [Selecting and Installing Python Interpreters](#) and the [PTVS installation instructions](#).

## Python for Visual Studio Code

[Visual Studio Code](#) (VSC) is a free cross-platform source code editor. The [Python for Visual Studio Code extension](#) allows VSC to connect to Python distributions installed on your computer.

If you've installed Anaconda as your default Python installation and installed Python for Visual Studio Code, your VSC installation is already set to use Anaconda's Python interpreter.

1. Create a new Python source code file:
  1. To choose a directory to place the code, in the **File** menu, select Open.
  2. In the **File** menu, select New File. Your screen will now look like this:

2. To associate the new file with the Python interpreter, at the bottom of the window, click Plain Text:

3. In the menu that displays, type or select Python.
4. In the pane on the right, add source code:

5. To save the file, in the **File** menu, select Save.
6. To open the Debug pane, click the bug icon. Click the gear icon, and then select Python:
7. At the top-right, click the green run arrow next to Python.

The source code is run using your Anaconda Python interpreter:

### Spyder

Spyder, the Scientific Python Development Environment, is a free integrated development environment (IDE) that is included with Anaconda. It includes editing, interactive testing, debugging, and introspection features.

After you have installed Anaconda, start Spyder on Windows, macOS, or Linux by running the command `spyder`.

Spyder is also pre-installed in *Anaconda Navigator*, which is included in Anaconda. On the Navigator **Home** tab, click the Spyder icon.

For more information about Spyder, see the [Spyder web page](#) or the [Spyder documentation](#).

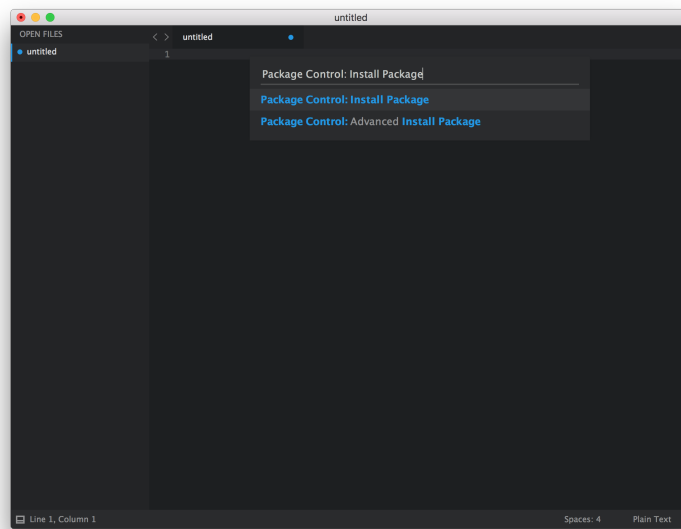

### Sublime Text

Sublime Text is a cross-platform text editor for code, markup, and prose.

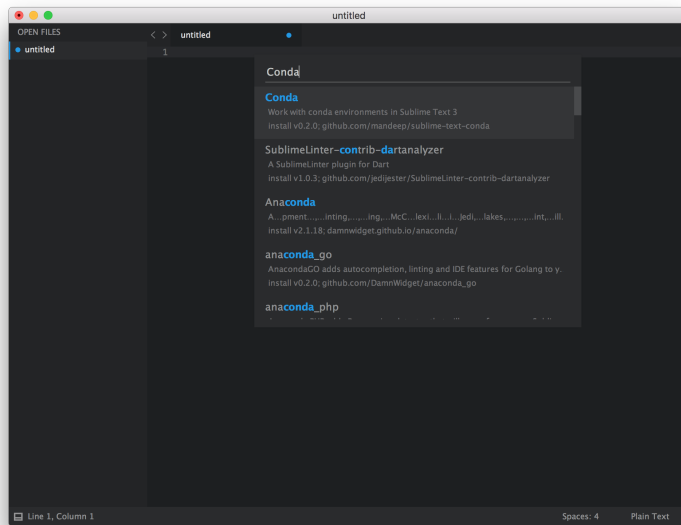

- [Download and Install Sublime Text](#).

To use your Anaconda installation with Sublime Text:

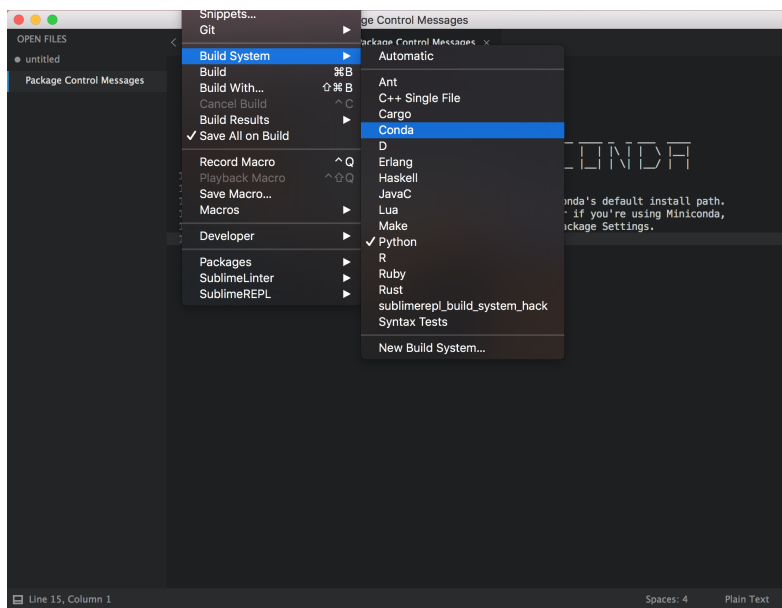

- [Download Package control](#).
- Open the Sublime Text command palette by pressing `ctrl+shift+p` (Windows, Linux) or `cmd+shift+p` (macOS).
- All Package Control commands begin with “Package Control:”. Start by typing “Package”. Select “Package Control: Install Package”.

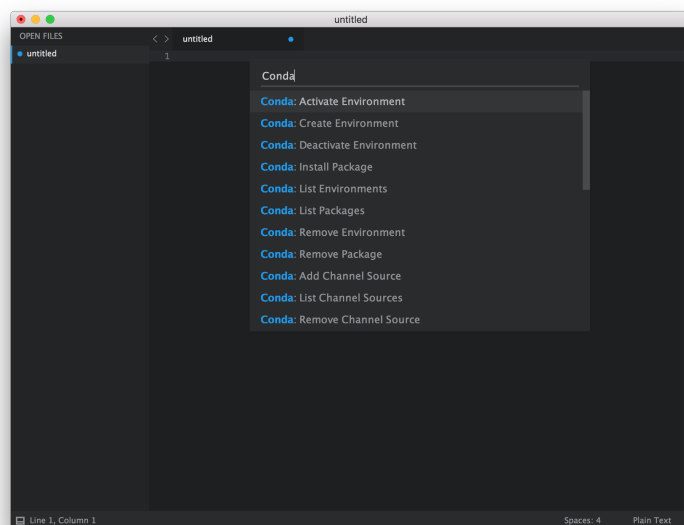

- Search for [Conda](#) in the command palette and select the conda plugin. When the plugin is installed, a Package Control Message will open in the Sublime Text window.

- Change the current Build System to conda by accessing Tools -> Build System -> Conda in the menu bar.

- Access the conda Commands with the Command Palette by searching for conda.

## Microsoft Visual Studio Code (VS Code)

Anaconda Distribution works with Visual Studio Code (VS Code), Microsoft’s lightweight and fast open-source code editor.

VS Code is free for both private and commercial use, runs on Windows, macOS, and Linux, and includes support for linting, debugging, task running, version control and Git integration, IntelliSense code completion, and conda environments.

VS Code is openly extensible and [many extensions](#) are available.

In Anaconda Navigator version 1.7 or higher, use the VS Code tile on the home screen to install or launch VS Code.

When you launch VS Code from Navigator, VS Code is configured to use the Python interpreter in the currently selected environment.

In addition to VS Code, Anaconda fully supports [Spyder](#), Jupyter Notebook, and other IDEs.

## Wing IDE

**Wing IDE** is an IDE designed specifically for the Python programming language. Wing IDE is offered in a paid Pro version and in free Personal and 101 versions.

To set up your Wing IDE installation to use Anaconda:

1. Navigate to the Python configuration window:

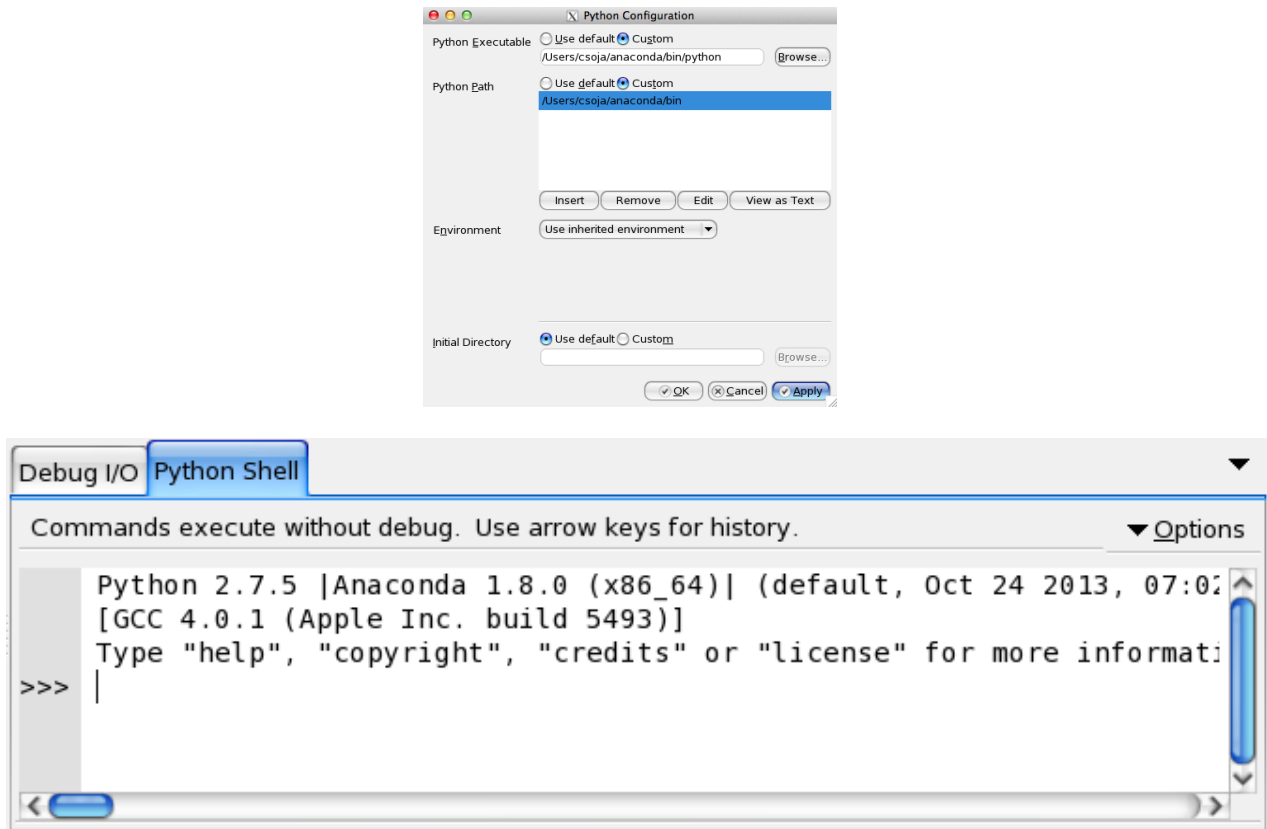

- In Wing 101, in the **Edit** menu, select Configure Python.
- In Wing Personal and Wing Pro, in the **Project** menu, select Project Properties.

The Wing 101 menu looks like this:

2. Next to Python Executable, click the Custom radio button.
  3. Click the Browse button and navigate to your *Anaconda Python interpreter path*.
  4. For Python Path, click the Custom radio button.
  5. Click the Insert button and browse to your *Anaconda Python interpreter path*.
  6. Click the OK button:
- 
7. If you are prompted to reload your Python shell, do so. After the reload, Anaconda is displayed on the **Python Shell** tab:

Wing IDE is now set up to Anaconda's Python.

For more information, see the [Wing IDE documentation](#).

## Finding your Anaconda Python interpreter path

IDEs often require you to specify the path to your Python interpreter.

This path varies according to which operating system version and which Anaconda version you use, so you will need to search your file system to find the correct path to your Python interpreter.

You can search for the Python interpreter with your operating system's file manager, such as File Explorer on Windows, Finder on macOS, or Nautilus on Ubuntu Linux.

You can also use the command line to show the location of the Python interpreter in the active conda environment.

## Windows

1. From the Start Menu open the Anaconda Prompt.
2. If you want the location of a Python interpreter for a conda environment other than the root conda environment, run `activate environment-name`.
3. Run `where python`.

## macOS and Linux

1. Open a terminal window.
2. If you want the location of a Python interpreter for a conda environment other than the root conda environment, run `conda activate environment-name`.
3. Run `which python`.

## Examples

- Windows 10 with Anaconda3 and username “jsmith”—`C:\Users\jsmith\Anaconda3\python.exe`.  
The Python image in a conda environment called “my-env” might be in a location such as `C:\Users\jsmith\Anaconda3\envs\my-env\python.exe`
- macOS—`~/anaconda/bin/python` or `/Users/jsmith/anaconda/bin/python`
- Linux—`~/anaconda/bin/python` or `/home/jsmith/anaconda/bin/python`

Instead of `anaconda`, the folder in your home directory might be named one of the following:

- `anaconda2`
- `anaconda3`

If you have installed Miniconda instead of Anaconda, the folder might be named:

- `miniconda`
- `miniconda2`
- `miniconda3`

## Excel plug-ins for Anaconda

Anaconda on Windows comes ready to interact with Microsoft Excel—quickly, intuitively, and powerfully. You can use one of the many included packages in Anaconda or you can connect to an outside integration tool to bring the power of Python into Excel.

The packages described here are available only on Windows unless otherwise noted. Like most Anaconda packages, this software is written by third-party open source development teams around the world. Anaconda collects and curates these programs, builds them into conda packages, and distributes them through the Anaconda platform so our users can enjoy the benefits of easy installation, version control, package management, and environment management.

## What tool should I use?

For a versatile, all-purpose tool, Anaconda includes `xlwings`, which incorporates the following features:

- Drives Excel interactively from an IPython Session/Notebook.
- Performs one-line conversion to and from a NumPy array or pandas DataFrame.

- Uses Python as Excel’s computation backend by wrapping Python function calls in VBA macros.
- Easily shares Python-integrated Excel workbooks with collaborators who are also running Anaconda, with no additional installation needed.

---

**Note:** The `xlwings` package is in active development. Additional features may be added in the future. This package is available for Windows and macOS platforms.

---

To export data from a Python object into Excel or import the contents of an Excel spreadsheet to perform calculations or visualizations in Python, Anaconda includes the following libraries and modules:

- `openpyxl`—Read/write Excel 2007 `xlsx/xlsm` files.
- `xlrd`—Extract data from Excel spreadsheets—`.xls` and `.xlsx`, versions 2.0 onwards—on any platform.
- `xlsxwriter`—Write files in the Excel 2007+ `XLSX` file format.
- `xlwt`—Generate spreadsheet files that are compatible with Excel 97/2000/XP/2003, OpenOffice.org Calc, and Gnumeric.

To determine which one best suits your needs, see the documentation for each library or module.

### Python-Excel tools not included in Anaconda

- `DataNitro`—Offers full-featured Python-Excel integration, including user-defined functions (UDFs). Trial downloads are available, but users must purchase a license.
- `ExcelPython`—A free, open-source library that lets you write UDFs and macros in Python, as well as load Python modules, call methods, and manipulate objects from VBA without modifying the original Python code.
- `XLLoop`—Open source software that implements UDFs that are hosted from a server in a variety of languages, including Python, Java, C++, and R. Installation requires multiple steps to set up the provided Excel add-in and configure the UDF server.
- `ExPy`—Freely available demonstration software that is simple to install. Once installed, Excel users have access to built-in Excel functions that wrap Python code. Documentation and examples are provided at the site.
- `PyXLL`—A widely used tool that is free for personal or educational use. It implements UDFs written in Python as add-in functions for Excel.

### Using default repositories

When you use a `conda` command that involves looking for a package to install or upgrade, by default `conda` searches the default repository located at <https://repo.anaconda.com/pkg>.

### Main channel

<https://repo.anaconda.com/pkg/main>

Added Sept 26, 2017 with the release of Anaconda 5.0 and `conda` 4.3.27, the main channel includes packages built by Anaconda, Inc. with the new compiler stack. The majority of all new Anaconda, Inc. package builds are hosted here. This is the top priority channel in `conda`’s default channel list.

## More info

Utilizing the New Compilers in Anaconda Distribution 5

## Free channel

<https://repo.anaconda.com/pkgsg/free>

As of conda 4.7, the `free` channel was removed from conda's default channels.

The `free` channel contains packages built without the new compiler stack. It includes packages built as far back as Fall 2012. The majority of these packages are compatible with the packages in `main`. Learn more about the `free` channel.

## R Language channel

<https://repo.anaconda.com/pkgsg/r>

Mirror: <https://anaconda.org/r>

Microsoft R Open conda packages and Anaconda, Inc.'s R conda packages. This channel is included in conda's "defaults" channel. When creating new environments, MRO is now chosen as the default R implementation.

## MRO channel

<https://repo.anaconda.com/pkgsg/mro>

Mirror: <https://anaconda.org/mro>

As of Dec. 19, 2017, this is an empty channel. Packages in this channel have been moved to `pkgsg/mro-archive`. New MRO packages are in the `pkgsg/r` channel.

## Pro channel

<https://repo.anaconda.com/pkgsg/pro>

Now deprecated, though still available in conda's default channels. Packages in this channel were once sold commercially, but are now open source and available without charge. The last package was updated Feb. 2017. Includes MKL Optimizations, IOPro, and Accelerate.

## More info

Open sourcing Anaconda Accelerate Working Efficiently with Big Data in Text Formats Using Free Software Anaconda 2.5 Release – now with MKL Optimizations

## Anaconda-Extras channel

<https://anaconda.org/anaconda-extras>

This channel contains packages custom built for customers by Anaconda, Inc.

### Archive channel

<https://repo.anaconda.com/pkg/archive>

Sometimes a package that is released onto one of the other channels has an issue that forces Anaconda, Inc. to remove it from the channel. In these cases, the package is archived to this channel for anyone who still needs it.

### MSYS2 channel

<https://repo.anaconda.com/pkg/msys2>

Mirror: <https://anaconda.org/msys2>

Windows only - included in conda's default channels. Necessary for Anaconda, Inc.'s R conda packages and some others in /main and /free. It provides a bash shell, Autotools, revision control systems and the like for building native Windows applications using MinGW-w64 toolchains.

### Anaconda channel on anaconda.org

<https://anaconda.org/anaconda>

The Anaconda channel on anaconda.org is a mirror of the packages available in <https://repo.anaconda.com/pkg/main>, <https://repo.anaconda.com/pkg/free>, and <https://repo.anaconda.com/pkg/pro>.

### Working with GPU packages

The Anaconda Distribution includes several packages that use the GPU as an accelerator to increase performance, sometimes by a factor of five or more. These packages can dramatically improve machine learning and simulation use cases, especially deep learning. Read more about [getting started with GPU computing in Anaconda](#).

While both AMD and NVIDIA are major vendors of GPUs, NVIDIA is currently the most common GPU vendor for machine learning and cloud computing. The information on this page applies only to NVIDIA GPUs. As of August 27th, 2018, experimental AMD GPU packages for Anaconda are in progress but not yet officially supported.

### GPU compatibility

GPU acceleration requires the author of a project such as TensorFlow to implement GPU-specific code paths for algorithms that can be executed on the GPU. A GPU-accelerated project will call out to NVIDIA-specific libraries for standard algorithms or use the NVIDIA GPU compiler to compile custom GPU code. Only the algorithms specifically modified by the project author for GPU usage will be accelerated, and the rest of the project will still run on the CPU.

For most packages, GPU support is either a compile-time or run-time choice, allowing a variant of the package to be available for CPU-only usage. When GPU support is a compile-time choice, Anaconda will typically need to build two versions of the package, to allow the user to choose between the “regular” version of the project that runs on CPU only and the “GPU-enabled” version of the project that runs on GPU.

Due to the different ways that CUDA support is enabled by project authors, there is no universal way to detect GPU support in a package. For many GPU-enabled packages, there is a dependency on the `cuda-toolkit` package. Other packages such as Numba do not have a `cuda-toolkit` dependency, because they can be used without the GPU.

## Hardware requirements

NVIDIA released the CUDA API for GPU programming in 2006, and all new NVIDIA GPUs released since that date have been CUDA-capable regardless of market. Although any NVIDIA GPU released in the last 5 years will technically work with Anaconda, these are the best choices for machine learning and specifically model training use cases:

- Tesla P100 or V100
- Titan Xp or V
- GeForce 1080 or 1080 Ti
- Various recent Quadro models

Deployed models do not always require a GPU. When a GPU is required for a deployed model, there are other Tesla GPU models that are more optimized for inference than training, such as the Tesla M4, M40, P4 and P40.

Cloud and on-premise data center deployments require Tesla cards, whereas the GeForce, Quadro, and Titan options are suitable for use in workstations.

Most users will have an Intel or AMD 64-bit CPU. We recommend having at least two to four times more CPU memory than GPU memory, and at least 4 CPU cores to support data preparation before model training. There are a limited number of Anaconda packages with GPU support for IBM POWER 8/9 systems as well.

## Software requirements

The best performance and user experience for CUDA is on Linux systems, and Windows is also supported. No Apple computers have been released with an NVIDIA GPU since 2014, so they generally lack the memory for machine learning applications and only have support for Numba on the GPU.

Anaconda requires that the user has installed a recent NVIDIA driver that meets the version requirements in the table below. Anaconda does not require the installation of the CUDA SDK.

Ubuntu and some other Linux distributions ship with a third party open source driver for NVIDIA GPUs called Nouveau. CUDA requires replacing the Nouveau driver with the official closed source NVIDIA driver.

All other CUDA libraries are supplied as conda packages.

GPU-enabled packages are built against a specific version of CUDA. Currently supported versions include CUDA 8, 9.0 and 9.2. The NVIDIA drivers are designed to be backward compatible to older CUDA versions, so a system with NVIDIA driver version 384.81 can support CUDA 9.0 packages and earlier. As a result, if a user is not using the latest NVIDIA driver, they may need to manually pick a particular CUDA version by selecting the version of the `cuda-toolkit` conda package in their environment. To select a `cuda-toolkit` version, add a selector such as `cuda-toolkit=8.0` to the version specification.

Required NVIDIA driver versions, excerpted from the [NVIDIA CUDA Toolkit Release Notes](#):

| CUDA Version                | Linux x86_64 Driver Version | Windows x86_64 Driver Version |
|-----------------------------|-----------------------------|-------------------------------|
| CUDA 8.0 (8.0.61 GA2)       | $\geq 375.26$               | $\geq 376.51$                 |
| CUDA 9.0 (9.0.76)           | $\geq 384.81$               | $\geq 385.54$                 |
| CUDA 9.2 (9.2.88)           | $\geq 396.26$               | $\geq 397.44$                 |
| CUDA 9.2 (9.2.148 Update 1) | $\geq 396.37$               | $\geq 398.26$                 |

Sometimes specific GPU hardware generations have a minimum CUDA version. As of August 27th, 2018, the only relevant constraint is that the Tesla V100 and Titan V (using the “Volta” GPU architecture) require CUDA 9 or later.

### Available packages

#### TensorFlow

TensorFlow is a general machine learning library, but most popular for deep learning applications. There are three supported variants of the `tensorflow` package in Anaconda, one of which is the NVIDIA GPU version. This is selected by installing the meta-package `tensorflow-gpu`:

```
conda install tensorflow-gpu
```

Other packages such as Keras depend on the generic `tensorflow` package name and will use whatever version of TensorFlow is installed. This makes it easy to switch between variants in an environment.

#### PyTorch

PyTorch is another machine learning library with a deep learning focus. PyTorch detects GPU availability at run-time, so the user does not need to install a different package for GPU support.

```
conda install pytorch
```

#### Caffe

Caffe was one of the first popular deep learning libraries.

```
conda install caffe-gpu
```

#### Chainer/CuPy (Linux only)

Chainer is a deep learning library that uses NumPy or CuPy for computations.

```
conda install chainer
```

Chainer's companion project CuPy is a GPU-accelerated clone of the NumPy API that can be used as a drop-in replacement for NumPy with a few changes to user code. When CuPy is installed, Chainer is GPU-accelerated. CuPy can also be used on its own for general array computation.

```
conda install cupy
```

#### XGBoost

XGBoost is a machine learning library that implements gradient-boosted decision trees. Training several forms of trees is GPU-accelerated.

```
conda install py-xgboost-gpu
```

## MXNet

MXNet is a machine learning library supported by various industry partners, most notably Amazon. Like TensorFlow, it comes in three variants, with the GPU variant selected by the `mxnet-gpu` meta-package.

```
conda install mxnet-gpu
```

## Numba

Numba is a general-purpose JIT compiler for Python functions. It provides a way to implement custom GPU algorithms in purely Python syntax when the `cuda-toolkit` package is present.

```
conda install numba cuda-toolkit
```

## GPU support in Anaconda Enterprise

GPU-enabled conda packages can be used in AE 5 projects when the cluster has resource profiles which include GPUs. For more details see the [GPU support section of the AE 5 FAQ](#).

## Using Jupyter Notebook extensions

You can open Jupyter Notebook by running `jupyter notebook`, or by opening Anaconda Navigator and clicking the Jupyter Notebook icon.

- *Obtaining the extensions*
- *Uninstalling the extensions*
- *Notebook Present*
- *Notebook Anaconda Cloud*
- *Notebook Conda*
- *Notebook Conda Kernels*

With Anaconda you can download and install four extensions for the Jupyter Notebook that make the notebook easier to use:

- Notebook Present (`nbpresent`).
- Notebook Anaconda Cloud (`nb_anacondacloud`).
- Notebook Conda (`nb_conda`).
- Notebook Conda Kernels (`nb_conda_kernels`).

Installing any of the four installs all of them. The `_nb_ext_conf` package is also installed, which activates the extensions.

## Obtaining the extensions

To get the extensions using Anaconda Navigator:

1. Install and manage notebook extensions packages like any other packages. See [User guide](#).
2. To use the new extensions, on the Navigator **Home** tab, open Jupyter Notebook.

To install all Jupyter Notebook extensions from the command line, run:

```
conda install nb_conda
```

---

**Note:** These extensions were already installed in Anaconda versions 4.1 and 4.2. If you have Anaconda v4.1 or v4.2 installed, there is no need to install them separately. To begin using them, open a new or existing notebook.

---

### Uninstalling the extensions

To remove all Jupyter Notebook extensions, run:

```
conda remove nb_conda
```

Uninstalling `nb_conda` or any other one of the four extensions uninstalls all four.

To disable Jupyter Notebook extensions individually without uninstalling them, run:

```
python -m nb_conda_kernels.install --disable --prefix=<ENV_PREFIX>

jupyter-nbextension disable nb_conda --py --sys-prefix
jupyter-serverextension disable nb_conda --py --sys-prefix

jupyter-nbextension disable nb_anacondacloud --py --sys-prefix
jupyter-serverextension disable nb_anacondacloud --py --sys-prefix

jupyter-nbextension disable nbpresent --py --sys-prefix
jupyter-serverextension disable nbpresent --py --sys-prefix
```

---

**Note:** Replace `<ENV_PREFIX>` with your root environment or another conda environment where the extensions have been installed.

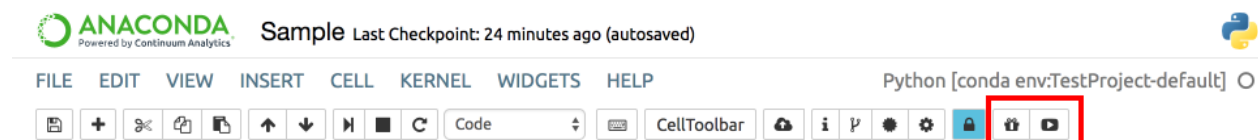

---

### Notebook Present

This extension turns your notebook into a PowerPoint-style presentation.

To begin using Notebook Present:

1. In the top menu bar, locate the two buttons Edit Presentation and Show Presentation:

2. Click the Edit Presentation button. The icon looks like a present in a box with wrapping paper and a bow on top.

A black bar with several icons appears on the right side of your browser. As you click each icon, the layout of your screen changes:

3. Click the Help icon to view three quick tours of the main features of Notebook Present:

- Intro Tour.
- Slides Tour.
- Editor Tour.

## Intro tour

To see a 2-minute presentation on how to use all of the main features, in the **Help** menu, select Intro.

Every button is explained. You can pause, go back to the previous slide or advance to the next slide. Here is a summary of the presentation:

- App Bar—When Authoring, use the App Bar to control the content and style of your presentation. It also activates several special editing keyboard shortcuts:
- Stop Authoring—Clicking the Edit Presentation button again stops Authoring and removes all keyboard shortcuts.
- Show Presentation—If you just want to run your presentation without using any Authoring tools, click the Show Presentation button.
- Presenting/Authoring—Once you have made some slides, start Presenting, where you can use most Notebook functions with the Theme we have defined, as well as customize slides on the fly.
- Slides button—Slides, which are made of Regions linked to Cell Parts, and can be imported, created, linked, reordered and edited here:

## Keyboard shortcuts

The Jupyter Notebook has two different keyboard input modes. **Edit mode** allows you to type code/text into a cell and is indicated by a green cell border. **Command mode** binds the keyboard to notebook level actions and is indicated by a grey cell border with a blue left margin.

Mac OS X modifier keys:

: Command

: Control

: Option

: Shift

: Return

: Space

: Tab

### Command Mode (press to enable)

: find and replace

: previous slide

: next slide

: next slide

: enter edit mode

: open the command palette

: run cell, select below

: run selected cells

: run cell, insert below

: to code

: to markdown

: extend selected cells above

: extend selected cells above

: extend selected cells below

: extend selected cells below

: insert cell above

: insert cell below

: cut selected cells

: copy selected cells

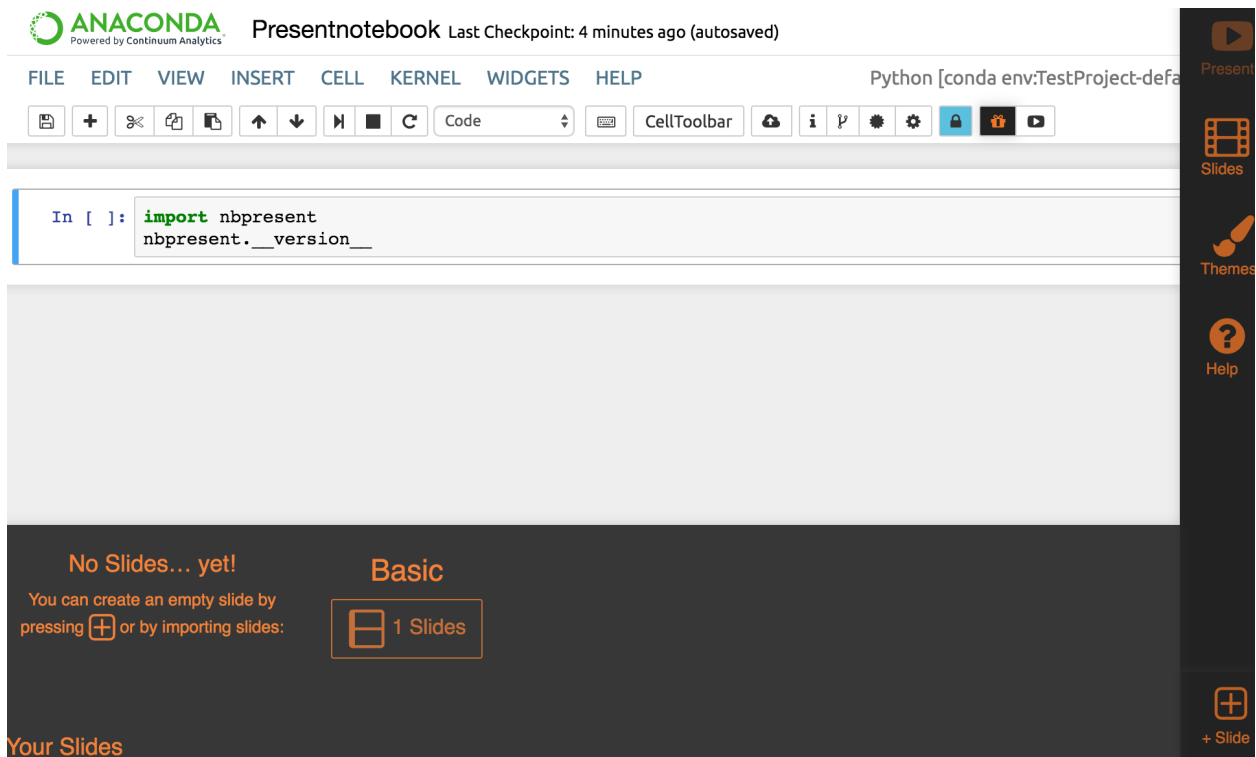

: paste cells above

: paste cells below

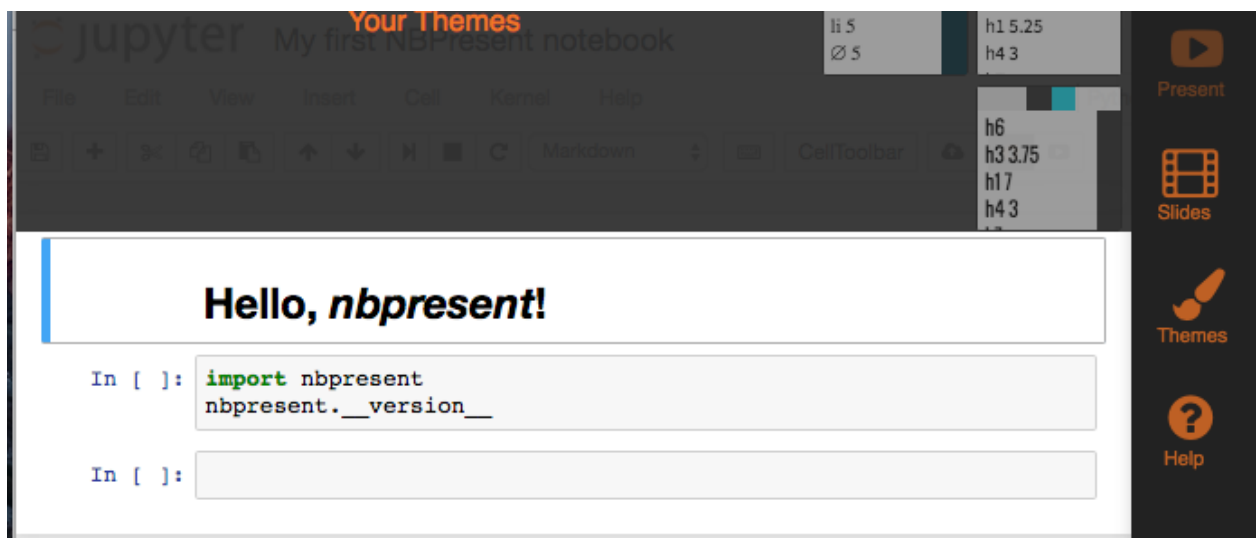

: undo cell deletion

Close

- Theming—Theming lets you select from existing colors, typography and backgrounds to make distinctive presentations. The first theme you select becomes the default, while you can choose custom themes for a particular slide, such as a title:

- Saving—Whenever you save your Notebook, all your presentation data will be stored in the Notebook .ipynb file.
- Downloading—After you've made a presentation, you can download it as an HTML page. In the menu, select

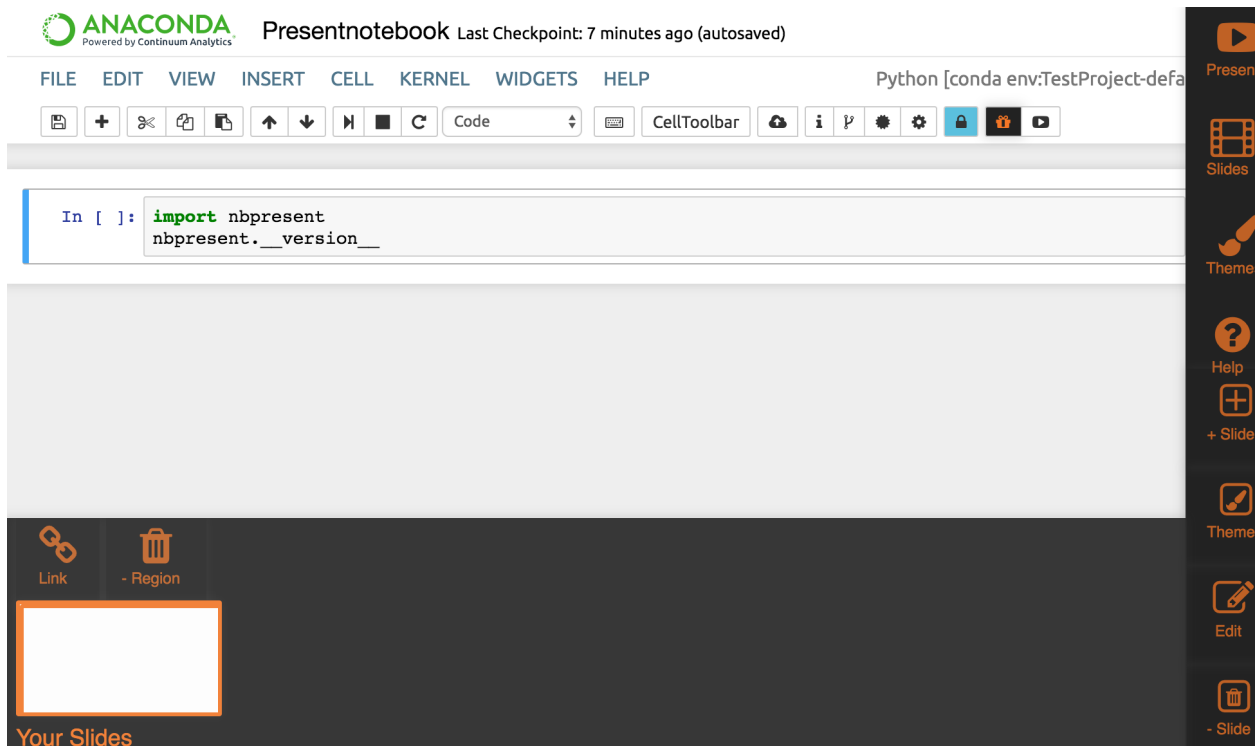

Download, and then select Download As: Presentation (.html).

- Help—Activate Help at any time to try other tours, obtain other information and connect with the Present community.

### Slides Tour

To see a 2-minute presentation on how to create and manage slides, in the **Help** menu, click Slides.

Here is a summary of the presentation:

- Slides make up a presentation. Clicking Slides toggles the sorter view and the Slide Toolbar.
- Slide Toolbar—Let's create a new slide. Clicking the + Slide offers some choices for creating your new slide.
- Import—The quickest way to create a presentation is to import every complete cell as a slide. If you've already created slides with the official slideshow cell toolbar or RISE, you can import most of the content.
- Template Library—You can also pick from some existing templates.
- Reuse Slide as Template—You can copy an existing slide.
- Simple Template—A common template is the Quad Chart, with four pieces of content arranged in a grid.
- Region—The Quad Chart has four Regions. Select a region by clicking it.
- Linking a Region to a Cell Part—Each Region can be linked to a single Cell Part.
- Link Overlay—The Link Overlay shows all of the parts available.

- Cell Part: Source (blue)—Source, such as code and Markdown text.
- Cell Part: Outputs (red)—Outputs, such as rich figures and script results.
- Cell Part: Widgets (purple)—Jupyter widgets, which are interactive widgets that provide both visualization and user input.
- Cell Part: Whole (orange)—Finally, a Whole Cell (including its Source, Widgets, and Outputs) can be linked to a single region.
- Part Thumbnail—We'll try to draw a part thumbnail. It can be reliably updated only when a linked Cell Part is displayed when you mouse over it, but you should usually be able to get an idea of what you're seeing. The colors of the regions correspond to the cell types.
- Cell Part: Unlinking—Unlinking removes the connection between a region and a cell part, without deleting either one.
- Region: Trashing—Trashing a Region permanently deletes it, without affecting any linked Cell Part.
- Presenting—Clicking the Present button while editing brings up the Presenter with editing mode still enabled.
- It's still a Notebook—Linked inputs and widgets are still interactive.
- Go forward—Click to go to the next slide.
- Go back—Click to go back to the previous slide.
- Go back to the beginning—Click here to go back to the first slide.
- My work is done here—Click to go back to the Notebook.

## Editor Tour

To see a 2-minute presentation on editing your notebook, in the **Help** menu, click Editor.

Here is a summary of the presentation:

- So You Made Some Slides—Once you've made a few slides, you'll likely need to customize them.
- Editing Slides—Once you have selected a slide, you can activate the Slide Editor by double-clicking the slide or clicking Edit Slide.
- Region Editor—You can click and drag Regions around and resize them.
- Region Tree—You can reorder Regions and see the details of how your Regions show their linked Parts.
- Add Region—You can add new regions.
- Attribute Editor—All of the properties of a region can be edited here.
- Data Layouts—In addition to manually moving regions around, you can use other Layouts, such as a Treemap, which fills the slide.
- More Regions—More regions will be added with a weight of 1.
- Tree Weight—This new value lets you make a Region bigger or smaller based on relative Weight.
- 12 Grid—The Grid is a compromise between Free layout and Treemap layout, and rounds all the values to a factor of 12.

### Notebook Anaconda Cloud

You must have an Anaconda Cloud account for this extension to work. You can sign up for a free account at [Anaconda Cloud](#).

1. You can upload your notebook to your Cloud account with a simple button push:

You can use the Attach conda environment option described below to embed a copy of your conda environment as an `environment.yml` file in the notebook metadata.

2. Sign in to Cloud:
  - If you are not signed in to Cloud, a dialog box appears asking for your Cloud user name and password.
  - You may instead log in at the command line:

```
anaconda login
```

---

**Note:** This is recommended if you do not have a secure connection.

---

3. Open Jupyter Notebook, then open the notebook you wish to upload to Cloud.
4. In the top navigation bar, click the Publish to Anaconda Cloud button:

5. In the dialog box that appears, select your user name.
6. Type a description of the notebook for display on Cloud:
7. If you want the identical environment to be included when the notebook is downloaded and opened, select the Attach conda environment checkbox.

### Publish My first NBPresent notebook to ANACONDA CLOUD ×

User/Organization

ContinuumCrew (Continuum Crew) ⬆⬇⬆

Summary

This is a description of the notebook I am uploading

Environment

☒ Attach conda environment

 Publish

This notebook was previously published as <https://anaconda.org/continuumcrew/my-first-nbpresent-notebook>

Initially, all published notebooks will be public .

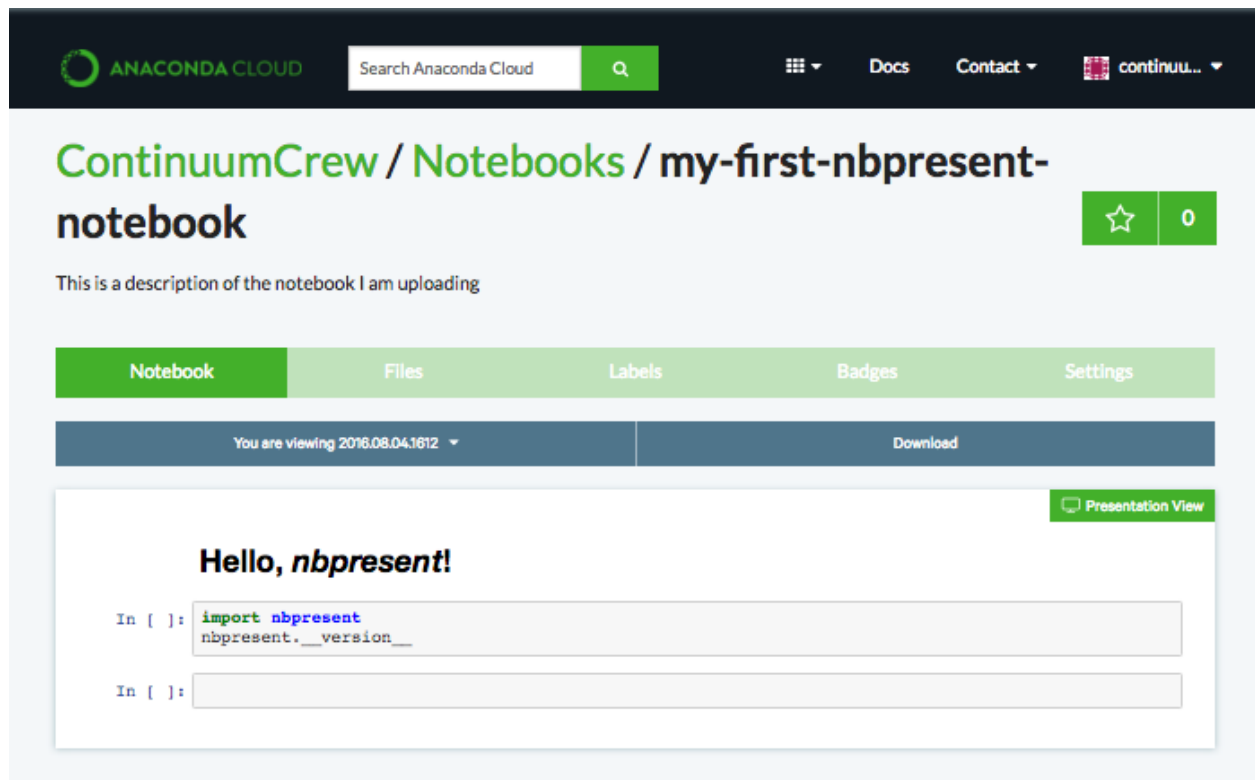

Make **My first NBPresent notebook** private or authenticated on the [Anaconda Cloud settings page](#).

Close

- Click the Publish button.
- After publishing, you can view the notebook or play the presentation on Cloud from the top navigation bar by clicking the Cloud button:

Your notebook on Anaconda Cloud will look similar to this one:

For more information on Cloud, see [Anaconda Cloud](#).

### Notebook Conda

This extension provides conda environment and package access from within Jupyter Notebook.

To manage all environments:

1. While viewing the dashboard file manager, select the **Conda** tab, which shows your current conda environments:

| Files   | Running | Clusters | Conda  |
|---|---------|----------|--|
| 4 Conda environments <span style="float: right;">+ ↻</span> |         |          |  |
| Action  | Name    | Default? | Directory                                      |
|   | root    |          | /opt/wakari/anaconda                           |
|   | default | ✓        | /projects/TestUser/screenshottest/envs/default |
|   | flowers |          | /projects/TestUser/screenshottest/envs/flowers |
|   | snakes  |          | /projects/TestUser/screenshottest/envs/snakes  |

**Note:** To add a new conda environment, click the + button above the environments list on the right side.

2. Select an environment by clicking its name.
3. In the package management section that displays, the icons from left to right have the following meanings:
  - Search for packages in your current environment.
  - Refresh your packages list.
  - Update selected packages.
  - Remove selected packages.

**Conda Packages** ×

562 available packages

53 installed packages in environment "snakes"

| Name  | Version | Channel  |
|---|---------|----------|
| <input type="checkbox"/> _license           | 1.1     | defaults |
| <input type="checkbox"/> _nb_ext_conf       | 0.2.0   | defaults |
| <input type="checkbox"/> abstract-rendering | 0.5.1   | defaults |
| <input type="checkbox"/> accelerate         | 2.3.0   | defaults |
| <input type="checkbox"/> accelerate_cudalib | 2.0     | defaults |

| Name                                   | Version | Build  | Available |
|--|---------|--------|-----------|
| <input type="checkbox"/> appnope       | 0.1.0   | py27_0 |           |
| <input type="checkbox"/> backports     | 1.0     | py27_0 |           |
| <input type="checkbox"/> backports_abc | 0.4     | py27_0 |           |
| <input type="checkbox"/> configparser  | 3.5.0b2 | py27_1 |           |
| <input type="checkbox"/> decorator     | 4.0.10  | py27_0 |           |
| <input type="checkbox"/> entrypoints   | 0.2.2   | py27_0 |           |

To manage the current kernel environment, in the **Kernel** menu, select Conda Packages, which displays a list of Conda Packages in the current environment:

For more information on using and managing conda packages, see [Managing packages](#).

### Notebook Conda Kernels

This extension allows you to use conda environment-based kernels from the dashboard and the notebook's **Kernel** menu. It makes the notebook aware of your conda environments, and it is required for Notebook Anaconda Cloud and Notebook Conda.

When creating a new notebook on the **Files** tab, you can pick any of the Python or R language kernels in any of your environments:

You can also change to those kernels on a current notebook:

### Running Jupyter Notebook on a remote server

Follow the following steps to use Jupyter Notebook launched from remote server.

1. Launch Jupyter Notebook from remote server using port 8080: `jupyter notebook --no-browser --port=8080`

Or run the following command to launch with default port: `jupyter notebook --no-browser`

Please note the port setting. You will need it in the next step.

2. You can access the notebook from your remote machine over SSH by setting up a SSH tunnel. Run the following command from your local machine: `ssh -L 8080:localhost:<port> <remote_user>@<remote_host>`

---

**Note:** Replace <port> with your port number used in the above step, <remote\_user> with remote server username, and <remote\_host> with your remote server address.

---

The above command opens up a new SSH session in the terminal.

3. Open a browser from your local machine and navigate to <http://localhost:8080/>, the Jupyter Notebook web interface. Replace 8080 with your port number used in step 1.

### Moving Anaconda from one directory to another

Anaconda environment management requires known paths, and Anaconda must know the exact path where it is installed at installation time.

If you simply copy the Anaconda files to a new directory, Anaconda will not work.

To move Anaconda from one directory to another:

1. OPTIONAL: Save your environments using the conda [managing environments](#) instructions.
2. *Uninstall Anaconda.*
3. Go to the new directory and install it there following the *Anaconda installation instructions*.
4. OPTIONAL: Restore your environments using the conda [managing environments](#) instructions.

### Cheatsheet

Download the [Anaconda Cheat Sheet](#) for a quick guide to using Anaconda.

### Frequently asked questions

- [Getting Anaconda](#)
- [Installing Anaconda](#)

- *Using conda packages*
- *General*

## Getting Anaconda

### How do I get Anaconda with Python 3.5 or 3.6?

There are three ways to get Anaconda with Python 3.5 or 3.6:

- We recommend that you download the latest version of Anaconda and then [make a Python 3.5 \(or 3.6\) environment](#).
- Or download the latest version of Anaconda and run the following command to install Python 3.5 (or 3.6) in the root environment: `conda install python=3.5`

or

```
conda install python=3.6
```

- Or download the most recent Anaconda installer that included Python 3.5 (Anaconda 4.2.0) or Python 3.6 (Anaconda 5.2.0). You can download either of these from our [archive](#). Scroll down the page until you find the version you need for your platform.

### How do I get previous versions of Anaconda or older versions of packages?

You can download previous versions of Anaconda from the [Anaconda installer archive](#).

The installation procedures for previous versions are the same as the installation for the current version. For graphical installs, double click the downloaded installer file and follow the prompts. For command line installs, run “`bash filename.sh`” and follow the prompts. The installer filenames and hashes for previous versions will be different.

Older versions of packages can usually be downloaded from the [package repository](#) or from `https://anaconda.org/anaconda/PackageName`.

---

**Note:** Replace `PackageName` with the name of the desired package.

---

EXAMPLE: At <https://anaconda.org/anaconda/beautifulsoup4>, previous versions of beautifulsoup4 are shown on the **Files** tab.

You can also search for packages from the command line with `conda search PackageName`.

### I am behind a firewall. How can I download Anaconda?

If your corporate security settings do not allow you to download a Windows .exe executable file, download our [zipped file](#).

## Installing Anaconda

### How can I install Anaconda on an air gapped computer?

After you have the file, it's the same as any other install. Save a local copy of the appropriate Anaconda installer for the non-networked computer. You can copy the Anaconda installer using many different methods including a portable hard drive, USB drive, or CD.

After copying the installer to the air gapped machine, follow the installation instructions for your operating system.

### In what folder should I install Anaconda on Windows?

We recommend installing Anaconda or Miniconda into a directory that contains only 7-bit ASCII characters and no spaces, such as `C:\anaconda`. Do not install into paths that contain spaces such as `C:\Program Files` or that include Unicode characters outside the 7-bit ASCII character set. This helps ensure correct operation and no errors when using any open source tools in either Python 3 or Python 2 conda environments.

### Should I add Anaconda to the Windows PATH?

When installing Anaconda, we recommend that you do not add Anaconda to the Windows PATH because this can interfere with other software. Instead, open Anaconda with the Start Menu and select Anaconda Prompt, or use Anaconda Navigator (Start Menu - Anaconda Navigator).

### Should I add Anaconda to the macOS or Linux PATH?

We do not recommend adding Anaconda to the PATH manually. During installation, you will be asked “Do you wish the installer to initialize Anaconda3 by running `conda init`?” We recommend “yes”. If you enter “no”, then conda will not modify your shell scripts at all. In order to initialize after the installation process is done, first run `source <path to conda>/bin/activate` and then run `conda init`.

---

**Note:** Replace `<path-to-anaconda>` with the actual path of your installed Anaconda file.

---

### What is the default path for installing Anaconda?

If you accept the default option to install Anaconda on the “default path” Anaconda is installed in your user home directory:

- Windows 10: `C:\Users\<your-username>\Anaconda3\`
- macOS: `/Users/<your-username>/anaconda3`
- Linux: `/home/<your-username>/anaconda3`

---

**Note:** If your username includes spaces, as is common on Windows systems, you should not accept the default path. See [In what folder should I install Anaconda on Windows?](#)

---

### I already have Python installed. Can I install Anaconda?

You do not need to uninstall other Python installations or packages before installing Anaconda. Even if you already have a system Python, another Python installation from a source such as the macOS Homebrew package manager and globally installed packages from pip such as pandas and NumPy, you do not need to uninstall, remove, or change any of them.

Install Anaconda or Miniconda normally. There is no need to set the PYTHONPATH environment variable.

To see if the conda installation of Python is in your PATH variable:

- On macOS and Linux, open the terminal and run—`echo $PATH`.
- On Windows, open an Anaconda Prompt and run—`echo %PATH%`.

To see which Python installation is currently set as the default:

- On macOS and Linux, open the terminal and run—`which python`.
- On Windows, open an Anaconda Prompt and run—`where python`.

To see which packages are installed in your current conda environment and their version numbers, in your terminal window or an Anaconda Prompt, run `conda list`.

### How can I use Anaconda on older systems?

- For macOS 10.5 and macOS 10.6, use the command line installers for Anaconda versions 1.8 and earlier. NOTE: These installer files end in `.sh`, not `.pkg`. Download from our [archive](#).
- For macOS 10.7 and macOS 10.8, use the command line installers for Anaconda versions 4.2 and earlier. Download from our [archive](#).
- For macOS 10.9, use the command line or graphical installers for Anaconda versions 5.1 and earlier. Download from our [archive](#). Qt and other packages released after Anaconda Distribution 5.1's release date of February 15th, 2018 may not work on macOS 10.9, so it may be necessary not to update certain packages beyond this point.
- For Windows XP, use Anaconda versions 2.2 and earlier.

### Using conda packages

#### How can I configure or opt out of the Intel Math Kernel Library (MKL)?

For information on configuring and uninstalling MKL, see the [Anaconda MKL documentation](#).

#### How can I use TKinter?

Make sure the conda package `tk` is installed:

```
conda list tk
```

If it is not installed, run:

```
conda install tk
```

Python programs can use TKinter with `import Tkinter` on Python 2 or `import tkinter` on Python 3.

#### How can I use Cython on macOS?

Cython needs a C compiler, so you need to install [Xcode](#).

#### How can I use Theano?

Theano requires [gcc](#) for acceleration.

To install Theano with acceleration:

- On Windows, run `conda install theano`.
- On Linux and macOS run `conda install gcc theano`.

---

**Note:** Theano is available from the default Anaconda channels for Windows, macOS and Linux with the command `conda install theano`.

---

#### How can I use GPUs with Anaconda?

See [Working with GPU packages](#).

### General

#### How is CPython compiled?

- Python 2.6 and 2.7 were compiled with Visual Studio 2008.

- Python 3.3 and 3.4 were compiled with VS 2010.
- Python 3.5 was compiled with VS 2015.

### How do I cite Anaconda in an academic paper?

To cite Anaconda in an academic paper, use the recommended format. Example:

*Anaconda Software Distribution*. Computer software. Vers. 2-2.4.0. Anaconda, Nov. 2016. Web. <<https://anaconda.com>>.

## 3.2.3 Reference

The following information is provided for your reference, to help you understand some of the *core terminology* used in Anaconda Distribution as well as information about the various *packages* available.

Consult the *release notes* to see what changes were made between releases. We also include several *support resources*, and workarounds for *known issues* you may encounter while using the product.

## Glossary

### Anaconda Cloud

A cloud package repository hosting service at <https://www.anaconda.org>. With a free account, you can publish packages you create to be used publicly.

### Anaconda Distribution

Open source repository of hundreds of popular data science packages, along with the conda package and virtual environment manager for Windows, Linux, and MacOS. Conda makes it quick and easy to install, run, and upgrade complex data science and machine learning environments like scikit-learn, TensorFlow, and SciPy.

### Anaconda Enterprise

A software platform for developing, governing, and automating data science and AI pipelines from laptop to production. Enterprise enables collaboration between teams of thousands of data scientists running large-scale model deployments on high-performance production clusters.

### Anaconda metapackage

A collection of packages at specific versions that are associated with Distribution installers. Anaconda metapackage is used to pull all of the other packages into the installer. It contains several core, low-level libraries, including compression, encryption, linear algebra, and some GUI libraries.

The Anaconda metapackage is useful for creating environments that have all of the Anaconda Distribution packages in them and it has strong effects on conda's solver behavior.

Read more about the [Anaconda metapackage](#). Read more about the distinctions between [Anaconda Distribution](#) and the [Anaconda metapackage](#).

### **Anaconda Navigator**

A desktop Graphical User Interface (GUI) included in Anaconda Distribution that allows you to easily use and manage IDEs, conda packages, environments, channels, and notebooks without the need to use the Command Line Interface (CLI).

### **Anaconda Repository**

A public repository of over 100,000 professionally built software packages maintained by Anaconda, Inc. Anyone can download packages from the Anaconda Repository. A subset of them are included in the Anaconda Distribution installer, and it can be mirrored—completely or partially—for use with Anaconda Enterprise.

### **channel**

A location in a repository where conda looks for packages. Channels may point to a Cloud repository or a private location on a remote or local repository that you or your organization created. The `conda channel` command has a default set of channels to search beginning with <https://repo.anaconda.com/pkg/>. You may override the default channels, for example to maintain a private or internal channel. In conda commands and in the `.condarc` file, these default channels are referred to by the channel name `defaults`.

### **conda**

An open source package and environment manager bundled with Anaconda Distribution that finds, installs, and updates conda packages and their dependencies. Conda also lets you easily switch between conda environments on your local computer.

### **conda-build**

A tool used to build conda packages from recipes.

### **conda environment**

A superset of Python virtual environments, conda environments make it easy to create projects with different versions of Python and avoid issues related to dependencies and version requirements. A conda environment maintains its own files, directories, and paths so that you can work with specific versions of libraries and/or Python itself without affecting other Python projects. For example, you may use one conda environment for only Python 2.7 and Python 2.7 packages, and maintain another conda environment with only Python 3.5 and Python 3.5 packages.

### **conda package**

A binary tarball file containing system-level libraries, Python and R modules, executable programs, or other components. Conda tracks dependencies between specific packages and platforms, making it simple to create operating system-specific environments using different combinations of packages.

### **conda recipe**

Instructions used to tell conda-build how to build a package.

### **Miniconda**

A minimal installer for conda. Like Anaconda Distribution, Miniconda is a free software package that includes the Anaconda Distribution and conda. Miniconda does not include any packages other than those dependencies needed to install it. After installing Miniconda, you can install additional conda packages directly from the command line using `conda install`.

### **package**

Software files and information about the software, such as its name, the specific version, and a description, that are bundled into a file that can be installed and managed by a package manager. While packages are generally used for files, they can also be used for metadata alone. When it is, it is called a metapackage.

### **repository**

Any storage location from which software or software assets may be retrieved and installed on a local computer.

## How to contribute to Anaconda

Community engagement makes Anaconda Distribution, conda, and conda-build better. We value our open-source community and encourage all users to contribute to the Anaconda ecosystem. The best contributions start by helping and encouraging others, especially newcomers who are struggling with something you've overcome. See below for other ways you can contribute.

- *Social*
- *Mailing lists*
- *GitHub issues*
- *Stack Overflow*
- *Documentation*
- *Conda-forge feedstocks*
- *Anaconda Enterprise*

## Social

The easiest way to contribute is to tell your friends about all of the things you can do with Anaconda. Be sure to mention that Anaconda provides package and environment management and over 1,500+ open source packages—completely free.

Check our social media to keep up with what's happening at Anaconda and add to the conversation.

[Twitter](#) | [Facebook](#) | [LinkedIn](#) | [SlideShare](#)

## Mailing lists

Join the mailing lists to help other users answer questions, debug issues, and suggest solutions.

- [Anaconda mailing list](#)
- [Conda mailing list](#)
- [Documentation mailing list](#)

### GitHub issues

If you want to get involved in contributing code for Anaconda, conda, or conda-build, we recommend collaborating with others, resolving bug issues, and submitting pull requests with those resolutions.

- [Conda issues](#)
- [Conda-build issues](#)
- [Anaconda issues](#)

### Stack Overflow

Answer questions and suggest resolutions and workarounds on [Stack Overflow](#).

### Documentation

Notice an error or gap in our documentation? We welcome pull requests for conda and conda-build documentation improvements and additions.

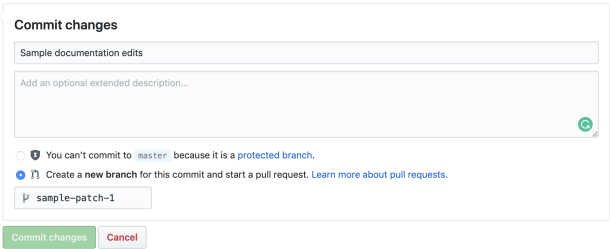

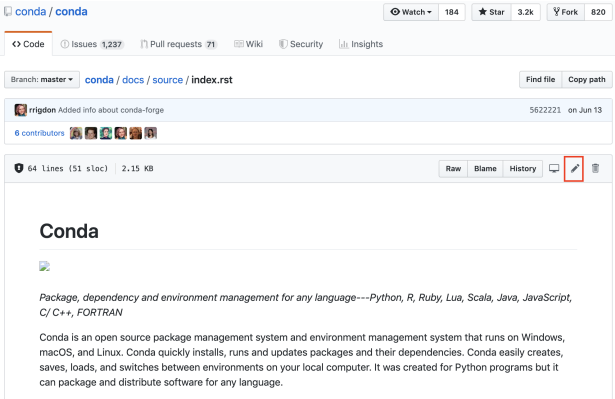

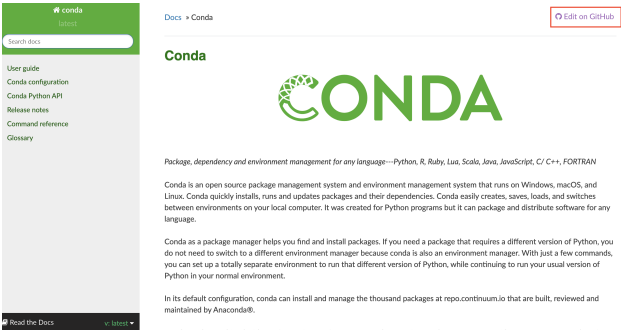

- [Conda documentation](#)
- [Conda GitHub](#)
- [Conda-build documentation](#)
- [Conda-build GitHub](#)

If a documentation change is needed in Distribution, open a ticket on [anaconda-issues](#).

### Example documentation contribution

Follow the directions below to submit a documentation PR using the GitHub interface.

1. Start in the [conda](#) or [conda-build](#) documentation.
2. Select “Edit on GitHub” on the page needing the edit.
3. Edit the file in GitHub
4. Commit your changes
5. PR review process
  - PR is submitted.
  - Anaconda community members and/or staff review the PR, providing comments and revisions.
  - New contributors sign the CLA.

- PR is merged.

### Conda-forge feedstocks

Contribute to [conda-forge feedstocks](#) where you can improve, update, and/or add new conda-build recipes to conda-forge. See our [tutorials](#) on how to build conda-build recipes.

The recipes here are often used as the base of recipes used to build packages for defaults/repo.anaconda.com. Helping conda-forge increases the number and quality of packages available to install with conda, as well as helping Anaconda do the same for packages shipped in defaults.

---

**Tip:** A good way to find feedstocks to work on is to look at the [staged recipes](#) issues with the “Package request” label.

---

### Anaconda Enterprise

Ready to scale up your projects? Anaconda Enterprise is an enterprise-ready, secure, and scalable data science platform that empowers teams to govern data science assets, collaborate, and deploy their data science projects.

Read more about [Anaconda Enterprise](#) to see if it’s the right option for you and your team.

### Release notes

#### Anaconda 2019.10 (October 15, 2019)

##### User-facing changes

- Updated packages.
- For macOS Catalina, we have notarized the package installers and changed the default install directory to `/opt/anaconda{2,3}`.

##### Backend improvements (non-visible changes)

- Added a new Cython-based Python wrapper to clear up library loading problems with libarchive.
- Extraction scripts work better with older operating systems.

##### Changes for all x86 platforms

##### Updated:

- `asn1crypto 0.24.0 -> 1.0.1`

- astroid 2.2.5 -> 2.3.1
- astropy 3.2.1 -> 3.2.2
- attrs 19.1.0 -> 19.2.0
- beautifulsoup4 4.7.1 -> 4.8.0
- bitarray 0.9.3 -> 1.0.1
- ca-certificates 2019.5.15 -> 2019.8.28
- certifi 2019.6.16 -> 2019.9.11
- cloudpickle 1.2.1 -> 1.2.2
- configparser 3.7.4 -> 4.0.2
- contextlib2 0.5.5 -> 0.6.0
- curl 7.65.2 -> 7.65.3
- cython 0.29.12 -> 0.29.13
- dask 2.1.0 -> 2.5.2
- dask-core 2.1.0 -> 2.5.2
- distributed 2.1.0 -> 2.5.2
- docutils 0.14 -> 0.15.2
- heapdict 1.0.0 -> 1.0.1
- imageio 2.5.0 -> 2.6.0
- importlib\_metadata 0.17 -> 0.23
- ipykernel 5.1.1 -> 5.1.2
- ipython 7.6.1 -> 7.8.0
- ipywidgets 7.5.0 -> 7.5.1
- jedi 0.13.3 -> 0.15.1

- vs2015\_runtime 14.15.26706 -> 14.16.27012
- xlwings 0.15.8 -> 0.15.10

**Added:**

- tbb 2019.4

### More changes specific to osx-64

#### Updated:

- bokeh 1.2.0 -> 1.3.4
- numba 0.45.0 -> 0.45.1
- numpy 1.16.4 -> 1.17.2
- numpy-base 1.16.4 -> 1.17.2
- qtconsole 4.5.1 -> 4.5.5
- scikit-learn 0.21.2 -> 0.21.3
- scipy 1.3.0 -> 1.3.1
- wurlitzer 1.0.2 -> 1.0.3
- xlwings 0.15.8 -> 0.15.10

#### Added:

- ripgrep 0.10.0
- tbb 2019.8

### Anaconda 2019.07 (July 24, 2019)

#### User-facing changes

- Conda install times have decreased by more than half for large packages.
- Conda 4.7.10 improves environment management and error messages.
- Conda constructor now supports building installers with the new .conda file format as well as noarch packages.
- Documentation has been updated for our integration with PyCharm, including more tutorials and improved navigation for easier use.
- Updated packages, including R packages and ML/AI packages.

#### Backend improvements (non-visible changes)

- Conda is moving to a quarterly release cycle.
- Conda build 3.18 works with the new .conda file format.

### Changes for all x86 platforms

#### Updated:

- anaconda-project 0.8.2 -> 0.8.3
- astropy 3.1.2 -> 3.2.1
- babel 2.6.0 -> 2.7.0
- bitarray 0.8.3 -> 0.9.3

- `blosc` 1.15.0 -> 1.16.3
- `bzip2` 1.0.6 -> 1.0.8
- `ca-certificates` 2019.1.23 -> 2019.5.15
- `certifi` 2019.3.9 -> 2019.6.16
- `cffi` 1.12.2 -> 1.12.3
- `cloudpickle` 0.8.0 -> 1.2.1
- `configparser` 3.7.3 -> 3.7.4
- `cryptography` 2.6.1 -> 2.7
- `curl` 7.64.0 -> 7.65.2
- `cython` 0.29.6 -> 0.29.12
- `cytoolz` 0.9.0.1 -> 0.10.0
- `dask` 1.1.4 -> 2.1.0
- `dask-core` 1.1.4 -> 2.1.0
- `defusedxml` 0.5.0 -> 0.6.0
- `distributed` 1.26.0 -> 2.1.0
- `fastcache` 1.0.2 -> 1.1.0
- `filelock` 3.0.10 -> 3.0.12
- `flask` 1.0.2 -> 1.1.1
- `futures` 3.2.0 -> 3.3.0
- `glob2` 0.6 -> 0.7
- `importlib_metadata` 0.8 -> 0.17
- `intel-openmp` 2019.3 -> 2019.4
- `ipykernel` 5.1.0 -> 5.1.1
- `ipython` 7.4.0 -> 7.6.1
- `ipywidgets` 7.4.2 -> 7.5.0
- `isort` 4.3.16 -> 4.3.21
- `jdcal` 1.4 -> 1.4.1
- `jinja2` 2.10 -> 2.10.1
- `jupyter_client` 5.2.4 -> 5.3.1
- `jupyter_core` 4.4.0 -> 4.5.0
- `jupyterlab` 0.35.4 -> 1.0.2
- `jupyterlab_server` 0.2.0 -> 1.0.0
- `kiwisolver` 1.0.1 -> 1.1.0
- `lazy-object-proxy` 1.3.1 -> 1.4.1
- `libcurl` 7.64.0 -> 7.65.2
- `libpng` 1.6.36 -> 1.6.37

- libssh2 1.8.0 -> 1.8.2
- llvmlite 0.28.0 -> 0.29.0
- lxml 4.3.2 -> 4.3.4
- matplotlib 3.0.3 -> 3.1.0
- mkl 2019.3 -> 2019.4
- mkl-service 1.1.2 -> 2.0.2
- mkl\_fft 1.0.10 -> 1.0.12
- more-itertools 6.0.0 -> 7.0.0
- nbconvert 5.4.1 -> 5.5.0
- networkx 2.2 -> 2.3
- nltk 3.4 -> 3.4.4
- notebook 5.7.8 -> 6.0.0
- numba 0.43.1 -> 0.45.0
- numpy 1.16.2 -> 1.16.4
- numpy-base 1.16.2 -> 1.16.4
- numpydoc 0.8.0 -> 0.9.1
- openpyxl 2.6.1 -> 2.6.2
- openssl 1.1.1b0 -> 1.1.1rc0
- parso 0.3.4 -> 0.5.0
- partd 0.3.10 -> 1.0.0
- path.py 11.5.0 -> 12.0.1
- pathlib2 2.3.3 -> 2.3.4
- pillow 5.4.1 -> 6.1.0
- pip 19.0.3 -> 19.1.1
- pluggy 0.9.0 -> 0.12.0
- prometheus\_client 0.6.0 -> 0.7.1
- psutil 5.6.1 -> 5.6.3
- pycurl 7.43.0.2 -> 7.43.0.3
- pygments 2.3.1 -> 2.4.2
- pyparsing 2.3.1 -> 2.4.0
- pysocks 1.6.8 -> 1.7.0
- pytables 3.5.1 -> 3.5.2
- pytest 4.3.1 -> 5.0.1
- pytz 2018.9 -> 2019.1
- pywavelets 1.0.2 -> 1.0.3
- pyyaml 5.1 -> 5.1.1

- qtpy 1.7.0 -> 1.8.0
- requests 2.21.0 -> 2.22.0
- rope 0.12.0 -> 0.14.0
- scikit-image 0.14.2 -> 0.15.0
- setuptools 40.8.0 -> 41.0.1
- snowballstemmer 1.2.1 -> 1.9.0
- sphinx 1.8.5 -> 2.1.2
- sphinxcontrib-websupport 1.1.0 -> 1.1.2
- spyder 3.3.3 -> 3.3.6
- spyder-kernels 0.4.2 -> 0.5.1
- sqlalchemy 1.3.1 -> 1.3.5
- sqlite 3.27.2 -> 3.29.0
- statsmodels 0.9.0 -> 0.10.0
- subprocess32 3.5.3 -> 3.5.4
- sympy 1.3 -> 1.4
- tblib 1.3.2 -> 1.4.0
- terminado 0.8.1 -> 0.8.2
- toolz 0.9.0 -> 0.10.0
- tornado 6.0.2 -> 6.0.3
- tqdm 4.31.1 -> 4.32.1
- typed-ast 1.3.1 -> 1.3.4
- typing 3.6.6 -> 3.7.4
- urllib3 1.24.1 -> 1.24.2

- xlswriter 1.1.5 -> 1.1.8
- zict 0.1.4 -> 1.0.0
- zipp 0.3.3 -> 0.5.1

**Added:**

- joblib 0.13.2
- json5 0.8.4
- mock 3.0.5
- sphinxcontrib-applehelp 1.0.1
- sphinxcontrib-devhelp 1.0.1

- sphinxcontrib-htmlhelp 1.0.2
- sphinxcontrib-jsmath 1.0.1
- sphinxcontrib-qthelp 1.0.2
- sphinxcontrib-serializinghtml 1.1.3

### More changes specific to linux-64

#### Updated:

- bokeh 1.0.4 -> 1.2.0
- libgcc-ng 8.2.0 -> 9.1.0
- libstdcxx-ng 8.2.0 -> 9.1.0
- pexpect 4.6.0 -> 4.7.0
- pycairo 1.18.0 -> 1.18.1
- qtconsole 4.4.3 -> 4.5.1
- scikit-learn 0.20.3 -> 0.21.2
- scipy 1.2.1 -> 1.3.0

#### Added:

- \_libgcc\_mutex 0.1

### More changes specific to linux-ppc64le

#### Updated:

- bokeh 1.0.4 -> 1.2.0
- pexpect 4.6.0 -> 4.7.0
- pillow 5.3.0 -> 6.1.0
- pycairo 1.18.0 -> 1.18.1
- scikit-image 0.14.1 -> 0.15.0

#### Added:

- \_libgcc\_mutex 0.1

### More changes specific to win-32

#### Updated:

- bokeh 1.0.4 -> 1.3.0
- qtconsole 4.4.3 -> 4.5.2
- scikit-learn 0.20.3 -> 0.21.1
- scipy 1.2.1 -> 1.3.0
- xlwings 0.15.4 -> 0.15.8

### Added:

- liblief 0.9.0
- py-lief 0.9.0

### More changes specific to win-64

#### Updated:

- bokeh 1.0.4 -> 1.3.0
- qtconsole 4.4.3 -> 4.5.2
- scikit-learn 0.20.3 -> 0.21.2
- xlwings 0.15.4 -> 0.15.8

### More changes specific to osx-64

#### Updated:

- bokeh 1.0.4 -> 1.2.0
- pexpect 4.6.0 -> 4.7.0
- qtconsole 4.4.3 -> 4.5.1
- scikit-learn 0.20.3 -> 0.21.2
- scipy 1.2.1 -> 1.3.0
- xlwings 0.15.4 -> 0.15.8

#### Added:

- llvm-openmp 4.0.1

## Anaconda 2019.03 (April 4, 2019)

### User-facing changes

- Full conda integration with Windows Powershell.
- The Windows Python package includes an optional feature that, when enabled, will improve DLL handling of library conflicts.
- This is the first release which includes conda 4.6.
- A link is added to the installer so you have the option to easily install PyCharm for Anaconda.

### Backend improvements (non-visible changes)

- Anaconda uninstalls faster on Windows.

## Changes for all x86 platforms

### Updated:

- astroid 2.1.0 -> 2.2.5
- astropy 3.1 -> 3.1.2
- atomicwrites 1.2.1 -> 1.3.0
- attrs 18.2.0 -> 19.1.0
- beautifulsoup4 4.6.3 -> 4.7.1
- bleach 3.0.2 -> 3.1.0
- blosc 1.14.4 -> 1.15.0
- bokeh 1.0.2 -> 1.0.4
- ca-certificates 2018.3.7 -> 2019.1.23
- certifi 2018.11.29 -> 2019.3.9
- cffi 1.11.5 -> 1.12.2
- cloudpickle 0.6.1 -> 0.8.0
- configparser 3.5.0 -> 3.7.3
- cryptography 2.4.2 -> 2.6.1
- curl 7.63.0 -> 7.64.0
- cython 0.29.2 -> 0.29.6
- dask 1.0.0 -> 1.1.4
- dask-core 1.0.0 -> 1.1.4
- decorator 4.3.0 -> 4.4.0
- distributed 1.25.1 -> 1.26.0
- entrypoints 0.2.3 -> 0.3
- event 1.3.7 -> 1.4.0
- h5py 2.8.0 -> 2.9.0
- hdf5 1.10.2 -> 1.10.4
- imageio 2.4.1 -> 2.5.0
- importlib\_metadata 0.6 -> 0.8
- intel-openmp 2019.1 -> 2019.3
- ipython 7.2.0 -> 7.4.0
- isort 4.3.4 -> 4.3.16
- jedi 0.13.2 -> 0.13.3
- jsonschema 2.6.0 -> 3.0.1
- jupyterlab 0.35.3 -> 0.35.4
- keyring 17.0.0 -> 18.0.0
- libcurl 7.63.0 -> 7.64.0

- libpng 1.6.35 -> 1.6.36
- libtiff 4.0.9 -> 4.0.10
- libxml2 2.9.8 -> 2.9.9
- libxslt 1.1.32 -> 1.1.33
- llvmlite 0.26.0 -> 0.28.0
- lxml 4.2.5 -> 4.3.2
- markupsafe 1.1.0 -> 1.1.1
- matplotlib 3.0.2 -> 3.0.3
- mkl 2019.1 -> 2019.3
- mkl\_fft 1.0.6 -> 1.0.10
- more-itertools 4.3.0 -> 6.0.0
- msgpack-python 0.5.6 -> 0.6.1
- nbconvert 5.4.0 -> 5.4.1
- notebook 5.7.4 -> 5.7.8
- numba 0.41.0 -> 0.43.1
- numexpr 2.6.8 -> 2.6.9
- numpy 1.15.4 -> 1.16.2
- numpy-base 1.15.4 -> 1.16.2
- openpyxl 2.5.12 -> 2.6.1
- openssl 1.1.1a0 -> 1.1.1b0
- packaging 18.0 -> 19.0
- pandas 0.23.4 -> 0.24.2
- pandoc 1.19.2.1 -> 2.2.3.2
- parso 0.3.1 -> 0.3.4
- partd 0.3.9 -> 0.3.10
- pillow 5.3.0 -> 5.4.1
- pip 18.1 -> 19.0.3
- pkginfo 1.4.2 -> 1.5.0.1
- pluggy 0.8.0 -> 0.9.0
- prometheus\_client 0.5.0 -> 0.6.0
- prompt\_toolkit 2.0.7 -> 2.0.9
- psutil 5.4.8 -> 5.6.1
- py 1.7.0 -> 1.8.0
- pycodestyle 2.4.0 -> 2.5.0

- pylint 2.2.2 -> 2.3.1

- pyodbc 4.0.25 -> 4.0.26
- pyopenssl 18.0.0 -> 19.0.0
- pyparsing 2.3.0 -> 2.3.1
- pytables 3.4.4 -> 3.5.1
- pytest 4.0.2 -> 4.3.1
- pytest-doctestplus 0.2.0 -> 0.3.0
- pytest-openfiles 0.3.1 -> 0.3.2
- python 3.7.1 -> 3.7.3
- python-dateutil 2.7.5 -> 2.8.0
- pytz 2018.7 -> 2018.9
- pywavelets 1.0.1 -> 1.0.2
- pyyaml 3.13 -> 5.1
- pyzmq 17.1.2 -> 18.0.0
- qtawesome 0.5.3 -> 0.5.7
- qtpy 1.5.2 -> 1.7.0
- rope 0.11.0 -> 0.12.0
- scandir 1.9.0 -> 1.10.0
- scikit-image 0.14.1 -> 0.14.2
- scikit-learn 0.20.1 -> 0.20.3
- scipy 1.1.0 -> 1.2.1
- setuptools 40.6.3 -> 40.8.0
- sortedcollections 1.0.1 -> 1.1.2
- sphinx 1.8.2 -> 1.8.5
- spyder 3.3.2 -> 3.3.3
- spyder-kernels 0.3.0 -> 0.4.2
- sqlalchemy 1.2.15 -> 1.3.1
- sqlite 3.26.0 -> 3.27.2
- ssl\_match\_hostname 3.5.0.1 -> 3.7.0.1
- tornado 5.1.1 -> 6.0.2
- tqdm 4.28.1 -> 4.31.1
- typed-ast 1.1.0 -> 1.3.1
- wheel 0.32.3 -> 0.33.1
- wrapt 1.10.11 -> 1.11.1
- xlswriter 1.1.2 -> 1.1.5
- zeromq 4.2.5 -> 4.3.1
- zict 0.1.3 -> 0.1.4

### Added:

- pyrsistent 0.14.11
- soupsieve 1.8
- zipp 0.3.3

### Removed:

- blaze
- conda
- conda-build
- conda-env
- datashape
- flask-cors
- odo

### More changes specific to linux-64

#### Updated:

- dbus 1.13.2 -> 1.13.6
- graphite2 1.3.12 -> 1.3.13
- libedit 3.1.20170329 -> 3.1.20181209
- pcre 8.42 -> 8.43
- pixman 0.34.0 -> 0.38.0
- secretstorage 3.1.0 -> 3.1.1

### More changes specific to linux-ppc64le

#### Updated:

- libedit 3.1.20170329 -> 3.1.20181209
- nbconvert 5.3.1 -> 5.4.1
- pcre 8.42 -> 8.43

#### Added:

- defusedxml 0.5.0

### More changes specific to win-32

#### Updated:

- menuinst 1.4.14 -> 1.4.16
- win\_inet\_pton 1.0.1 -> 1.1.0
- xlwings 0.15.1 -> 0.15.4

**Added:**

- powershell\_shortcut 0.0.1
- pyreadline 2.1

**More changes specific to win-64****Updated:**

- menuinst 1.4.14 -> 1.4.16
- win\_inet\_pton 1.0.1 -> 1.1.0
- xlwings 0.15.1 -> 0.15.4

**Added:**

- liblief 0.9.0
- powershell\_shortcut 0.0.1
- py-lief 0.9.0
- pyreadline 2.1

**More changes specific to osx-64****Updated:**

- appscript 1.0.1 -> 1.1.0
- dbus 1.13.2 -> 1.13.6
- libedit 3.1.20170329 -> 3.1.20181209
- pcre 8.42 -> 8.43
- xlwings 0.15.1 -> 0.15.4

**Anaconda 2018.12 (December 21, 2018)****User-facing changes**

- Anaconda version numbers now follow a year.month format.
- OpenSSL 1.1.1 is installed on all platforms and versions except for the Python 2.7 on win-32 and win-64.
- This is the last Anaconda release for the linux-32 platform.

**Backend improvements (non-visible changes)**

- Improvements have been made to conda which will decrease the time it takes to solve and install packages.

## Changes for all x86 platforms

### Updated:

- alabaster 0.7.11 -> 0.7.12
- astroid 2.0.4 -> 2.1.0
- astropy 3.0.4 -> 3.1
- bleach 2.1.4 -> 3.0.2
- bokeh 0.13.0 -> 1.0.2
- certifi 2018.8.24 -> 2018.11.29
- click 6.7 -> 7.0
- cloudpickle 0.5.5 -> 0.6.1
- colorama 0.3.9 -> 0.4.1
- cryptography 2.3.1 -> 2.4.2
- curl 7.61.0 -> 7.63.0
- cython 0.28.5 -> 0.29.2
- dask 0.19.1 -> 1.0.0
- dask-core 0.19.1 -> 1.0.0
- distributed 1.23.1 -> 1.25.1
- filelock 3.0.8 -> 3.0.10
- flask-cors 3.0.6 -> 3.0.7
- gevent 1.3.6 -> 1.3.7
- idna 2.7 -> 2.8
- intel-openmp 2019.0 -> 2019.1
- ipython 6.5.0 -> 7.2.0
- ipywidgets 7.4.1 -> 7.4.2
- itsdangerous 0.24 -> 1.1.0
- jedi 0.12.1 -> 0.13.2
- jupyter\_client 5.2.3 -> 5.2.4
- jupyter\_console 5.2.0 -> 6.0.0
- jupyterlab 0.34.9 -> 0.35.3
- keyring 13.2.1 -> 17.0.0
- libcurl 7.61.0 -> 7.63.0
- libpng 1.6.34 -> 1.6.35
- llvmlite 0.24.0 -> 0.26.0
- markupsafe 1.0 -> 1.1.0
- matplotlib 2.2.3 -> 3.0.2
- mistune 0.8.3 -> 0.8.4

- mkl 2019.0 -> 2019.1
- mkl\_fft 1.0.4 -> 1.0.6
- mkl\_random 1.0.1 -> 1.0.2
- mpmath 1.0.0 -> 1.1.0
- networkx 2.1 -> 2.2
- nltk 3.3.0 -> 3.4
- notebook 5.6.0 -> 5.7.4
- numba 0.39.0 -> 0.41.0
- numpy 1.15.1 -> 1.15.4
- numpy-base 1.15.1 -> 1.15.4
- openpyxl 2.5.6 -> 2.5.12
- openssl 1.0.2p -> 1.1.1a0
- packaging 17.1 -> 18.0
- partd 0.3.8 -> 0.3.9
- path.py 11.1.0 -> 11.5.0
- pathlib2 2.3.2 -> 2.3.3
- patsy 0.5.0 -> 0.5.1
- pickleshare 0.7.4 -> 0.7.5
- pillow 5.2.0 -> 5.3.0
- pip 10.0.1 -> 18.1
- pluggy 0.7.1 -> 0.8.0
- prometheus\_client 0.3.1 -> 0.5.0
- prompt\_toolkit 1.0.15 -> 2.0.7
- psutil 5.4.7 -> 5.4.8
- py 1.6.0 -> 1.7.0
- pycparser 2.18 -> 2.19
- pygments 2.2.0 -> 2.3.1
- pylint 2.1.1 -> 2.2.2
- pyodbc 4.0.24 -> 4.0.25
- pyparsing 2.2.0 -> 2.3.0
- pytest 3.8.0 -> 4.0.2
- pytest-arraydiff 0.2 -> 0.3
- pytest-astropy 0.4.0 -> 0.5.0
- pytest-doctestplus 0.1.3 -> 0.2.0
- pytest-openfiles 0.3.0 -> 0.3.1
- pytest-remotedata 0.3.0 -> 0.3.1

- python 3.7.0 -> 3.7.1
- python-dateutil 2.7.3 -> 2.7.5
- pytz 2018.5 -> 2018.7
- pywavelets 1.0.0 -> 1.0.1
- qt 5.9.6 -> 5.9.7
- qtawesome 0.4.4 -> 0.5.3
- qtconsole 4.4.1 -> 4.4.3
- qtpy 1.5.0 -> 1.5.2
- requests 2.19.1 -> 2.21.0
- scikit-image 0.14.0 -> 0.14.1
- scikit-learn 0.19.2 -> 0.20.1
- setuptools 40.2.0 -> 40.6.3
- six 1.11.0 -> 1.12.0
- sortedcontainers 2.0.5 -> 2.1.0
- sphinx 1.7.9 -> 1.8.2
- spyder 3.3.1 -> 3.3.2
- spyder-kernels 0.2.6 -> 0.3.0
- sqlalchemy 1.2.11 -> 1.2.15
- sqlite 3.24.0 -> 3.26.0
- subprocess32 3.5.2 -> 3.5.3
- sympy 1.2 -> 1.3
- testpath 0.3.1 -> 0.4.2
- tornado 5.1 -> 5.1.1
- tqdm 4.26.0 -> 4.28.1
- urllib3 1.23 -> 1.24.1
- wheel 0.31.1 -> 0.32.3
- widgetsnbextension 3.4.1 -> 3.4.2
- xlrd 1.1.0 -> 1.2.0
- xlswriter 1.1.0 -> 1.1.2

**Added:**

- backports.os 0.1.1
- conda 4.5.12
- conda-build 3.17.6
- conda-env 2.6.0
- future 0.17.1
- importlib\_metadata 0.6

- jupyterlab\_server 0.2.0
- krb5 1.16.1
- libarchive 3.3.3
- lz4-c 1.8.1.2
- python-libarchive-c 2.8
- zstd 1.3.7

**Removed:**

- appdirs
- automat
- constantly
- hyperlink
- incremental
- pyasn1
- pyasn1-modules
- service\_identity
- twisted
- zope
- zope.interface

**More changes specific to linux-64****Updated:**

- ipykernel 4.9.0 -> 5.1.0
- jeepney 0.3.1 -> 0.4
- pycairo 1.17.1 -> 1.18.0

**Added:**

- liblief 0.9.0
- py-lief 0.9.0
- wurlitzer 1.0.2

**More changes specific to linux-32****Updated:**

- ipykernel 4.9.0 -> 5.1.0
- jeepney 0.3.1 -> 0.4
- pycairo 1.17.1 -> 1.18.0

**Added:**

- liblief 0.9.0
- py-lief 0.9.0
- wurlitzer 1.0.2

### More changes specific to linux-ppc64le

#### Updated:

- conda 4.5.11 -> 4.5.12
- conda-build 3.15.1 -> 3.16.3
- ipykernel 4.9.0 -> 5.1.0
- libpng 1.6.32 -> 1.6.35
- pycairo 1.17.1 -> 1.18.0
- tqdm 4.25.0 -> 4.28.1

#### Added:

- libssh2 1.8.0

### More changes specific to win-32

#### Updated:

- backports.shutil\_which 3.5.1 -> 3.5.2
- icc\_rt 2017.0.4 -> 2019.0.0
- ipykernel 4.10.0 -> 5.1.0
- pywinpty 0.5.4 -> 0.5.5
- xlwings 0.11.8 -> 0.15.1

#### Added:

- xz 5.2.4

### More changes specific to win-64

#### Updated:

- backports.shutil\_which 3.5.1 -> 3.5.2
- icc\_rt 2017.0.4 -> 2019.0.0
- ipykernel 4.10.0 -> 5.1.0
- pywinpty 0.5.4 -> 0.5.5
- xlwings 0.11.8 -> 0.15.1

#### Added:

- xz 5.2.4

## Anaconda 5.3.1 (Nov 19, 2018)

### User-facing changes

- The Anaconda Installers are shipped with a fix for VSCode Installation. xref: <https://github.com/ContinuumIO/anaconda-issues/issues/10286>

## Anaconda 5.3.0 (Sept 28, 2018)

### User-facing changes

- The Anaconda3 installers ship with python 3.7 instead of python 3.6
- Windows installers disallow the character , in installation path to prevent usability issues.
- Instructions in the macOS pkg installer for choice of initializing installation has been improved.

### Backend improvements (non-visible changes)

- Installers mimic the functionality of “conda init” (a highly anticipated feature in conda 4.6) instead of just adding \$PREFIX/bin to PATH in bash profile.
- The repodata\_record.json file for each package in the package cache directory is populated correctly, which will assist in offline installation of packages in new environments.

### Changes for all x86 platforms

#### Updated:

- alabaster 0.7.10 -> 0.7.11
- anaconda-client 1.6.14 -> 1.7.2
- astroid 1.6.3 -> 2.0.4
- astropy 3.0.2 -> 3.0.4
- attrs 18.1.0 -> 18.2.0
- babel 2.5.3 -> 2.6.0
- beautifulsoup4 4.6.0 -> 4.6.3
- bitarray 0.8.1 -> 0.8.3
- bleach 2.1.3 -> 2.1.4
- blosc 1.14.3 -> 1.14.4
- bokeh 0.12.16 -> 0.13.0
- boto 2.48.0 -> 2.49.0
- certifi 2018.4.16 -> 2018.8.24
- cloudpickle 0.5.3 -> 0.5.5
- cryptography 2.2.2 -> 2.3.1

- curl 7.60.0 -> 7.61.0
- cython 0.28.2 -> 0.28.5
- dask 0.17.5 -> 0.19.1
- dask-core 0.17.5 -> 0.19.1
- distributed 1.21.8 -> 1.23.1
- filelock 3.0.4 -> 3.0.8
- flask-cors 3.0.4 -> 3.0.6
- freetype 2.8 -> 2.9.1
- gevent 1.3.0 -> 1.3.6
- greenlet 0.4.13 -> 0.4.15
- h5py 2.7.1 -> 2.8.0
- idna 2.6 -> 2.7
- imageio 2.3.0 -> 2.4.1
- imagesize 1.0.0 -> 1.1.0
- intel-openmp 2018.0.0 -> 2019.0
- ipython 6.4.0 -> 6.5.0
- ipywidgets 7.2.1 -> 7.4.1
- jedi 0.12.0 -> 0.12.1
- jupyterlab 0.32.1 -> 0.34.9
- jupyterlab\_launcher 0.10.5 -> 0.13.1
- libcurl 7.60.0 -> 7.61.0
- llvmlite 0.23.1 -> 0.24.0
- lxml 4.2.1 -> 4.2.5
- matplotlib 2.2.2 -> 2.2.3
- mkl 2018.0.2 -> 2019.0
- mkl\_fft 1.0.1 -> 1.0.4
- more-itertools 4.1.0 -> 4.3.0
- multipledispatch 0.5.0 -> 0.6.0
- nbconvert 5.3.1 -> 5.4.0
- notebook 5.5.0 -> 5.6.0
- numba 0.38.0 -> 0.39.0
- numexpr 2.6.5 -> 2.6.8
- numpy 1.14.3 -> 1.15.1
- numpy-base 1.14.3 -> 1.15.1
- olefile 0.45.1 -> 0.46
- openpyxl 2.5.3 -> 2.5.6

- openssl 1.0.2o -> 1.0.2p
- pandas 0.23.0 -> 0.23.4
- parso 0.2.0 -> 0.3.1

- mpfr 4.0.1
- numpy-base 1.14.5
- tqdm 4.25.0

- twisted 18.4.0

### Removed:

- conda-verify
- libssh2

### More changes specific to win-32

#### Updated:

- comtypes 1.1.4 -> 1.1.7
- ipykernel 4.8.2 -> 4.10.0
- pywinpty 0.5.1 -> 0.5.4
- vc 14 -> 14.1
- vs2015\_runtime 14.0.25123 -> 14.15.26706

### More changes specific to win-64

#### Updated:

- comtypes 1.1.4 -> 1.1.7
- ipykernel 4.8.2 -> 4.10.0
- pywinpty 0.5.1 -> 0.5.4
- vc 14 -> 14.1
- vs2015\_runtime 14.0.25123 -> 14.15.26706

## Anaconda 5.2.0 (May 30, 2018)

### User-facing changes

- Windows installers disallow the characters ! % ^ = in installation path to prevent later usability issues
- Improved Windows multi-user installations by providing more dynamic shortcut working directory behavior
- Default channels point to repo.anaconda.com instead of repo.anaconda.com

### Backend improvements (non-visible changes)

- Security fixes for more than 20 packages based on a deep-dive of CVE vulnerabilities
- Windows installer uses a trimmed down value for `PATH` env var, to avoid DLL hell with existing software
- History file in the conda-meta directory is populated correctly to improve behavior of `--prune`
- Developer certificate for macOS pkg installers has been updated to Anaconda, Inc.

## Changes for all x86 platforms

### Updated:

- anaconda-client 1.6.9 -> 1.6.14
- astroid 1.6.1 -> 1.6.3
- astropy 2.0.3 -> 3.0.2
- attrs 17.4.0 -> 18.1.0
- backports.functools\_lru\_cache 1.4 -> 1.5
- bleach 2.1.2 -> 2.1.3
- bokeh 0.12.13 -> 0.12.16
- ca-certificates 2017.8.26 -> 2018.3.7
- certifi 2018.1.18 -> 2018.4.16
- cffi 1.11.4 -> 1.11.5
- cloudpickle 0.5.2 -> 0.5.3
- cryptography 2.1.4 -> 2.2.2
- curl 7.58.0 -> 7.60.0
- cython 0.27.3 -> 0.28.2
- cytoolz 0.9.0 -> 0.9.0.1
- dask 0.16.1 -> 0.17.5
- dask-core 0.16.1 -> 0.17.5
- decorator 4.2.1 -> 4.3.0

### Added:

- attrs 18.1.0
- pluggy 0.6.0

### Removed:

- gmpy2
- mpc
- mpfr

## More changes specific to win-32

### Updated:

- menuinst 1.4.11 -> 1.4.14
- pywin32 222 -> 223
- pywinpty 0.5 -> 0.5.1
- xlwings 0.11.5 -> 0.11.8

### Added:

- libsodium 1.0.16
- m2w64-gcc-libgfortran 5.3.0
- m2w64-gcc-libs 5.3.0
- m2w64-gcc-libs-core 5.3.0
- m2w64-gmp 6.1.0
- m2w64-libwinpthread-git 5.0.0.4634.697f757
- msys2-conda-epoch 20160418
- zeromq 4.2.5

## More changes specific to win-64

### Updated:

- menuinst 1.4.11 -> 1.4.14
- pywin32 222 -> 223

- pywinpty 0.5 -> 0.5.1
- xlwings 0.11.5 -> 0.11.8

**Added:**

- libsodium 1.0.16
- m2w64-gcc-libgfortran 5.3.0
- m2w64-gcc-libs 5.3.0
- m2w64-gcc-libs-core 5.3.0
- m2w64-gmp 6.1.0
- m2w64-libwinpthread-git 5.0.0.4634.697f757
- msys2-conda-epoch 20160418
- zeromq 4.2.5

**Anaconda 5.1.0 (Feb 15, 2018)****User-facing changes**

- Microsoft Visual Studio Code added as an install option
- Anaconda Navigator has install and launch options for VS Code
- The installer support link has been replaced with the [Getting Started](#) page

**Backend improvements (non-visible changes)**

- Power packages are built with [same recipes](#) as rest of distribution
- Fixed some incomplete Windows installations due to interactions with antivirus software
- Fixed spaces in paths problems on Windows
- Anaconda Navigator was removed from the anaconda metapackage (but not the Anaconda installer)
- Installers present warnings when executed on the wrong platform

**Changes for all x86 platforms****Updated:**

- anaconda-client 1.6.5 -> 1.6.9
- anaconda-project 0.8.0 -> 0.8.2
- anaconda-navigator 1.6.9 -> 1.7.0
- asn1crypto 0.22.0 -> 0.24.0
- astroid 1.5.3 -> 1.6.1
- astropy 2.0.2 -> 2.0.3
- babel 2.5.0 -> 2.5.3
- bleach 2.0.0 -> 2.1.2

- bokeh 0.12.10 -> 0.12.13
- certifi 2017.7.27.1 -> 2018.1.18
- cffi 1.10.0 -> 1.11.4
- cloudpickle 0.4.0 -> 0.5.2
- conda 4.3.27 -> 4.4.10
- conda-build 3.0.27 -> 3.4.1
- cryptography 2.0.3 -> 2.1.4
- curl 7.55.1 -> 7.58.0
- cython 0.26.1 -> 0.27.3
- cytoolz 0.8.2 -> 0.9.0
- dask 0.15.3 -> 0.16.1
- dask-core 0.15.3 -> 0.16.1
- decorator 4.1.2 -> 4.2.1
- distributed 1.19.1 -> 1.20.2
- filelock 2.0.12 -> 2.0.13
- futures 3.1.1 -> 3.2.0
- glob2 0.5 -> 0.6
- h5py 2.7.0 -> 2.7.1
- html5lib 0.999999999 -> 1.0.1

- tornado 4.5.2 -> 4.5.3
- werkzeug 0.12.2 -> 0.14.1
- wheel 0.29.0 -> 0.30.0
- widgetsnbextension 3.0.2 -> 3.1.0

### Added:

- attrs 17.4.0
- libcurl 7.58.0
- parso 0.1.1
- pluggy 0.6.0
- send2trash 1.4.2

### More changes specific to win-64

### Updated:

- comtypes 1.1.2 -> 1.1.4
- jupyterlab 0.27.0 -> 0.31.4
- menuinst 1.4.10 -> 1.4.11
- pywin32 221 -> 222
- xlwings 0.11.4 -> 0.11.5

### Added:

- backports.shutil\_which 3.5.1
- pywinpty 0.5
- terminado 0.8.1
- winpty 0.4.3

### Removed:

- cachecontrol
- distlib
- lockfile
- progress

### More changes specific to win-32

**Updated:**

- comtypes 1.1.2 -> 1.1.4
- jupyterlab 0.27.0 -> 0.31.5
- menuinst 1.4.10 -> 1.4.11
- pywin32 221 -> 222
- xlwings 0.11.4 -> 0.11.5

**Added:**

- backports.shutil\_which 3.5.1
- pywinpty 0.5
- terminado 0.8.1
- winpty 0.4.3

**Removed:**

- cachecontrol
- distlib
- lockfile
- progress

### More changes specific to osx-64

**Updated:**

- dbus 1.10.22 -> 1.12.2
- expat 2.2.4 -> 2.2.5
- jupyterlab 0.27.0 -> 0.31.5
- libsodium 1.0.13 -> 1.0.15
- pexpect 4.2.1 -> 4.3.1
- terminado 0.6 -> 0.8.1
- xlwings 0.11.4 -> 0.11.5

### More changes specific to linux-64

**Updated:**

- libiconv

## Anaconda 5.0.1 (Oct 25, 2017)

The changes detailed here are based on an upgrade from Anaconda 5.0.0.

- R has been updated to version 3.4.2. All R packages (including RStudio) have been rebuilt to be compatible with the new Anaconda 5.0 compilers.
- Updated many packages, including Python, Numpy, Spyder, Navigator, and Bokeh.
- The MKL library load path has been modified to address issue for Julia users.
- Fixed an OpenSSL issue with WSL on Windows.
- Fixed Anaconda Installer Configuration (AIC) feature for Unix installers.
- Re-enabled spaces in installation paths on Windows (temporarily disabled in 5.0.0).

## Changes for all x86 platforms

### Updated:

- anaconda-navigator 1.6.8 -> 1.6.9
- bokeh 0.12.7 -> 0.12.10
- conda 4.3.27 -> 4.3.30
- conda-build 3.0.22 -> 3.0.27
- dask 0.15.2 -> 0.15.3
- dask-core 0.15.2 -> 0.15.3
- distributed 1.18.3 -> 1.19.1
- lxml 3.8.0 -> 4.1.0
- matplotlib 2.0.2 -> 2.1.0
- networkx 1.11 -> 2.0
- numpy 1.13.1 -> 1.13.3
- psutil 5.2.2 -> 5.4.0
- pyflakes 1.5.0 -> 1.6.0
- pylint 1.7.2 -> 1.7.4
- python 2.7.13 -> 2.7.14

- python 3.6.2 -> 3.6.3
- scandir 1.5 -> 1.6
- scikit-learn 0.19.0 -> 0.19.1
- six 1.10.0 -> 1.11.0
- spyder 3.2.3 -> 3.2.4
- xlswriter 0.9.8 -> 1.0.2
- zict 0.1.2 -> 0.1.3

### **More changes specific to win-64**

#### **Updated:**

- menuinst 1.4.8 -> 1.4.10

#### **Added:**

- lzo 2.10

### **More changes specific to win-32**

#### **Updated:**

- menuinst 1.4.8 -> 1.4.10

#### **Added:**

- lzo 2.10

### **More changes specific to macOS-64**

#### **Added:**

- bzip2 1.0.6
- lzo 2.10

### **More changes specific to linux-64**

#### **Added:**

- bzip2 1.0.6

### **More changes specific to linux-32**

#### **Added:**

- bzip2 1.0.6

### Anaconda 5.0.0.1 (Oct 2, 2017)

- Fixes Python & C compiler fallback path for all cases on x86/x86\_64 Linux. Without this fix, people were required to use our new compilers, which is not something we want to enforce at this time. This was affecting travis-ci builds and pip installs of packages that require compilation for extensions.

### What's new in Anaconda 5.0?

Anaconda 5.0 was released on Sept 26, 2017.

- Over 100 packages updated and added. MKL is updated to 2018.0.0. JupyterLab alpha preview 0.27.0 is included.
- All new compilers on macOS and Linux, giving substantial security and performance improvements.
- Where possible, all build recipes use conda-forge as a base, using <https://github.com/AnacondaRecipes>.
- A new channel, `pkgs/main`, has been added to `defaults`. The new channel is given top priority within `defaults` and holds packages built with the new compiler stack.
- Continuum Analytics has been renamed to Anaconda, Inc. See [this blog post](#) for more.
- Spaces are no longer allowed in the installation path on Windows.
- Transitioned to more flexible dependency pinning of numpy packages, giving wider ranges of compatibility.

### Changes for all x86 platforms

#### Updated:

- anaconda-client 1.6.3 -> 1.6.5
- anaconda-navigator 1.6.2 -> 1.6.8
- anaconda-project 0.6.0 -> 0.8.0
- astroid 1.4.9 -> 1.5.3
- astropy 1.3.2 -> 2.0.2
- babel 2.4.0 -> 2.5.0
- blaze 0.10.1 -> 0.11.3
- bleach 1.5.0 -> 2.0.0
- bokeh 0.12.5 -> 0.12.7
- boto 2.46.1 -> 2.48.0
- chardet 3.0.3 -> 3.0.4
- cloudpickle 0.2.2 -> 0.4.0
- conda 4.3.21 -> 4.3.27
- cryptography 1.8.1 -> 2.0.3
- curl 7.52.1 -> 7.55.1
- cython 0.25.2 -> 0.26.1
- dask 0.14.3 -> 0.15.2

- decorator 4.0.11 -> 4.1.2
- distributed 1.16.3 -> 1.18.3
- docutils 0.13.1 -> 0.14
- entrypoints 0.2.2 -> 0.2.3
- flask-cors 3.0.2 -> 3.0.3
- freetype 2.5.5 -> 2.8
- gevent 1.2.1 -> 1.2.2
- html5lib 0.999 -> 0.999999999
- idna 2.5 -> 2.6
- ipywidgets 6.0.0 -> 7.0.0
- isort 4.2.5 -> 4.2.15
- jupyter\_client 5.0.1 -> 5.1.0
- jupyter\_console 5.1.0 -> 5.2.0
- lazy-object-proxy 1.2.2 -> 1.3.1
- libpng 1.6.27 -> 1.6.32
- libtiff 4.0.6 -> 4.0.8
- llvmlite 0.18.0 -> 0.20.0
- lxml 3.7.3 -> 3.8.0
- markupsafe 0.23 -> 1.0
- mkl 2017.0.1 -> 2018.0.0
- nbconvert 5.1.1 -> 5.3.1
- nbformat 4.3.0 -> 4.4.0
- nltk 3.2.3 -> 3.2.4
- numba 0.33.0 -> 0.35.0
- numpy 1.12.1 -> 1.13.1
- numpydoc 0.6.0 -> 0.7.0
- odo 0.5.0 -> 0.5.1
- openpyxl 2.4.7 -> 2.4.8
- pandas 0.20.1 -> 0.20.3
- pandocfilters 1.4.1 -> 1.4.2
- pathlib2 2.2.1 -> 2.3.0
- pillow 4.1.1 -> 4.2.1
- prompt\_toolkit 1.0.14 -> 1.0.15
- py 1.4.33 -> 1.4.34
- pycparser 2.17 -> 2.18
- pylint 1.6.4 -> 1.7.2

- pyodbc 4.0.16 -> 4.0.17
- pyopenssl 17.0.0 -> 17.2.0
- pyparsing 2.1.4 -> 2.2.0
- pytest 3.0.7 -> 3.2.1
- python-dateutil 2.6.0 -> 2.6.1
- qtconsole 4.3.0 -> 4.3.1
- qtpy 1.2.1 -> 1.3.1
- requests 2.14.2 -> 2.18.4
- rope 0.9.4 -> 0.10.5
- scikit-learn 0.18.1 -> 0.19.0
- scipy 0.19.0 -> 0.19.1
- seaborn 0.7.1 -> 0.8.0
- setuptools 27.2.0 -> 36.5.0
- sip 4.18 -> 4.18.1
- sphinx 1.5.6 -> 1.6.3
- spyder 3.1.4 -> 3.2.3
- sqlalchemy 1.1.9 -> 1.1.13
- sympy 1.0 -> 1.1.1
- testpath 0.3 -> 0.3.1
- tk 8.5.18 -> 8.6.7
- tornado 4.5.1 -> 4.5.2
- widgetsnbextension 2.0.0 -> 3.0.2
- wrapt 1.10.10 -> 1.10.11
- xlrd 1.0.0 -> 1.1.0
- xlswriter 0.9.6 -> 0.9.8
- zlib 1.2.8 -> 1.2.11

**Added:**

- backports.shutil\_get\_terminal\_size 1.0.0
- bkcharts 0.2
- ca-certificates 2017.08.26
- certifi 2017.7.27.1
- conda-build 3.0.22
- dask-core 0.15.2
- filelock 2.0.12
- glob2 0.5
- imageio 2.2.0

- intel-openmp 2018.0.0
- jupyterlab 0.27.0
- jupyterlab\_launcher 0.4.0
- libssh2 1.8.0
- mccabe 0.6.1
- pkginfo 1.4.1
- pycodestyle 2.3.1
- pysocks 1.6.7
- sphinxcontrib 1.0
- sphinxcontrib-websupport 1.0.1
- typing 3.6.2
- urllib3 1.22
- webencodings 0.5.1

**Removed:**

- \_license

**More changes specific to win-64****Updated:**

- hdf5 1.8.15.1 -> 1.10.1
- icu 57.1 -> 58.2
- ipython 5.3.0 -> 5.4.1
- ipython 5.3.0 -> 6.1.0
- menuinst 1.4.7 -> 1.4.8
- pytables 3.2.2 -> 3.4.2
- python 3.5.3 -> 3.5.4
- python 3.6.1 -> 3.6.2
- pywin32 220 -> 221
- ssl\_match\_hostname 3.4.0.2 -> 3.5.0.1

- sphinxcontrib-websupport 1.0.1
- typing 3.6.2

### What's new in Anaconda 4.4?

Anaconda 4.4 was released on May 31, 2017 and includes the following:

- Support added for the “ppc64le” machine type, for the POWER8 LE architecture used by IBM Power Systems and OpenPOWER servers.
- On Windows, the PATH environment variable is no longer changed by default, as this can cause trouble with other software. Instead, use Anaconda Navigator or the Anaconda Prompt in the Start Menu under “Anaconda” to use Anaconda software. If a user does choose to change the PATH variable, Anaconda is no longer appended to the PATH in system mode, and is now always added to the front of PATH in either system mode or user mode.
- Python 3.5 is updated from 3.5.2 to 3.5.3 and Python 3.6 from 3.6.0 to 3.6.1. Anaconda 4.4 supports Python 2.7, 3.5, and 3.6. Anaconda 4.3 was the last release to support Python 3.4.
- Minimum supported version of CentOS is now CentOS 6. Anaconda 4.3 was the last release to support CentOS 5.
- Applied pycrypto patch for CVE-2013-7439.
- Improved cp\_acp support for install paths with non-ASCII characters on Windows.
- conda is updated from 4.3.14 to 4.3.21.
- Navigator is updated from 1.5.0 to 1.6.2.
- Project is updated from 0.4.1 to 0.6.0.
- Added distributed and pyodbc to the installers.
- Updated EULA.
- Conda packages with “mkl” in the package name now contain a file license.txt with a copy of the [Intel Simplified Software License](#) that applies to the Intel Math Kernel Library (MKL).
- Over 90 packages are updated or added.

### 2017-05-31 4.4.0:

#### Highlights:

- add support for the ppc64le (POWER8 LE used by IBM Power Systems and OpenPOWER servers) machine types

#### Other changes:

- On Windows, the PATH environment variable is no longer changed by default, as this can cause trouble with other software. The recommended approach is to instead use Anaconda Navigator or the Anaconda Prompt (located in the Start Menu under “Anaconda”) when you wish to use Anaconda software. Also, Anaconda will always be added to the front of PATH, for either system or user mode. (Previously it was appended to the system path.)
- improve cp\_acp support for install path on Windows
- updated 80 packages in the installer (and their dependencies)
- added distributed and pyodbc to the installers
- apply pycrypto patch for CVE-2013-7439
- end support for CentOS 5. CentOS 6 is now the minimum supported version.

#### Updates:

- alabaster from 0.7.9 to 0.7.10
- anaconda-client from 1.6.0 to 1.6.3
- anaconda-navigator from 1.5.0 to 1.6.2
- anaconda-project from 0.4.1 to 0.6.0
- astropy from 1.3 to 1.3.2
- babel from 2.3.4 to 2.4.0
- beautifulsoup4 from 4.5.3 to 4.6.0
- bokeh from 0.12.4 to 0.12.5
- boto from 2.45.0 to 2.46.1

- werkzeug from 0.11.15 to 0.12.2
- widgetsnbextension from 1.2.6 to 2.0.0
- wrapt from 1.10.8 to 1.10.10
- xlwings from 0.10.2 to 0.10.4

**Added:**

- asn1crypto 0.22.0
- bleach 1.5.0
- distributed 1.16.3
- html5lib 0.999
- msgpack-python 0.4.8
- navigator-updater 0.1.0
- olefile 0.44
- packaging 16.8
- pandocfilters 1.4.1
- pyodbc 4.0.16
- pywavelets 0.5.2
- sortedcollections 0.5.3

- sortedcontainers 1.5.7
- tblib 1.3.2
- testpath 0.3
- zict 0.1.2

**Removed (from installers only):**

- argcomplete
- chest
- configobj
- dill
- pyasn1
- redis
- redis-py
- sockjs-tornado

**2017-03-10 4.3.1:**

This patch release fixes problems with Anaconda Navigator not starting correctly on some versions of Mac OS X when using the GUI installers.

**Fixes:**

- removed creation of `~/ .continuum` folder during install process on all platforms
- fixed `'/'` showing up in prefix when installing system wide on Mac OS using the GUI installer
- fixed OpenSSL not being installable into a path which contains spaces
- allow Unicode characters in install path on Windows (cp\_acp fix)

**Updates:**

- anaconda-navigator from 1.4.3 to 1.5.0
- conda from 4.3.8 to 4.3.14

**Added:**

- anaconda-project 0.4.1

**2017-02-03 4.3.0.1:**

In this “mirco” patch release, we fixed a problem with the Windows installers which was causing problems with Qt applications when the install prefix exceeds 30 characters. No new Anaconda meta-packages correspond to this release (only new Windows installers).

**2017-01-31 4.3.0:****Highlights:**

- The Anaconda3 installers are based on Python 3.6. Anaconda 4.3 supports Python 2.7, 3.4, 3.5 and 3.6. Anaconda 4.3 will be the last release which supports Python 3.4. We will discontinue regular Python 3.4 package updates in the next release.
- The Intel Math Kernel Library (MKL) is updated from 11.3.3 to 2017.0.1.
- Over 90 packages are updated.
- seaborn is now installed by default.

### Other changes:

- Updates jpeg and libpng to increase compatibility with conda-forge.
- Warns about possible errors if installing on Windows into an install path with spaces, and does not allow installation if the install path contains unicode characters.
- Fixes many Windows menu uninstallation issues and some other often reported uninstallation issues on Windows.
- Anaconda 4.2 is the last release that supports macOS 10.7 and macOS 10.8. Anaconda 4.3 supports macOS versions from 10.9 through the current version 10.12.
- conda-build, anaconda-clean and the Jupyter Notebook extensions are no longer installed by default but can be installed with a single conda command.

### Updates:

- anaconda-client from 1.5.1 to 1.6.0
- anaconda-navigator from 1.3.1 to 1.4.3
- astroid from 1.4.7 to 1.4.9
- astropy from 1.2.1 to 1.3
- backports\_abc from 0.4 to 0.5
- beautifulsoup4 from 4.5.1 to 4.5.3
- bokeh from 0.12.2 to 0.12.4
- boto from 2.42.0 to 2.45.0
- bottleneck from 1.1.0 to 1.2.0
- cairo from 1.12.18 to 1.14.8
- cffi from 1.7.0 to 1.9.1
- click from 6.6 to 6.7
- cloudpickle from 0.2.1 to 0.2.2
- conda from 4.2.9 to 4.3.8
- contextlib2 from 0.5.3 to 0.5.4
- cryptography from 1.5 to 1.7.1
- curl from 7.49.0 to 7.52.1
- cython from 0.24.1 to 0.25.2
- cytoolz from 0.8.0 to 0.8.2
- dask from 0.11.0 to 0.13.0
- datashape from 0.5.2 to 0.5.4

- decorator from 4.0.10 to 4.0.11
- docutils from 0.12 to 0.13.1
- flask from 0.11.1 to 0.12
- flask-cors from 2.1.2 to 3.0.2
- fontconfig from 2.11.1 to 2.12.1
- gevent from 1.1.2 to 1.2.1
- glib from 2.43.0 to 2.50.2
- greenlet from 0.4.10 to 0.4.11
- hdf5 from 1.8.15.1 to 1.8.17
- idna from 2.1 to 2.2
- ipaddress from 1.0.16 to 1.0.18
- ipykernel from 4.5.0 to 4.5.2
- jdcalf from 1.2 to 1.3
- jinja2 from 2.8 to 2.9.4
- jpeg from 8d to 9b
- jupyter\_core from 4.2.0 to 4.2.1
- lazy-object-proxy from 1.2.1 to 1.2.2
- libpng from 1.6.22 to 1.6.27
- libxml2 from 2.9.2 to 2.9.4
- libxslt from 1.1.28 to 1.1.29
- llvmlite from 0.13.0 to 0.15.0
- lxml from 3.6.4 to 3.7.2
- matplotlib from 1.5.3 to 2.0.0
- menuinst from 1.4.1 to 1.4.4
- mkl from 11.3.3 to 2017.0.1
- multipledispatch from 0.4.8 to 0.4.9
- nbformat from 4.1.0 to 4.2.0
- nltk from 3.2.1 to 3.2.2
- notebook from 4.2.3 to 4.3.1
- numba from 0.28.1 to 0.30.1
- numpy from 1.11.1 to 1.11.3
- openpyxl from 2.3.2 to 2.4.1
- openssl from 1.0.2j to 1.0.2k
- pandas from 0.18.1 to 0.19.2
- partd from 0.3.6 to 0.3.7
- path.py from 8.2.1 to 10.0

- pathlib2 from 2.1.0 to 2.2.0
- pexpect from 4.0.1 to 4.2.1
- pillow from 3.3.1 to 4.0.0
- pip from 8.1.2 to 9.0.1
- pixman from 0.32.6 to 0.34.0
- prompt\_toolkit from 1.0.3 to 1.0.9
- psutil from 4.3.1 to 5.0.1
- py from 1.4.31 to 1.4.32
- pycparser from 2.14 to 2.17
- pyflakes from 1.3.0 to 1.5.0
- pylint from 1.5.4 to 1.6.4
- pyopenssl from 16.0.0 to 16.2.0
- pytables from 3.2.2 to 3.3.0
- pytest from 2.9.2 to 3.0.5
- python from 2.7.12 to 2.7.13
- python-dateutil from 2.5.3 to 2.6.0
- pytz from 2016.6.1 to 2016.10
- pyzmq from 15.4.0 to 16.0.2
- qt from 5.6.0 to 5.6.2
- qtawesome from 0.3.3 to 0.4.3
- qtpy from 1.1.2 to 1.2.1
- requests from 2.11.1 to 2.12.4
- scikit-learn from 0.17.1 to 0.18.1
- sphinx from 1.4.6 to 1.5.1
- spyder from 3.0.0 to 3.1.2
- sqlalchemy from 1.0.13 to 1.1.5
- toolz from 0.8.0 to 0.8.2
- tornado from 4.4.1 to 4.4.2
- traitlets from 4.3.0 to 4.3.1
- werkzeug from 0.11.11 to 0.11.15
- wrapt from 1.10.6 to 1.10.8
- xlswriter from 0.9.3 to 0.9.6
- xlwings from 0.10.0 to 0.10.2
- xlwt from 1.1.2 to 1.2.0
- zeromq from 4.1.4 to 4.1.5

**Added:**

- chardet 2.3.0
- isort 4.2.5
- libiconv 1.14
- numpydoc 0.6.0
- pcre 8.39 (on Linux)
- scandir 1.4
- seaborn 0.7.1
- subprocess32 3.2.7 (Python 2)

**Removed (from installer only):**

- anaconda-clean
- dynd-python
- filelock
- libdynd
- nb\_anacondacloud
- nb\_conda
- nb\_conda\_kernels
- nbpresent
- patchelf
- pkginfo

**2016-09-28 4.2.0:****Highlights:**

- updated Qt from major version 4 to 5
- updated IPython from 4.2 to 5.1
- added anaconda-clean, a tool for cleaning up Anaconda related configuration files and directories

**Fixes:**

- fixed Windows Outlook crash in silent install mode
- updated OpenSSL to 1.0.2j which contains important security fixes

**Updates:**

- alabaster from 0.7.8 to 0.7.9
- anaconda-client from 1.4.0 to 1.5.1
- anaconda-navigator from 1.2.1 to 1.3.1
- babel from 2.3.3 to 2.3.4
- beautifulsoup4 from 4.4.1 to 4.5.1
- bokeh from 0.12.0 to 0.12.2
- boto from 2.40.0 to 2.42.0

- cffi from 1.6.0 to 1.7.0
- conda from 4.1.4 to 4.2.9
- conda-build from 1.21.2 to 2.0.2
- configparser from 3.5.0b2 to 3.5.0
- cryptography from 1.4 to 1.5
- cython from 0.24 to 0.24.1
- dask from 0.10.0 to 0.11.0
- gevent from 1.1.1 to 1.1.2
- hdf5 from 1.8.15.1 to 1.8.17
- ipykernel from 4.3.1 to 4.5.0
- ipython from 4.2.0 to 5.1.0
- ipywidgets from 4.1.1 to 5.2.2
- jupyter\_client from 4.3.0 to 4.4.0
- jupyter\_console from 4.1.1 to 5.0.0
- jupyter\_core from 4.1.0 to 4.2.0
- llvmlite from 0.11.0 to 0.13.0
- lxml from 3.6.0 to 3.6.4
- matplotlib from 1.5.1 to 1.5.3
- mistune from 0.7.2 to 0.7.3
- nb\_anacondacloud from 1.1.0 to 1.2.0
- nb\_conda from 1.1.0 to 2.0.0
- nb\_conda\_kernels from 1.0.3 to 2.0.0
- nbformat from 4.0.1 to 4.1.0
- notebook from 4.2.1 to 4.2.3
- numba from 0.26.0 to 0.28.1
- numexpr from 2.6.0 to 2.6.1
- openssl from 1.0.2h to 1.0.2j
- partd from 0.3.4 to 0.3.6
- pickleshare from 0.7.2 to 0.7.4
- pillow from 3.2.0 to 3.3.1
- ply from 3.8 to 3.9
- psutil from 4.3.0 to 4.3.1
- pyflakes from 1.2.3 to 1.3.0
- pyopenssl from 0.16.0 to 16.0.0
- pyqt from 4.11.4 to 5.6.0
- pytables from 3.2.2 to 3.2.3.1

- pytz from 2016.4 to 2016.6.1
- pyyaml from 3.11 to 3.12
- pyzmq from 15.2.0 to 15.4.0
- qt from 4.8.7 to 5.6.0
- qtpy from 1.0.2 to 1.1.2
- requests from 2.10.0 to 2.11.1
- ruamel\_yaml from 0.11.7 to 0.11.14
- scipy from 0.17.1 to 0.18.1
- setuptools from 23.0.0 to 27.2.0
- sip from 4.16.9 to 4.18
- sphinx from 1.4.1 to 1.4.6
- spyder from 2.3.9 to 3.0.0
- tornado from 4.3 to 4.4.1
- traitlets from 4.2.1 to 4.3.0
- werkzeug from 0.11.10 to 0.11.11
- xlswriter from 0.9.2 to 0.9.3
- xlwings from 0.7.2 to 0.10.0

**Added:**

- anaconda-clean 1.0.0
- astroid 1.4.7
- dbus 1.10.10 (Linux)
- expat 2.1.0 (Linux)
- filelock 2.0.6
- glib 2.43.0 (Linux)
- gst-plugins-base 1.8.0 (Linux)
- gstreamer 1.8.0 (Linux)
- harfbuzz 0.9.39 (Linux)
- icu 57.1
- lazy-object-proxy 1.2.1
- libgcc 4.8.5 (Linux)
- libxcb 1.12 (Linux)
- pkginfo 1.3.2
- prompt\_toolkit 1.0.3
- pylint 1.5.4
- qtawesome 0.3.3
- wcwidth 0.1.7

- widgetsnbextension 1.2.6
- win\_unicode\_console 0.5 (Windows)
- wrapt 1.10.6

### Removed (from installer only):

- pyreadline
- sphinx\_rtd\_theme
- conda-env (now part of conda itself)

### 2016-07-08 4.1.1:

#### Fixes:

- Running the shell installer on some older system, would print out (harmless) tracebacks during the install process, see: <https://github.com/ContinuumIO/anaconda-issues/issues/860>
- We added blaze 0.10.1 back into the installer, which was accidentally missing in 4.1.0

#### Updates:

- bokeh from 0.11.1 to 0.12.0
- bottleneck from 1.0.0 to 1.1.0
- conda from 4.1.4 to 4.1.6
- conda-build from 1.21.2 to 1.21.3
- numpy from 1.11.0 to 1.11.1
- Python 2.7 from 2.7.11 to 2.7.12
- Python 3.4 from 3.4.4 to 3.4.5
- Python 3.5 from 3.5.1 to 3.5.2

### 2016-06-28 4.1.0:

#### Highlights:

- added Jupyter Notebook Extensions
- Windows installation: silent mode fixes & now compatible with SCCM (System Center Configuration Manager)
- updated MKL to 11.3.3, numpy to 1.11.0, as well as over 80 other updates, see below
- update Navigator from 1.1 to 1.2, in particular it no longer installs a desktop shortcut on macOS
- conda-recipes used to build the vast majority of the packages in the Anaconda installer have been published at: <https://github.com/ContinuumIO/anaconda-recipes>

#### Updates:

- alabaster from 0.7.7 to 0.7.8
- anaconda-navigator from 1.1.0 to 1.2.1
- astropy from 1.1.2 to 1.2.1

- babel from 2.2.0 to 2.3.3
- boto from 2.39.0 to 2.40.0
- cffi from 1.5.2 to 1.6.0
- cloudpickle from 0.1.1 to 0.2.1
- clyent from 1.2.1 to 1.2.2
- conda from 4.0.5 to 4.1.4
- conda-build from 1.20.0 to 1.21.2
- conda-env from 2.4.5 to 2.5.1
- cryptography from 1.3 to 1.4
- curl from 7.45.0 to 7.49.0
- cython from 0.23.4 to 0.24
- cytoolz from 0.7.5 to 0.8.0
- dask from 0.8.1 to 0.10.0
- datashape from 0.5.1 to 0.5.2
- decorator from 4.0.9 to 4.0.10
- dill from 0.2.4 to 0.2.5
- enum34 from 1.1.2 to 1.1.6
- flask from 0.10.1 to 0.11.1
- funcsigs from 0.4 to 1.0.2
- futures from 3.0.3 to 3.0.5
- gevent from 1.1.0 to 1.1.1
- greenlet from 0.4.9 to 0.4.10
- h5py from 2.5.0 to 2.6.0
- hdf5 from 1.8.15.1 to 1.8.16
- idna from 2.0 to 2.1
- ipaddress from 1.0.14 to 1.0.16
- ipython from 4.1.2 to 4.2.0
- jsonschema from 2.4.0 to 2.5.1
- jupyter\_client from 4.2.2 to 4.3.0
- libffi from 3.0.13 to 3.2.1
- libgfortran from 3.0 to 3.0.0
- libpng from 1.6.17 to 1.6.22
- libsodium from 1.0.3 to 1.0.10
- llvmlite from 0.9.0 to 0.11.0
- menuinst from 1.3.2 to 1.4.1
- mkl from 11.3.1 to 11.3.3

- nbconvert from 4.1.0 to 4.2.0
- nltk from 3.2 to 3.2.1
- notebook from 4.1.0 to 4.2.1
- numba from 0.24.0 to 0.26.0
- numexpr from 2.5 to 2.6.0
- numpy from 1.10.4 to 1.11.0
- odo from 0.4.2 to 0.5.0
- openssl from 1.0.2g to 1.0.2h
- pandas from 0.18.0 to 0.18.1
- partd from 0.3.2 to 0.3.4
- patchelf from 0.8 to 0.9
- path.py from 8.1.2 to 8.2.1
- patsy from 0.4.0 to 0.4.1
- pickleshare from 0.5 to 0.7.2
- pillow from 3.1.1 to 3.2.0
- pip from 8.1.1 to 8.1.2
- psutil from 4.1.0 to 4.3.0
- ptyprocess from 0.5 to 0.5.1
- pycurl from 7.19.5.3 to 7.43.0
- pyflakes from 1.1.0 to 1.2.3
- pygments from 2.1.1 to 2.1.3
- pyopenssl from 0.15.1 to 0.16.0
- pyparsing from 2.0.3 to 2.1.4
- pytest from 2.8.5 to 2.9.2
- python-dateutil from 2.5.1 to 2.5.3
- pytz from 2016.2 to 2016.4
- qtconsole from 4.2.0 to 4.2.1
- qtpy from 1.0 to 1.0.2
- redis from 2.6.9 to 3.2.0
- redis-py from 2.10.3 to 2.10.5
- requests from 2.9.1 to 2.10.0
- scipy from 0.17.0 to 0.17.1
- setuptools from 20.3 to 23.0.0
- sockjs-tornado from 1.0.1 to 1.0.3
- sphinx from 1.3.5 to 1.4.1
- spyder from 2.3.8 to 2.3.9

- sqlalchemy from 1.0.12 to 1.0.13
- sqlite from 3.9.2 to 3.13.0
- terminado from 0.5 to 0.6
- toolz from 0.7.4 to 0.8.0
- werkzeug from 0.11.4 to 0.11.10
- xlrd from 0.9.4 to 1.0.0
- xlswriter from 0.8.4 to 0.9.2
- xlwings from 0.7.0 to 0.7.2
- xlwt from 1.0.0 to 1.1.2
- xz from 5.0.5 to 5.2.2
- zeromq from 4.1.3 to 4.1.4

**Added:**

- click 6.6
- configparser 3.5.0b2
- contextlib2 0.5.3
- entrypoints 0.2.2
- functools32 3.2.3.2
- get\_terminal\_size 1.0.0
- imagesize 0.7.1
- nb\_anacondacloud 1.1.0
- nb\_conda 1.1.0
- nb\_conda\_kernels 1.0.3
- nbpresent 3.0.2
- pathlib2 2.1.0
- ruamel\_yaml 0.11.7

**Removed:**

- conda-manager
- qtawesome

**2016-03-29 4.0.0:**

The reason for jumping the Anaconda version from 2.5 to 4.0 is to avoid any possible confusion with the versions of Python included in Anaconda.

**Highlights:**

- this release of Anaconda includes the new Navigator, which is a graphical tool developed by Continuum Analytics to manage conda environments, applications and much more.

**Enhancements:**

- much improved package resolving in the new conda 4.0

### Fixes:

- updated OpenSSL to 1.0.2g which contains important security fixes

### Updates:

- anaconda-client from 1.2.2 to 1.4.0
- astropy from 1.1.1 to 1.1.2
- blaze from 0.9.0 to 0.9.1
- bokeh from 0.11.0 to 0.11.1
- cffi from 1.2.1 to 1.5.2
- clyent from 1.2.0 to 1.2.1
- colorama from 0.3.6 to 0.3.7
- conda from 3.19.1 to 4.0.5
- conda-build from 1.19.0 to 1.20.0
- cryptography from 1.0.2 to 1.3
- cycler from 0.9.0 to 0.10.0
- datashape from 0.5.0 to 0.5.1
- decorator from 4.0.6 to 4.0.9
- dynd-python from 0.7.1 to 0.7.2
- gevent from 1.0.2 to 1.1.0
- ipykernel from 4.2.2 to 4.3.1
- ipython from 4.0.3 to 4.1.2
- jupyter\_client from 4.1.1 to 4.2.2
- jupyter\_console from 4.1.0 to 4.1.1
- jupyter\_core from 4.0.6 to 4.1.0
- libdynd from 0.7.1 to 0.7.2
- libgfortran from 1.0 to 3.0
- llvmlite from 0.8.0 to 0.9.0
- lxml from 3.5.0 to 3.6.0
- mistune from 0.7.1 to 0.7.2
- nltk from 3.1 to 3.2
- numba from 0.23.1 to 0.24.0
- numexpr from 2.4.6 to 2.5
- odo from 0.4.0 to 0.4.2
- openssl from 1.0.2f to 1.0.2g
- pandas from 0.17.1 to 0.18.0
- pexpect from 3.3 to 4.0.1

- pillow from 3.1.0 to 3.1.1
- pip from 8.0.2 to 8.1.1
- psutil from 3.4.2 to 4.1.0
- pyflakes from 1.0.0 to 1.1.0
- pygments from 2.1 to 2.1.1
- python-dateutil from 2.4.2 to 2.5.1
- pytz from 2015.7 to 2016.2
- pywin32 from 219 to 220
- qtconsole from 4.1.1 to 4.2.0
- scikit-image from 0.11.3 to 0.12.3
- scikit-learn from 0.17 to 0.17.1
- setuptools from 19.6.2 to 20.3
- sqlalchemy from 1.0.11 to 1.0.12
- sympy from 0.7.6.1 to 1.0
- traitlets from 4.1.0 to 4.2.1
- werkzeug from 0.11.3 to 0.11.4
- wheel from 0.26.0 to 0.29.0
- xlwings from 0.6.4 to 0.7.0

**Added:**

- anaconda-navigator 1.1.0
- chest 0.2.3
- cloudpickle 0.1.1
- conda-manager 0.3.1
- dask 0.8.1
- dill 0.2.4
- flask-cors 2.1.2
- heapdict 1.0.0
- locket 0.2.0
- mpmath 0.19
- partd 0.3.2
- qtawesome 0.3.2
- qtpy 1.0

**Removed (from installer only, the packages are still available):**

- abstract-rendering
- gevent-websocket
- launcher

- node-webkit

### 2016-02-05 2.5.0:

#### Highlights:

- add MKL (runtime, version 11.3.1) and make it the default backend for numpy, scipy, scikit-learn and numexpr on all platforms

#### Enhancements:

- added Windows debug information files, more precisely program database (.pdb files) files for Python by default
- added NoRegistry option to Windows installers, passing /NoRegistry=1 makes the installer not touch the registry

#### Fixes:

- in some cases start menu items were not created on Windows, due to a race condition, which we fixed in menuinst
- fixed the -f option of the Unix bash installers
- updated OpenSSL to 1.0.2f which contains important security fixes

#### Updates:

- alabaster from 0.7.6 to 0.7.7
- anaconda-client from 1.2.1 to 1.2.2
- astropy from 1.0.6 to 1.1.1
- babel from 2.1.1 to 2.2.0
- blaze-core from 0.8.3 to 0.9.0
- bokeh from 0.10.0 to 0.11.0
- boto from 2.38.0 to 2.39.0
- colorama from 0.3.3 to 0.3.6
- conda from 3.18.8 to 3.19.1
- conda-build from 1.18.2 to 1.19.0
- cytoolz from 0.7.4 to 0.7.5
- datashape from 0.4.7 to 0.5.0
- decorator from 4.0.4 to 4.0.6
- dynd-python from 0.7.0 to 0.7.1
- enum34 from 1.0.4 to 1.1.2
- gevent from 1.0.1 to 1.0.2
- gevent-websocket from 0.9.3 to 0.9.5
- ipykernel from 4.1.1 to 4.2.2
- ipython from 4.0.1 to 4.0.3
- ipywidgets from 4.1.0 to 4.1.1

- jdcal from 1.0 to 1.2
- jupyter\_console from 4.0.3 to 4.1.0
- libdynd from 0.7.0 to 0.7.1
- lxml from 3.4.4 to 3.5.0
- matplotlib from 1.5.0 to 1.5.1
- menuinst from 1.3.1 to 1.3.2
- nbconvert from 4.0.0 to 4.1.0
- networkx from 1.10 to 1.11
- notebook from 4.0.6 to 4.1.0
- numba from 0.22.1 to 0.23.1
- numexpr from 2.4.4 to 2.4.6
- numpy from 1.10.1 to 1.10.4
- odo from 0.3.4 to 0.4.0
- openpyxl from 2.2.6 to 2.3.2
- openssl from 1.0.2d to 1.0.2f
- patchelf from 0.6 to 0.8
- pep8 from 1.6.2 to 1.7.0
- pillow from 3.0.0 to 3.1.0
- pip from 7.1.2 to 8.0.2
- psutil from 3.3.0 to 3.4.2
- py from 1.4.30 to 1.4.31
- pycurl from 7.19.5.1 to 7.19.5.3
- pygments from 2.0.2 to 2.1
- pytest from 2.8.1 to 2.8.5
- python 3.4 from 3.4.3 to 3.4.4
- pyzmq from 14.7.0 to 15.2.0
- requests from 2.8.1 to 2.9.1
- scipy from 0.16.0 to 0.17.0
- setuptools from 18.5 to 19.6.2
- snowballstemmer from 1.2.0 to 1.2.1
- sphinx from 1.3.1 to 1.3.5
- sphinx\_rtd\_theme from 0.1.7 to 0.1.9
- sqlalchemy from 1.0.9 to 1.0.11
- sqlite from 3.8.4.1 to 3.9.2
- traitlets from 4.0.0 to 4.1.0
- werkzeug from 0.11.2 to 0.11.3

- xlsxwriter from 0.7.7 to 0.8.4
- xlwings from 0.5.0 to 0.6.4

### Added:

- et\_xmlfile 1.0.1
- futures 3.0.3
- mkl 11.3.1
- mkl-service 1.1.1

### Removed (from installer only, the packages are still maintained and available):

- openblas 0.2.14 (Linux)
- theano 0.7.0 (Linux)
- ujson 1.33

### 2015-12-08 2.4.1:

#### Fixes:

- added missing Windows process elevation when creating menu items
- added libdynd and dynd-python, which was missing in the last release
- fixed Cython on Mac OS X reporting missing libgcc\_s.10.5.dylib
- fixed default channels being shown correctly in “conda list” after installing using Anaconda installer

#### Updates:

- anaconda-client from 1.1.0 to 1.2.1
- astropy from 1.0.5 to 1.0.6
- clyent from 0.4.0 to 1.2.0
- conda from 3.18.3 to 3.18.8
- conda-build 1.18.1 to 1.18.2
- conda-env from 2.4.4 to 2.4.5
- ipython from 4.0.0 to 4.0.1
- llvmlite from 0.7.0 to 0.8.0
- matplotlib from 1.4.3 to 1.5.0
- menuinst from 1.2.1 to 1.3.1
- numba from 0.21.0 to 0.22.1
- pandas from 0.17.0 to 0.17.1
- pixman from 0.26.2 to 0.32.6
- psutil from 3.2.2 to 3.3.0
- python 2.7 from 2.7.10 to 2.7.11
- python 3.5 from 3.5.0 to 3.5.1
- pytz from 2015.6 to 2015.7

- qtconsole from 4.1.0 to 4.1.1
- scikit-learn from 0.16.1 to 0.17
- setuptools from 18.4 to 18.5
- spyder from 2.3.7 to 2.3.8
- tornado from 4.2.1 to 4.3
- werkzeug from 0.10.4 to 0.11.2
- xlwings from 0.4.1 to 0.5.0

**Added:**

- backports\_abc 0.4
- cycler 0.9.0
- libdynd and dynd-python 0.7.0
- jbig 2.1
- pycairo 1.10.0

**2015-11-02 2.4.0:****Highlights:**

- add Python 3.5 support
- updated NumPy to 1.10
- added OpenBLAS support on Linux
- made drastic speed improvements to conda
- moved from IPython to Jupyter
- improved Start Menus on Windows
- updated Qt to 4.8.7 on all platforms
- updates to more than 60 other packages

**Known issues:**

- numba and llvmlite are missing for Python 3.5 (because they don't support this Python version yet)
- numpy 1.10 has performance regression for record array access, see <https://github.com/numpy/numpy/issues/6467>
- Python 3.5 does not work on Windows XP

**Updates:**

- alabaster from 0.7.3 to 0.7.6
- argcomplete from 0.8.9 to 1.0.0
- astropy from 1.0.3 to 1.0.5
- babel from 1.3 to 2.1.1
- blaze-core from 0.8.0 to 0.8.3
- bokeh from 0.9.0 to 0.10.0

- cffi from 1.1.0 to 1.2.1
- clyent from 0.3.4 to 0.4.0
- cryptography from 0.9.1 to 1.0.2
- curl from 7.43.0 to 7.45.0
- conda from 3.14.1 to 3.18.3
- conda-build from 1.14.1 to 1.18.1
- conda-env from 2.2.3 to 2.4.4
- cython from 0.22.1 to 0.23.4
- cytoolz from 0.7.3 to 0.7.4
- datashape from 0.4.5 to 0.4.7
- decorator from 3.4.2 to 4.0.4
- freetype from 2.5.2 to 2.5.5
- greenlet from 0.4.7 to 0.4.9
- ipaddress from 1.0.7 to 1.0.14
- ipython from 3.2.0 to 4.0.0
- ipython-notebook from 3.2.0 to 4.0.4
- ipython-qtconsole from 3.2.0 to 4.0.1
- jedi from 0.8.1 to 0.9.0
- jinja2 from 2.7.3 to 2.8
- libsodium from 0.4.5 to 1.0.3
- libtiff from 4.0.2 to 4.0.6
- llvmlite from 0.5.0 to 0.7.0
- menuinst from 1.0.4 to 1.2.1
- mistune from 0.5.1 to 0.7.1
- multipledispatch from 0.4.7 to 0.4.8
- networkx from 1.9.1 to 1.10
- nltk from 3.0.3 to 3.1
- numba from 0.19.1 to 0.21.0
- numexpr from 2.4.3 to 2.4.4
- numpy from 1.9.2 to 1.10.1
- odo from 0.3.2 to 0.3.4
- openpyxl from 1.8.5 to 2.2.6
- openssl from 1.0.1k to 1.0.2d
- pandas from 0.16.2 to 0.17.0
- patsy from 0.3.0 to 0.4.0
- pillow from 2.8.2 to 3.0.0

- pip from 7.0.3 to 7.1.2
- ply from 3.6 to 3.8
- psutil from 2.2.1 to 3.2.2
- ptyprocess from 0.4 to 0.5
- py from 1.4.27 to 1.4.30
- pyasn1 from 0.1.7 to 0.1.9
- pyflakes from 0.9.2 to 1.0.0
- pyqt from 4.11.3 to 4.11.4
- pytables from 3.2.0 to 3.2.2
- pytest from 2.7.1 to 2.8.1
- pytz from 2015.4 to 2015.6
- qt from 4.8.6 to 4.8.7
- requests from 2.7.0 to 2.8.1
- scipy from 0.15.1 to 0.16.0
- setuptools from 17.1.1 to 18.4
- sip from 4.16.5 to 4.16.9
- six from 1.9.0 to 1.10.0
- spyder from 2.3.5.2 to 2.3.7
- spyder-app from 2.3.5.2 to 2.3.7
- sqlalchemy from 1.0.5 to 1.0.9
- sympy from 0.7.6 to 0.7.6.1
- toolz from 0.7.2 to 0.7.4
- tornado from 4.2 to 4.2.1
- unicodesv from 0.9.4 to 0.14.1
- xlrd from 0.9.3 to 0.9.4
- xlswriter from 0.7.3 to 0.7.7
- xlwings from 0.3.5 to 0.4.1
- zeromq from 4.0.5 to 4.1.3

**Added:**

- anaconda-client 1.1.0
- beautifulsoup4 4.4.1
- ipykernel 4.1.1
- ipython\_genutils 0.1.0
- ipywidgets 4.1.0
- jupyter 1.0.0
- jupyter\_client 4.1.1

- jupyter\_console 4.0.3
- jupyter\_core 4.0.6
- libgfortran 1.0
- nbconvert 4.0.0
- nbformat 4.0.1
- notebook 4.0.6
- openblas 0.2.14
- patchelf 0.6
- path.py 8.1.2
- pexpect 3.3
- pickleshare 0.5
- qtconsole 4.1.0
- simplegeneric 0.8.1
- singledispatch 3.4.0.3
- traitlets 4.0.0
- wheel 0.26.0

**Removed (from installer only, the packages are still maintained and available):**

- bcolz
- blz
- certifi
- dynd-python
- libdynd
- mock
- runipy

### 2015-07-02 2.3.0:

#### Highlights:

- updates to 60 packages, including Python 2.7.10 and Pandas 0.16.2
- support for signed packages in conda

#### Fixes:

- fixed the extra space in IPython terminal being created when typing the tab key on Linux
- added missing zope.interface.common sub-package
- fixed Sphinx package being included in Spyder package

#### Enhancements:

- added support for signed packages in conda
- added curl on Windows, and kerberos authentication support

- added Windows support for libnetcdf and hdf5
- split gdal into libgdal and gdal (python-bindings)

**Known issues:**

- when opening some HDF5 files, pytables will crash on Windows and Python 3

**Updates:**

- argcomplete from 0.8.4 to 0.8.9
- astropy from 1.0.1 to 1.0.3
- bcolz from 0.8.1 to 0.9.0
- binstar from 0.10.1 to 0.11.0
- blaze-core from 0.7.3 to 0.8.0
- bokeh from 0.8.1 to 0.9.0
- boto from 2.36.0 to 2.38.0
- cffi from 0.9.2 to 1.1.0
- cryptography from 0.8 to 0.9.1
- conda from 3.10.0 to 3.14.1
- conda-build from 1.11.0 to 1.14.1
- conda-env from 2.1.3 to 2.2.3
- curl from 7.38.0 to 7.43.0
- cython from 0.22 to 0.22.1
- cytoolz from 0.7.2 to 0.7.3
- datashape from 0.4.4 to 0.4.5
- decorator from 3.4.0 to 3.4.2
- greenlet from 0.4.5 to 0.4.7
- h5py from 2.4.0 to 2.5.0
- hdf5 from 1.8.14 to 1.8.15.1
- ipython from 3.0.0 to 3.2.0
- libpng from 1.5.13 to 1.6.17
- libxml2 from 2.9.0 to 2.9.2
- llvmlite from 0.2.2 to 0.5.0
- lxml from 3.4.2 to 3.4.4
- nltk from 3.0.2 to 3.0.3
- nose from 1.3.4 to 1.3.7
- numba from 0.17.0 to 0.19.1
- numexpr from 2.3.1 to 2.4.3
- odo from 0.3.1 to 0.3.2
- pandas from 0.15.2 to 0.16.2

- pillow from 2.7.0 to 2.8.2
- pip from 6.0.8 to 7.0.3
- ply from 3.4 to 3.6
- py from 1.4.26 to 1.4.27
- pycparser from 2.10 to 2.14
- pyflakes from 0.8.1 to 0.9.2
- pyopenssl from 0.14 to 0.15.1
- pytables from 3.1.1 to 3.2.0
- pytest from 2.6.4 to 2.7.1
- python from 2.7.9 to 2.7.10
- python-dateutil from 2.4.1 to 2.4.2
- pytz from 2015.2 to 2015.4
- pyzmq from 14.5.0 to 14.7.0
- requests from 2.6.0 to 2.7.0
- scikit-image from 0.11.2 to 0.11.3
- scikit-learn from 0.15.2 to 0.16.1
- setuptools from 14.3 to 17.1.1
- sphinx from 1.2.3 to 1.3.1
- spyder from 2.3.4 to 2.3.5.2
- sqlalchemy from 0.9.9 to 1.0.5
- theano from 0.6.0 to 0.7.0
- toolz from 0.7.1 to 0.7.2
- tornado from 4.1 to 4.2
- werkzeug from 0.10.1 to 0.10.4
- xlswriter from 0.6.7 to 0.7.3
- xlwt from 0.7.5 to 1.0.0
- yaml from 0.1.4 to 0.1.6
- zeromq from 4.0.4 to 4.0.5

**Added to Anaconda installers:**

- alabaster 0.7.3
- babel 1.3
- bottleneck 1.0.0
- idna 2.0
- ipaddress 1.0.7
- snowballstemmer 1.2.0
- sphinx\_rtd\_theme 0.1.7

**Removed (from installer only, the packages are still maintained and available):**

- futures

**Added (repository) support for:**

- ansi2html
- azure
- blockspring
- boost
- btrees
- cloudpickle
- chest
- cligj
- csvkit
- dbf
- dill
- essbasepy
- flask-login
- heapdict
- holoviews
- ldap3
- line\_profiler
- locket
- lockfile
- markdown
- markdown2
- meld3
- msgpack-python
- mysql-connector-python
- nano (Unix)
- param
- partd
- plac
- pyopengl
- pywget
- rasterio
- sas7bdat
- seaborn

- semantic\_version
- snuggs
- spacy
- stripe
- supervisor (Unix)
- thinc
- unxutils (Windows)
- xray

### 2015-03-31 2.2.0:

#### Highlights:

- updates to 61 packages, including: Python, NumPyBokeh, pandas and blaze
- added 16 new packages
- added HTTPS support for default conda packages repo

#### Fixes:

- fixed cython command on Windows
- fixed untgz NSIS plugin to install files with exactly 100 characters

#### Enhancements:

- added https support for default conda packages repo
- renamed dateutil to python-dateutil to reflect the official name
- added HDF5 and netcdf support for GDAL
- switched to using Pillow instead of PIL
- changed ipython-notebook to start directory to home directory on Windows

#### Updates:

- argcomplete from 0.8.1 to 0.8.4
- astropy from 0.4.2 to 1.0.1
- binstar from 0.7.1 to 0.10.1
- blaze from 0.6.3 to 0.7.3
- bokeh from 0.6.1 to 0.8.1
- boto from 2.32.1 to 2.36.0
- cairo from 1.12.2 to 1.12.18
- cffi from 0.8.6 to 0.9.2
- colorama from 0.3.1 to 0.3.3
- conda from 3.7.0 to 3.10.0
- conda-build from 1.8.2 to 1.11.0
- cryptography from 0.5.4 to 0.8

- cython from 0.21 to 0.22
- cytoolz from 0.7.0 to 0.7.2
- datashape from 0.3.0 to 0.4.4
- freetype from 2.4.10 to 2.5.2
- futures from 2.1.6 to 2.2.0
- greenlet from 0.4.4 to 0.4.5
- h5py from 2.3.1 to 2.4.0
- hdf5 from 1.8.13 to 1.8.14
- ipython from 2.2.0 to 3.0.0
- ipython-notebook from 2.2.0 to 3.0.0
- ipython-qtconsole from 2.2.0 to 3.0.0
- lxml from 3.4.0 to 3.4.2
- matplotlib from 1.4.0 to 1.4.3
- nltk from 3.0.0 to 3.0.2
- numba from 0.14.0 to 0.17.0
- numpy from 1.9.0 to 1.9.2
- openssl from 1.0.1h to 1.0.1k
- pandas from 0.14.1 to 0.15.2
- pep8 from 1.5.7 to 1.6.2
- pip from 1.5.6 to 6.0.8
- psutil from 2.1.1 to 2.2.1
- py from 1.4.25 to 1.4.26
- pycurl from 7.19.5 to 7.19.5.1
- pygments from 1.6 to 2.0.2
- pyparsing from 2.0.1 to 2.0.3
- pyqt from 4.10.4 to 4.11.3
- pytest from 2.6.3 to 2.6.4
- python from 2.7.8 to 2.7.9
- python-dateutil from 2.1 to 2.4.1
- pytz from 2014.7 to 2015.2
- pyzmq from 14.3.1 to 14.5.0
- qt from 4.8.5 to 4.8.6
- redis-py from 2.9.1 to 2.10.3
- requests from 2.4.1 to 2.6.0
- runipy from 0.1.1 to 0.1.3
- scikit-image from 0.10.1 to 0.11.2

- scipy from 0.14.0 to 0.15.1
- setuptools from 5.8 to 14.3
- sip from 4.15.5 to 4.16.5
- six from 1.8.0 to 1.9.0
- spyder from 2.3.1 to 2.3.4
- spyder-app from 2.3.1 to 2.3.4
- sqlalchemy from 0.9.7 to 0.9.9
- statsmodels from 0.5.0 to 0.6.1
- sympy from 0.7.5 to 0.7.6
- tk from 8.5.15 to 8.5.18
- toolz from 0.7.0 to 0.7.1
- tornado from 4.0.2 to 4.1
- werkzeug from 0.9.6 to 0.10.1
- xlswriter from 0.5.7 to 0.6.7
- zlib from 1.2.7 to 1.2.8

**Added:**

- bcolz 0.8.1
- certifi 14.05.14
- clyent 0.3.4
- enum34 1.0.4 (on Python 2.6, 2.7 and 3.3)
- fastcache 1.0.2
- fontconfig 2.11.1
- funcsigs 0.4
- jedi 0.8.1
- jsonschema 2.4.0
- llvmlite 0.2.2
- mistune 0.5.1
- odo 0.3.1
- pillow 2.7.0
- ptyprocess 0.4
- pyasn1 0.1.7
- terminado 0.5

**Removed (from installer only, the packages are still maintained and available):**

- atom
- casuarius
- chaco

- enable
- enaml
- future
- kiwisolver
- llvmpy
- mingw (on Windows)
- mpi4py
- pil (in favor of pillow)
- pyface
- traits
- traitsui

### 2014-09-30 2.1.0:

#### Fixes:

- fixed the ability to compile C extensions in Python 3 using MinGW
- added missing lzma module to Python 3.3 and 3.4 (links to xz)
- added missing werkzeug/debug/shared package data to Werkzeug package

#### Enhancements:

- added statsmodel support for Python 3.4
- added LZO support for pytables on Linux
- added scikit-learn support for Python 3.4
- added Windows cffi support (in repository)
- added bsddb conda package on Linux to support Berkeley DB

#### Updates:

- argcomplete from 0.6.7 to 0.8.1
- astropy from 0.3.2 to 0.4.2
- atom from 0.3.7 to 0.3.9
- beautiful-soup from 4.3.1 to 4.3.2
- binstar from 0.5.3 to 0.7.1
- blaze from 0.5.0 to 0.6.3
- bokeh from 0.4.4 to 0.6.1
- boto from 0.28.0 to 2.32.1
- conda from 3.5.2 to 3.7.0
- conda-build from 1.3.3 to 1.8.2
- configobj from 5.0.5 to 5.0.6
- colorama from 0.2.7 to 0.3.1

- curl from 7.30.0 to 7.38.0
- cython from 0.20.1 to 0.20.2
- datashape from 0.2.0 to 0.3.0
- docutils from 0.11 to 0.12
- dynd from 0.6.2 to 0.6.5
- enaml from 0.9.1 to 0.9.8
- future from 0.12.1 to 0.13.1
- greenlet from 0.4.2 to 0.4.4
- h5py from 2.3.0 to 2.3.1
- hdf5 from 1.8.9 to 1.8.13
- ipython from 2.1.0 to 2.2.0
- jinja2 from 2.7.2 to 2.7.3
- kiwisolver from 0.1.2 to 0.1.3
- launcher from 0.1.5 to 1.0.0
- libnetcdf from 4.2.1.1 to 4.3.2
- llvmpy from 0.12.6 to 0.12.7
- lxml from 3.3.5 to 3.4.0
- markupsafe from 0.18 to 0.23
- matplotlib from 1.3.1 to 1.4.0
- multipledispatch from 0.4.3 to 0.4.7
- networkx from 1.8.1 to 1.9.1
- nltk from 2.0.4 to 3.0.0
- nose from 1.3.3 to 1.3.4
- numba from 0.13.2 to 0.14.0
- numpy from 1.8.2 to 1.9.0
- pandas from 0.14.0 to 0.14.1
- patsy from 0.2.1 to 0.3.0
- pep8 from 1.5.6 to 1.5.7
- py from 1.4.20 to 1.4.25
- pycurl from 7.19.3.1 to 7.19.5
- pytest from 2.5.2 to 2.6.3
- python from 2.7.7 to 2.7.8
- pytz from 2014.3 to 2014.7
- pyzmq from 14.3.0 to 14.3.1
- requests from 2.3.0 to 2.4.1
- runipy from 0.1.0 to 0.1.1

- scikit-image from 0.10.0 to 0.10.1
- scikit-learn from 0.14.1 to 0.15.2
- setuptools from 3.6 to 5.8
- six 1.6.1 to 1.8.0
- sphinx from 1.2.2 to 1.2.3
- spyder from 2.3.0rc1 to 2.3.1
- sqlalchemy from 0.9.4 to 0.9.7
- tornado from 3.2.1 to 4.0.2
- xlswriter from 0.5.5 to 0.5.7

**Added:**

- abstract-rendering 0.5.1 (on Unix and Python 2)
- cffi 0.8.6
- cryptography 0.5.4
- cytoolz 0.7.0
- decorator 3.4.0
- futures-2.1.6 (for Python 2)
- pyopenssl 0.14
- sockjs-tornado 1.0.1
- toolz 0.7.0
- unicodecsv 0.9.4
- xz 5.0.5

**2014-06-12 2.0.1:****Fixes:**

- added missing libpython (the so-called MinGW import library) for Python 3.4
- in order to make pandas.io.excel work, we downgraded openpyxl from 2.0.2 to 1.8.5
- added missing idle script on Windows

**Updates:**

- conda from 3.5.2 to 3.5.5
- conda-build from 1.3.3 to 1.3.5
- numba from 0.13.1 to 0.13.2
- openssl from 1.0.1g to 1.0.1h
- pandas from 0.13.1 to 0.14.0
- python from 2.7.6 to 2.7.7
- scikit-image from 0.9.3 to 0.10.0
- werkzeug from 0.9.4 to 0.9.6

### 2014-05-28: 2.0.0:

#### Fixes:

- on Windows the /D option of the executable installer is now working
- added missing TkAgg matplotlib backend on Windows
- added missing osgeo.\_gdal\_array extension to GDAL
- fixed rope on Python 3

#### Known issues:

- even though the matplotlib tkagg backend is now supported on all platforms and with all Python versions now, there might be problems on Windows with Python 3.4
- the Windows file association (‘.py’-files being executed by the Anaconda Python interpreter) is not working

#### Enhancements:

- switched from using PySide to PyQt as the default Qt binding
- added lcms to PIL on Unix
- added ability to copy files upon install when filesystem fails to create hard links
- added netCDF4 support on 64-bit Windows
- on macOS, Tk in now linked to Cocoa (instead of X11)

#### Updated:

- astropy from 0.3.0 to 0.3.2
- binstar from 0.4.4 to 0.5.3
- blz from 0.6.1 to 0.6.2
- bokeh from 0.4.1 to 0.4.4
- boto from 2.25.0 to 2.28.0
- conda from 3.0.6 to 3.5.2
- conda-build from 1.2.0 to 1.3.3
- configobj from 4.7.2 to 5.0.5
- datashape from 0.1.1 to 0.2.0
- dynd-python gtom 0.6.1 to 0.6.2
- future from 0.11.2 to 0.12.1
- gevent from 1.0 to 1.0.1
- gevent-websocket from 0.9.2 to 0.9.3
- h5py from 2.2.1 to 2.3.0
- ipython from 1.1.0 to 2.1.0
- itsdangerous from 0.23 to 0.24
- launcher from 0.1.2 to 0.1.5
- llvmpy from 0.12.3 to 0.12.4
- lxml from 3.3.1 to 3.3.5

- nose from 1.3.0 to 1.3.3
- numba from 0.12.1 to 0.13.1
- numpy from 1.8.0 to 1.8.1
- openpyxl 1.8.2 to 2.0.2
- openssl from 1.0.1c to 1.0.1g
- pep8 gtom 1.4.6 to 1.5.6
- pip from 1.5.2 to 1.5.6
- psutil from 1.2.1 to 2.1.1
- pycosat from 0.6.0 to 0.6.1
- pycurl from 7.19.0 to 7.19.3.1
- pyflakes from 0.7.3 to 0.8.1
- pytables from 3.1.0 to 3.1.1
- pytz from 2013b to 2014.3
- pyyaml 3.10 to 3.11
- pyzmq from 2.2.0.1 to 14.3.0
- requests from 2.2.1 to 2.3.0
- scipy from 0.13.3 to 0.14.0
- setuptools from 2.2 to 3.6
- six from 1.5.2 to 1.6.1
- sphinx form 1.2.1 to 1.2.2
- spyder from 2.2.5 to 2.3.0rc1
- sqlalchemy from 0.9.2 to 0.9.4
- sqlite from 3.7.13 to 3.8.4.1
- sympy from 0.7.4.1 to 0.7.5
- tk from 8.5.13 to 8.5.15
- tornado from 3.2.0 to 3.2.1
- xlrd from 0.9.2 to 0.9.3
- xlswriter from 0.5.2 to 0.5.5
- zeromq from 2.2.0 to 4.0.4

**Added:**

- conda-launch 0.1
- jdcals 1.0
- multipledispatch 0.4.0
- python 3.4.1
- pyqt 4.10.4
- runipy 0.1.0

- sip 4.15.5
- xlwings 0.1.0 (Windows only)

**Removed (from installer, packages are still supported and available in repo):**

- apptools
- biopython
- envisage
- disco and erlang (from 64-bit Linux)
- gevent\_zeromq
- keyring
- mayavi
- mdp
- netcdf4
- pykit
- pysal
- pysam
- vtk

**2014-04-09: 1.9.2:**

**Fixes:**

- updated to openssl 1.0.1g on Unix to fix the “Heartbleed bug” of the TLS Heartbeat Extension problem (reported in the news)
- fixed /D option in silent mode for Windows installer

**Updates:**

- openssl from 1.0.1c to 1.0.1g
- conda from 3.0.6 to 3.4.1
- conda-build from 1.2.0 to 1.3.1

**2014-02-20: 1.9.1:**

**Fixes:**

- openpyxl to depend on up-to-date version of lxml
- added missing MSVCP (both for 2008 and 2010) DLLs to Windows installers which fixes issues with the user install mode on some systems

**Updates:**

- atom from 0.3.6 to 0.3.7
- blaze from 0.4.1 to 0.4.2
- bokeh from 0.4 to 0.4.1

- boto 2.24.0 to 2.25.0
- conda from 3.0.3 to 3.0.6
- conda-build from 1.1.0 to 1.2.0
- cython from 0.20 to 0.20.1
- datashape from 0.1.0 to 0.1.1
- dynd-python 0.6.0 to 0.6.1
- enaml from 0.9.0 to 0.9.1
- llvmpy from 0.12.2 to 0.12.3
- lxml from 3.2.3 to 3.3.1
- netcdf4 from 1.0.7 to 1.0.8
- numba from 0.12.0 to 0.12.1
- numexpr from 2.3.0 to 2.3.1
- pandas from 0.13.0 to 0.13.1
- pykit from 0.1.0 to 0.2.0
- python from 3.3.3 to 3.3.4
- setuptools from 2.1 to 2.2

**Added:**

- added Py3k support for h5py
- netcdf4 on 32-bit Windows
- xlsxwriter 0.5.2

**2014-02-10: 1.9.0:****Highlights:**

- NumPy updated to version 1.8
- updates to about 35 packages, including Bokeh and Blaze
- added 10 new packages

**Enhancements:**

- use MSVC 2010 to compile Python 3 and C extensions on Windows
- remove distribute in favor of setuptools
- enable threadsafe when building HDF5 on Linux
- renamed the Python Imaging Library (PIL) from imaging to pil
- updated EULA

**Fixes:**

- ssl bindings in Python standard library on macOS
- Windows installers not working properly when PYTHONHOME is set

**Updated:**

- apptools from 4.2.0 to 4.2.1
- astropy from 0.2.5 to 0.3.0
- atom from 0.3.4 to 0.3.6
- binstar from 0.3.1 to 0.4.4
- biopython from 1.62 to 1.63
- blaze from 0.3.0 to 0.4.1
- boto from 2.15.0 to 2.24.0
- bokeh from 0.2 to 0.4
- chaco from 4.3.0 to 4.4.1
- conda from 2.0.4 to 3.0.3
- cython from 0.19.2 to 0.20
- dynd-python 0.5.0 to 0.6.0
- enaml from 0.8.3 to 0.9.0
- envisage from 4.3.0 to 4.4.1
- gevent from 0.13.8 to 1.0
- gevent-websocket from 0.3.6 to 0.9.2
- greenlet from 0.4.1 to 0.4.2
- h5py from 2.2.0 to 2.2.1
- jinja2 from 2.7.1 to 2.7.2
- keyring from 3.2 to 3.3
- llvmmath from 0.1.1 to 0.1.2
- llvmpy from 0.12.0 to 0.12.1
- netcdf4 from 1.0.6 to 1.0.7
- numexpr from 2.2.2 to 2.3.0
- numba from 0.11.0 to 0.12.0
- numpy from 1.7.1 to 1.8.0
- openpyxl from 1.6.2 to 1.8.2
- pandas from 0.12.0 to 0.13.0
- pip from 1.4.1 to 1.5.2
- psutil from 1.1.2 to 1.2.1
- py from 1.4.17 to 1.4.20
- pycparser from 2.9.1 to 2.10
- pyface from 4.3.0 to 4.4.0
- pyparsing from 1.5.6 to 2.0.1
- pyreadline from 2.0.dev to 2.0
- pytables from 3.0.0 to 3.1.0

- pytest from 2.4.2 to 2.5.2
- python from 2.7.5 to 2.7.6, and 3.3.2 to 3.3.3
- redis-py from 2.7.2 to 2.9.1
- requests 1.2.3 to 2.2.1
- scipy from 0.13.0 to 0.13.2
- six from 1.4.1 to 1.5.2
- sphinx from 1.1.3 to 1.2.1
- sqlalchemy from 0.8.3 to 0.9.2
- sympy from 0.7.3 to 0.7.4.1
- tornado from 3.1.1 to 3.2.0
- theano from 0.5.0 to 0.6.0
- traits from 4.3.0 to 4.4.0
- traitsui from 4.3.0 to 4.4.0

**Added:**

- argcomplete 0.6.7
- blz 0.6.1
- cdecimal 2.3
- conda-build 1.1.0
- datashape 0.1.0
- future 0.11.2
- kiwisolver 0.1.2
- mock 1.0.1
- setuptools 2.1
- ssl\_match\_hostname 3.4.0.2
- ujson 1.33
- scikit-learn and redis-py support for Python 3
- added traits and unittest2 support for Python 2.6

**Removed:**

- distribute
- llvmmath
- meta

**2013-11-05: 1.8.0:****Enhancements:**

- on Windows the installer now allows installing in user mode without having system administrator privileges

- use RPATH (instead of RUNPATH) on Linux, which fixes link problems when LD\_LIBRARY\_PATH is set
- added ipython-notebook meta package for all supported Python versions
- removed curl binary on macOS, to avoid superseding system curl

### Fixes:

- wrong location of VTK libraries in VTKTargets-debug.cmake on Linux
- fix python.app problem related to adding the symlink to lib, which also appears to create problems with %%cython magic in ipython
- apply patch to Mayavi, which fixes running mlab scripts

### Updated:

- astropy from 0.2.4 to 0.2.5
- atom from 0.3.2 to 0.3.4
- biopython from 1.61 to 1.62
- boto from 2.12.0 to 2.15.0
- bokeh from 0.1.1 to 0.2
- conda from 1.9.1 to 2.0.4
- cython from 0.19.1 to 0.19.2
- dynd from 0.4.2 to 0.5.0
- enaml from 0.7.19 to 0.8.3
- ipython 1.0.0 to 1.1.0
- keyring from 3.0.1 to 3.2
- matplotlib from 1.3.0 to 1.3.1
- netcdf4 from 1.0.5 to 1.0.6
- numba from 0.10.2 to 0.11.0
- numexpr from 2.0.1 to 2.2.2
- psutil from 1.0.1 to 1.1.2
- pycrypto from 2.6 to 2.6.1
- pytables from 2.4.0 to 3.0.0
- python 2.6.8 to 2.6.9
- pytest from 2.3.5 to 2.4.2
- scikit-image from 0.8.2 to 0.9.3
- scipy from 0.12.0 to 0.13.0
- sqlalchemy from 0.8.2 to 0.8.3
- sympy from 2.2.4 to 2.2.5

### Added:

- blaze 0.3
- pykit 0.1

- beautiful-soup 4.3.1
- openpyxl 1.6.2

**2013-09-10: 1.7.0:****Highlights:**

- added VTK, Mayavi and Bokeh
- updated to new ipython 1.0 and matplotlib 1.3, and llvm 3.3
- many improvements and bug fixes to conda

**Enhancements:**

- removed conda as a direct anaconda dependency
- add MinGW runtime DLLs to Scripts directory on Windows
- fixed python-dateutil for Python 2

**Updated:**

- astropy from 0.2.3 to 0.2.4
- atom from 0.2.3 to 0.3.2
- binstar from 0.1.2 to 0.3.1
- boto from 2.9.6 to 2.12.0
- conda from 1.7.2 to 1.9.1
- docutils from 0.10 to 0.11
- enaml from 0.7.6 to 0.7.19
- h5py from 2.1.1 to 2.2.0
- ipython from 0.13.2 to 1.0.0
- itsdangerous from 0.21 to 0.23
- jinja2 from 2.6 to 2.7.1
- libdynd and dynd-python from 0.4.0 to 0.4.2
- llvm from 3.2 to 3.3
- llvmmath from 0.1.0 to 0.1.1
- llvmpy from 0.11.3 to 0.12.0
- lxml from 3.2.1 to 3.2.3
- keyring from 1.4 to 3.0.1
- matplotlib from 1.2.1 to 1.3.0
- netcdf4 from 1.0.4 to 1.0.5
- networkx fomr 1.7 to 1.8.1
- numba from 0.9.0 to 0.10.2
- opencv from 2.4.2 to 2.4.6
- pandas from 0.11.0 to 0.12.0

- pep8 from 1.4.5 to 1.4.6
- pip from 1.3.1 to 1.4.1
- psutil from 0.7.1 to 1.0.1
- pyflakes from 0.7.2 to 0.7.3
- pysal 1.5.0 to 1.6.0
- pyside from 1.1.2 to 1.2.1 (not macOS)
- qt from 4.7.4 to 4.8.5 (not macOS)
- scikit-learn from 0.13.1 to 0.14.1
- six from 1.3.0 to 1.4.1
- spyder from 2.2.0 to 2.2.4
- sqlalchemy 0.8.1 to 0.8.2
- statsmodels from 0.4.3 to 0.5.0
- sympy from 0.7.2 to 0.7.3
- tornado from 3.1 to 3.1.1
- werkzeug from 0.9.1 to 0.9.4

**Added:**

- bokeh 0.1.1
- chaco 4.3.0
- configobj 4.7.2
- markupsafe 0.18
- mayavi 4.3.0
- patsy 0.2.1
- traits 4.3.0
- vtk 5.10.1

**2013-07-09: 1.6.2: (Windows only)**

- Fixed path being incorrectly appended on Windows during install

**2013-07-03: 1.6.1:**

- fixed .pkg installer
- updated binstar from 0.1.1 to 0.1.2 (fixes upload on Windows)
- updated conda from 1.7.1 to 1.7.2 (fixes updating python.app on macOS)
- updated dynd from 0.3.0 to 0.4.0
- updated launcher from 0.1.1 to 0.1.2
- added missing pydoc command on Unix

- macOS: fix hard coded build prefix in .dylib files for may other libraries
- Windows: append instead of prepend path on Windows

**2013-06-21: 1.6.0:****Highlights:**

- the “Launcher”, which allows users to start up applications
- conda has now the ability to build conda packages, which can be uploaded to binstar.org
- conda now uses a SAT solver to solve the install dependency problem

**Enhancements:**

- added a .pkg installer for macOS, such that installing Anaconda does not require command line access
- create copy of .bashrc (.bash\_profile on macOS) before appending the PATH setting upon install
- Windows Menu items should are now installed system wide

**Fixes:**

- removed Lib/test/testbz2\_bigmem.bz2 from Windows, this (harmless) file was triggering Trojan-ArcBomb.BZip.Agent warning, see: <http://bugs.python.org/issue17843>
- json.decoder in Python 2.7 standard library not using .decode('hex'), this was (mysteriously) causing install problems on macOS
- fixed PIL.\_imaging on Linux

**Updated:**

- python from 2.7.4 to 2.7.5, and 3.3.1 to 3.3.2
- astropy from 0.2.1 to 0.2.3
- boto from 2.9.2 to 2.9.6
- conda from 1.5.2 to 1.7.1
- cython from 0.19 to 0.19.1
- distribute from 0.6.36 to 0.6.45
- flask from 0.9 to 0.10.1
- greenlet from 0.4.0 to 0.4.1
- llvmpy from 0.11.2 to 0.11.3
- lxml from 3.2.0 to 3.2.1
- numba from 0.8.1 to 0.9.0
- py from 1.4.12 to 1.4.14
- pytest from 2.3.4 to 2.3.5
- requests from 1.2.0 to 1.2.3
- tornado from 3.0.1 to 3.1
- werkzeug from 0.8.3 to 0.9.1

**Added:**

- launcher 0.1.1
- binstar 0.1.1
- itsdangerous 0.21
- keyring 1.4
- llvmmath 0.1.0
- pep8 1.4.5
- pywin32 218.4 on Windows

### 2013-05-09: 1.5.1: (macOS only)

- fixed pip command
- replace spaces by underscore in user install location
- shared libraries now link to /usr/lib/libgcc\_s.1.dylib (instead of /usr/local/lib/libgcc\_s.1.dylib)

### 2013-05-08: 1.5.0:

#### Highlights:

- updates to all important packages: python, numpy, scipy, ipython, matplotlib, pandas, cython
- added netCDF4 (with OpenDAP support) on Linux and macOS

#### Fixed:

- Cython on macOS on Python 2.6, due to a problem with Pyhton's config/Makefile
- py.test command (all platforms)
- python-config command not using correct interpreter on macOS
- added missing MSVC 2008 and 2010 runtime to Windows installers
- removed hard-coded build location from identification name of dynamic shared libraries on macOS, to allow easier building against libraries in Anaconda

#### Enhancements:

- **The Windows installers has a new dialog box with the following options:**
  - “Add Anaconda to the System Path”
  - “Register Anaconda as default Python version of the system”
- The Unix installers have an option to add Anaconda to the path in the ~/.bashrc (on Linux) or ~/.bash\_profile (on macOS). On macOS the default is ‘yes’, on Linux the default is ‘no’.
- added armv6l supports (only Python 2.7 and selected packages)
- link pycurl and libnetcdf dynamically against curl library on Unix
- add configure option –with-pgm for zeromq on Unix

#### Added:

- netCDF4 (with OpenDAP support) 1.0.4 on Linux and macOS
- ordereddict 1.1 (on Python 2.6)

- pycosat 0.6.0
- atom 0.2.3
- enaml 0.7.6
- casuarius 1.1
- dynd-python 0.3.0
- rope 0.9.4

**Updates:**

- python from 2.7.3 to 2.7.4, and 3.3.0 to 3.3.1
- numpy from 1.7.0 to 1.7.1
- scipy from 0.11.0 to 0.12.0
- ipython from 0.13.1 to 0.13.2
- matplotlib from 1.2.0 to 1.2.1
- astropy from 0.2 to 0.2.1
- biopython from 1.60 to 1.61
- bitarray from 0.8.0 to 0.8.1
- boto from 2.8.0 to 2.9.2
- conda from 1.4.4 to 1.5.2
- curl from 7.26.0 to 7.30.0
- cython from 0.18 to 0.19
- distribute from 0.6.34 to 0.6.36
- llvmpy from 0.11.1 to 0.11.2
- lxml from 3.0.2 to 3.2.0
- nose from 1.2.1 to 1.3.0
- numba from 0.7.0 to 0.8.1
- pandas from 0.10.1 to 0.11.0
- psutil from 0.6.1 to 0.7.1
- pyflakes from 0.6.1 to 0.7.2
- pytz from 2012j to 2013b
- requests from 0.13.9 to 1.2.0
- scikit-learn from 0.13 to 0.13.1
- six from 1.2.0 to 1.3.0
- spyder from 2.1.13 to 2.2.0
- sqlalchemy from 0.7.8 to 0.8.1
- sympy from 0.7.1 to 0.7.2
- tornado from 2.4.1 to 3.0.1
- xlrd from 0.9.0 to 0.9.2

- xlwt from 0.7.4 to 0.7.5

**Removed (from installer only, still available with conda):**

- bitey
- gdata (conflicts with atom (which is required by enaml))
- googlecl (requires gdata)

**2013-03-12: 1.4.0:**

Many more packages are now supported on Python 3.3. In addition, we have added Python 3 support on Windows, such that now Python 2.6, 2.7 and 3.3 is supported across all platforms. In addition, we have redesigned the Windows installer, which was suffering from a number of problems, in particular the lack of uninstall functionality and the GUI not working on some systems.

**added:**

- astropy 0.2
- lxml 3.0.2
- pycparser 2.9.1
- six 1.2.0
- xlrd 0.9.0
- xlwt 0.7.4

**updated:**

- boto from 2.7.0 to 2.8.0
- conda from 1.3.5 to 1.4.2
- cubes from 0.10.1 to 0.10.2
- cython from 0.17.4 to 0.18
- dateutil from 1.5 to 2.1
- llvmpy from 0.10.2 to 0.11.1
- numba from 0.6.0 to 0.7.0
- numpy from 1.7rc1 to 1.7.0
- pyflakes from 0.5.0 to 0.6.1
- pygments from 1.5 to 1.6
- pysal from 1.4.0 to 1.5.0
- pyreadline from 1.7.1 to 2.0.dev
- pytz from 2012d to 2012j
- scikit-image from 0.7.1 to 0.8.2

**fixed:**

- pytables on Windows

**other notes:**

- Linux: a ATLAS package is now available (conda install atlas). In addition the site.cfg in the numpy.distutils has been updated, such that other packages (e.g. scipy) which use the atlas build configuration can be build against the (non-MKL linked) numpy in Anaconda.

**2013-02-06: 1.3.1:****added:**

- Python 2.6 support for iopro, numba and numbapro
- Python 2.6 support on Windows (Python 2.6 is now supported on all platforms)
- added pythonw (the command to run Python GUI applications) on macOS
- added chaco on Windows

**updates:**

- conda from 1.3.2 to 1.3.5
- iopro from 1.3.0 to 1.3.2
- llvmpy from 0.10.0 to 0.10.2
- numba from 0.5.0 to 0.6.0
- numbapro from 0.8.1 to 0.8.1

**other changes:**

- removed anaconda-launcher

**2013-01-23: 1.3.0:****fixes:**

- fixed missing Grammar.txt in Sphinx
- recompiled llvm and llvmpy using gcc 4.4.6 on Linux, this fixes a problem with the mandel.py example in numba
- made Windows installer dialog box resizable
- fixed problem that importing numbapro or iopro removed sys from the namespace

**updates:**

- LLVM from 3.1 to 3.2
- llvmpy from 0.9 to 0.10.0
- numba from 0.3.2 to 0.5.0
- numbapro from 0.7.3 to 0.8.0
- iopro from 1.2.3 to 1.3.0
- conda from 1.2.1 to 1.3.0
- pandas from 0.9.0 to 0.10.1
- cython from 0.17.1 to 0.17.4
- iopro from 1.2.2 to 1.2.3

- spyder from 2.1.11 to 2.1.13
- h5py from 2.1.0 to 2.1.1
- distribute from 0.6.30 to 0.6.34
- nose from 1.1.2 to 1.2.1
- tornado from 2.3 to 2.4.1
- docutils from 0.9.1 to 0.10
- nltk from 2.0.3 to 2.0.4
- gevent from 0.13.7 to 0.13.8
- numpy from 1.7.0b2 to 1.7.0rc1
- boto from 2.6.0 to 2.7.0
- scikit-learn from 0.11 to 0.12.1
- scikits-image from 0.6.1 to 0.7.1
- pyaudio from 0.2.6 to 0.2.7
- pytest from 2.3.3 to 2.3.4
- redis from 2.4.15 to 2.6.9
- redis-py from 2.4.13 to 2.7.2
- disco from 0.4.2 to 0.4.4

**added:**

- Tkinter support on all platforms
- redis support on macOS
- cubes 0.10.1
- ply 3.4
- pycrypto 2.6
- pyparsing 1.5.6
- googlecl 0.9.12
- gdata 2.0.17
- biopython 1.60

**2012-11-21: 1.2.1:**

- pucurl on macOS
- anaconda-launcher envs by updating to conda 1.2.1
- add missing pyodbc numpy\_tests in iopro/tests/pyodbc
- updated wiseRF to version 1.1
- add creation of .continuum directory (if not created yet) on Windows
- minor fixes in numba, numbapro, and iopro
- fixed version of “py” package

- add missing Windows manifest to Windows executable installer
- fixed Windows Menu install and making Anaconda the default Python
- on 2012-12-06 we released a 32-bit Linux version

**2012-11-13: 1.2.0:**

- performance and feature enhancements to Numba Pro
- performance and feature enhancements to IOPro
- improved conda command (package management)
- added Qt to the Linux Version (Qt is now on all platforms)
- added MDP, NLTK and py, pytest
- update matplotlib from 1.1.1 to 1.2.0
- update h5py from 2.0.1 to 2.1.0
- update IOPro to 1.2.1
- update libpng to 1.5.13

**2012-10-05: 1.1.0:**

- add GUI to Windows installer
- IDE Spyder (Qt) for Mac Version
- add conda 1.0
- update llvmpy to 0.8.3
- add MinGW on Windows

**2012-09-06: 1.0.0:**

- add Windows support
- installer can now install into different locations
- enable building free and permium version
- enable termcap in erlang
- add MKL support to permium version
- add networkx, pysal, pycurl, gevent\_zeromq, requests, pip, distribute
- add iopro to permium version
- update scipy from 0.11.0b1 to 0.11.0rc2
- update scikits-image form 0.6 to 0.6.1
- update pytables from 2.4.0b1 to 2.4.0
- update pandas from 0.8.0 to 0.8.1
- add patch to disco to always use the anaconda erl

- remove useless files (Python) from being installed

### 2012-08-21: 0.9.0:

- add macOS (x86\_64 10.5 or higher) support
- add bitey and other packages
- update several other packages

### 2012-07-18: 0.8.3:

- update changes to etc/init.d/disco script
- add patch, fixes disco and ddfs listdir misfeature
- add `-packages` option to `anaconda` command
- add missing `h5py`
- improve ease of testing

### 2012-07-18: 0.8.2:

- fixed `theano.sparse`
- removed (broken) `scikits` namespace
- add disco config and setup files
- add `anaconda` command, for version information

### 2012-07-17: 0.8.1:

- fixed `libm.so ctypes` error in `scipy` tests
- added import tests to all C extension modules
- fixed `lzo` support in `pytables`

### 2012-07-17: 0.8.0:

- initial release

## Help and support

The following resources are available to help you:

- Free community support is available from the [Anaconda Support Group](#).
- Anaconda offers [support](#) and [training](#).
- Anaconda also offers custom package builds through our [consulting services](#).

- Package creators or maintainers may be able to help you with installing a package or building and publishing an updated version. Package creators may also contact Anaconda to submit their package for consideration to be included in Anaconda.
- Report bugs on the [Anaconda GitHub issue tracker](#).

## Troubleshooting

If you have a troubleshooting issue that is not listed here, obtain free support for Anaconda through the [Anaconda mailing list](#). For Anaconda installation or technical support options, visit our [support offerings](#) page.

You may also wish to see the *Anaconda Navigator Troubleshooting guide*.

- *Segmentation fault on package import with macOS Python 3.7 interpreter*
- *Using 32- and 64-bit libraries and CONDA\_FORCE\_32BIT*

### Anaconda installer download problems

#### Cause

The Anaconda installer files are large (over 300 MB), and some users have problems with errors and interrupted downloads when downloading large files.

#### Solution

One option is to download and install the smaller [Miniconda](#) (under 60MB) and then use the command `conda install anaconda` to download and install all the remaining packages in Anaconda. If the package downloads are interrupted, just run `conda install anaconda` again. Conda only downloads the packages that were not finished in any previous attempts.

A second option is to download the large Anaconda installer file, and restart it if the download is interrupted or you need to pause it.

#### Windows

If you use Internet Explorer:

1. Click the Settings icon.
2. Click “View Downloads” to open the Download Manager.
3. Click on the “Resume” button next to the stopped download to restart downloading. The download resumes at the point where it stopped.

If you use Edge browser:

1. In Windows Explorer, open your downloads folder. There will be temporary files there associated with the partial downloads. Delete all of the temporary files except for the download you want to resume.
2. In Edge, click the file to download it again. Pause the download but do not cancel it.
3. In Windows Explorer, open your downloads folder. You will see two files: the partially downloaded file from earlier, and the paused download you just started. Copy the name of the file you just started, delete this file, and rename the other file with the copied name.
4. In Edge, resume the download.

If you use Chrome browser:

Download the plugin for Chrome called Chrono Download manager. In your Chrome browser, go to <https://chrome.google.com/webstore/category/extensions>, search on “Chrono Download” and select, “Add to Chrome.”

To resume the download using Chrono Download, from your top browser menu, click on the Chrome menu button, then click “Downloads.” Select the filename, then click “Resume” to restart your download.

### macOS and Linux

- In your terminal window, download the file with the command `curl -O FILENAME`.

---

**Note:** Replace FILENAME with the full path and name of the file, including `http://` or `https://`.

---

- To pause the download, use `CTRL-C`.

---

**Note:** While a download is paused, you can shut down or restart your computer.

---

- When ready to resume your download, use `curl -O -C FILENAME`.

Where “-C” is the option for “continue”. You can pause and restart a download as many times as you wish.

### Cannot open Anaconda Prompt after installation

I get an error message that says “activate.bat is not a recognized file or command”.

#### Cause

Anaconda 5.0.1 sometimes does not install completely on Windows.

#### Solution

Until a new version is released, you can install Miniconda, and then use conda to install the rest of the packages in Anaconda with these instructions:

Open the command prompt (Windows key + the R key on your keyboard) which brings up the Run... dialog box. Enter `cmd.exe` and then press enter)

Copy the following text:

```
cd %UserProfile%
powershell -command "& { (New-Object Net.WebClient).DownloadFile('https://repo.
↪anaconda.com/miniconda/Miniconda3-latest-Windows-x86_64.exe', 'mc3.exe') }"
start /wait "" mc3.exe /InstallationType=JustMe /AddToPath=0 /RegisterPython=0 /
↪NoRegistry=0 /S /D=%UserProfile%\anaconda3
%UserProfile%\anaconda3\Scripts\activate.bat
conda install -y anaconda=5.0.1 conda-build _ipyw_jlab_nb_ext_conf
```

Then paste it into the command prompt window.

---

**Note:** This installs to a subdirectory in your User directory named `anaconda3`. If you use a different directory, replace `anaconda3` with the actual name.

---

### Cannot see Anaconda menu shortcuts after installation on Windows

After installing on Windows, in the Windows Start menu I cannot see Anaconda prompt, Anaconda Cloud and Navigator shortcuts.

#### Cause

This may be caused by the way Windows updates the Start menu, or by having multiple versions of Python installed, where they are interfering with one another. Existing Python installations, installations of Python modules in global locations, or libraries that have the same names as Anaconda libraries can all prevent Anaconda from working properly.

#### Solution

If start menu shortcuts are missing, Microsoft recommends rebooting your computer or [restarting Windows Explorer](#).

If that doesn't work, clear `$PYTHONPATH` and re-install Anaconda. Other potential solutions are covered in the “Conflicts with system state” section of [this blog post](#).

### Windows error: Failed to create Anaconda menus or Failed to add Anaconda to the system PATH

During installation on a Windows system, a dialog box appears that says “Failed to create Anaconda menus, Abort Retry Ignore” or “Failed to add Anaconda to the system PATH.” There are many possible Windows causes for this.

#### Solution

Try these solutions, in order:

- Do not install on a PATH longer than 1024 characters.
- Turn off anti-virus programs during install, then turn back on.
- Uninstall all previous Python installations.
- Clear all PATHs related to Python in `sysdm.cpl` file.
- Delete any previously set up Java PATHs.
- If JDK is installed, uninstall it.

### I'm having trouble with the Anaconda installer on Windows. How can I debug my issue?

#### Cause

The cause could be any number of issues.

#### Solution

Anaconda 4.4 added a feature to the Windows installer so that the “verbose” install information is printed out to a special debug stream via the Win32 API function `OutputDebugStream`. To see these messages, during installation you need to run the Microsoft utility <https://technet.microsoft.com/en-us/sysinternals/debugview.aspx>. This may provide useful clues for troubleshooting or submitting bug reports.

## Cannot get conda to run after installing

You may get “conda not found” or “conda is not recognized as an internal or external command” or a similar message, and you cannot execute conda in a terminal window regardless of what path you are on.

### Cause

Most likely when you were installing Anaconda or Miniconda, you answered “NO” to the question whether or not to prepend the conda prompt to your path.

### Solution

Uninstall and then reinstall Anaconda or Miniconda, answering “YES” to the question about prepending the conda prompt.

Or, you can manually edit your `.bashrc` file to prepend the Anaconda or Miniconda install location. Open a text editor and in your home directory, locate the hidden file `.bashrc`. Add this line to it and save:

```
export PATH=/Users/your-username/anaconda3/bin:$PATH
```

Close your terminal window and re-open before running a conda command.

## Recovering your Anaconda installation

If your Anaconda installation is in a state where normal conda commands are not functioning, use the following steps to repair Anaconda and preserve your installed packages and environments.

### Step 1

Download a [new installer](#), then follow the instructions for your system Windows, macOS, or Linux.

---

**Note:** Use the actual path, filename, and directory name for your installation.

---

### Windows

Change your original installer’s name so you do not overwrite it:

```
move Anaconda Anaconda_old
```

Run the `Anaconda.exe` installer as usual and use robocopy to sync the directories:

```
robocopy Anaconda_old Anaconda /S  
rd /s Anaconda_old
```

### macOS

Change your original installer's name so you do not overwrite it:

```
mv anaconda anaconda_orig
```

Install to same directory as your original installer:

```
bash Anaconda3-4.0.0-MacOSX-x86_64.sh
rsync -a anaconda_orig/ anaconda/
rm -rf anaconda_orig
```

### Linux

Change your original installer's name so you do not overwrite it:

```
mv anaconda anaconda_orig
```

Install to same directory as your original installer:

```
bash Anaconda3-4.0.0-Linux-x86_64.sh
rsync -a anaconda_orig/ anaconda/
```

### Step 2

Run `conda list` to view the packages from the previous installation.

Run `conda info -e` to list the environments created in the previous installation which are now available in the new installation.

### Using Anaconda behind a firewall or proxy

Corporate security policies may prevent a new Anaconda installation from downloading packages and other functionality that requires connecting to an external server. To make external connections you may need to connect to a firewall/proxy. Additionally, your IT team may need to allow connections to <https://anaconda.org> and <https://repo.anaconda.com> as these are the main package repositories.

### Solution

To add the proxy information you will need to add two entries to your `.condarc` file located in the user's home directory. This information should be made available by your IT team and may contain a username and password that is included in the URL. Read more about the [.condarc configuration](#).

Example configuration:

```
channels:
- defaults

proxy_servers:
- http: http://username:password@proxyurl.com:8080
- https: https://username:password@proxyurl.com:8443
```

In some situations it may be necessary to export the HTTP\_PROXY and HTTPS\_PROXY environment variables.

### MacOS/Linux

```
export HTTP_PROXY=http://username:password@proxyurl.com:8080
export HTTPS_PROXY=https://username:password@proxyurl.com:8443
```

### Windows

```
set HTTP_PROXY=http://username:password@proxyurl.com:8080
set HTTPS_PROXY=https://username:password@proxyurl.com:8443
```

If these steps have not allowed connections you should speak to your IT team to verify that security policies are not blocking connections to <https://anaconda.com> and <https://repo.continuum.io>.

## .zshrc not updated under macOS Catalina

### Cause

MacOS Catalina changed the default shell from Bash to zsh.

### Solution

Run `bash -c "conda init zsh"` and then restart your shell to initialize conda for zsh.

## Insecure Platform Warning

### Cause

“InsecurePlatformWarning” appears only when the installed version of Python is older than version 2.7.9. This message warns only that the validity of the SSL connection is not being verified. It should not affect your package downloads.

### Solution

To resolve this on Windows, install the updated package `ndg-httpsclient`:

```
conda install ndg-httpsclient
```

**Note:** When initially installing this package, you receive the SSL warning again. Once it is installed, the package will prevent the warnings.

## Conda: command not found on macOS or Linux

### Cause

The conda shell function is not available, or is not working properly. Some causes:

- You have set `conda_auto_activate_base` to `false`. You need to run `conda activate [env]`. Env is optional, the default if not provided is `base`.
- You haven't started a new shell after installing Anaconda/Miniconda (assuming you allow it to modify your startup script)
- You didn't allow the installer to modify your startup script
- Conda has been corrupted, usually by a change in the Python package (e.g. 3.6->3.7)

### Solution

Run `/full/path/to/bin/conda init` to modify `~/.bashrc`.

Either start a new shell or source the modified `~/.bash_profile` (Windows/MSYS2, Windows/Cygwin and macOS) or `~/.bashrc` (Linux and Windows Subsystem for Linux). Source them via `. ~/.bash_profile`.

You may prefer that conda not automatically activate your base environment when a new shell is started. This behavior shadows your system Python, and some users prefer to have their conda environment be inactive until they need it. To achieve this, you can set a `.condarc` setting:

```
conda config --set auto_activate_base false
```

If you have this set, the conda command will still be available as a shell function, but your base environment will not be active when a new shell is started. To activate your base environment, run `conda activate`.

## Anaconda interfering with other software on Windows

### Cause

If a user chooses to add Anaconda to the Windows PATH, this can cause programs to use the new Anaconda versions of software such as Python and not the versions that were already in place. In some cases this can cause incompatibility and errors.

### Solution

We recommend not adding Anaconda to the Windows PATH. Instead, use Anaconda software by opening Anaconda Navigator or the Anaconda Prompt from the Start Menu.

### Windows error: no environment named “search” exists

If `anaconda-client` is not installed and you search for a package on `anaconda.org` using the Anaconda search command:  
`anaconda search -t conda packagename`

You will receive the following error message:

```
C:\Users\username>anaconda search -t conda packagename
No environment named "search" exists in C:\Anaconda\envs
Solution
```

Anaconda on Windows contains an `anaconda.bat` file, which is used for setting environment paths and switching environments. If `anaconda-client` is not installed, this batch file is called instead and produces the error.

To resolve the error, install `anaconda-client`:

```
conda install anaconda-client
```

And then search for a package:

```
anaconda search -t conda packagename
```

### **MKL Trial warning is displayed even though MKL-linked packages are now free and installed by default**

See [Dismissing MKL Trial warnings](#).

### **Error message: Permission denied, when loading MKL shared libraries**

See [Resolving MKL shared library permission denied errors](#).

### **Error message on Miniconda install: Already installed**

#### **Cause**

This situation can occur if you are getting a conda error and you want to reinstall Miniconda to fix it.

#### **Solution**

For macOS and Linux, download and install the appropriate Miniconda for your operating system from the [Miniconda download page](#) using the force or -f option:

```
bash Miniconda3-latest-MacOSX-x86_64.sh -f
```

---

**Note:** For `Miniconda3-latest-MacOSX-x86_64`, substitute the appropriate filename and version for your operating system.

Be sure that you install to the same location as your existing install so it overwrites the core conda files and does not install a duplicate in a new folder.

---

### **Conda update anaconda command does not install the latest version of Anaconda**

#### **Cause**

For users who have installed packages that are not compatible with the latest version of the Anaconda metapackage, running `conda update anaconda` updates the Anaconda metapackage to the latest compatible version, but this may not be the latest version.

#### **Solution**

Obtain a list of the conflicting packages by running `conda update anaconda` or `conda install anaconda=5.2`.

---

**Note:** Replace 5.2 with the latest version number.

---

Once you know which packages are conflicting, you can update all current packages without upgrading to the latest version of Anaconda, or you can remove the conflicting packages and then upgrade to the latest version of Anaconda.

To update all current packages without upgrading to the latest version of Anaconda:

1. Use `conda remove anaconda` to remove the Anaconda metapackage itself. (This will not remove any of the packages included with Anaconda.)
2. Use `conda update --all` to update all currently installed packages.

To remove the conflicting packages and upgrade to the latest version of Anaconda:

1. Remove the conflicting packages by running `conda remove package-name` for each one.

---

**Note:** Replace `package-name` with the name of the package.

---

2. Run `conda update anaconda`.

## Linking problems when Python extensions are compiled with gcc

### Cause

When compiling Python extensions with gcc on Windows, linking problems may result.

### Solution

To resolve these linking problems, use the mingw import library—the conda package `libpython`—which Anaconda builds and includes with the Anaconda Distribution.

## Error message: Unable to remove files

When trying to update or install packages with conda, you may see an error message such as:

```
Error: Unable to remove files for package: <package-name>
Please close all processes running code from conda and try again.
```

### Cause

This may be caused by a file lock issue.

### Solution

Before updating or installing any packages with conda, be sure to terminate any running Anaconda processes such as Spyder or IPython.

You can also force the installation of the package: `conda install -f package-name`.

---

**Note:** Replace `package-name` with the name of the package that you want to install.

---

## Files left behind after uninstalling Anaconda on Windows

### Cause

Some users may need to keep settings files and other users may need to delete them, so Anaconda leaves some settings files in place when it is uninstalled. Specifically, the directories `.spyder2`, `.ipython`, `.matplotlib`, and `.astropy` remain. Depending on your version of Windows these may be in `C:\Documents and Settings\Your_User_Name` or in `C:\Users\Your_User_Name`.

---

**Note:** Replace `Your_User_Name` with your Windows user name as it appears in the `Documents and Settings` or `Users` folder.

---

### Solution

Manually delete any unneeded settings files.

## Spyder errors or failure to launch on Windows

### Cause

This may be caused by errors in the Spyder setting and configuration files.

### Solution

1. Close and relaunch Spyder and see if the problem remains.
2. On the menu, select `Start`, then select `Reset Spyder Settings` and see if the problem remains.
3. Close Spyder and relaunch it from the Anaconda Prompt:
  1. From the `Start` menu, open the Anaconda Prompt.
  2. At the Anaconda Prompt, enter `Spyder`.
  3. See if the problem remains.
4. Delete the directory `.spyder2` and then repeat the previous steps from Step 1. Depending on your version of Windows, `.spyder2` may be in `C:\Documents and Settings\Your_User_Name` or in `C:\Users\Your_User_Name`.

---

**Note:** Replace `Your_User_Name`, with your Windows user name as it appears in the *Documents and Settings* folder.

---

### Problems running Anaconda on macOS 10.12.2

#### Cause

Some installations of Anaconda on macOS 10.12.2 experienced incorrect file and directory permissions, which caused a range of errors with Navigator and other parts of Anaconda.

#### Solution

We recommend that any users with Anaconda on macOS 10.12.2 follow these steps:

1. Uninstall Anaconda. Open the Terminal.app or iTerm2 terminal application and remove your Anaconda directory, which will have a name such as “anaconda2” or “anaconda3”, by entering a command such as this: `rm -rf ~/anaconda3`
2. Use a text editor such as TextEdit to open the file named `.bash_profile` in your home directory. If you see a line that adds Anaconda or Miniconda to your PATH environment variable, remove this line, and then save and close the file. For example, if you see a line such as `export PATH="/Users/jsmith/anaconda3/bin:$PATH"`, remove that line.
3. Update to macOS 10.12.3 or later.
4. [Reinstall Anaconda](#).

### “execution error: localhost doesn’t understand the “open location” message. (-1708)” when opening a Jupyter notebook on macOS 10.12.5

#### Cause

This version of macOS seems to have a bug affecting some of the ways for a program to open a web page in a browser.

#### Solution

Several possible workarounds have been found for this bug.

You can explicitly set the browser in `~/jupyter/jupyter_notebook_config.py` with a line such as this:

```
c.NotebookApp.browser = u'Safari'
```

Or you can copy the Jupyter notebook URL from the log messages on the command line and paste it into your browser.

Or you can set the BROWSER environment variable: `export BROWSER=/Applications/Google\ Chrome.app/Contents/MacOS/Google\ Chrome`

Further information is available at the [Jupyter bug tracker](#), the [Python bug tracker](#), and [this blog post](#).

### Missing libgfortran on Power8

#### Cause

Anaconda 4.4.0.0 for Power8 did not include libgfortran.

## Solution

Anaconda 4.4.0.1 and later for Power8 do include libgfortran.

Upgrade to the latest version of Anaconda:

```
conda update anaconda
```

Anaconda 4.4.0.0 users who do not wish to upgrade may instead install libgfortran with this command:

```
conda install libgfortran
```

## Missing libgomp on Power8

If the Python command “import numpy” fails, the system is likely missing the libgomp system library.

## Cause

Most Power8 Linux distributions include libgomp, but some may not.

## Solution

Check whether the system is missing libgomp with this command:

```
conda inspect linkages -n root numpy
```

If libgomp.so.1 is listed in the “not found:” section, it must be installed.

Install libgomp on Ubuntu with this command:

```
apt install libgomp1
```

Install libgomp on Red Hat Enterprise Linux (RHEL) or CentOS with this command:

```
yum install libgomp
```

## Anaconda on Power8 reports “can not execute binary file”

## Cause

Anaconda on Power8 only supports little endian mode. The little endian Python binary will not execute on a big endian operating system.

## Solution

Install Anaconda on Power8 on a little endian Linux installation or VM.

### Uninstaller requests admin privileges on Windows

#### Cause

After installing Anaconda or Miniconda as a non-administrative user on Windows, uninstalling may prompt for administrative privileges.

This occurs when running the uninstaller by choosing Control Panel, System, Apps & features, Python x.x.x (Miniconda3 4.3.xx 64-bit), Uninstall.

#### Solution

Open the Anaconda or Miniconda installation folder and run the `.exe` file uninstaller from that location. Uninstallation will complete without prompting for administrative privileges.

EXAMPLE: If you installed Miniconda3, the uninstall file will be `Uninstall-Miniconda3.exe`. Users who installed Miniconda2 or Anaconda will find a similar file with the appropriate name.

### Windows permission errors when installing from Favorites folder

#### Cause

The Windows Favorites folder has unusual permissions and may cause permission errors with installers of any software. If you try launching the installer from the Favorites folder you may see errors such as “Setup was unable to create the directory”, “Access is denied”, or “Error opening file for writing”.

#### Solution

Move the installer to a different folder and run the installer from the new folder.

### Trouble with activation on PowerShell on Windows

#### Solution

If you run into the following backtrace on Windows:

```
File "C:\Users\damia\Miniconda3\lib\site-packages\conda\activate.py", line 550, in _  
→replace_prefix_in_path  
assert last_idx is not None  
AssertionError
```

Open a cmd.exe prompt. `cd` to where you installed conda and run:

```
python -m conda init
```

Close the cmd.exe prompt and the Anaconda Prompt or the Anaconda PowerShell Prompt as usual.

If this doesn't work, try running:

```
conda update conda
```

## Cannot install Distribution 2019.07 on a webfaction server

You may receive an error when trying to install Distribution 2019.07 for Linux on a webfaction server:

```
PREFIX=/home/myname/anaconda3
Unpacking payload ...
[13822] Error loading Python lib '/tmp/_MEI<randomstring>/libpython3.6m.so.1.0':
↳dlopen /tmp/_MEI<randomstring>/libpython3.6m.so.1.0: failed to map segment from
↳shared object: Operation not permitted
ERROR: could not extract tar starting at offset 00000000000020980+9231072+2
```

### Cause

This is caused by having TMP as a noexec.

### Solution

To enable installation, you can temporarily set TMP to somewhere else from which you can execute software.

For example:

```
cd
mkdir TMPconda
TMP=~ /TMPconda bash Anaconda3-2019.07-Linux-x86_64.sh
```

After installing, set the TMP folder back to its initial location.

## Segmentation fault on package import with macOS Python 3.7 interpreter

In CPython < 3.8, using `python3-config` to determine a linking command line to compile an extension module will cause that extension module to segfault upon import. `python3-config` does provide command-line flags but for the different purpose of embedding a Python interpreter.

### Cause

This is because of the command-line flags returned by `python3-config`. Before Python 3.8, those are needed to embed the core Python interpreter into a different project altogether and not those that should be used when linking a Python extension module.

Python modules should never link to the core Python interpreter library directly, either statically at build time or dynamically at runtime. This is because the Python executable itself provides all the necessary functions and symbols.

### Solution

You should only use `python*-config --ldflags` when linking to an interpreter library (either static or shared).

| Action                                       | Python < 3.8  | Python >= 3.8                                 |
|--|---|---|
| Get command line to link to extension module | <code>python -c "import sysconfig; print(sysconfig.get_config_var('LD_SHARED'))"</code> | <code>python3-config --ldflags</code>         |
| Get command line to embed Python interpreter | <code>python3-config --ldflags</code>   | <code>python3-config --ldflags --embed</code> |

`python3-config` doesn't include the command/compiler name whereas the `sysconfig` way does. This works provided none of your arguments have spaces:

```
python -c "import sysconfig; print(' '.join(sysconfig.get_config_var('LD_SHARED').
↳split(' ')[1:]))"
```

## Using 32- and 64-bit libraries and CONDA\_FORCE\_32BIT

To work with both 32- and 64-bit libraries, we recommend that you have two separate installs: Anaconda32 and Anaconda64 or Miniconda32 and Miniconda64.

When working with both versions, add the path to your installer files to the PATH.

**Note:** Always specify which version you want to work with because mixing 32- and 64-bit packages can cause problems in your environment.

To get the information about conda including your PATH, run: `conda info -a`

Using `CONDA_FORCE_32BIT` is not recommended because it forces 32-bit packages to be installed in the environment, but does not force 32-bit libraries to load at runtime.

`CONDA_FORCE_32BIT` should be used only when running `conda-build` to build 32-bit packages on a 64-bit system.

## Packages

### Anaconda package lists

All packages available in the latest release of Anaconda are listed on the pages linked below. These packages may be installed with the command `conda install PACKAGENAME` and are located in the [package repository](#).

Click the links below to see which packages are available for each version of Python (3.7, 3.6, or 2.7) and each operating system and architecture.

Anaconda is available for 64 and 32 bit Windows, macOS, and 64 Linux on the Intel and AMD x86, x86-64 CPU, and IBM Power CPU architectures.

An [RSS feed](#) is updated each time a new package is added to the Anaconda package repository.

To request a package not listed on this page, please create an issue on the [Anaconda issues page](#).

**R language packages for Anaconda**

- *R Essentials bundle*
- *More resources*
- *List of R packages for Anaconda*

The R language packages are available to install with conda at <http://repo.anaconda.com/pkgs/r/>. You can install any of these R language packages into your current environment with the conda command `conda install -c r package-name`.

---

**Note:** Replace package-name with the name of the package. For example, you can install the package “r-acepack” with the command `conda install -c r r-acepack`.

---

Many Comprehensive R Archive Network (CRAN) packages are available as conda packages. Anaconda does not provide builds of the entire CRAN repository, so there are some packages in CRAN that are not available as conda packages.

---

**Tip:** You can also search for any R package if you know the name, such as `conda search -f r-EXACTNAME`. Replace EXACTNAME with the desired CRAN or MRAN R package name. For example, for rbokeh, you would use `conda search -f r-rbokeh`.

---

### R Essentials bundle

Rather than install each R language package individually, you can get the R Essentials bundle. It includes approximately 80 of the most popular scientific packages for the R programming language.

You can install the R Essentials bundle with this command:

```
conda install -c r r-essentials
```

### More resources

| Name                          | Version | Summary/License   | Platforms  |
|-------------------------------|---------|---|--|
| <code>_r-mutex</code>         | 1.0.0   | A mutex package to ensure environment exclusivity between Anaconda R and MRO. / BSD | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <code>_r-xgboost-mutex</code> | 2.0     | None / None   | linux-64,<br>osx-64,<br>win-64                         |

Table 34: A

| Name                     | Version | Summary/License   | Platforms   |
|--------------------------|---------|---|---|
| <a href="#">abind</a>    | 1.4.5   | Combine multidimensional arrays into a single array. This is a generalization of 'cbind' and 'rbind'. Works with vectors, matrices, and higher-dimensional arrays. Also provides functions 'adrop', 'asub', and 'afill' for manipulating, extracting and replacing data in arrays. / LGPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">acepack</a>  | 1.4.1   | Two nonparametric methods for multiple regression transform selection are provided. The first, Alternative Conditional Expectations (ACE), is an algorithm to find the fixed point of maximal correlation, i.e. it finds a set of transformed response variables that maximizes $R^2$ using smoothing functions [see Breiman, L., and J.H. Friedman. 1985. Estimating Optimal Transformations for Multiple Regression and Correlation. Journal of the American Statistical Association. 80:580-598. <doi:10.1080/01621459.1985.10478157>]. Also included is the Additivity Variance Stabilization (AVAS) method which works better than ACE when correlation is low [see Tibshirani, R.. 1986. Estimating Transformations for Regression via Additivity and Variance Stabilization. Journal of the American Statistical Association. 83:394-405. <doi:10.1080/01621459.1988.10478610>]. A good introduction to these two methods is in chapter 16 of Frank Harrel's Regression Modeling Strategies in the Springer Series in Statistics. / MIT file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| <a href="#">aer</a>      | 1.2.6   | Functions, data sets, examples, demos, and vignettes for the book Christian Kleiber and Achim Zeileis (2008), Applied Econometrics with R, Springer-Verlag, New York. ISBN 978-0-387-77316-2. (See the vignette AER for a package overview.) / GPL-2   GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">afex</a>     | 0.23.0  | Convenience functions for analyzing factorial experiments using ANOVA or mixed models. aov_ez(), aov_car(), and aov_4() allow specification of between, within (i.e., repeated-measures), or mixed (i.e., split-plot) ANOVAs for data in long format (i.e., one observation per row), automatically aggregating multiple observations per individual and cell of the design. mixed() fits mixed models using lme4::lmer() and computes p-values for all fixed effects using either Kenward-Roger or Satterthwaite approximation for degrees of freedom (LMM only), parametric bootstrap (LMMs and GLMMs), or likelihood ratio tests (LMMs and GLMMs). afex_plot() provides a high-level interface for interaction or one-way plots using ggplot2, combining raw data and model es-  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 35: B

| Name                      | Version | Summary/License   | Platforms  |
|---------------------------|---------|---|--|
| <a href="#">backports</a> | 1.1.4   | Functions introduced or changed since R v3.0.0 are re-implemented in this package. The backports are conditionally exported in order to let R resolve the function name to either the implemented backport, or the respective base version, if available. Package developers can make use of new functions or arguments by selectively importing specific backports to support older installations. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">base64enc</a> | 0.1_3   | This package provides tools for handling base64 encoding. It is more flexible than the orphaned base64 package. / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">bcp</a>       | 4.0.3   | Provides an implementation of the Barry and Hartigan (1993) product partition model for the normal errors change point problem using Markov Chain Monte Carlo. It also extends the methodology to regression models on a connected graph (Wang and Emerson, 2015); this allows estimation of change point models with multivariate responses. Parallel MCMC, previously available in bcp v.3.0.0, is currently not implemented. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">bdsmatrix</a> | 1.3_3   | This is a special case of sparse matrices, used by coxme. / LGPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">bestglm</a>   | 0.37    | Best subset glm using information criteria or cross-validation. Implements PCR and PLS using AIC/BIC. Implements one-standard deviation rule for use with the <i>caret</i> package. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">bh</a>        | 1.69.0  | Boost provides free peer-reviewed portable C source libraries. A large part of Boost is provided as C template code which is resolved entirely at compile-time without linking. This package aims to provide the most useful subset of Boost libraries for template use among CRAN package. By placing these libraries in this package, we offer a more efficient distribution system for CRAN as replication of this code in the sources of other packages is avoided. As of release 1.69.0-1, the following Boost libraries are included: ‘algorithm’ ‘align’ | linux-32,<br>linux-64,<br>noarch,<br>osx-64,           |

Table 36: C

| Name                    | Version | Summary/License  | Platforms   |
|-------------------------|---------|--|---|
| <a href="#">cairo</a>   | 1.5_10  | R graphics device using cairographics library that can be used to create high-quality vector (PDF, PostScript and SVG) and bitmap output (PNG,JPEG,TIFF), and high-quality rendering in displays (X11 and Win32). Since it uses the same back-end for all output, copying across formats is WYSIWYG. Files are created without the dependence on X11 or other external programs. This device supports alpha channel (semi-transparent drawing) and resulting images can contain transparent and semi-transparent regions. It is ideal for use in server environments (file output) and as a replacement for other devices that don't have Cairo's capabilities such as alpha support or anti-aliasing. Backends are modular such that any subset of backends is supported. / GPL-2 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">callr</a>   | 3.2.0   | It is sometimes useful to perform a computation in a separate R process, without affecting the current R process at all. This packages does exactly that. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">car</a>     | 3.0_2   | Functions to Accompany J. Fox and S. Weisberg, An R Companion to Applied Regression, Third Edition, Sage, in press. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">cardata</a> | 3.0_2   | Datasets to Accompany J. Fox and S. Weisberg, An R Companion to Applied Regression, Third Edition, Sage (forthcoming). / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">caret</a>   | 6.0_83  | Misc functions for training and plotting classification and regression models. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <b>1556</b>             |         | <b>Chapter 3. Anaconda Cloud</b>   |   |
| <a href="#">catools</a> | 1.17.10 | Contains several basic utility functions including: moving (rolling, running) window statistic functions, read/write for GIF and ENVI binary files, fast calculation of AUC, LogitBoost classifier, base64 encoder/decoder, round-off-   | linux-32,<br>linux-   |

Table 37: D

| Name                       | Version | Summary/License  | Platforms   |
|----------------------------|---------|--|---|
| <a href="#">data.table</a> | 1.12.2  | Fast aggregation of large data (e.g. 100GB in RAM), fast ordered joins, fast add/modify/delete of columns by group using no copies at all, list columns, friendly and fast character-separated-value read/write. Offers a natural and flexible syntax, for faster development. / MPL-2.0   file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">dbi</a>        | 1.0.0   | A database interface definition for communication between R and relational database management systems. All classes in this package are virtual and need to be extended by the various R/DBMS implementations. / LGPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">dbplyr</a>     | 1.4.0   | A 'dplyr' back end for databases that allows you to work with remote database tables as if they are in-memory data frames. Basic features works with any database that has a 'DBI' back end; more advanced features require 'SQL' translation to be provided by the package author. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">ddalpha</a>    | 1.3.9   | Contains procedures for depth-based supervised learning, which are entirely non-parametric, in particular the DDalpha-procedure (Lange, Mosler and Mozharovskyi, 2014 <doi:10.1007/s00362-012-0488-4>). The training data sample is transformed by a statistical depth function to a compact low-dimensional space, where the final classification is done. It also offers an extension to functional data and routines for calculating certain notions of statistical depth functions. 50 multivariate and 5 functional classification problems are included. / GPL-2 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">debugme</a>    | 1.1.0   | Specify debug messages as special string constants, and control debugging of packages via environment variables. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">deoptim</a>    | 1.0-8   | Differential Evolution (DE) stochastic algorithms for global optimization of problems with and without constraints. The aim is to curate a collection of its state-of-the-art variants that (1) do not sacrifice simplicity of design, (2) are essentially tuning-free, and (3) can be efficiently implemented directly in   | linux-32,<br>linux-64,  |

Table 38: E

| Name                                | Version | Summary/License  | Platforms   |
|-------------------------------------|---------|--|---|
| <a href="#">e1071</a>               | 1.7_1   | Functions for latent class analysis, short time Fourier transform, fuzzy clustering, support vector machines, shortest path computation, bagged clustering, naive Bayes classifier, ... / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">ellipsis</a>            | 0.1.0   | In S3 generics, it's useful to take ... so that methods can have additional argument. But this flexibility comes at a cost: misspelled arguments will be silently ignored. The ellipsis packages is an experiment that allows a generic to warn if any arguments passed in ... are not used. / GPL-3   | linux-64,<br>osx-64,<br>win-32,<br>win-64                         |
| <a href="#">emmeans</a>             | 1.3.4   | Obtain estimated marginal means (EMMs) for many linear, generalized linear, and mixed models. Compute contrasts or linear functions of EMMs, trends, and comparisons of slopes. Plots and compact letter displays. Least-squares means are discussed, and the term estimated marginal means is suggested, in Searle, Speed, and Milliken (1980) Population marginal means in the linear model: An alternative to least squares means, The American Statistician 34(4), 216-221 <doi:10.1080/00031305.1980.10483031>. / GPL-2   GPL-3 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 40: G

| Name                  | Version | Summary/License  | Platforms   |
|-----------------------|---------|--|---|
| <code>gdata</code>    | 2.18.0  | Various R programming tools for data manipulation, including: - medical unit conversions ('ConvertMedUnits', 'MedUnits'), - combining objects ('bindData', 'cbindX', 'combine', 'interleave'), - character vector operations ('centerText', 'startsWith', 'trim'), - factor manipulation ('levels', 'reorder.factor', 'mapLevels'), - obtaining information about R objects ('object.size', 'elem', 'env', 'humanReadable', 'is.what', 'll', 'keep', 'ls.funs', 'Args', 'nPairs', 'nobs'), - manipulating MS-Excel formatted files ('read.xls', 'installXLSX-support', 'sheetCount', 'xlsFormats'), - generating fixed-width format files ('write.fwf'), - extricating components of date & time objects ('getYear', 'getMonth', 'getDay', 'getHour', 'getMin', 'getSec'), - operations on columns of data frames ('matchcols', 'rename.vars'), - matrix operations ('unmatrix', 'upperTriangle', 'lowerTriangle'), - operations on vectors ('case', 'unknown-ToNA', 'duplicated2', 'trimSum'), - operations on data frames ('frameApply', 'wideByFactor'), - value of last evaluated expression ('ans'), and - wrapper for 'sample' that ensures consistent behavior for both scalar and vector arguments ('resample'). / GPL-2 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>generics</code> | 0.0.2   | In order to reduce potential package dependencies and conflicts, generics provides a number of commonly used S3 generics. / GPL-2  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-64            |
| <code>geometry</code> | 0.4.1   | Makes the 'Qhull' library < <a href="http://www.qhull.org">http://www.qhull.org</a> > available in R, in a similar manner as in Octave and MATLAB. Qhull computes convex hulls, Delaunay triangulations, halfspace intersections about a point, Voronoi diagrams, furthest-site Delaunay triangulations, and furthest-site Voronoi diagrams. It runs in 2D, 3D, 4D, and higher dimensions. It implements the Quickhull algorithm for computing the convex hull. Qhull does not support constrained Delaunay triangulations, or mesh generation of non-convex objects, but the package does include some R functions that allow for this. / GPL (>= 3)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <code>getopt</code>   | 1.20.3  | Package designed to be used with Rscript to write "#!" shebang scripts that accept short and long flags/options. Many users will prefer using instead the packages optparse or argparse which add extra features like automatically generated help option and usage, support for default values, positional argument support, etc. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>ggplot2</code>  | 3.1.1   | A system for 'declaratively' creating graphics, based on The Grammar of Graphics. You provide the data, tell 'ggplot2' how to map variables to aesthetics, what graphical primitives to use, and it takes care of the details. / GPL-2   file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-64            |
| 1560                  |         | Chapter 3. Anaconda Cloud  | linux-32,<br>win-64   |

|-----------------------------|---------|---|---|
| <a href="#">haven</a>       | 2.1.0   | Import foreign statistical formats into R via the embedded ‘ReadStat’ C library, < <a href="https://github.com/WizardMac/ReadStat">https://github.com/WizardMac/ReadStat</a> >. / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">hexbin</a>      | 1.27    | Binning and plotting functions for hexagonal bins. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">highcharter</a> | 0.7.0   | A wrapper for the ‘Highcharts’ library including shortcut functions to plot R objects. ‘Highcharts’ < <a href="http://www.highcharts.com/">http://www.highcharts.com/</a> > is a charting library offering numerous chart types with a simple configuration syntax. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">highr</a>       | 0.8     | Provides syntax highlighting for R source code. Currently it supports LaTeX and HTML output. Source code of other languages is supported via Andre Simon’s highlight package (< <a href="http://www.andre-simon.de">http://www.andre-simon.de</a> >). / GPL   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">hmisc</a>       | 4.2_0   | Contains many functions useful for data analysis, high-level graphics, utility operations, functions for computing sample size and power, importing and annotating datasets, imputing missing values, advanced table making, variable clustering, character string manipulation, conversion of R objects to LaTeX and html code, and recoding variables. / GPL (>= 2) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">hms</a>         | 0.4.2   | Implements an S3 class for storing and formatting time-of-day values, based on the ‘difftime’ class. / GPL-3  | linux-32,<br>linux-64,<br>noarch,                                 |

Table 42: I

| Name                       | Version | Summary/License   | Platforms   |
|----------------------------|---------|---|---|
| <a href="#">igraph</a>     | 1.2.4   | Routines for simple graphs and network analysis. It can handle large graphs very well and provides functions for generating random and regular graphs, graph visualization, centrality methods and much more. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">implyr</a>     | 0.2.4   | 'SQL' back-end to 'dplyr' for Apache Impala, the massively parallel processing query engine for Apache 'Hadoop'. Impala enables low-latency 'SQL' queries on data stored in the 'Hadoop' Distributed File System '(HDFS)', Apache 'HBase', Apache 'Kudu', Amazon Simple Storage Service '(S3)', Microsoft Azure Data Lake Store '(ADLS)', and Dell 'EMC' 'Isilon'. See < <a href="https://impala.apache.org">https://impala.apache.org</a> > for more information about Impala. / Apache License 2.0   file LICENSE                   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">influencer</a> | 0.1.0   | Provides functionality to compute various node centrality measures on networks. Included are functions to compute betweenness centrality (by utilizing Madduri and Bader's SNAP library), implementations of Burt's constraint and effective network size (ENS) metrics, Borgatti's algorithm to identify key players, and Valente's bridging metric. On Unix systems, the betweenness, Key Players, and bridging implementations are parallelized with OpenMP, which may run faster on systems which have OpenMP configured. / GPL-2 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">ini</a>        | 0.3.1   | Parse simple '.ini' configuration files to an structured list. Users can manipulate this resulting list with lapply() functions. This same structured list can be used to write back to file after modifications. / GPL-3   | noarch  |
| <a href="#">inline</a>     | 0.3.15  | Functionality to dynamically define R functions and S4 methods with 'inlined' C, C or Fortran code supporting the .C and .Call calling conventions. / LGPL  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">ipred</a>      | 0.9_8   | Improved predictive models by indirect classification and bagging for classification, regression and survival problems as well as resampling based estimators of prediction error. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <b>1562</b>                |         | <b>Chapter 3. Anaconda Cloud</b>  | linux-32,<br>win-64   |
| <a href="#">irdisplay</a>  | 0.7.0   | An interface to the rich display capabilities of 'Jupyter' front-ends (e.g. 'Jupyter Notebook') < <a href="https://jupyter.org">https://jupyter.org</a> >. Designed to be used from a run-  | linux-32,   |

| Name                        | Version | Summary/License   | Platforms   |
|-----------------------------|---------|---|---|
| <a href="#">janeaustenr</a> | 0.1.5   | Full texts for Jane Austen's 6 completed novels, ready for text analysis. These novels are Sense and Sensibility, Pride and Prejudice, Mansfield Park, Emma, Northanger Abbey, and Persuasion. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">jpeg</a>        | 0.1_8   | This package provides an easy and simple way to read, write and display bitmap images stored in the JPEG format. It can read and write both files and in-memory raw vectors. / GPL-2   GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">jsonlite</a>    | 1.6     | A fast JSON parser and generator optimized for statistical data and the web. Started out as a fork of 'RJSONIO', but has been completely rewritten in recent versions. The package offers flexible, robust, high performance tools for working with JSON in R and is particularly powerful for building pipelines and interacting with a web API. The implementation is based on the mapping described in the vignette (Ooms, 2014). In addition to converting JSON data from/to R objects, 'jsonlite' contains functions to stream, validate, and prettify JSON data. The unit tests included with the package verify that all edge cases are encoded and decoded consistently for use with dynamic data in systems and applications. / MIT file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| labeling     | 0.3     | Provides a range of axis labeling algorithms / MIT file LICENSE   Unlimited   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| lahman       | 6.0_0   | Provides the tables from the ‘Sean Lahman Baseball Database’ as a set of R data.frames. It uses the data on pitching, hitting and fielding performance and other tables from 1871 through 2015, as recorded in the 2016 version of the database. / GPL  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| lars         | 1.2     | Efficient procedures for fitting an entire lasso sequence with the cost of a single least squares fit. Least angle regression and infinitesimal forward stagewise regression are related to the lasso, as described in the paper below. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| later        | 0.8.0   | Executes arbitrary R or C functions some time after the current time, after the R execution stack has emptied. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| lattice      | 0.20_38 | A powerful and elegant high-level data visualization system inspired by Trelis graphics, with an emphasis on multivariate data. Lattice is sufficient for typical graphics needs, and is also flexible enough to handle most nonstandard requirements. See ?Lattice for an introduction. / GPL (>= 2) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| latticeextra | 0.6_28  | Building on the infrastructure provided by the lattice package, this package provides several new high-level functions and methods, as well as additional utilities such as panel and axis annotation functions. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,                                 |

Table 46: M

| Name                             | Version | Summary/License   | Platforms   |
|----------------------------------|---------|---|---|
| <a href="#">magic</a>            | 1.5.9   | A collection of efficient, vectorized algorithms for the creation and investigation of magic squares and hypercubes, including a variety of functions for the manipulation and analysis of arbitrarily dimensioned arrays. The package includes methods for creating normal magic squares of any order greater than 2. The ultimate intention is for the package to be a computerized embodiment all magic square knowledge, including direct numerical verification of properties of magic squares (such as recent results on the determinant of odd-ordered semimagic squares). Some antimagic functionality is included. The package also serves as a rebuttal to the often-heard comment I thought R was just for statistics. / GPL-2 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">magrittr</a>         | 1.5     | Provides a mechanism for chaining commands with a new forward-pipe operator, %>%. This operator will forward a value, or the result of an expression, into the next function call/expression. There is flexible support for the type of right-hand side expressions. For more information, see package vignette. To quote Rene Magritte, Ceci n'est pas un pipe. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">manipulate</a>       | 1.0.1   | Interactive plotting functions for use within RStudio. The manipulate function accepts a plotting expression and a set of controls (e.g. slider, picker, checkbox, or button) which are used to dynamically change values within the expression. When a value is changed using its corresponding control the expression is automatically re-executed and the plot is redrawn. / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">manipulatewidget</a> | 0.10.0  | Like package 'manipulate' does for static graphics, this package helps to easily add controls like sliders, pickers, checkboxes, etc. that can be used to modify the input data or the parameters of an interactive chart created with package 'htmlwidgets'. / GPL (>= 2)   file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name                        | Version   | Summary/License  | Platforms   |
|-----------------------------|-----------|--|---|
| <code>memoise</code>        | 1.1.0     | Cache the results of a function so that when you call it again with the same arguments it returns the pre-computed value. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>mgcv</code>           | 1.8.2     | Generalized additive (mixed) models, some of their extensions and other generalized ridge regression with multiple smoothing parameter estimation by (Restricted) Marginal Likelihood, Generalized Cross Validation and similar, or using iterated nested Laplace approximation for fully Bayesian inference. See Wood (2017) <doi:10.1201/9781315370279> for an overview. Includes a <code>gam()</code> function, a wide variety of smoothers, ‘JAGS’ support and distributions beyond the exponential family. / GPL (>= 2) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <code>microbenchmark</code> | 1.4.6     | Provides infrastructure to accurately measure and compare the execution time of R expressions. / BSD_2_clause file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <code>microsoftr</code>     | 3.5.0.108 | Umbrella package with licenses and notices for all Microsoft R packages / file LICENSE   | linux-64,<br>osx-64,<br>win-64                                    |
| <code>mime</code>           | 0.6       | Guesses the MIME type from a filename extension using the data derived from <code>/etc/mime.types</code> in UNIX-type systems. / GPL   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| Name                      | Version | Summary/License  | Platforms   |
|---------------------------|---------|--|---|
| <a href="#">miniui</a>    | 0.1.1   | Provides UI widget and layout functions for writing Shiny apps that work well on small screens. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">minqa</a>     | 1.2.4   | Derivative-free optimization by quadratic approximation based on an interface to Fortran implementations by M. J. D. Powell. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">misctools</a> | 0.6_2   | Miscellaneous small tools and utilities. Many of them facilitate the work with matrices, e.g. inserting rows or columns, creating symmetric matrices, or checking for semidefiniteness. Other tools facilitate the work with regression models, e.g. extracting the standard errors, obtaining the number of (estimated) parameters, or calculating R-squared values. / GPL (>= 2) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">mlmrev</a>    | 1.0_7   | Data and examples from a multilevel modelling software review as well as other well-known data sets from the multilevel modelling literature. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 46 – continued from previous page

| Name                         | Version | Summary/License   | Platforms   |
|------------------------------|---------|---|---|
| <a href="#">mnormt</a>       | 1.5_5   | Functions are provided for computing the density and the distribution function of multivariate normal and t random variables, and for generating random vectors sampled from these distributions. Probabilities are computed via non-Monte Carlo methods; different routines are used in the case d=1, d=2, d>2, if d denotes the number of dimensions. / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">modelmetrics</a> | 1.2.2   | Collection of metrics for evaluating models written in C using ‘Rcpp’. Popular metrics include area under the curve, log loss, root mean square error, etc. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">modelr</a>       | 0.1.4   | Functions for modelling that help you seamlessly integrate modelling into a pipeline of data manipulation and visualisation. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">modeltools</a>   | 0.2_22  | A collection of tools to deal with statistical models. The functionality is experimental and the user interface is likely to change in the future. The documentation is rather terse, but packages ‘coin’ and ‘party’ have some working examples. However, if you find the implemented ideas interesting we would be very interested in a discussion of this proposal. Contributions are more than welcome! / GPL-2 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name                       | Version | Summary/License  | Platforms   |
|----------------------------|---------|--|---|
| <code>mongolite</code>     | 2.0.1   | High-performance MongoDB client based on ‘mongo-c-driver’ and ‘jsonlite’. Includes support for aggregation, indexing, map-reduce, streaming, encryption, enterprise authentication, and GridFS. The online user manual provides an overview of the available methods in the package: < <a href="https://jeroen.github.io/mongolite/">https://jeroen.github.io/mongolite/</a> >. / Apache License 2.0 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <code>mrclient</code>      | 3.4.3   | A free, community-supported, data science tool for high performance analytics / Proprietary  | linux-64,<br>win-64   |
| <code>mrclient-mlm</code>  | 3.4.3   | Pre-trained machine learning models for sentiment analysis and image detection / Proprietary   | noarch  |
| <code>mrclient-mml</code>  | 3.4.3   | Provides state-of-the-art fast, scalable machine learning algorithms and transforms for R / Proprietary  | linux-64,<br>win-64   |
| <code>mro</code>           | 0.1.1   | Computes multiple correlation coefficient when the data matrix is given and tests its significance. / GPL-2  | linux-64,<br>win-64   |
| <code>mro-base</code>      | 3.5.1   | R is a free software environment for statistical computing and graphics. / GPL-2   GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| <code>mro-base_impl</code> | 3.5.1   | R is a free software environment for statistical computing and graphics. / GPL-2   GPL-3   | linux-64,<br>win-64   |
| <code>mro-basics</code>    | 3.5.1   | None / None  | linux-64,<br>osx-64,<br>win-64                                    |
| <code>multcomp</code>      | 1.4.1   | Simultaneous tests and confidence intervals for general linear hypotheses in parametric models, including linear, generalized linear, linear mixed effects, and survival models. The package includes demos reproducing analyzes presented in the book Multiple Comparisons Using R (Bretz, Hothorn, Westfall, 2010, CRC Press). / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name                    | Version | Summary/License   | Platforms   |
|-------------------------|---------|---|---|
| <a href="#">munsell</a> | 0.5.0   | Provides easy access to, and manipulation of, the Munsell colours. Provides a mapping between Munsell's original notation (e.g. 5R 5/10) and hexadecimal strings suitable for use directly in R graphics. Also provides utilities to explore slices through the Munsell colour tree, to transform Munsell colours and display colour palettes. / MIT file LICENSE | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">mvtnorm</a> | 1.0_1   | Computes multivariate normal and t probabilities, quantiles, random deviates and densities. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

Table 47: N

| Name                         | Version | Summary/License   | Platforms   |
|------------------------------|---------|---|---|
| <a href="#">networkd3</a>    | 0.4     | Creates 'D3' 'JavaScript' network, tree, dendrogram, and Sankey graphs from 'R'. / GPL (>= 3)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">nlme</a>         | 3.1_1   | Fit and compare Gaussian linear and nonlinear mixed-effects models. / GPL (>= 2)   file LICENCE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">nlopt-static</a> | 2.4.2   | nonlinear optimization library / GNU Lesser General Public License (LGPL)   | linux-32,<br>linux-64,<br>osx-64                                  |
| <a href="#">nloptr</a>       | 1.2.1   | Solve optimization problems using an R interface to NLOpt. NLOpt is a free/open-source library for nonlinear optimization, providing a common interface for a number of different free optimization routines available online as well as original implementations of various other algorithms. See <a href="http://ab-initio.mit.edu/wiki/index.php/NLOpt_Introduction">http://ab-initio.mit.edu/wiki/index.php/NLOpt_Introduction</a> for more information on the available algorithms. During installation of nloptr on Unix-based systems, the installer checks whether the NLOpt library is installed on the system. If the NLOpt library cannot be found, the code is compiled using the NLOpt source included in the nloptr package. / LGPL-3 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">nlp</a>          | 0.2_0   | Basic classes and methods for Natural Language Processing. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">nmf</a>          | 0.21.0  | Provides a framework to perform Non-negative Matrix Factorization (NMF). The package implements a set of already published algorithms and seeding methods, and provides a framework to test, develop and plug new/custom algorithms. Most of the built-in algorithms have been optimized in C, and the main interface function provides an easy way of performing parallel computations on multicore machines. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

Table 48: O

| Name                     | Version | Summary/License  | Platforms   |
|--------------------------|---------|--|---|
| <a href="#">oce</a>      | 1.0.1   | Supports the analysis of Oceanographic data, including ‘ADCP’ measurements, measurements made with ‘argo’ floats, ‘CTD’ measurements, sectional data, sea-level time series, coastline and topographic data, etc. Provides specialized functions for calculating seawater properties such as potential temperature in either the ‘UNESCO’ or ‘TEOS-10’ equation of state. Produces graphical displays that conform to the conventions of the Oceanographic literature. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">odbc</a>     | 1.1.6   | A DBI-compatible interface to ODBC databases. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">openssl</a>  | 1.3     | Bindings to OpenSSL libssl and libcrypto, plus custom SSH key parsers. Supports RSA, DSA and EC curves P-256, P-384 and P-521. Cryptographic signatures can either be created and verified manually or via x509 certificates. AES can be used in cbc, ctr or gcm mode for symmetric encryption; RSA for asymmetric (public key) encryption or EC for Diffie Hellman. High-level envelope functions combine RSA and AES for encrypting arbitrary sized data. Other utilities include key generators, hash functions (md5, sha1, sha256, etc), base64 encoder, a secure random number generator, and ‘bignum’ math methods for manually performing crypto calculations on large multibyte integers. / MIT file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">openxlsx</a> | 4.1.0   | Simplifies the creation of Excel .xlsx files by providing a high level interface to writing, styling and editing worksheets. Through the use of ‘Rcpp’, read/write times are comparable to the ‘xlsx’ and ‘XLConnect’ packages with the added benefit of removing the dependency on Java. / MIT file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

Table 49: P

| Name                     | Version | Summary/License   | Platforms   |
|--------------------------|---------|---|---|
| <a href="#">packrat</a>  | 0.5.0   | Manage the R packages your project depends on in an isolated, portable, and reproducible way. / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">pbdzmq</a>   | 0.3_3   | 'ZeroMQ' is a well-known library for high-performance asynchronous messaging in scalable, distributed applications. This package provides high level R wrapper functions to easily utilize 'ZeroMQ'. We mainly focus on interactive client/server programming frameworks. For convenience, a minimal 'ZeroMQ' library (4.2.2) is shipped with 'pbdZMQ', which can be used if no system installation of 'ZeroMQ' is available. A few wrapper functions compatible with 'rzmq' are also provided. / GPL-3 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">pbivnorm</a> | 0.6.0   | Provides a vectorized R function for calculating probabilities from a standard bivariate normal CDF. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-32,<br>win-64                         |
| <a href="#">pbkrtest</a> | 0.4_7   | Test in mixed effects models. Attention is on mixed effects models as implemented in the 'lme4' package. This package implements a parametric bootstrap test and a Kenward Roger modification of F-tests for linear mixed effects models and a parametric bootstrap test for generalized linear mixed models. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">pcapp</a>    | 1.9_7   | Provides functions for robust PCA by projection pursuit. The methods are described in Croux et al. (2006) <doi:10.2139/ssrn.968376>, Croux et al. (2013) <doi:10.1080/00401706.2012.727746>, Todorov and Filzmoser (2013) <doi:10.1007/978-3-642-33042-1_31>. / GPL (>= 3)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

Table 49 – continued from previous page

| Name                     | Version | Summary/License   | Platforms   |
|--------------------------|---------|---|---|
| <a href="#">pkgload</a>  | 1.0.2   | Simulates the process of installing a package and then attaching it. This is a key part of the ‘devtools’ package as it allows you to rapidly iterate while developing a package. / GPL-3   | linux-64,<br>osx-64,<br>win-32,<br>win-64                         |
| <a href="#">pkgmaker</a> | 0.27    | Provides some low-level utilities to use for package development. It currently provides managers for multiple package specific options and registries, vignette, unit test and bibtext related utilities. It serves as a base package for packages like NMF, RcppOctave, doRNG, and as an incubator package for other general purposes utilities, that will eventually be packaged separately. It is still under heavy development and changes in the interface(s) are more than likely to happen. / GPL (>= 2) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">pki</a>      | 0.1_5   | PKI functions such as verifying certificates, RSA encryption and signing which can be used to build PKI infrastructure and perform cryptographic tasks. / GPL-2   GPL-3   file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">plm</a>      | 1.7_0   | A set of estimators and tests for panel data econometrics. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">plogr</a>    | 0.2.0   | A simple header-only logging library for C. Add ‘LinkingTo: plogr’ to ‘DESCRIPTION’, and ‘#include <plogr.h>’ in your C modules to use it. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name                      | Version    | Summary/License  | Platforms   |
|---------------------------|------------|--|---|
| <code>proc</code>         | 1.14.0     | Tools for visualizing, smoothing and comparing receiver operating characteristic (ROC curves). (Partial) area under the curve (AUC) can be compared with statistical tests based on U-statistics or bootstrap. Confidence intervals can be computed for (p)AUC or ROC curves. / GPL ( $\geq 3$ )   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <code>processx</code>     | 3.3.0      | Tools to run system processes in the background. It can check if a background process is running; wait on a background process to finish; get the exit status of finished processes; kill background processes. It can read the standard output and error of the processes, using non-blocking connections. ‘processx’ can poll a process for standard output or error, with a timeout. It can also poll several processes at once. / MIT file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <code>prodlim</code>      | 2018.04.18 | Fast and user friendly implementation of nonparametric estimators for censored event history (survival) analysis. Kaplan-Meier and Aalen-Johansen method. / GPL ( $\geq 2$ )   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <code>profilemodel</code> | 0.6.0      | Provides tools that can be used to calculate, evaluate, plot and use for inference the profiles of <i>arbitrary</i> inference functions for <i>arbitrary</i> ‘glm’-like fitted models with linear predictors. More information on the methods that are implemented can be found in Kosmidis (2008) < <a href="https://www.r-project.org/doc/Rnews/Rnews_2008-2.pdf">https://www.r-project.org/doc/Rnews/Rnews_2008-2.pdf</a> >. / GPL ( $\geq 2$ )     | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>profvis</code>      | 0.3.5      | Interactive visualizations for profiling R code. / GPL-3   file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| Name                     | Version | Summary/License  | Platforms   |
|--------------------------|---------|--|---|
| <a href="#">progress</a> | 1.2.0   | Configurable Progress bars, they may include percentage, elapsed time, and/or the estimated completion time. They work in terminals, in ‘Emacs’ ‘ESS’, ‘RStudio’, ‘Windows’ ‘Rgui’ and the ‘macOS’ ‘R.app’. The package also provides a ‘C’ ‘API’, that works with or without ‘Rcpp’. / MIT file LICENSE   | noarch  |
| <a href="#">promises</a> | 1.0.1   | Provides fundamental abstractions for doing asynchronous programming in R using promises. Asynchronous programming is useful for allowing a single R process to orchestrate multiple tasks in the background while also attending to something else. Semantics are similar to ‘JavaScript’ promises, but with a syntax that is idiomatic R. / MIT file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">proto</a>    | 1.0.0   | An object oriented system using object-based, also called prototype-based, rather than class-based object oriented ideas. / GPL-2  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">pryr</a>     | 0.1.4   | Useful tools to pry back the covers of R and understand the language at a deeper level. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">ps</a>       | 1.3.0   | List, query and manipulate all system processes, on ‘Windows’, ‘Linux’ and ‘macOS’. / BSD_3_clause file LICENSE  | linux-64,<br>osx-64,<br>win-32,<br>win-64                         |

| <a href="#">pspline</a> | 1.0_1   | Smoothing splines with penalties on order m derivatives. / Unlimited   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">psych</a>   | 1.8.12  | A general purpose toolbox for personality, psychometric theory and experimental psychology. Functions are primarily for multivariate analysis and scale construction using factor analysis, principal component analysis, cluster analysis and reliability analysis, although others provide basic descriptive statistics. Item Response Theory is done using factor analysis of tetrachoric and polychoric correlations. Functions for analyzing data at multiple levels include within and between group statistics, including correlations and factor analysis. Functions for simulating and testing particular item and test structures are included. Several functions serve as a useful front end for structural equation modeling. Graphical displays of path diagrams, factor analysis and structural equation models are created using basic graphics. Some of the functions are written to support a book on psychometric theory as well as publications in personality research. For more information, see the <a href="https://personality-project.org/r">https://personality-project.org/r</a> web page. / GPL (>= 2) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| quadprog | 1.5_5   | This package contains routines and documentation for solving quadratic programming problems. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| quantmod | 0.4_14  | Specify, build, trade, and analyse quantitative financial trading strategies. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| quantreg | 5.38    | Estimation and inference methods for models of conditional quantiles: Linear and nonlinear parametric and non-parametric (total variation penalized) models for conditional quantiles of a univariate response and several methods for handling censored survival data. Portfolio selection methods based on expected shortfall risk are also included. / GPL (>= 2) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| qvcalc   | 0.9_1   | Functions to compute quasi variances and associated measures of approximation error. / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| 1584     |         | Chapter 3. Anaconda Cloud  | osx-64,<br>win-32,<br>win-64                                      |

Table 51: R

| Name       | Version | Summary/License   | Platforms   |
|------------|---------|---|---|
| r          | 3.6.0   | R is a free software environment for statistical computing and graphics. / GPL-3.0  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| r-abc.data | 1.0     | Contains data which are used by functions of the ‘abc’ package. / GPL (>= 3)  | noarch  |
| r-abc.rap  | 0.9.0   | It aims to identify candidate genes that are “differentially methylated” between cases and controls. It applies Student’s t-test and delta beta analysis to identify candidate genes containing multiple “CpG sites”. / GPL-3   | noarch  |
| r-abcoptim | 0.15.0  | An implementation of Karaboga (2005) Artificial Bee Colony Optimization algorithm < <a href="http://mf.erciyes.edu.tr/abc/pub/tr06_2005.pdf">http://mf.erciyes.edu.tr/abc/pub/tr06_2005.pdf</a> >. This (working) version is a Work-in-progress, which is why it has been implemented using pure R code. This was developed upon the basic version programmed in C and distributed at the algorithm’s official website. / MIT file LICENSE  | linux-64,<br>osx-64,<br>win-64                                    |
| r-abcp2    | 1.2     | Tests the goodness of fit of a distribution of offspring to the Normal, Poisson, and Gamma distribution and estimates the proportional paternity of the second male (P2) based on the best fit distribution. / GPL-2  | noarch  |
| r-abe      | 3.0.1   | Performs augmented backward elimination and checks the stability of the obtained model. Augmented backward elimination combines significance or information based criteria with the change in estimate to either select the optimal model for prediction purposes or to serve as a tool to obtain a practically sound, highly interpretable model. More details can be found in Dunkler et al. (2014) < <a href="https://doi.org/10.1371/journal.pone.0113677">doi:10.1371/journal.pone.0113677</a> >. / GPL (>= 2) | noarch  |
| r-abf2     | 0.7.1   | Loads ABF2 files containing gap-free data from electrophysiological recordings, as created by Axon Instruments/Molecular Devices software such as pClamp 10. / Artistic-2.0   | noarch  |
| r-abind    | 1.4.5   | Combine multidimensional arrays into a single array. This is a generalization of ‘cbind’ and ‘rbind’. Works with vectors, matrices, and higher-dimensional arrays. Also provides functions ‘adrop’, ‘asub’, and ‘afill’ for manipulating, extracting and replacing data in arrays. / LGPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name                 | Version | Summary/License   | Platforms |
|----------------------|---------|---|-----------|
| r-abnormality        | 0.1.0   | Contains the functions to implement the methodology and considerations laid out by Marks et al. in the manuscript Measuring Abnormality in High Dimensional Spaces: Applications in Biomechanical Gait Analysis. As of 2/27/2018 this paper has been submitted and is under scientific review. Using high-dimensional datasets to measure a subject's overall level of abnormality as compared to a reference population is often needed in outcomes research. Utilizing applications in instrumented gait analysis, that article demonstrates how using data that is inherently non-independent to measure overall abnormality may bias results. A methodology is introduced to address this bias to accurately measure overall abnormality in high dimensional spaces. While this methodology is in line with previous literature, it differs in two major ways. Advantageously, it can be applied to datasets in which the number of observations is less than the number of features/variables, and it can be abstracted to practically any number of domains or dimensions. After applying the proposed methodology to the original data, the researcher is left with a set of uncorrelated variables (i.e. principal components) with which overall abnormality can be measured without bias. Different considerations are discussed in that article in deciding the appropriate number of principal components to keep and the aggregate distance measure to utilize. / MIT file LICENSE | noarch    |
| r-abodoutlier        | 0.1     | Performs angle-based outlier detection on a given dataframe. Three methods are available, a full but slow implementation using all the data that has cubic complexity, a fully randomized one which is way more efficient and another using k-nearest neighbours. These algorithms are specially well suited for high dimensional data outlier detection. / MIT file LICENSE  | noarch    |
| r-abps               | 0.3     | An implementation of the Abnormal Blood Profile Score (ABPS, part of the Athlete Biological Passport program of the World Anti-Doping Agency), which combines several blood parameters into a single score in order to detect blood doping (Sottas et al. (2006) <doi:10.2202/1557-4679.1011>). The package also contains functions to calculate other scores used in anti-doping programs, such as the OFF-score (Gore et al. (2003) <http://www.haematologica.org/content/88/3/333>), as well as example data. / GPL (>= 2)   | noarch    |
| r-ac3net             | 1.2.2   | Infers directional conservative causal core (gene) networks. It is an advanced version of the algorithm C3NET by providing directional network. Gokmen Altay (2018) <doi:10.1101/271031>, bioRxiv. / GPL (>= 3)   | noarch    |
| r-aca                | 1.1     | Offers an interactive function for the detection of breakpoints in series. / GPL  | noarch    |
| r-acceptancesampling | 1.0_6   | Provides functionality for creating and evaluating acceptance sampling plans. Sampling plans can be single, double or multiple. / GPL (>= 3)  | noarch    |
| r-acclma             | 1.0     | The main function is plotLMA(sourcefile,header) that takes a data set and plots the appropriate LMA and ACC graphs. If no sourcefile (a string) was passed, a manual data entry window is opened. The header parameter indicates by TRUE/FALSE (false by default) if the source CSV file has a head row or not. The data set should contain only one independent variable (X) and one dependent variable (Y) and can contain a weight for each observation / GPL-2  | noarch    |
| r-accrued            | 1.4.1   | Package for visualizing data quality of partially accruing data. / GPL-3  | noarch    |
| r-acd                | 1.5.3   | Categorical data analysis with complete or missing responses / GPL (>= 2)   | noarch    |

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms  |
|-----------------------------|---------|---|--|
| <a href="#">r-ace2fastq</a> | 0.6.0   | The ACE file format is used in genomics to store contigs from sequencing machines. This tools converts it into FASTQ format. Both formats contain the sequence characters and their corresponding quality information. Unlike the FASTQ file, the ace file stores the quality values numerically. The conversion algorithm uses the standard Sanger formula. The package facilitates insertion into pipelines, and content inspection. / GPL-3  | noarch   |
| <a href="#">r-acepack</a>   | 1.4.1   | Two nonparametric methods for multiple regression transform selection are provided. The first, Alternative Conditional Expectations (ACE), is an algorithm to find the fixed point of maximal correlation, i.e. it finds a set of transformed response variables that maximizes $R^2$ using smoothing functions [see Breiman, L., and J.H. Friedman. 1985. Estimating Optimal Transformations for Multiple Regression and Correlation. Journal of the American Statistical Association. 80:580-598. <doi:10.1080/01621459.1985.10478157>]. Also included is the Additivity Variance Stabilization (AVAS) method which works better than ACE when correlation is low [see Tibshirani, R.. 1986. Estimating Transformations for Regression via Additivity and Variance Stabilization. Journal of the American Statistical Association. 83:394-405. <doi:10.1080/01621459.1988.10478610>]. A good introduction to these two methods is in chapter 16 of Frank Harrel's Regression Modeling Strategies in the Springer Series in Statistics. / MIT file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-acet</a>      | 1.8.0   | Twin models that are able to estimate the dynamic behaviour of the variance components in the classical twin models with respect to age using B-splines and P-splines. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-acfperiod</a> | 1.0.0   | Non-robust and robust computations of the sample autocovariance (ACOVF) and sample autocorrelation functions (ACF) of univariate and multivariate processes. The methodology consists in reversing the diagonalization procedure involving the periodogram or the cross-periodogram and the Fourier transform vectors, and, thus, obtaining the ACOVF or the ACF as discussed in Fuller (1995) <doi:10.1002/9780470316917>. The robust version is obtained by fitting robust M-regressors to obtain the M-periodogram or M-cross-periodogram as discussed in Reisen et al. (2017) <doi:10.1016/j.jspi.2017.02.008>. / GPL (>= 2)  | noarch   |
| <a href="#">r-acm4r</a>     | 1.0     | Fragment lengths or molecular weights from pairs of lanes are compared, and a number of matching bands are calculated using the Align-and-Count Method. / GPL   | noarch   |
| <a href="#">r-acmer</a>     | 1.1.0   | Implementation of estimator ACME, described in Wolpert (2015), ACME: A Partially Periodic Estimator of Avian & Chiropteran Mortality at Wind Turbines (submitted). Unlike most other models, this estimator supports decreasing-hazard Weibull model for persistence; decreasing search proficiency as carcasses age; variable bleed-through at successive searches; and interval mortality estimates. The package provides, based on search data, functions for estimating the mortality inflation factor in Frequentist and Bayesian settings. / MIT file LICENSE   | noarch   |
| <a href="#">r-acnr</a>      | 1.0.0   | Provides SNP array data from different types of copy-number regions. These regions were identified manually by the authors of the package and may be used to generate realistic data sets with known truth. / LGPL (>= 2.1)   | noarch   |

| Name                        | Version | Summary/License  | Platforms                      |
|-----------------------------|---------|--|--------------------------------|
| <a href="#">r-acopula</a>   | 0.9.3   | Archimax copulas are mixture of Archimedean and EV copulas. The package provides definitions of several parametric families of generator and dependence function, computes CDF and PDF, estimates parameters, tests for goodness of fit, generates random sample and checks copula properties for custom constructs. In 2-dimensional case explicit formulas for density are used, in the contrary to higher dimensions when all derivatives are linearly approximated. Several non-archimax families (normal, FGM, Plackett) are provided as well. / GPL-2  | noarch                         |
| <a href="#">r-acp</a>       | 2.1     | Analysis of count data exhibiting autoregressive properties, using the Autoregressive Conditional Poisson model (ACP(p,q)) proposed by Heinen (2003). / GPL-2  | noarch                         |
| <a href="#">r-acrt</a>      | 1.0.1   | Functions for testing affine hypotheses on the regression coefficient vector in regression models with autocorrelated errors. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-acs</a>       | 2.1.4   | Provides a general toolkit for downloading, managing, analyzing, and presenting data from the U.S. Census (< <a href="https://www.census.gov/data/developers/data-sets.html">https://www.census.gov/data/developers/data-sets.html</a> >), including SF1 (Decennial short-form), SF3 (Decennial long-form), and the American Community Survey (ACS). Confidence intervals provided with ACS data are converted to standard errors to be bundled with estimates in complex acs objects. Package provides new methods to conduct standard operations on acs objects and present/plot data in statistically appropriate ways. / GPL-3                             | noarch                         |
| <a href="#">r-acss</a>      | 0.2.5   | Main functionality is to provide the algorithmic complexity for short strings, an approximation of the Kolmogorov Complexity of a short string using the coding theorem method (see ?acss). The database containing the complexity is provided in the data only package acss.data, this package provides functions accessing the data such as prob_random returning the posterior probability that a given string was produced by a random process. In addition, two traditional (but problematic) measures of complexity are also provided: entropy and change complexity. / GPL (>= 2)   | noarch                         |
| <a href="#">r-acss.data</a> | 1.0     | Data only package providing the algorithmic complexity of short strings, computed using the coding theorem method. For a given set of symbols in a string, all possible or a large number of random samples of Turing machines (TM) with a given number of states (e.g., 5) and number of symbols corresponding to the number of symbols in the strings were simulated until they reached a halting state or failed to end. This package contains data on 4.5 million strings from length 1 to 12 simulated on TMs with 2, 4, 5, 6, and 9 symbols. The complexity of the string corresponds to the distribution of the halting states of the TMs. / GPL (>= 2) | noarch                         |
| <a href="#">r-acswt</a>     | 1.0     | A book designed to meet the requirements of masters students. Tattar, P.N., Suresh, R., and Manjunath, B.G. A Course in Statistics with R, J. Wiley, ISBN 978-1-119-15272-9. / GPL-2   | noarch                         |

|----------------------|---------|--|--------------------------------|
| r-activedriver       | 1.0.0   | A mutation analysis tool that discovers cancer driver genes with frequent mutations in protein signalling sites such as post-translational modifications (phosphorylation, ubiquitination, etc). The Poisson generalised linear regression model identifies genes where cancer mutations in signalling sites are more frequent than expected from the sequence of the entire gene. Integration of mutations with signalling information helps find new driver genes and propose candidate mechanisms to known drivers. Reference: Systematic analysis of somatic mutations in phosphorylation signaling predicts novel cancer drivers. Juri Reimand and Gary D Bader. Molecular Systems Biology (2013) 9:637 <doi:10.1038/msb.2012.68>. / GPL (>= 2) | noarch                         |
| r-activityindex      | 0.3.6   | Read raw accelerometry from 'GT3X' data and plain table data to calculate Activity Index from Bai et al. (2016) <doi:10.1371/journal.pone.0160644>. / GPL-3  | noarch                         |
| r-activpalprocessing | 1.0.2   | Performs estimation of physical activity and sedentary behavior variables from activPAL (PAL Technologies, Glasgow, Scotland) events files. See < <a href="http://paltechnologies.com">http://paltechnologies.com</a> > for more information on the activPAL. / GPL-2   GPL-3  | noarch                         |
| r-ada                | 2.0.5   | Performs discrete, real, and gentle boost under both exponential and logistic loss on a given data set. The package ada provides a straightforward, well-documented, and broad boosting routine for classification, ideally suited for small to moderate-sized data sets. / GPL  | noarch                         |
| r-adagio             | 0.7.1   | The R package 'adagio' will provide methods and algorithms for discrete optimization, e.g. knapsack and subset sum procedures, derivative-free Nelder-Mead and Hooke-Jeeves minimization, and some (evolutionary) global optimization functions. / GPL (>= 3)  | linux-64,<br>osx-64,<br>win-64 |
| r-adaptivesparsity   | 1.6     | Implements Figueiredo EM algorithm for adaptive sparsity (Jeffreys prior) (see Figueiredo, M.A.T.; , Adaptive sparseness for supervised learning, Pattern Analysis and Machine Intelligence, IEEE Transactions on , vol.25, no.9, pp. 1150- 1159, Sept. 2003) and Wong algorithm for adaptively sparse gaussian geometric models (see Wong, Eleanor, Suyash Awate, and P. Thomas Fletcher. Adaptive Sparsity in Gaussian Graphical Models. In Proceedings of the 30th International Conference on Machine Learning (ICML-13), pp. 311-319. 2013.) / LGPL (>= 3.0)  | linux-64,<br>osx-64,<br>win-64 |
| r-adaptivetau        | 2.2.3   | Implements adaptive tau leaping to approximate the trajectory of a continuous-time stochastic process as described by Cao et al. (2007) The Journal of Chemical Physics <doi:10.1063/1.2745299> (aka. the Gillespie stochastic simulation algorithm). This package is based upon work supported by NSF DBI-0906041 and NIH K99-GM104158 to Philip Johnson and NIH R01-AI049334 to Rustom Antia. / GPL (>= 3)   | linux-64,<br>osx-64,<br>win-64 |
| r-adaptmcmc          | 1.3     | Enables sampling from arbitrary distributions if the log density is known up to a constant; a common situation in the context of Bayesian inference. The implemented sampling algorithm was proposed by Vihola (2012) <DOI:10.1007/s11222-011-9269-5> and achieves often a high efficiency by tuning the proposal distributions to a user defined acceptance rate. / GPL (>= 2)  | noarch                         |
| r-adapmtmt           | 1.0.0   | Implementation of adaptive p-value thresholding (AdaPT), including both a framework that allows the user to specify any algorithm to learn local false discovery rate and a pool of convenient functions that implement specific algorithms. See Lei, Lihua and Fithian, William (2016) <arXiv:1609.06035>. / MIT file LICENSE   | noarch                         |

|-------------------|---------|---|--------------------------------|
| r-adapttest       | 1.0     | The functions defined in this program serve for implementing adaptive two-stage tests. Currently, four tests are included: Bauer and Koehne (1994), Lehmacher and Wassmer (1999), Vandemeulebroecke (2006), and the horizontal conditional error function. User-defined tests can also be implemented. Reference: Vandemeulebroecke, An investigation of two-stage tests, Statistica Sinica 2006. / GPL ( $\geq 2$ )  | noarch                         |
| r-adct            | 0.1.0   | Existing adaptive design methods in clinical trials. The package includes power, stopping boundaries (sample size) calculation functions for two-group group sequential designs, adaptive design with coprimary endpoints, biomarker-informed adaptive design, etc. / GPL ( $\geq 2$ )  | noarch                         |
| r-addhaz          | 0.5     | Functions to fit the binomial and multinomial additive hazard models and to estimate the contribution of diseases/conditions to the disability prevalence, as proposed by Nusselder and Looman (2004) and extended by Yokota et al (2017). / GPL-3  | noarch                         |
| r-additivitytests | 1.1_4   | Implementation of the Tukey, Mandel, Johnson-Graybill, LBI, Tusell and modified Tukey non-additivity tests. / GPL-3   | noarch                         |
| r-addt            | 2.0     | Accelerated destructive degradation tests (ADDT) are often used to collect necessary data for assessing the long-term properties of polymeric materials. Based on the collected data, a thermal index (TI) is estimated. The TI can be useful for material rating and comparison. This package implements the traditional method based on the least-squares method, the parametric method based on maximum likelihood estimation, and the semiparametric method based on spline methods, and the corresponding methods for estimating TI for polymeric materials. The traditional approach is a two-step approach that is currently used in industrial standards, while the parametric method is widely used in the statistical literature. The semiparametric method is newly developed. Both the parametric and semiparametric approaches allow one to do statistical inference such as quantifying uncertainties in estimation, hypothesis testing, and predictions. Publicly available datasets are provided illustrations. More details can be found in Jin et al. (2017). / GPL-2 | noarch                         |
| r-ade4            | 1.7_13  | Tools for multivariate data analysis. Several methods are provided for the analysis (i.e., ordination) of one-table (e.g., principal component analysis, correspondence analysis), two-table (e.g., coinertia analysis, redundancy analysis), three-table (e.g., RLQ analysis) and K-table (e.g., STATIS, multiple coinertia analysis). The philosophy of the package is described in Dray and Dufour (2007) <doi:10.18637/jss.v022.i04>. / GPL ( $\geq 2$ )  | linux-64,<br>osx-64,<br>win-64 |
| r-ade4tkgui       | 0.2_9   | A Tcl/Tk GUI for some basic functions in the ‘ade4’ package. / GPL ( $\geq 2$ )   | noarch                         |
| r-adegraphics     | 1.0_15  | Graphical functionalities for the representation of multivariate data. It is a complete re-implementation of the functions available in the ‘ade4’ package. / GPL ( $\geq 2$ )  | noarch                         |
| r-adeptdata       | 1.0.1   | Created to host raw accelerometry data sets and their derivatives which are used in the corresponding ‘adept’ package. / GPL-3  | noarch                         |
| r-adequacymodel   | 2.0.0   | The main application concerns to a new robust optimization package with two major contributions. The first contribution refers to the assessment of the adequacy of probabilistic models through a combination of several statistics, which measure the relative quality of statistical models for a given data set. The second one provides a general purpose optimization method based on meta-heuristics functions for maximizing or minimizing an arbitrary objective function. / GPL ( $\geq 2$ )  | noarch                         |

Table 51 – continued from previous page

| Name                          | Version | Summary/License  | Platforms   |
|-------------------------------|---------|--|---|
| <a href="#">r-adfexplorer</a> | 0.1.4   | Amiga Disk Files (ADF) are virtual representations of 3.5 inch floppy disks for the Commodore Amiga. Most disk drives from other systems (including modern drives) are not able to read these disks. To be able to emulate this system, the ADF format was created. This package enables you to read ADF files and import and export files from and to such virtual DOS-formatted disks. / GPL-3   | noarch  |
| <a href="#">r-adgofest</a>    | 0.3     | Anderson-Darling GoF test with p-value calculation based on Marsaglia's 2004 paper Evaluating the Anderson-Darling Distribution / GPL  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-adimpro</a>     | 0.9.0   | Implements tools for manipulation of digital images and the Propagation Separation approach by Polzehl and Spokoiny (2006) <DOI:10.1007/s00440-005-0464-1> for smoothing digital images, see Polzehl and Tabelow (2007) <DOI:10.18637/jss.v019.i01>. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-adjclust</a>    | 0.5.7   | Implements a constrained version of hierarchical agglomerative clustering, in which each observation is associated to a position, and only adjacent clusters can be merged. Typical application fields in bioinformatics include Genome-Wide Association Studies or Hi-C data analysis, where the similarity between items is a decreasing function of their genomic distance. Taking advantage of this feature, the implemented algorithm is time and memory efficient. This algorithm is described in Chapter 4 of Alia Dehman (2015) < <a href="https://hal.archives-ouvertes.fr/tel-01288568v1">https://hal.archives-ouvertes.fr/tel-01288568v1</a> >. / GPL-3 | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-adklakedata</a> | 0.6.1   | Package for the access and distribution of Long-term lake datasets from lakes in the Adirondack Park, northern New York state. Includes a wide variety of physical, chemical, and biological parameters from 28 lakes. Data are from multiple collection organizations and have been harmonized in both time and space for ease of reuse. / MIT file LICENSE   | noarch  |
| <a href="#">r-admisc</a>      | 0.3     | Contains functions used across packages 'QCA', 'DDIwR', and 'venn'. Interprets and translates DNF - Disjunctive Normal Form expressions, for both binary and multi-value crisp sets, and extracts information (set names, set values) from those expressions. Other functions perform various other checks if possibly numeric (even if all numbers reside in a character vector) and coerce to numeric, or check if the numbers are whole. It also offers, among many others, a highly flexible recoding function. / GPL (>= 2)   | noarch  |
| <a href="#">r-admit</a>       | 2.1.3   | Provides functions to perform the fitting of an adaptive mixture of Student-t distributions to a target density through its kernel function as described in Ardia et al. (2009) <doi:10.18637/jss.v029.i03>. The mixture approximation can then be used as the importance density in importance sampling or as the candidate density in the Metropolis-Hastings algorithm to obtain quantities of interest for the target density itself. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64                                    |

|---------------------------|---------|--|--------------------------------|
| <a href="#">r-admmnet</a> | 0.1     | Fit linear and cox models regularized with net (L1 and Laplacian), elastic-net (L1 and L2) or lasso (L1) penalty, and their adaptive forms, such as adaptive lasso and net adjusting for signs of linked coefficients. In addition, it treats the number of non-zero coefficients as another tuning parameter and simultaneously selects with the regularization parameter. The package uses one-step coordinate descent algorithm and runs extremely fast by taking into account the sparsity structure of coefficients. / GPL ( $\geq 2$ )   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-adoptr</a>  | 0.2.2   | Optimize one or two-arm, two-stage designs for clinical trials with respect to several pre-implemented objective criteria or implement custom objectives. Optimization under uncertainty and conditional (given stage-one outcome) constraints are supported. See Pilz M, Kunzmann K, Herrmann C, Rauch G, Kieser M. A variational approach to optimal two-stage designs. Statistics in Medicine. 2019;13. <doi:10.1002/sim.8291> for details. / MIT file LICENSE  | noarch                         |
| <a href="#">r-adpf</a>    | 0.0.1   | This function takes a vector or matrix of data and smooths the data with an improved Savitzky Golay transform. The Savitzky-Golay method for data smoothing and differentiation calculates convolution weights using Gram polynomials that exactly reproduce the results of least-squares polynomial regression. Use of the Savitzky-Golay method requires specification of both filter length and polynomial degree to calculate convolution weights. For maximum smoothing of statistical noise in data, polynomials with low degrees are desirable, while a high polynomial degree is necessary for accurate reproduction of peaks in the data. Extension of the least-squares regression formalism with statistical testing of additional terms of polynomial degree to a heuristically chosen minimum for each data window leads to an adaptive-degree polynomial filter (ADPF). Based on noise reduction for data that consist of pure noise and on signal reproduction for data that is purely signal, ADPF performed nearly as well as the optimally chosen fixed-degree Savitzky-Golay filter and outperformed sub-optimally chosen Savitzky-Golay filters. For synthetic data consisting of noise and signal, ADPF outperformed both optimally chosen and sub-optimally chosen fixed-degree Savitzky-Golay filters. See Barak, P. (1995) <doi:10.1021/ac00113a006> for more information. / GPL-3 | noarch                         |
| <a href="#">r-adpss</a>   | 0.1.1   | Provides the functions for planning and conducting a clinical trial with adaptive sample size determination. Maximal statistical efficiency will be exploited even when dramatic or multiple adaptations are made. Such a trial consists of adaptive determination of sample size at an interim analysis and implementation of frequentist statistical test at the interim and final analysis with a prefixed significance level. The required assumptions for the stage-wise test statistics are independent and stationary increments and normality. Predetermination of adaptation rule is not required. / GPL ( $\geq 2$ )   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-advdif4</a> | 0.7.18  | This software solves an Advection Bi-Flux Diffusive Problem using the Finite Difference Method FDM. Vasconcellos, J.F.V., Marinho, G.M., Zanni, J.H., 2016, Numerical analysis of an anomalous diffusion with a bimodal flux distribution. <doi:10.1016/j.rimni.2016.05.001>. Silva, L.G., Knupp, D.C., Bevilacqua, L., Galeao, A.C.N.R., Silva Neto, A.J., 2014, Formulation and solution of an Inverse Anomalous Diffusion Problem with Stochastic Techniques. <doi:10.5902/2179460X13184>. In this version, it is possible to include a source as a function depending on space and time, that is, $s(x,t)$ . / GPL-3   | noarch                         |

| Name                          | Version | Summary/License  | Platforms   |
|-------------------------------|---------|--|---|
| <code>r-adwordsr</code>       | 0.3.1   | Allows access to selected services that are part of the ‘Google Adwords’ API < <a href="https://developers.google.com/adwords/api/docs/guides/start">https://developers.google.com/adwords/api/docs/guides/start</a> >. ‘Google Adwords’ is an online advertising service by ‘Google’, that delivers Ads to users. This package offers a authentication process using ‘OAUTH2’. Currently, there are two methods of data of accessing the API, depending on the type of request. One method uses ‘SOAP’ requests which require building an ‘XML’ structure and then sent to the API. These are used for the ‘ManagedCustomerService’ and the ‘TargetingIdeaService’. The second method is by building ‘AWQL’ queries for the reporting side of the ‘Google Adwords’ API. / MIT file LICENSE  | noarch  |
| <code>r-aer</code>            | 1.2_6   | Functions, data sets, examples, demos, and vignettes for the book Christian Kleiber and Achim Zeileis (2008), Applied Econometrics with R, Springer-Verlag, New York. ISBN 978-0-387-77316-2. (See the vignette AER for a package overview.) / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-afc</code>            | 1.4.0   | This is an implementation of the Generalized Discrimination Score (also known as Two Alternatives Forced Choice Score, 2AFC) for various representations of forecasts and verifying observations. The Generalized Discrimination Score is a generic forecast verification framework which can be applied to any of the following verification contexts: dichotomous, polychotomous (ordinal and nominal), continuous, probabilistic, and ensemble. A comprehensive description of the Generalized Discrimination Score, including all equations used in this package, is provided by Mason and Weigel (2009) < <a href="https://doi.org/10.1175/MWR-D-10-05069.1">doi:10.1175/MWR-D-10-05069.1</a> >. / GPL-3  | noarch  |
| <code>r-afex</code>           | 0.23_0  | Convenience functions for analyzing factorial experiments using ANOVA or mixed models. <code>aov_ez()</code> , <code>aov_car()</code> , and <code>aov_4()</code> allow specification of between, within (i.e., repeated-measures), or mixed (i.e., split-plot) ANOVAs for data in long format (i.e., one observation per row), automatically aggregating multiple observations per individual and cell of the design. <code>mixed()</code> fits mixed models using <code>lme4::lmer()</code> and computes p-values for all fixed effects using either Kenward-Roger or Satterthwaite approximation for degrees of freedom (LMM only), parametric bootstrap (LMMs and GLMMs), or likelihood ratio tests (LMMs and GLMMs). <code>afex_plot()</code> provides a high-level interface for interaction or one-way plots using <code>ggplot2</code> , combining raw data and model estimates. <code>afex</code> uses type 3 sums of squares as default (imitating commercial statistical software). / GPL (>= 2) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-affluenceindex</code> | 1.0     | Computes the statistical indices of affluence (richness) and constructs bootstrap confidence intervals for these indices. Also computes the Wolfson polarization index. / GPL-2  | noarch  |

| Name                | Version | Summary/License   | Platforms                      |
|---------------------|---------|---|--------------------------------|
| r-afpt              | 1.0.0   | Allows estimation and modelling of flight costs in animal (vertebrate) flight, implementing the aerodynamic power model described in Klein Heerenbrink et al. (2015) <doi:10.1098/rspa.2014.0952>. Taking inspiration from the program 'Flight', developed by Colin Pennycuik (Pennycuik (2008) Modelling the flying bird. Amsterdam: Elsevier. ISBN 0-19-857721-4), flight performance is estimated based on basic morphological measurements such as body mass, wingspan and wing area. 'afpt' can be used to make predictions on how animals should adjust their flight behaviour and wingbeat kinematics to varying flight conditions. / GPL (>= 3) | noarch                         |
| r-aggregater        | 0.0.2   | Convenience functions for aggregating data frame. Currently mean, sum and variance are supported. For Date variables, recency and duration are supported. There is also support for dummy variables in predictive contexts. / GPL-2   | noarch                         |
| r-aggregation       | 1.0.1   | Contains functionality for performing the following methods of p-value aggregation: Fisher's method [Fisher, RA (1932, ISBN: 9780028447308)], the Lancaster method (weighted Fisher's method) [Lancaster, HO (1961, <doi:10.1111/j.1467-842X.1961.tb00058.x>)], and Sidak correction [Sidak, Z (1967, <doi:10.1080/01621459.1967.10482935>)]. Please cite Yi et al., the manuscript corresponding to this package [Yi, L et al., (2017), <doi:10.1101/190199>]. / GPL-3   | noarch                         |
| r-aghmatrix         | 1.0.2   | Computation of A (pedigree), G (genomic-base), and H (A corrected by G) relationship matrices for diploid and autopolyploid species. Several methods are implemented considering additive and non-additive models. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-agop              | 0.2_2   | Tools supporting multi-criteria and group decision making, including variable number of criteria, by means of aggregation operators, spread measures, fuzzy logic connectives, fusion functions, and preordered sets. Possible applications include, but are not limited to, quality management, scientometrics, software engineering, etc. / LGPL (>= 3)   | linux-64,<br>osx-64,<br>win-64 |
| r-agreementinterval | 0.1.1   | A tool for calculating agreement interval of two measurement methods (Jason Liao (2015) <DOI:10.1515/ijb-2014-0030>) and present results in plots with discordance rate and/or clinically meaningful limit to quantify agreement quality. / MIT file LICENSE  | noarch                         |
| r-agridat           | 1.16    | Datasets from books, papers, and websites related to agriculture. Example graphics and analyses are included. Data come from small-plot trials, multi-environment trials, uniformity trials, yield monitors, and more. / CC BY-SA 4.0   | noarch                         |
| r-agrmt             | 1.40.4  | Calculate agreement or consensus in ordered rating scales. The package implements van der Eijk's (2001) <DOI: 10.1023/A:1010374114305> measure of agreement A, which can be used to describe agreement, consensus, or polarization among respondents. It also implements measures of consensus (dispersion) by Leik, Tatsle and Wierman, Blair and Lacy, Kvalseth, Berry and Mielke, and Garcia-Montalvo and Reynal-Querol. Furthermore, an implementation of Galtungs AJUS-system is provided to classify distributions, as well as a function to identify the position of multiple modes. / GPL-3   | noarch                         |
| r-agsemisc          | 1.3_1   | High-featured panel functions for bwplot and xyplot, some plot management helpers, various convenience functions / GPL-2  | noarch                         |

|-----------------------------------|---------|---|--------------------------------|
| <a href="#">r-ahaz</a>            | 1.14    | Computationally efficient procedures for regularized estimation with the semi-parametric additive hazards regression model. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ahocorasicktrie</a> | 0.1.0   | Aho-Corasick is an optimal algorithm for finding many keywords in a text. It can locate all matches in a text in $O(NM)$ time; i.e., the time needed scales linearly with the number of keywords (N) and the size of the text (M). Compare this to the naive approach which takes $O(N*M)$ time to loop through each pattern and scan for it in the text. This implementation builds the trie (the generic name of the data structure) and runs the search in a single function call. If you want to search multiple texts with the same trie, the function will take a list or vector of texts and return a list of matches to each text. By default, all 128 ASCII characters are allowed in both the keywords and the text. A more efficient trie is possible if the alphabet size can be reduced. For example, DNA sequences use at most 19 distinct characters and usually only 4; protein sequences use at most 26 distinct characters and usually only 20. UTF-8 (Unicode) matching is not currently supported. / Apache License 2.0 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-aidar</a>           | 1.0.5   | Read objects from the AIDA (< <a href="http://aida.freehep.org/">http://aida.freehep.org/</a> >) file and make them available as dataframes in R. / LGPL (>= 2)   | noarch                         |
| <a href="#">r-aim</a>             | 1.01    | R functions for adaptively constructing index models for continuous, binary and survival outcomes. Implementation requires loading R-pacakge survival / LGPL-2  | noarch                         |
| <a href="#">r-airgr</a>           | 1.3.2.1 | Hydrological modelling tools developed at Irstea-Antony (HYCAR Research Unit, France). The package includes several conceptual rainfall-runoff models (GR4H, GR4J, GR5J, GR6J, GR2M, GR1A), a snow accumulation and melt model (CemaNeige) and the associated functions for their calibration and evaluation. Use help(airGR) for package description and references. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-airthermo</a>       | 1.2.1   | Deals with many computations related to the thermodynamics of atmospheric processes. It includes many functions designed to consider the density of air with varying degrees of water vapour in it, saturation pressures and mixing ratios, conversion of moisture indices, computation of atmospheric states of parcels subject to dry or pseudoadiabatic vertical evolutions and atmospheric instability indices that are routinely used for operational weather forecasts or meteorological diagnostics. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ake</a>             | 1.0     | Continuous and discrete (count or categorical) estimation of density, probability mass function (p.m.f.) and regression functions are performed using associated kernels. The cross-validation technique and the local Bayesian procedure are also implemented for bandwidth selection. / GPL (>= 2)  | noarch                         |
| <a href="#">r-akima</a>           | 0.6_2   | Several cubic spline interpolation methods of H. Akima for irregular and regular gridded data are available through this package, both for the bivariate case (irregular data: ACM 761, regular data: ACM 760) and univariate case (ACM 433 and ACM 697). Linear interpolation of irregular gridded data is also covered by reusing D. J. Renkas triangulation code which is part of Akima's Fortran code. A bilinear interpolator for regular grids was also added for comparison with the bicubic interpolator on regular grids. / ACM   file LICENSE (Restricts use)   | linux-64,<br>osx-64,<br>win-64 |

| <a href="#">r-albopictus</a>            | 0.5     | Implements discrete time deterministic and stochastic age-structured population dynamics models described in Erguler and others (2016) <doi:10.1371/journal.pone.0149282> and Erguler and others (2017) <doi:10.1371/journal.pone.0174293>. / GPL (>= 3)  | noarch                         |
| <a href="#">r-ald</a>                   | 1.2     | It provides the density, distribution function, quantile function, random number generator, likelihood function, moments and Maximum Likelihood estimators for a given sample, all this for the three parameter Asymmetric Laplace Distribution defined in Koenker and Machado (1999). This is a special case of the skewed family of distributions available in Galarza et.al. (2017) <doi:10.1002/sta4.140> useful for quantile regression. / GPL (>= 2)  | noarch                         |
| <a href="#">r-alf</a>                   | 1.2.1   | Allows you to connect to an 'Alfresco' content management repository and interact with its contents using simple and intuitive functions. You will be able to establish a connection session to the 'Alfresco' repository, read and upload content and manage folder hierarchies. For more details on the 'Alfresco' content management repository see < <a href="https://www.alfresco.com/ecm-software/document-management">https://www.alfresco.com/ecm-software/document-management</a> >. / GPL-3   file LICENSE  | noarch                         |
| <a href="#">r-algaeclassify</a>         | 0.1.0   | Functions designed to facilitate the assignment of morpho-functional group (MFG) classifications to phytoplankton species based on a combination of taxonomy (Class,Order) and a suite of 7 binomial functional traits. Classifications can also be made using only a species list and a database of trait-derived classifications included in the package. MFG classifications are derived from Salmaso et al. (2015) <doi:10.1111/fwb.12520> and this reference should be cited when using the package. The 'algaeClassify' package is a product of the GEISHA (Global Evaluation of the Impacts of Storms on freshwater Habitat and Structure of phytoplankton Assemblages), funded by CESAB (Centre for Synthesis and Analysis of Biodiversity) and the USGS John Wesley Powell Center, with data and other support provided by members of GLEON (Global Lake Ecology Observation Network). This software is preliminary or provisional and is subject to revision. It is being provided to meet the need for timely best science. The software has not received final approval by the U.S. Geological Survey (USGS). No warranty, expressed or implied, is made by the USGS or the U.S. Government as to the functionality of the software and related material nor shall the fact of release constitute any such warranty. The software is provided on the condition that neither the USGS nor the U.S. Government shall be held liable for any damages resulting from the authorized or unauthorized use of the software. / GPL (>= 3) | noarch                         |
| <a href="#">r-algdesign</a>             | 1.1_7   | Algorithmic experimental designs. Calculates exact and approximate theory experimental designs for D,A, and I criteria. Very large designs may be created. Experimental designs may be blocked or blocked designs created from a candidate list, using several criteria. The blocking can be done when whole and within plot factors interact. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-algebraichaplopackage</a> | 1.2     | Two unordered pairs of data of two different snips positions is haplotyped by resolving a small number of closed equations. / GPL-2   | noarch                         |

| Name                           | Version | Summary/License   | Platforms                      |
|--------------------------------|---------|---|--------------------------------|
| <a href="#">r-algorithmia</a>  | 0.2.0   | The company, Algorithmia, houses the largest marketplace of online algorithms. This package essentially holds a bunch of REST wrappers that make it very easy to call algorithms in the Algorithmia platform and access files and directories in the Algorithmia data API. To learn more about the services they offer and the algorithms in the platform visit <a href="http://algorithmia.com">http://algorithmia.com</a> . More information for developers can be found at <a href="http://developers.algorithmia.com">http://developers.algorithmia.com</a> . / MIT file LICENSE  | noarch                         |
| <a href="#">r-aliner</a>       | 1.1.4   | Functions are provided to calculate the ‘ALINE’ Distance between words as per (Kondrak 2000) and (Downey, Hallmark, Cox, Norquest, & Lansing, 2008, <doi:10.1080/09296170802326681>). The score is based on phonetic features represented using the Unicode-compliant International Phonetic Alphabet (IPA). Parameterized features weights are used to determine the optimal alignment and functions are provided to estimate optimum values using a genetic algorithm and supervised learning. See (Downey, Sun, and Norquest 2017, <https://journal.r-project.org/archive/2017/RJ-2017-005/index.html>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-allan</a>        | 1.01    | Automated fitting of linear regression models and a stepwise routine / GPL-3  | noarch                         |
| <a href="#">r-allanvar</a>     | 1.1     | A collection of tools for stochastic sensor error characterization using the Allan Variance technique originally developed by D. Allan. / GPL-2   | noarch                         |
| <a href="#">r-allehap</a>      | 0.9.9   | Tools to simulate alphanumeric alleles, impute genetic missing data and reconstruct non-recombinant haplotypes from pedigree databases in a deterministic way. Allelic simulations can be implemented taking into account many factors (such as number of families, markers, alleles per marker, probability and proportion of missing genotypes, recombination rate, etc). Genotype imputation can be used with simulated datasets or real databases (previously loaded in .ped format). Haplotype reconstruction can be carried out even with missing data, since the program firstly imputes each family genotype (without a reference panel), to later reconstruct the corresponding haplotypes for each family member. All this considering that each individual (due to meiosis) should unequivocally have two alleles per marker (one inherited from each parent) and thus imputation and reconstruction results can be deterministically calculated. / GPL (>= 2) | noarch                         |
| <a href="#">r-allelematch</a>  | 2.5.1   | Tools for the identification of unique of multilocus genotypes when both genotyping error and missing data may be present. The package is targeted at those working with large datasets and databases containing multiple samples of each individual, a situation that is common in conservation genetics, and particularly in non-invasive wildlife sampling applications. Functions explicitly incorporate missing data, and can tolerate allele mismatches created by genotyping error. If you use this tool, please cite the package using the journal article in Molecular Ecology Resources (Galpern et al., 2012). Please use citation(‘allelematch’) to call the full citation. For users with access to the associated journal article, tutorial material is also available as supplementary material to the article describing this software, the citation for which can be called using citation(‘allelematch’). / GPL-3                                       | noarch                         |
| <a href="#">r-alleleretain</a> | 2.0.2   | Simulate the effect of management or demography on allele retention and inbreeding accumulation in bottlenecked populations of animals with overlapping generations. / GPL (>= 2)   | noarch                         |

| Name                                   | Version | Summary/License   | Platforms                      |
|--|---------|---|--------------------------------|
| <a href="#">r-allelic</a>              | 0.1     | This is the implementation in RC of a new association test described in A fast, unbiased and exact allelic exact test for case-control association studies (Submitted). It appears that in most cases the classical chi-square test used for testing for allelic association on genotype data is biased. Our test is unbiased, exact but fast through careful optimization. / GPL ( $\geq 2$ )  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-allpossiblespellings</a> | 1.1     | Contains functions possSpells.fnc and batch.possSpells.fnc. / GPL-2   | noarch                         |
| <a href="#">r-alluvial</a>             | 0.1_2   | Creating alluvial diagrams (also known as parallel sets plots) for multivariate and time series-like data. / MIT file LICENSE   | noarch                         |
| <a href="#">r-alpaca</a>               | 0.3.1   | Provides a routine to concentrate out factors with many levels during the optimization of the log-likelihood function of the corresponding generalized linear model (glm). The package is based on the algorithm proposed by Stammann (2018) <arXiv:1707.01815> and is restricted to glm's that are based on maximum likelihood estimation and non-linear. It also offers an efficient algorithm to recover estimates of the fixed effects in a post-estimation routine and includes robust and multi-way clustered standard errors. Further the package provides an analytical bias-correction for binary choice models (logit and probit) derived by Fernandez-Val and Weidner (2016) <doi:10.1016/j.jeconom.2015.12.014>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-alphasimr</a>            | 0.10.0  | The successor to the 'AlphaSim' software for breeding program simulation [Faux et al. (2016) <doi:10.3835/plantgenome2016.02.0013>]. Used for stochastic simulations of breeding programs to the level of DNA sequence for every individual. Contained is a wide range of functions for modeling common tasks in a breeding program, such as selection and crossing. These functions allow for constructing simulations of highly complex plant and animal breeding programs via scripting in the R software environment. Such simulations can be used to evaluate overall breeding program performance and conduct research into breeding program design, such as implementation of genomic selection. Included is the 'Markovian Coalescent Simulator' ('MaCS') for fast simulation of biallelic sequences according to a population demographic history [Chen et al. (2009) <doi:10.1101/gr.083634.108>]. / MIT file LICENSE | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-alphavantageclient</a>   | 0.0.1   | Download data from the Alpha Vantage API (< <a href="https://www.alphavantage.co/">https://www.alphavantage.co/</a> >). Alpha Vantage is a RESTful API which provides various financial data, including stock prices and technical indicators. There is documentation for the underlying API available here: < <a href="https://www.alphavantage.co/documentation/">https://www.alphavantage.co/documentation/</a> >. To get access to this API, the user needs to first claim an API key: < <a href="https://www.alphavantage.co/support/">https://www.alphavantage.co/support/</a> >. / MIT file LICENSE  | noarch                         |
| <a href="#">r-alscpc</a>               | 1.0     | Using of the accelerated line search algorithm for simultaneously diagonalize a set of symmetric positive definite matrices. / GPL ( $\geq 2$ )   | noarch                         |
| <a href="#">r-alterryx</a>             | 0.5.0   | A tool to access each of the 'Alteryx' Gallery 'API' endpoints. Users can queue jobs, poll job status, and retrieve application output as a data frame. You will need an 'Alteryx' Server license and have 'Alteryx' Gallery running to utilize this package. The 'API' is accessed through the 'URL' that you setup for the server running 'Alteryx' Gallery and more information on the endpoints can be found at < <a href="https://gallery.alteryx.com/api-docs/">https://gallery.alteryx.com/api-docs/</a> >. / GPL-2  | noarch                         |
| <a href="#">r-altmeta</a>              | 2.2     | Provides alternative statistical methods for meta-analysis, including new heterogeneity tests and measures that are robust to outliers. / GPL ( $\geq 2$ )  | noarch                         |

|----------------|---------|--|--------------------------------|
| r-altopt       | 0.1.1   | Creates the optimal (D, U and I) designs for the accelerated life testing with right censoring or interval censoring. It uses generalized linear model (GLM) approach to derive the asymptotic variance-covariance matrix of regression coefficients. The failure time distribution is assumed to follow Weibull distribution with a known shape parameter and log-linear link functions are used to model the relationship between failure time parameters and stress variables. The acceleration model may have multiple stress factors, although most ALTs involve only two or less stress factors. ALTopt package also provides several plotting functions including contour plot, Fraction of Use Space (FUS) plot and Variance Dispersion graphs of Use Space (VDUS) plot. / GPL-3   | noarch                         |
| r-amap         | 0.8.1   | Tools for Clustering and Principal Component Analysis (With robust methods, and parallelized functions). / GPL   | linux-64,<br>osx-64,<br>win-64 |
| r-amap.seq     | 1.0     | An Approximated Most Average Powerful Test with Optimal FDR Control with Application to RNA-seq Data / GPL (>= 2)  | noarch                         |
| r-ambient      | 0.1.0   | Generation of natural looking noise has many application within simulation, procedural generation, and art, to name a few. The 'ambient' package provides an interface to the 'FastNoise' C library and allows for efficient generation of perlin, simplex, worley, cubic, value, and white noise with optional perturbation in either 2, 3, or 4 (in case of simplex and white noise) dimensions. / MIT file LICENSE  | linux-64,<br>osx-64,<br>win-64 |
| r-amcp         | 0.0.4   | Accompanies Designing experiments and analyzing data: A model comparison perspective (3rd ed.) by Maxwell, Delaney, & Kelley (forthcoming from Routledge). Contains all of the data sets in the book's chapters and end-of-chapter exercises. Information about the book is available at < <a href="http://www.DesigningExperiments.com">http://www.DesigningExperiments.com</a> >. / GPL (>= 3)   | noarch                         |
| r-amctestmaker | 1.0.0   | Generate code for use with the Optical Mark Recognition free software Auto Multiple Choice (AMC). More specifically, this package provides functions that use as input the question and answer texts, and output the LaTeX code for AMC. / GPL-3   | noarch                         |
| r-ameco        | 0.2.9   | Annual macro-economic database provided by the European Commission. / CC0  | noarch                         |
| r-amelia       | 1.7.5   | A tool that multiply imputes missing data in a single cross-section (such as a survey), from a time series (like variables collected for each year in a country), or from a time-series-cross-sectional data set (such as collected by years for each of several countries). Amelia II implements our bootstrapping-based algorithm that gives essentially the same answers as the standard IP or EMis approaches, is usually considerably faster than existing approaches and can handle many more variables. Unlike Amelia I and other statistically rigorous imputation software, it virtually never crashes (but please let us know if you find to the contrary!). The program also generalizes existing approaches by allowing for trends in time series across observations within a cross-sectional unit, as well as priors that allow experts to incorporate beliefs they have about the values of missing cells in their data. Amelia II also includes useful diagnostics of the fit of multiple imputation models. The program works from the R command line or via a graphical user interface that does not require users to know R. / GPL (>= 2) | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                              | Version | Summary/License   | Platforms |
|-----------------------------------|---------|---|-----------|
| <a href="#">r-amelie</a>          | 0.2.1   | Implements anomaly detection as binary classification for cross-sectional data. Uses maximum likelihood estimates and normal probability functions to classify observations as anomalous. The method is presented in the following lecture from the Machine Learning course by Andrew Ng: <a href="https://www.coursera.org/learn/machine-learning/lecture/C8IJp/algorithm/">https://www.coursera.org/learn/machine-learning/lecture/C8IJp/algorithm/</a> , and is also described in: Aleksandar Lazarevic, Levent Ertoz, Vipin Kumar, Aysel Ozgur, Jaideep Srivastava (2003) <doi:10.1137/1.9781611972733.3>. / GPL (>= 3)   | noarch    |
| <a href="#">r-amen</a>            | 1.3     | Analysis of dyadic network and relational data using additive and multiplicative effects (AME) models. The basic model includes regression terms, the covariance structure of the social relations model (Warner, Kenny and Stoto (1979) <DOI:10.1037/0022-3514.37.10.1742>, Wong (1982) <DOI:10.2307/2287296>), and multiplicative factor models (Hoff(2009) <DOI:10.1007/s10588-008-9040-4>). Four different link functions accommodate different relational data structures, including binary/network data (bin), normal relational data (nrm), ordinal relational data (ord) and data from fixed-rank nomination schemes (frn). Several of these link functions are discussed in Hoff, Fosdick, Volfovsky and Stovel (2013) <DOI:10.1017/nws.2013.17>. Development of this software was supported in part by NIH grant R01HD067509. / GPL-3   | noarch    |
| <a href="#">r-americancallopt</a> | 0.95    | This package includes a set of pricing functions for American call options. The following cases are covered: Pricing of an American call using the standard binomial approximation; Hedge parameters for an American call with a standard binomial tree; Binomial pricing of an American call with continuous payout from the underlying asset; Binomial pricing of an American call with an underlying stock that pays proportional dividends in discrete time; Pricing of an American call on futures using a binomial approximation; Pricing of a currency futures American call using a binomial approximation; Pricing of a perpetual American call. The user should kindly notice that this material is for educational purposes only. The codes are not optimized for computational efficiency as they are meant to represent standard cases of analytical and numerical solution. / GPL-3 | noarch    |
| <a href="#">r-amerika</a>         | 0.1.0   | A color palette generator inspired by American politics, with colors ranging from blue on the left to gray in the middle and red on the right. A variety of palettes allow for a range of applications from brief discrete scales (e.g., three colors for Democrats, Independents, and Republicans) to continuous interpolated arrays including dozens of shades graded from blue (left) to red (right). This package greatly benefitted from building on the source code (with permission) from Ram and Wickham (2015). / MIT file LICENSE   | noarch    |
| <a href="#">r-amget</a>           | 1.0     | AMGET allows to simply and rapidly creates highly informative diagnostic plots for ADAPT 5 models. Features include data analysis prior any modeling form either NONMEM or ADAPT shaped dataset, goodness-of-fit plots (GOF), posthoc-fits plots (PHF), parameters distribution plots (PRM) and visual predictive check plots (VPC) based on ADAPT output. / GPL (>= 2)   | noarch    |
| <a href="#">r-aml</a>             | 0.1.1   | This package implements the adaptive mixed lasso (AML) method proposed by Wang et al.(2011). AML applies adaptive lasso penalty to a large number of predictors, thus producing a sparse model, while accounting for the population structure in the linear mixed model framework. The package here is primarily designed for application to genome wide association studies or genomic prediction in plant breeding populations, though it could be applied to other settings of linear mixed models. / GPL (>= 2)   | noarch    |

| Name                   | Version | Summary/License  | Platforms                      |
|------------------------|---------|--|--------------------------------|
| r-ammoniaconcentration | 0.1     | Provides a function to calculate the concentration of un-ionized ammonia in the total ammonia in aqueous solution using the pH and temperature values. / MIT file LICENSE  | noarch                         |
| r-amore                | 0.2.1   | This package was born to release the TAO robust neural network algorithm to the R users. It has grown and I think it can be of interest for the users wanting to implement their own training algorithms as well as for those others whose needs lie only in the user space. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64 |
| r-ampd                 | 0.2     | A method for automatic detection of peaks in noisy periodic and quasi-periodic signals. This method, called automatic multiscale-based peak detection (AMPD), is based on the calculation and analysis of the local maxima scalogram, a matrix comprising the scale-dependent occurrences of local maxima. For further information see <doi:10.3390/a5040588>. / GPL   | noarch                         |
| r-anacoda              | 0.1.3.0 | Is a collection of models to analyze genome scale codon data using a Bayesian framework. Provides visualization routines and checkpointing for model fittings. Currently published models to analyze gene data for selection on codon usage based on Ribosome Overhead Cost (ROC) are: ROC (Gilchrist et al. (2015) <doi:10.1093/gbe/evv087>), and ROC with phi (Wallace & Drummond (2013) <doi:10.1093/molbev/mst051>). In addition 'AnaCoDa' contains three currently unpublished models. The FONSE (First order approximation On NonSense Error) model analyzes gene data for selection on codon usage against of nonsense error rates. The PA (PAusing time) and PANSE (PAusing time NonSense Error) models use ribosome footprinting data to analyze estimate ribosome pausing times with and without nonsense error rate from ribosome footprinting data. / GPL (>= 2) | linux-64,<br>osx-64,<br>win-64 |
| r-analogsea            | 0.7.2   | Provides a set of functions for interacting with the 'Digital Ocean' API at < <a href="https://developers.digitalocean.com/documentation/v2">https://developers.digitalocean.com/documentation/v2</a> >, including creating images, destroying them, rebooting, getting details on regions, and available images. / MIT  | noarch                         |
| r-analyz               | 1.4     | Class with methods to read and execute R commands described as steps in a CSV file. / GPL (>= 2)   | noarch                         |
| r-anapuce              | 2.3     | Functions for normalisation, differentially analysis of microarray data and local False Discovery Rate. / GPL-2  | noarch                         |
| r-ande                 | 1.0     | AODE achieves highly accurate classification by averaging over all of a small space. / GPL-3   | noarch                         |
| r-andrews              | 1.0     | Andrews curves for visualization of multidimensional data / GPL (>= 2)   | noarch                         |
| r-anfis                | 0.99.1  | The package implements ANFIS Type 3 Takagi and Sugeno's fuzzy if-then rule network with the following features: (1) Independent number of membership functions(MF) for each input, and also different MF extensible types. (2) Type 3 Takagi and Sugeno's fuzzy if-then rule (3) Full Rule combinations, e.g. 2 inputs 2 membership functions -> 4 fuzzy rules (4) Hibrid learning, i.e. Descent Gradient for precedents and Least Squares Estimation for consequents (5) Multiple outputs. / GPL (>= 2)   | noarch                         |
| r-anmc                 | 0.2.1   | Computationally efficient method to estimate orthant probabilities of high-dimensional Gaussian vectors. Further implements a function to compute conservative estimates of excursion sets under Gaussian random field priors. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-annotlists           | 1.2     | Annotate multiple lists from a specific annotation file. / GPL   | noarch                         |

|-------------------------------------|---------|--|--|
| <a href="#">r-anocva</a>            | 0.1.1   | Provides ANOCVA (ANalysis Of Cluster Variability), a non-parametric statistical test to compare clustering structures with applications in functional magnetic resonance imaging data (fMRI). The ANOCVA allows us to compare the clustering structure of multiple groups simultaneously and also to identify features that contribute to the differential clustering. / GPL ( $\geq 3$ )  | noarch   |
| <a href="#">r-anoint</a>            | 1.4     | The tools in this package are intended to help researchers assess multiple treatment-covariate interactions with data from a parallel-group randomized controlled clinical trial. / GPL ( $\geq 2$ )   | noarch   |
| <a href="#">r-anomalydetection</a>  | 1.0     | A technique for detecting anomalies in seasonal univariate time series. / Apache License 2.0   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-anovareplication</a>  | 1.1.4   | Allows for the computation of a prior predictive p-value to test replication of relevant features of original ANOVA studies. Relevant features are captured in informative hypotheses. The package also allows for the computation of sample sizes for new studies, post-hoc power calculations, and comes with a Shiny application in which all calculations can be conducted as well. The statistical underpinnings are described in Zondervan-Zwijenburg (2019) <doi:10.31234/osf.io/6myqh>. / GPL ( $\geq 3$ )   | noarch   |
| <a href="#">r-antareseditobject</a> | 0.1.7   | Edit an ‘Antares’ simulation before running it : create new areas, links, thermal clusters or binding constraints or edit existing ones. Update ‘Antares’ general & optimization settings. ‘Antares’ is an open source power system generator, more information available here : < <a href="https://antares-simulator.org/">https://antares-simulator.org/</a> >. / GPL ( $\geq 2$ )   file LICENSE  | noarch   |
| <a href="#">r-antaresprocessing</a> | 0.17.0  | Process results generated by ‘Antares’, a powerful open source software developed by RTE (Réseau de Transport d’Électricité) to simulate and study electric power systems (more information about ‘Antares’ here: < <a href="https://github.com/AntaresSimulatorTeam/Antares_Simulator">https://github.com/AntaresSimulatorTeam/Antares_Simulator</a> >). You can see the results of several ANTARES studies here : < <a href="http://bpnumerique.rte-france.com/">http://bpnumerique.rte-france.com/</a> >. This package provides functions to create new columns like net load, load factors, upward and downward margins or to compute aggregated statistics like economic surpluses of consumers, producers and sectors. / GPL ( $\geq 2$ )   file LICENSE | noarch   |
| <a href="#">r-antaresread</a>       | 2.2.4   | Import, manipulate and explore results generated by ‘Antares’, a powerful open source software developed by RTE (Réseau de Transport d’Électricité) to simulate and study electric power systems (more information about ‘Antares’ here : < <a href="https://github.com/AntaresSimulatorTeam/Antares_Simulator">https://github.com/AntaresSimulatorTeam/Antares_Simulator</a> >). You can see the results of several ANTARES studies here : < <a href="http://bpnumerique.rte-france.com/">http://bpnumerique.rte-france.com/</a> >. / GPL ( $\geq 2$ )   file LICENSE   | noarch   |
| <a href="#">r-antiword</a>          | 1.3     | Wraps the ‘AntiWord’ utility to extract text from Microsoft Word documents. The utility only supports the old ‘doc’ format, not the new xml based ‘docx’ format. Use the ‘xml2’ package to read the latter. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |

Table 51 – continued from previous page

| Name                 | Version | Summary/License   | Platforms                      |
|----------------------|---------|---|--------------------------------|
| r-anylib             | 1.0.5   | Made to make your life simpler with packages, by installing and loading a list of packages, whether they are on CRAN, Bioconductor or github. For github, if you do not have the full path, with the maintainer name in it (e.g. achateigner/topReviGO), it will be able to load it but not to install it. / CC BY-SA 4.0   | noarch                         |
| r-anytime            | 0.3.5   | Convert input in any one of character, integer, numeric, factor, or ordered type into ‘POSIXct’ (or ‘Date’) objects, using one of a number of predefined formats, and relying on Boost facilities for date and time parsing. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64 |
| r-aod                | 1.3.1   | Provides a set of functions to analyse overdispersed counts or proportions. Most of the methods are already available elsewhere but are scattered in different packages. The proposed functions should be considered as complements to more sophisticated methods such as generalized estimating equations (GEE) or generalized linear mixed effect models (GLMM). / GPL (>= 2)   | noarch                         |
| r-aods3              | 0.4.1   | Provides functions to analyse overdispersed counts or proportions. These functions should be considered as complements to more sophisticated methods such as generalized estimating equations (GEE) or generalized linear mixed effect models (GLMM). aods3 is an S3 re-implementation of the deprecated S4 package aod. / GPL (>= 2)   | noarch                         |
| r-aos                | 0.5.0   | Another implementation of object-orientation in R. It provides syntactic sugar for the S4 class system and two alternative new implementations. One is an experimental version built around S4 and the other one makes it more convenient to work with lists as objects. / MIT file LICENSE   | noarch                         |
| r-aoptbdtvc          | 0.0.2   | A collection of functions to construct A-optimal block designs for comparing test treatments with one or more control(s). Mainly A-optimal balanced treatment incomplete block designs, weighted A-optimal balanced treatment incomplete block designs, A-optimal group divisible treatment designs and A-optimal balanced bipartite block designs can be constructed using the package. The designs are constructed using algorithms based on linear integer programming. To the best of our knowledge, these facilities to construct A-optimal block designs for comparing test treatments with one or more controls are not available in the existing R packages. For more details on designs for tests versus control(s) comparisons, please see Hedayat, A. S. and Majumdar, D. (1984) <doi:10.1080/00401706.1984.10487989> A-Optimal Incomplete Block Designs for Control-Test Treatment Comparisons, Technometrics, 26, 363-370 and Mandal, B. N. , Gupta, V. K., Parsad, Rajender. (2017) <doi:10.1080/03610926.2015.1071394> Balanced treatment incomplete block designs through integer programming. Communications in Statistics - Theory and Methods 46(8), 3728-3737. / GPL (>= 2) | noarch                         |
| r-apachelogprocessor | 0.2.3   | Provides capabilities to process Apache HTTPD Log files. The main functionalities are to extract data from access and error log files to data frames. / LGPL-3   file LICENSE   | noarch                         |
| r-apc                | 1.3     | Functions for age-period-cohort analysis. The data can be organised in matrices indexed by age-cohort, age-period or cohort-period. The data can include dose and response or just doses. The statistical model is a generalized linear model (GLM) allowing for 3,2,1 or 0 of the age-period-cohort factors. The canonical parametrisation of Kuang, Nielsen and Nielsen (2008) <DOI:10.1093/biomet/asn026> is used. Thus, the analysis does not rely on ad hoc identification. / GPL-3  | noarch                         |

Table 51 – continued from previous page

| Name                          | Version | Summary/License  | Platforms  |
|-------------------------------|---------|--|--|
| <a href="#">r-apcanalysis</a> | 1.0     | Analysis of data from unreplicated orthogonal experiments / GPL-3  | noarch   |
| <a href="#">r-apcf</a>        | 0.1.3   | The adapted pair correlation function transfers the concept of the pair correlation function from point patterns to patterns of objects of finite size and irregular shape (e.g. lakes within a country). This is a reimplementation of the method suggested by Nuske et al. (2009) <doi:10.1016/j.foreco.2009.09.050> using the libraries ‘GEOS’ and ‘GDAL’ directly instead of through ‘PostGIS’. / GPL (>= 3)   | win-64   |
| <a href="#">r-apcluster</a>   | 1.4.7   | Implements Affinity Propagation clustering introduced by Frey and Dueck (2007) <DOI:10.1126/science.1136800>. The algorithms are largely analogous to the ‘Matlab’ code published by Frey and Dueck. The package further provides leveraged affinity propagation and an algorithm for exemplar-based agglomerative clustering that can also be used to join clusters obtained from affinity propagation. Various plotting functions are available for analyzing clustering results. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-apdesign</a>    | 1.0.0   | An implementation of the additive polynomial (AP) design matrix. It constructs and appends an AP design matrix to a data frame for use with longitudinal data subject to seasonality. / GPL-3  | noarch   |
| <a href="#">r-ape</a>         | 5.3     | Functions for reading, writing, plotting, and manipulating phylogenetic trees, analyses of comparative data in a phylogenetic framework, ancestral character analyses, analyses of diversification and macroevolution, computing distances from DNA sequences, reading and writing nucleotide sequences as well as importing from BioConductor, and several tools such as Mantel’s test, generalized skyline plots, graphical exploration of phylogenetic data (alex, trex, kronoviz), estimation of absolute evolutionary rates and clock-like trees using mean path lengths and penalized likelihood, dating trees with non-contemporaneous sequences, translating DNA into AA sequences, and assessing sequence alignments. Phylogeny estimation can be done with the NJ, BIONJ, ME, MVR, SDM, and triangle methods, and several methods handling incomplete distance matrices (NJ*, BIONJ*, MVR*, and the corresponding triangle method). Some functions call external applications (PhyML, Clustal, T-Coffee, Muscle) whose results are returned into R. / GPL (>= 2) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-apercu</a>      | 0.2.3   | The goal is to print an aperçu, a short view of a vector, a matrix, a data.frame, a list or an array. By default, it prints the first 5 elements of each dimension. By default, the number of columns is equal to the number of lines. If you want to control the selection of the elements, you can pass a list, with each element being a vector giving the selection for each dimension. / CC BY-SA 4.0   | noarch   |
| <a href="#">r-apfr</a>        | 1.0.2   | Implements a multiple testing approach to the choice of a threshold gamma on the p-values using the Average Power Function (APF) and Bayes False Discovery Rate (FDR) robust estimation. Function apf_fdr() estimates both quantities from either raw data or p-values. Function apf_plot() produces smooth graphs and tables of the relevant results. Details of the methods can be found in Quatto P, Margaritella N, et al. (2019) <doi:10.1177/0962280219844288>. / GPL-3  | noarch   |
| <a href="#">r-aplore3</a>     | 0.9     | An unofficial companion to Applied Logistic Regression by D.W. Hosmer, S. Lemeshow and R.X. Sturdivant (3rd ed., 2013) containing the dataset used in the book. / GPL-3  | noarch   |

Table 51 – continued from previous page

| Name  | Version | Summary/License  | Platforms                      |
|---|---------|--|--------------------------------|
| <a href="#">r-aplpack</a>                   | 1.3.3   | Some functions for drawing some special plots: The function ‘bagplot’ plots a bagplot, ‘faces’ plots chernoff faces, ‘iconplot’ plots a representation of a frequency table or a data matrix, ‘plothulls’ plots hulls of a bivariate data set, ‘plotsummary’ plots a graphical summary of a data set, ‘puticon’ adds icons to a plot, ‘skyline.hist’ combines several histograms of a one dimensional data set in one plot, ‘slider’ functions supports some interactive graphics, ‘spin3R’ helps an inspection of a 3-dim point cloud, ‘stem.leaf’ plots a stem and leaf plot, ‘stem.leaf.backback’ plots back-to-back versions of stem and leaf plot. / GPL ( $\geq 2$ )   | noarch                         |
| <a href="#">r-apml0</a>                     | 0.9     | Fit linear, logistic and Cox models regularized with L0, lasso (L1), elastic-net (L1 and L2), or net (L1 and Laplacian) penalty, and their adaptive forms, such as adaptive lasso / elastic-net and net adjusting for signs of linked coefficients. It solves L0 penalty problem by simultaneously selecting regularization parameters and the number of non-zero coefficients. This augmented and penalized minimization method provides an approximation solution to the L0 penalty problem, but runs as fast as L1 regularization problem. The package uses one-step coordinate descent algorithm and runs extremely fast by taking into account the sparsity structure of coefficients. It could deal with very high dimensional data and has superior selection performance. / GPL ( $\geq 2$ ) | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-apng</a>                      | 1.0     | Convert several png files into an animated png file. This package exports only a single function ‘apng’. Call the apng function with a vector of file names (which should be png files) to convert them to a single animated png file. / GPL-3   file LICENSE  | noarch                         |
| <a href="#">r-appestimat</a>                | 0.1.1   | Calculating predictive model performance measures adjusted for predictor distributions using density ratio method (Sugiyama et al., (2012, ISBN:9781139035613)). L1 and L2 error for continuous outcome and C-statistics for binomial outcome are computed. / GPL-2  | noarch                         |
| <a href="#">r-apple</a>                     | 0.3     | Approximate Path for Penalized Likelihood Estimators for Generalized Linear Models penalized by LASSO or MCP / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-appliedpredictivemodeling</a> | 1.1_7   | A few functions and several data set for the Springer book ‘Applied Predictive Modeling’. / GPL-2  | noarch                         |
| <a href="#">r-appnn</a>                     | 1.0_0   | Amyloid propensity prediction neural network (APPNN) is an amyloidogenicity propensity predictor based on a machine learning approach through recursive feature selection and feed-forward neural networks, taking advantage of newly published sequences with experimental, in vitro, evidence of amyloid formation. / GPL-3  | noarch                         |
| <a href="#">r-approximator</a>              | 1.2_7   | Performs Bayesian prediction of complex computer codes when fast approximations are available. It uses a hierarchical version of the Gaussian process, originally proposed by Kennedy and O’Hagan (2000), Biometrika 87(1):1. / GPL-2  | noarch                         |
| <a href="#">r-approxmatch</a>               | 1.0     | Tools for constructing a matched design with multiple comparison groups. Further specifications of refined covariate balance restriction and exact match on covariate can be imposed. Matches are approximately optimal in the sense that the cost of the solution is at most twice the optimal cost, Crama and Spieksma (1992) <doi:10.1016/0377-2217(92)90078-N>. / MIT file LICENSE   | noarch                         |

Table 51 – continued from previous page

| Name          | Version    | Summary/License  | Platforms                      |
|---------------|------------|--|--------------------------------|
| r-aprean3     | 1.0.1      | An unofficial companion to the textbook Applied Regression Analysis by N.R. Draper and H. Smith (3rd Ed., 1998) including all the accompanying datasets. / GPL-3   | noarch                         |
| r-aprof       | 0.4.1      | Assists the evaluation of whether and where to focus code optimization, using Amdahl's law and visual aids based on line profiling. Amdahl's profiler organizes profiling output files (including memory profiling) in a visually appealing way. It is meant to help to balance development vs. execution time by helping to identify the most promising sections of code to optimize and projecting potential gains. The package is an addition to R's standard profiling tools and is not a wrapper for them. / GPL (>= 2)   | noarch                         |
| r-apsimbatch  | 0.1.0.2014 | APSIM in Batch mode / GPL-3  | noarch                         |
| r-apsrtable   | 0.8_8      | Formats latex tables from one or more model objects side-by-side with standard errors below, not unlike tables found in such journals as the American Political Science Review. / GPL (>= 2)   | noarch                         |
| r-aptools     | 6.8.8      | We provide tools to estimate two prediction accuracy metrics, the average positive predictive values (AP) as well as the well-known AUC (the area under the receiver operator characteristic curve) for risk scores. The outcome of interest is either binary or censored event time. Note that for censored event time, our functions' estimates, the AP and the AUC, are time-dependent for pre-specified time interval(s). A function that compares the APs of two risk scores/markers is also included. Optional outputs include positive predictive values and true positive fractions at the specified marker cut-off values, and a plot of the time-dependent AP versus time (available for event time data). / LGPL-3  | noarch                         |
| r-aqr         | 0.4        | This R extension provides methods to use a standalone ActiveQuant Master Server from within R. Currently available features include fetching and storing historical data, receiving and sending live data. Several utility methods for simple data transformations are included, too. For support requests, please join the mailing list at <a href="https://r-forge.r-project.org/mail/?group_id=1518">https://r-forge.r-project.org/mail/?group_id=1518</a> / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64 |
| r-ar          | 1.1        | In mathematics, 'rejection sampling' is a basic technique used to generate observations from a distribution. It is also commonly called 'the Acceptance-Rejection method' or 'Accept-Reject algorithm' and is a type of Monte Carlo method. 'Acceptance-Rejection method' is based on the observation that to sample a random variable one can perform a uniformly random sampling of the 2D cartesian graph, and keep the samples in the region under the graph of its density function. Package 'AR' is able to generate/simulate random data from a probability density function by Acceptance-Rejection method. Moreover, this package is a useful teaching resource for graphical presentation of Acceptance-Rejection method. From the practical point of view, the user needs to calculate a constant in Acceptance-Rejection method, which package 'AR' is able to compute this constant by optimization tools. Several numerical examples are provided to illustrate the graphical presentation for the Acceptance-Rejection Method. / LGPL-3 | noarch                         |
| r-arabicstemr | 1.2        | Allows users to stem Arabic texts for text analysis. / GPL (>= 2)  | noarch                         |

Continued on next page

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms                      |
|-----------------------------|---------|---|--------------------------------|
| <a href="#">r-ararredux</a> | 1.0     | Processes noble gas mass spectrometer data to determine the isotopic composition of argon (comprised of Ar36, Ar37, Ar38, Ar39 and Ar40) released from neutron-irradiated potassium-bearing minerals. Then uses these compositions to calculate precise and accurate geochronological ages for multiple samples as well as the covariances between them. Error propagation is done in matrix form, which jointly treats all samples and all isotopes simultaneously at every step of the data reduction process. Includes methods for regression of the time-resolved mass spectrometer signals to t=0 ('time zero') for both single- and multi-collector instruments, blank correction, mass fractionation correction, detector intercalibration, decay corrections, interference corrections, interpolation of the irradiation parameter between neutron fluence monitors, and (weighted mean) age calculation. All operations are performed on the logs of the ratios between the different argon isotopes so as to properly treat them as 'compositional data', sensu Aitchison [1986, The Statistics of Compositional Data, Chapman and Hall]. / GPL-2 | noarch                         |
| <a href="#">r-arc</a>       | 1.2     | Implements the Classification-based on Association Rules (CBA) (Bing Liu, Wynne Hsu, Yiming Ma (1999) < <a href="http://dl.acm.org/citation.cfm?id=3000292.3000305">http://dl.acm.org/citation.cfm?id=3000292.3000305</a> >) algorithm for association rule classification (ARC). The package also contains several convenience methods that allow to automatically set CBA parameters (minimum confidence, minimum support) and it also natively handles numeric attributes by integrating a pre-discretization step. The rule generation phase is handled by the 'arules' package. To further decrease the size of the CBA models produced by the 'arc' package, postprocessing by the 'qCBA' package is suggested. / AGPL-3  | noarch                         |
| <a href="#">r-archdata</a>  | 1.2     | The archdata package provides several types of data that are typically used in archaeological research. It provides all of the data sets used in Quantitative Methods in Archaeology Using R by David L Carlson, one of the Cambridge Manuals in Archaeology. / GPL   | noarch                         |
| <a href="#">r-arco</a>      | 0.3_1   | Set of functions to analyse and estimate Artificial Counterfactual models from Carvalho, Masini and Medeiros (2016) <DOI:10.2139/ssrn.2823687>. / MIT file LICENSE  | noarch                         |
| <a href="#">r-ardec</a>     | 2.0     | Package ArDec implements autoregressive-based decomposition of a time series based on the constructive approach in West (1997). Particular cases include the extraction of trend and seasonal components. / GPL (>= 2)  | noarch                         |
| <a href="#">r-areaplot</a>  | 1.2_1   | Plot stacked areas and confidence bands as filled polygons, or add polygons to existing plots. A variety of input formats are supported, including vectors, matrices, data frames, formulas, etc. / GPL (>= 2)  | noarch                         |
| <a href="#">r-arf3ds4</a>   | 2.5_10  | Activated Region Fitting (ARF) is an analysis method for fMRI data. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-argo</a>      | 2.0.0   | Augmented Regression with General Online data (ARGO) for accurate estimation of influenza epidemics in United States on both national level and regional level. It replicates the method introduced in paper Yang, S., Santillana, M. and Kou, S.C. (2015) <doi:10.1073/pnas.1515373112> and Ning, S., Yang, S. and Kou, S.C. (2019) <doi:10.1038/s41598-019-41559-6>. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name            | Version | Summary/License   | Platforms   |
|-----------------|---------|---|---|
| r-argon2        | 0.2.0   | Utilities for secure password hashing via the argon2 algorithm. It is a relatively new hashing algorithm and is believed to be very secure. The ‘argon2’ implementation included in the package is the reference implementation. The package also includes some utilities that should be useful for digest authentication, including a wrapper of ‘blake2b’. For similar R packages, see sodium and ‘bcrypt’. See < <a href="https://en.wikipedia.org/wiki/Argon2">https://en.wikipedia.org/wiki/Argon2</a> > or < <a href="https://eprint.iacr.org/2015/430.pdf">https://eprint.iacr.org/2015/430.pdf</a> > for more information. / BSD 2-clause License file LICENSE  | linux-64,<br>osx-64,<br>win-64                                    |
| r-argondash     | 0.1.0   | Create awesome ‘Bootstrap 4’ dashboards powered by ‘Argon’. See more here < <a href="https://rinterface.github.io/argonDash/">https://rinterface.github.io/argonDash/</a> >. / GPL-2  | noarch  |
| r-argonr        | 0.1.0   | R wrapper around the argon HTML library. More at < <a href="https://demos.creative-tim.com/argon-design-system/">https://demos.creative-tim.com/argon-design-system/</a> >. / GPL-2   | noarch  |
| r-argosfilter   | 0.63    | Functions to filters animal satellite tracking data obtained from Argos. It is especially indicated for telemetry studies of marine animals, where Argos locations are predominantly of low-quality. / GPL (>= 2)   | noarch  |
| r-argparse      | 2.0.1   | A command line parser to be used with Rscript to write #! shebang scripts that gracefully accept positional and optional arguments and automatically generate usage. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-argparser     | 0.4     | Cross-platform command-line argument parser written purely in R with no external dependencies. It is useful with the Rscript front-end and facilitates turning an R script into an executable script. / GPL (>= 3)  | noarch  |
| r-argumentcheck | 0.10.2  | The typical process of checking arguments in functions is iterative. In this process, an error may be returned and the user may fix it only to receive another error on a different argument. ‘ArgumentCheck’ facilitates a more helpful way to perform argument checks allowing the programmer to run all of the checks and then return all of the errors and warnings in a single message. / GPL-3  | noarch  |
| r-arht          | 0.1.0   | Perform the Adaptable Regularized Hotelling’s T <sup>2</sup> test (ARHT) proposed by Li et al., (2016) <arXiv:1609.08725>. Both one-sample and two-sample mean test are available with various probabilistic alternative prior models. It contains a function to consistently estimate higher order moments of the population covariance spectral distribution using the spectral of the sample covariance matrix (Bai et al. (2010) <doi:10.1111/j.1467-842X.2010.00590.x>). In addition, it contains a function to sample from 3-variate chi-squared random vectors approximately with a given correlation matrix when the degrees of freedom are large. / GPL (>= 2) | noarch  |
| r-aricode       | 0.1.2   | Implements an efficient O(n) algorithm based on bucket-sorting for fast computation of standard clustering comparison measures. Available measures include adjusted Rand index (ARI), normalized information distance (NID), normalized mutual information (NMI), adjusted mutual information (AMI), normalized variation information (NVI) and entropy, as described in Vinh et al (2009) <doi:10.1145/1553374.1553511>. / GPL (>= 3)  | linux-64,<br>osx-64,<br>win-64                                    |

Table 51 – continued from previous page

| Name             | Version | Summary/License  | Platforms                      |
|------------------|---------|--|--------------------------------|
| r-arm            | 1.10    | Functions to accompany A. Gelman and J. Hill, Data Analysis Using Regression and Multilevel/Hierarchical Models, Cambridge University Press, 2007. / GPL ( $\geq 3$ )  | noarch                         |
| r-armspp         | 0.0.2   | An efficient ‘Rcpp’ implementation of the Adaptive Rejection Metropolis Sampling (ARMS) algorithm proposed by Gilks, W. R., Best, N. G. and Tan, K. K. C. (1995) <doi:10.2307/2986138>. This allows for sampling from a univariate target probability distribution specified by its (potentially unnormalised) log density. / MIT file LICENSE   | linux-64,<br>osx-64,<br>win-64 |
| r-arnie          | 0.1.2   | Arnold Schwarzenegger movie weekend box office records from 1982-2014 / CC BY-SA 4.0   | noarch                         |
| r-arpobservation | 1.2.0   | Tools for simulating data generated by direct observation recording. Behavior streams are simulated based on an alternating renewal process, given specified distributions of event durations and interim times. Different procedures for recording data can then be applied to the simulated behavior streams. Functions are provided for the following recording methods: continuous duration recording, event counting, momentary time sampling, partial interval recording, whole interval recording, and augmented interval recording. / GPL-3  | noarch                         |
| r-arpr           | 0.1.1   | Provides convenience functions for programming with magrittr pipes. Conditional pipes, a string prefixer and a function to pipe the given object into a specific argument given by character name are currently supported. It is named after the dadaist Hans Arp, a friend of Rene Magritte. / GPL ( $\geq 3$ )   | noarch                         |
| r-arpsdca        | 1.1.1   | Functions for Arps decline-curve analysis on oil and gas data. Includes exponential, hyperbolic, harmonic, and hyperbolic-to-exponential models as well as the preceding with initial curtailment or a period of linear rate buildup. Functions included for computing rate, cumulative production, instantaneous decline, EUR, time to economic limit, and performing least-squares best fits. / LGPL-2.1   | noarch                         |
| r-arrangements   | 1.1.5   | Fast generators and iterators for permutations, combinations and partitions. The iterators allow users to generate arrangements in a memory efficient manner and the generated arrangements are in lexicographical (dictionary) order. Permutations and combinations can be drawn with/without replacement and support multisets. It has been demonstrated that ‘arrangements’ outperforms most of the existing packages of similar kind. Some benchmarks could be found at < <a href="https://randy3k.github.io/arrangements/articles/benchmark.html">https://randy3k.github.io/arrangements/articles/benchmark.html</a> >. / MIT file LICENSE  | linux-64,<br>osx-64,<br>win-64 |
| r-arrapply       | 2.1     | High performance variant of apply() for a fixed set of functions. Considerable speedup is a trade-off for universality, user defined functions cannot be used with this package. However, 21 most currently employed functions are available for usage. They can be divided in three types: reducing functions (like mean(), sum() etc., giving a scalar when applied to a vector), mapping function (like normalise(), cumsum() etc., giving a vector of the same length as the input vector) and finally, vector reducing function (like diff()) which produces result vector of a length different from the length of input vector). Optional or mandatory additional arguments required by some functions (e.g. norm type for norm() or normalise() functions) can be passed as named arguments in ‘...’. / GPL ( $\geq 2$ ) | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name      | Version | Summary/License   | Platforms                      |
|-----------|---------|---|--------------------------------|
| r-arrow   | 0.14.1  | Apache' 'Arrow' < <a href="https://arrow.apache.org/">https://arrow.apache.org/</a> > is a cross-language development platform for in-memory data. It specifies a standardized language-independent columnar memory format for flat and hierarchical data, organized for efficient analytic operations on modern hardware. This package provides an interface to the 'Arrow C' library. / Apache License (>= 2.0)   | linux-64                       |
| r-ars     | 0.6     | Adaptive Rejection Sampling, Original version. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64 |
| r-arsenal | 3.2.0   | An Arsenal of 'R' functions for large-scale statistical summaries, which are streamlined to work within the latest reporting tools in 'R' and 'RStudio' and which use formulas and versatile summary statistics for summary tables and models. The primary functions include tableby(), a Table-1-like summary of multiple variable types 'by' the levels of one or more categorical variables; paired(), a Table-1-like summary of multiple variable types paired across two time points; modelsum(), which performs simple model fits on one or more endpoints for many variables (univariate or adjusted for covariates); freqlist(), a powerful frequency table across many categorical variables; comparedf(), a function for comparing data.frames; and write2(), a function to output tables to a document. / GPL (>= 2) | noarch                         |
| r-artiva  | 1.2.3   | Reversible Jump MCMC (RJ-MCMC)sampling for approximating the posterior distribution of a time varying regulatory network, under the Auto Regressive Time VAring (ARTIVA) model (for a detailed description of the algorithm, see Lebre et al. BMC Systems Biology, 2010). Starting from time-course gene expression measurements for a gene of interest (referred to as target gene) and a set of genes (referred to as parent genes) which may explain the expression of the target gene, the ARTIVA procedure identifies temporal segments for which a set of interactions occur between the parent genes and the target gene. The time points that delimit the different temporal segments are referred to as changepoints (CP). / GPL (>= 2)  | noarch                         |
| r-artp    | 2.0.5   | For calculating gene and pathway p-values using the Adaptive Rank Truncated Product test. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-artp2   | 0.9.45  | Pathway and gene level association test using raw data or summary statistics. / GPL-2   GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-arules  | 1.6_3   | Provides the infrastructure for representing, manipulating and analyzing transaction data and patterns (frequent itemsets and association rules). Also provides C implementations of the association mining algorithms Apriori and Eclat. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |

| Name                              | Version | Summary/License  | Platforms                      |
|-----------------------------------|---------|--|--------------------------------|
| <a href="#">r-arulescba</a>       | 1.1.4   | Provides a function to build an association rule-based classifier for data frames, and to classify incoming data frames using such a classifier. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-arulesnbminer</a>   | 0.1_5   | NBMiner is an implementation of the model-based mining algorithm for mining NB-frequent itemsets presented in Michael Hahsler. A model-based frequency constraint for mining associations from transaction data. Data Mining and Knowledge Discovery, 13(2):137-166, September 2006. In addition an extension for NB-precise rules is implemented. / GPL-2   | noarch                         |
| <a href="#">r-arulessequences</a> | 0.2_2   | Add-on for arules to handle and mine frequent sequences. Provides interfaces to the C implementation of cSPADE by Mohammed J. Zaki. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-arxiv</a>           | 0.5.19  | An interface to the API for ‘arXiv’ (< <a href="https://arxiv.org">https://arxiv.org</a> >), a repository of electronic preprints for computer science, mathematics, physics, quantitative biology, quantitative finance, and statistics. / MIT file LICENSE   | noarch                         |
| <a href="#">r-asaur</a>           | 0.50    | Data sets are referred to in the text Applied Survival Analysis Using R by Dirk F. Moore, Springer, 2016, ISBN: 978-3-319-31243-9, <DOI:10.1007/978-3-319-31245-3>. / CC0  | noarch                         |
| <a href="#">r-asciiruler</a>      | 0.2     | An ASCII ruler is for measuring text and is especially useful for sequence analysis. Included in this package are methods to create ASCII rulers and associated GenBank sequence blocks, multi-column text displays that make it easy for viewers to locate nucleotides by position. / GPL-3   file LICENSE  | noarch                         |
| <a href="#">r-asd</a>             | 2.2     | Package runs simulations for adaptive seamless designs with and without early outcomes for treatment selection and subpopulation type designs. / GPL-3   | noarch                         |
| <a href="#">r-asdreader</a>       | 0.1_3   | A simple driver that reads binary data created by the ASD Inc. portable spectrometer instruments, such as the FieldSpec (for more information, see < <a href="http://www.asdi.com/products/fieldspec-spectroradiometers">http://www.asdi.com/products/fieldspec-spectroradiometers</a> >). Spectral data can be extracted from the ASD files as raw (DN), white reference, radiance, or reflectance. Additionally, the metadata information contained in the ASD file header can also be accessed. / GPL-3 | noarch                         |
| <a href="#">r-asgs.foyer</a>      | 0.2.1   | The Australian Statistical Geography Standard (‘ASGS’) is a set of shapefiles by the Australian Bureau of Statistics. This package provides an interface to those shapefiles, as well as methods for converting coordinates to shapefiles. / MPL   | noarch                         |
| <a href="#">r-ash</a>             | 1.0_1   | David Scott’s ASH routines ported from S-PLUS to R. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-asioheaders</a>     | 1.12.1  | ‘Asio’ is a cross-platform C library for network and low-level I/O programming that provides developers with a consistent asynchronous model using a modern C approach. It is also included in Boost but requires linking when used with Boost. Standalone it can be used header-only (provided a recent compiler). ‘Asio’ is written and maintained by Christopher M. Kohlhoff, and released under the ‘Boost Software License’, Version 1.0. / BSL-1.0   | noarch                         |

| Name                         | Version | Summary/License  | Platforms                                 |
|------------------------------|---------|--|---|
| <a href="#">r-askpass</a>    | 1.0     | Cross-platform utilities for prompting the user for credentials or a passphrase, for example to authenticate with a server or read a protected key. Includes native programs for MacOS and Windows, hence no ‘tcltk’ is required. Password entry can be invoked in two different ways: directly from R via the askpass() function, or indirectly as password-entry back-end for ‘ssh-agent’ or ‘git-credential’ via the SSH_ASKPASS and GIT_ASKPASS environment variables. Thereby the user can be prompted for credentials or a passphrase if needed when R calls out to git or ssh. / MIT file LICENSE | linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-asnipe</a>     | 1.1.1   | Implements several tools that are used in animal social network analysis. In particular, this package provides the tools to infer groups and generate networks from observation data, perform permutation tests on the data, calculate lagged association rates, and performed multiple regression analysis on social network data. / GPL-2  | noarch                                    |
| <a href="#">r-aspbay</a>     | 1.2     | This package allows to make inference on the properties of causal genetic variants in linkage disequilibrium with genotyped markers. In a first step, we select a subset of variants using a score statistic for affected sib-pairs. In a second step, on the selected subset, we make inference on causal genetic variants in the considered region. / GPL-2  | linux-64,<br>osx-64,<br>win-64            |
| <a href="#">r-aspc</a>       | 0.1.2   | The aSPC test is designed to test global association between two groups of variables potentially with moderate to high dimension (e.g. in hundreds). The aSPC is particularly useful when the association signals between two groups of variables are sparse. / GPL-3  | noarch                                    |
| <a href="#">r-aspect</a>     | 1.0.5   | Contains various functions for optimal scaling. One function performs optimal scaling by maximizing an aspect (i.e. a target function such as the sum of eigenvalues, sum of squared correlations, squared multiple correlations, etc.) of the corresponding correlation matrix. Another function performs implements the LINEALS approach for optimal scaling by minimization of an aspect based on pairwise correlations and correlation ratios. The resulting correlation matrix and category scores can be used for further multivariate methods such as structural equation models. / GPL-2         | linux-64,<br>osx-64,<br>win-64            |
| <a href="#">r-aspi</a>       | 0.2.0   | Tools for the analysis and visualization of bilateral asymmetry in parasitic infections. / GPL-3   | noarch                                    |
| <a href="#">r-assa</a>       | 1.0     | Functions to model and decompose time series into principal components using singular spectrum analysis (de Carvalho and Rua (2017) <doi:10.1016/j.ijforecast.2015.09.004>; de Carvalho et al (2012) <doi:10.1016/j.econlet.2011.09.007>). / GPL (>= 3)  | linux-64,<br>osx-64,<br>win-64            |
| <a href="#">r-assertable</a> | 0.2.5   | Simple, flexible, assertions on data.frame or data.table objects with verbose output for vetting. While other assertion packages apply towards more general use-cases, assertable is tailored towards tabular data. It includes functions to check variable names and values, whether the dataset contains all combinations of a given set of unique identifiers, and whether it is a certain length. In addition, assertable includes utility functions to check the existence of target files and to efficiently import multiple tabular data files into one data.table. / GPL-3                       | noarch                                    |
| <a href="#">r-assertive</a>  | 0.3.5   | Lots of predicates (is_* functions) to check the state of your variables, and assertions (assert_* functions) to throw errors if they aren’t in the right form. / GPL-3  | noarch                                    |

Table 51 – continued from previous page

| Name                   | Version | Summary/License   | Platforms |
|------------------------|---------|---|-----------|
| r-assertive.base       | 0.0_7   | A minimal set of predicates and assertions used by the assertive package. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL ( $\geq 3$ )   | noarch    |
| r-assertive.code       | 0.0_3   | A set of predicates and assertions for checking the properties of code. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL-3  | noarch    |
| r-assertive.data       | 0.0_3   | A set of predicates and assertions for checking the properties of (country independent) complex data types. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL-3  | noarch    |
| r-assertive.data.uk    | 0.0_2   | A set of predicates and assertions for checking the properties of UK-specific complex data types. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL-3  | noarch    |
| r-assertive.data.us    | 0.0_2   | A set of predicates and assertions for checking the properties of US-specific complex data types. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL-3  | noarch    |
| r-assertive.dates      | 0.0_2   | A set of predicates and assertions for checking the properties of dates and times. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL-3   | noarch    |
| r-assertive.files      | 0.0_2   | A set of predicates and assertions for checking the properties of files and connections. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL ( $\geq 3$ )  | noarch    |
| r-assertive.matrices   | 0.0_2   | A set of predicates and assertions for checking the properties of matrices. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL ( $\geq 3$ )   | noarch    |
| r-assertive.models     | 0.0_2   | A set of predicates and assertions for checking the properties of models. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL ( $\geq 3$ )   | noarch    |
| r-assertive.numbers    | 0.0_2   | A set of predicates and assertions for checking the properties of numbers. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL ( $\geq 3$ )  | noarch    |
| r-assertive.properties | 0.0_4   | A set of predicates and assertions for checking the properties of variables, such as length, names and attributes. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL ( $\geq 3$ )                              | noarch    |
| r-assertive.reflection | 0.0_4   | A set of predicates and assertions for checking the state and capabilities of R, the operating system it is running on, and the IDE being used. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL ( $\geq 3$ ) | noarch    |

| Name                             | Version | Summary/License  | Platforms   |
|----------------------------------|---------|--|---|
| <code>r-assertive.sets</code>    | 0.0_3   | A set of predicates and assertions for checking the properties of sets. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL ( $\geq 3$ )  | noarch  |
| <code>r-assertive.strings</code> | 0.0_3   | A set of predicates and assertions for checking the properties of strings. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL-3  | noarch  |
| <code>r-assertive.types</code>   | 0.0_3   | A set of predicates and assertions for checking the types of variables. This is mainly for use by other package developers who want to include run-time testing features in their own packages. End-users will usually want to use assertive directly. / GPL ( $\geq 3$ )  | noarch  |
| <code>r-assertthat</code>        | 0.2.1   | An extension to stopifnot() that makes it easy to declare the pre and post conditions that you code should satisfy, while also producing friendly error messages so that your users know what's gone wrong. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-assist</code>            | 3.1.5   | A comprehensive package for fitting various non-parametric/semi-parametric linear/nonlinear fixed/mixed smoothing spline models. / GPL ( $\geq 2$ )  | linux-64,<br>osx-64,<br>win-64                                    |
| <code>r-assocafc</code>          | 1.0.2   | When doing association analysis one does not always have the genotypes for the control population. In such cases it may be necessary to fall back on frequency based tests using well known sources for the frequencies in the control population, for instance, from the 1000 Genomes Project. The Allele Frequency Comparison ('AssocAFC') package performs multiple rare variant association analyses in both population and family-based GWAS (Genome-Wide Association Study) designs. It includes three score tests that are based on the difference of the sum of allele frequencies between cases and controls. Two of these tests, Wcorrected() and Wqls(), are collapsing-based tests and suffer from having protective and risk variants. The third test, afcSKAT(), is a score test that overcomes the mix of SNP (Single-Nucleotide Polymorphism) effect directions. For more details see Saad M and Wijsman EM (2017) <doi:10.1093/bib/bbx107>. / GPL-3 | noarch  |
| <code>r-assocind</code>          | 1.0.1   | Implements several new association indices that can control for various types of errors. Also includes existing association indices and functions for simulating the effects of different rates of error on estimates of association strength between individuals using each method. / GPL-2   | noarch  |
| <code>r-assortnet</code>         | 0.12    | Functions to calculate the assortment of vertices in social networks. This can be measured on both weighted and binary networks, with discrete or continuous vertex values. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name                         | Version | Summary/License  | Platforms                      |
|------------------------------|---------|--|--------------------------------|
| <a href="#">r-assotester</a> | 0.1_10  | R package with statistical tests and methods for genetic association studies with emphasis on rare variants and binary (dichotomous) traits / GPL ( $\geq 3$ )   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ast</a>        | 0.1.0   | Fits a model to adjust and consider additional variations in three dimensions of age groups, time, and space on residuals excluded from a prediction model that have residual such as: linear regression, mixed model and so on. Details are given in Foreman et al. (2015) <doi:10.1186/1478-7954-10-1>. / GPL-2   GPL-3  | noarch                         |
| <a href="#">r-aster2</a>     | 0.3     | Aster models are exponential family regression models for life history analysis. They are like generalized linear models except that elements of the response vector can have different families (e. g., some Bernoulli, some Poisson, some zero-truncated Poisson, some normal) and can be dependent, the dependence indicated by a graphical structure. Discrete time survival analysis, zero-inflated Poisson regression, and generalized linear models that are exponential family (e. g., logistic regression and Poisson regression with log link) are special cases. Main use is for data in which there is survival over discrete time periods and there is additional data about what happens conditional on survival (e. g., number of offspring). Uses the exponential family canonical parameterization (aster transform of usual parameterization). Unlike the aster package, this package does dependence groups (nodes of the graph need not be conditionally independent given their predecessor node), including multinomial and two-parameter normal as families. Thus this package also generalizes mark-capture-recapture analysis. / GPL ( $\geq 2$ ) | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-astrodatr</a>  | 0.1     | A collection of 19 datasets from contemporary astronomical research. They are described the textbook ‘Modern Statistical Methods for Astronomy with R Applications’ by Eric D. Feigelson and G. Jogesh Babu (Cambridge University Press, 2012, Appendix C) or on the website of Penn State’s Center for Astrostatistics ( <a href="http://astrostatistics.psu.edu/datasets">http://astrostatistics.psu.edu/datasets</a> ). These datasets can be used to exercise methodology involving: density estimation; heteroscedastic measurement errors; contingency tables; two-sample hypothesis tests; spatial point processes; nonlinear regression; mixture models; censoring and truncation; multivariate analysis; classification and clustering; inhomogeneous Poisson processes; periodic and stochastic time series analysis. / GPL  | noarch                         |
| <a href="#">r-astrofns</a>   | 4.1_0   | Miscellaneous astronomy functions, utilities, and data. / GPL ( $\geq 2$ )   | noarch                         |
| <a href="#">r-astrolibr</a>  | 0.1     | Several dozen low-level utilities and codes from the Interactive Data Language (IDL) Astronomy Users Library ( <a href="http://idlastro.gsfc.nasa.gov">http://idlastro.gsfc.nasa.gov</a> ) are implemented in R. They treat: time, coordinate and proper motion transformations; terrestrial precession and nutation, atmospheric refraction and aberration, barycentric corrections, and related effects; utilities for astrometry, photometry, and spectroscopy; and utilities for planetary, stellar, Galactic, and extragalactic science. / GPL  | noarch                         |
| <a href="#">r-astsa</a>      | 1.9     | Data sets and scripts to accompany Time Series Analysis and Its Applications: With R Examples (4th ed), by R.H. Shumway and D.S. Stoffer. Springer Texts in Statistics, 2017, <DOI:10.1007/978-3-319-52452-8>, and Time Series: A Data Analysis Approach Using R. Chapman-Hall, 2019, <ISBN: 978-0367221096>. / GPL-3  | noarch                         |

Table 51 – continued from previous page

| Name       | Version | Summary/License  | Platforms                      |
|------------|---------|--|--------------------------------|
| r-asyk     | 0.1.0   | Density estimation by using symmetrical kernels and to calculate mean square error. See Scaillet (2004) <doi:10.1080/10485250310001624819> and Khan and Akbar (2019). / GPL-2  | noarch                         |
| r-asyml    | 0.1     | Computes asymmetric LD measures (ALD) for multi-allelic genetic data. These measures are identical to the correlation measure (r) for bi-allelic data. / GPL-2   | noarch                         |
| r-asymp    | 0.1.4   | One and two sample mean and variance tests (differences and ratios) are considered. The test statistics are all expressed in the same form as the Student t-test, which facilitates their presentation in the classroom. This contribution also fills the gap of a robust (to non-normality) alternative to the chi-square single variance test for large samples, since no such procedure is implemented in standard statistical software. / GPL (>= 2)   | noarch                         |
| r-asymlong | 2.0     | Estimation of regression models for sparse asynchronous longitudinal observations, where time-dependent response and covariates are mismatched and observed intermittently within subjects. Kernel weighted estimating equations are used for generalized linear models with either time-invariant or time-dependent coefficients. / GPL-2   | noarch                         |
| r-asympow  | 2015.02 | Set of routines written in the S language that calculate power and related quantities utilizing asymptotic likelihood ratio methods. / ACM   file LICENSE (Restricts use)  | noarch                         |
| r-ate      | 0.2.0   | Nonparametric estimation and inference for average treatment effects based on covariate balancing. / GPL (>= 2)  | noarch                         |
| r-atlas    | 1.0.0   | Stanford 'ATLAS' (Advanced Temporal Search Engine) is a powerful tool that allows constructing cohorts of patients extremely quickly and efficiently. This package is designed to interface directly with an instance of 'ATLAS' search engine and facilitates API queries and data dumps. Prerequisite is a good knowledge of the temporal language to be able to efficiently construct a query. More information available at < <a href="https://shahlab.stanford.edu/start">https://shahlab.stanford.edu/start</a> >. / GPL-3 | noarch                         |
| r-atmcmc   | 1.0     | Uses adaptive diagnostics to tune and run a random walk Metropolis MCMC algorithm, to converge to a specified target distribution and estimate means of functionals. / GPL (>= 2)  | noarch                         |
| r-atmray   | 1.31    | Calculates acoustic traveltimes and ray paths in 1-D, linear atmospheres. Later versions will support arbitrary 1-D atmospheric models, such as radiosonde measurements and standard reference atmospheres. / GPL  | linux-64,<br>osx-64,<br>win-64 |
| r-atsa     | 3.1.2   | Contains some tools for testing, analyzing time series data and fitting popular time series models such as ARIMA, Moving Average and Holt Winters, etc. Most functions also provide nice and clear outputs like SAS does, such as identify, estimate and forecast, which are the same statements in PROC ARIMA in SAS. / GPL-2   GPL-3   | noarch                         |
| r-atsd     | 1.2.0   | Provides functions for retrieving time-series and related meta-data such as entities, metrics, and tags from the Axibase Time-Series Database (ATSD). ATSD is a non-relational clustered database used for storing performance measurements from IT infrastructure resources: servers, network devices, storage systems, and applications. / Apache License 2.0  | noarch                         |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms                      |
|------------------------------|---------|---|--------------------------------|
| <a href="#">r-attachment</a> | 0.0.9   | Tools to help manage dependencies during package development. This can retrieve all dependencies that are used in R files in the R directory, in Rmd files in vignettes directory and in 'roxygen2' documentation of functions. There is a function to update the Description file of your package and a function to create a file with the R commands to install all dependencies of your package. All functions to retrieve dependencies of R scripts and Rmd files can be used independently of a package development. / GPL-3   | noarch                         |
| <a href="#">r-attempt</a>    | 0.3.0   | Tools for defensive programming, inspired by 'purrr' mappers and based on 'rlang'. 'attempt' extends and facilitates defensive programming by providing a consistent grammar, and provides a set of easy to use functions for common tests and conditions. 'attempt' only depends on 'rlang', and focuses on speed, so it can be easily integrated in other functions and used in data analysis. / MIT file LICENSE   | noarch                         |
| <a href="#">r-attrcsum</a>   | 0.1.0   | An implementation of tools for design of attribute variable sampling interval cumulative sum chart. It currently provides information for monitoring of mean increase such as average number of sample to signal, average time to signal, a matrix of transient probabilities, suitable control limits when the data are (zero inflated) Poisson/binomial distribution. Functions in the tools can be easily applied to other count processes. Also, tools might be extended to more complicated cumulative sum control chart. We leave these issues as our perpetual work. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-atus</a>       | 0.2     | Abridged data from the American Time Use Survey (ATUS) for years 2003-2016. The ATUS is an annual survey conducted on a sample of individuals across the United States studying how individuals spent their time over the course of a day. Individual respondents were interviewed about what activities they did, during what times (rounded to 15 minute increments), at what locations, and in the presence of which individuals. The activities are subsequently encoded based on 3 separate tier codes for classification. This package includes data from the multi-year ATUS Activities, ATUS-CPS, and ATUS Respondents files were included. Columns were selected based on completeness of data as well as presence on the Frequently Used Variables list provided by the ATUS website. All activity codes (other than code '50' for 'Unable to Code') were included. Permission was obtained from the Bureau of Labor Statistics for inclusion in this package. The full data can be obtained from < <a href="http://www.bls.gov/tus/">http://www.bls.gov/tus/</a> >. / GPL (>= 2) | noarch                         |
| <a href="#">r-auc</a>        | 0.3.0   | This package includes functions to compute the area under the curve of selected measures: The area under the sensitivity curve (AUSEC), the area under the specificity curve (AUSPC), the area under the accuracy curve (AUACC), and the area under the receiver operating characteristic curve (AUROC). The curves can also be visualized. Support for partial areas is provided. / GPL (>= 2)   | noarch                         |
| <a href="#">r-aucrf</a>      | 1.1     | Variable selection using Random Forest based on optimizing the area-under-the ROC curve (AUC) of the Random Forest. / GPL (>= 2)  | noarch                         |
| <a href="#">r-audio</a>      | 0.1_6   | Interfaces to audio devices (mainly sample-based) from R to allow recording and playback of audio. Built-in devices include Windows MM, Mac OS X AudioUnits and PortAudio (the last one is very experimental). / MIT file LICENSE   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-audit</a>      | 0.1_1   | Two Bayesian methods for Accounting Populations / MIT   | noarch                         |

Table 51 – continued from previous page

| Name                | Version | Summary/License  | Platforms |
|---------------------|---------|--|-----------|
| r-auth0             | 0.1.1   | Uses Auth0 API (see < <a href="https://auth0.com">https://auth0.com</a> > for more information) to use a simple and secure authentication system. It provides tools to log in and out a shiny application using social networks or a list of e-mails. / MIT file LICENSE   | noarch    |
| r-auto.pca          | 0.3     | PCA done by eigenvalue decomposition of a data correlation matrix, here it automatically determines the number of factors by eigenvalue greater than 1 and it gives the uncorrelated variables based on the rotated component scores, Such that in each principal component variable which has the high variance are selected. It will be useful for non-statisticians in selection of variables. For more information, see the < <a href="http://www.ijcem.org/papers032013/ijcem_032013_06.pdf">http://www.ijcem.org/papers032013/ijcem_032013_06.pdf</a> > web page. / GPL-2  | noarch    |
| r-autodesk          | 0.1.3   | An interface to the 'AutoDesk' 'API' Platform including the Authentication 'API' for obtaining authentication to the 'AutoDesk' Forge Platform, Data Management 'API' for managing data across the platform's cloud services, Design Automation 'API' for performing automated tasks on design files in the cloud, Model Derivative 'API' for translating design files into different formats, sending them to the viewer app, and extracting design data, and Viewer for rendering 2D and 3D models (see < <a href="https://developer.autodesk.com">https://developer.autodesk.com</a> > for more information). / Apache License   file LICENSE | noarch    |
| r-autoencoder       | 1.1     | Implementation of the sparse autoencoder in R environment, following the notes of Andrew Ng ( <a href="http://www.stanford.edu/class/archive/cs/cs294a/cs294a.1104/sparseAutoencoder.pdf">http://www.stanford.edu/class/archive/cs/cs294a/cs294a.1104/sparseAutoencoder.pdf</a> ). The features learned by the hidden layer of the autoencoder (through unsupervised learning of unlabeled data) can be used in constructing deep belief neural networks. / GPL-2  | noarch    |
| r-automl            | 1.2.8   | Fits from simple regression to highly customizable deep neural networks either with gradient descent or metaheuristic, using automatic hyper parameters tuning and custom cost function. A mix inspired by the common tricks on Deep Learning and Particle Swarm Optimization. / GNU General Public License  | noarch    |
| r-automultinomial   | 2.0.0   | Fits the autologistic model described in Besag's famous 1974 paper on auto-models < <a href="http://www.jstor.org/stable/2984812">http://www.jstor.org/stable/2984812</a> >. Fits a multicategory generalization of the autologistic model when there are more than 2 response categories. Provides support for both asymptotic and bootstrap confidence intervals. For full model descriptions and a guide to the use of this package, please see the vignette. / GPL-2   | noarch    |
| r-autopls           | 1.3     | Some convenience functions for pls regression, including backward variable selection and validation procedures, image based predictions and plotting. / GPL-2  | noarch    |
| r-autoregressionmde | 1.0     | Consider autoregressive model of order p where the distribution function of innovation is unknown, but innovations are independent and symmetrically distributed. The package contains a function named ARMDE which takes X (vector of n observations) and p (order of the model) as input argument and returns minimum distance estimator of the parameters in the model. / GPL-2   | noarch    |
| r-autoshiny         | 0.0.2   | Static code compilation of a 'shiny' app given an R function (into 'ui.R' and 'server.R' files or into a 'shiny' app object). See examples at < <a href="https://github.com/alekrutkowski/autoshiny">https://github.com/alekrutkowski/autoshiny</a> >. / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name              | Version | Summary/License   | Platforms                      |
|-------------------|---------|---|--------------------------------|
| r-autovarcore     | 1.0.4   | Automatically find the best vector autoregression models and networks for a given time series data set. ‘AutovarCore’ evaluates eight kinds of models: models with and without log transforming the data, lag 1 and lag 2 models, and models with and without weekday dummy variables. For each of these 8 model configurations, ‘AutovarCore’ evaluates all possible combinations for including outlier dummies (at 2.5x the standard deviation of the residuals) and retains the best model. Model evaluation includes the Eigenvalue stability test and a configurable set of residual tests. These eight models are further reduced to four models because ‘AutovarCore’ determines whether adding weekday dummies improves the model fit. / MIT file LICENSE | linux-64,<br>osx-64,<br>win-64 |
| r-av              | 0.2     | Bindings to ‘FFmpeg’ < <a href="http://www.ffmpeg.org/">http://www.ffmpeg.org/</a> > AV library for working with audio and video in R. Generate high quality videos files by capturing images from the R graphics device combined with custom audio stream. This package interfaces directly to the C API and does not require any command line utilities. / MIT file LICENSE   | linux-64,<br>osx-64            |
| r-averisk         | 1.0.3   | Average population attributable fractions are calculated for a set of risk factors (either binary or ordinal valued) for both prospective and case-control designs. Confidence intervals are found by Monte Carlo simulation. The method can be applied to either prospective or case control designs, provided an estimate of disease prevalence is provided. In addition to an exact calculation of AF, an approximate calculation, based on randomly sampling permutations has been implemented to ensure the calculation is computationally tractable when the number of risk factors is large. / CC0   | noarch                         |
| r-aweek           | 1.0.0   | Which day a week starts depends heavily on the either the local or professional context. This package is designed to be a lightweight solution to easily switching between week-based date definitions. / MIT file LICENSE  | noarch                         |
| r-awr             | 1.11.1  | Installs the compiled Java modules of the Amazon Web Services (‘AWS’) ‘SDK’ to be used in downstream R packages interacting with ‘AWS’. See < <a href="https://aws.amazon.com/sdk-for-java">https://aws.amazon.com/sdk-for-java</a> > for more information on the ‘AWS’ ‘SDK’ for Java. / AGPL-3  | noarch                         |
| r-awr.athena      | 2.0.7   | ‘RJDBC’ based ‘DBI’ driver to Amazon Athena, which is an interactive query service to analyze data in Amazon ‘S3’ using standard ‘SQL’. / AGPL-3  | noarch                         |
| r-awr.kms         | 0.1     | Encrypt plain text and ‘decrypt’ cipher text using encryption keys hosted at Amazon Web Services (‘AWS’) Key Management Service (‘KMS’), on which see < <a href="https://aws.amazon.com/kms">https://aws.amazon.com/kms</a> > for more information. / AGPL-3  | noarch                         |
| r-aws             | 2.2.1   | We provide a collection of R-functions implementing adaptive smoothing procedures in 1D, 2D and 3D. This includes the Propagation-Separation Approach to adaptive smoothing as described in J. Polzehl and V. Spokoiny (2006) <DOI:10.1007/s00440-005-0464-1>, J. Polzehl and V. Spokoiny (2004) <DOI:10.20347/WIAS.PREPRINT.998> and J. Polzehl, K. Papafitsoros, K. Tabelow (2018) <DOI:10.20347/WIAS.PREPRINT.2520>, the Intersecting Confidence Intervals (ICI), variational approaches and a non-local means filter. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64 |
| r-aws.cloudtrail  | 0.1.5   | A simple client package for the Amazon Web Services (‘AWS’) ‘CloudTrail’ ‘API’ < <a href="https://aws.amazon.com/cloudtrail/">https://aws.amazon.com/cloudtrail/</a> >. / GPL-2   | noarch                         |
| r-aws.comprehend  | 0.1.2   | Client for ‘AWS Comprehend’ < <a href="https://aws.amazon.com/comprehend">https://aws.amazon.com/comprehend</a> >, a cloud natural language processing service that can perform a number of quantitative text analyses, including language detection, sentiment analysis, and feature extraction. / GPL (>= 2)  | noarch                         |
| r-aws.ec2metadata | 0.2.0   | Retrieve Amazon EC2 instance metadata from within the running instance. / GPL (>= 2)  | noarch                         |

| Name              | Version | Summary/License   | Platforms                      |
|-------------------|---------|---|--------------------------------|
| r-aws.iam         | 0.1.7   | A simple client for the Amazon Web Services ('AWS') Identity and Access Management ('IAM') 'API' < <a href="https://aws.amazon.com/iam/">https://aws.amazon.com/iam/</a> >. / GPL (>= 2)  | noarch                         |
| r-aws.kms         | 0.1.2   | Client package for the 'AWS Key Management Service' < <a href="https://aws.amazon.com/kms/">https://aws.amazon.com/kms/</a> >, a cloud service for managing encryption keys. / GPL (>= 2)   | noarch                         |
| r-aws.lambda      | 0.1.6   | A simple client package for the Amazon Web Services ('AWS') Lambda 'API' < <a href="https://aws.amazon.com/lambda/">https://aws.amazon.com/lambda/</a> >. / GPL (>= 2)  | noarch                         |
| r-aws.s3          | 0.3.12  | A simple client package for the Amazon Web Services ('AWS') Simple Storage Service ('S3') 'REST' 'API' < <a href="https://aws.amazon.com/s3/">https://aws.amazon.com/s3/</a> >. / GPL (>= 2)  | noarch                         |
| r-aws.ses         | 0.1.4   | A simple client package for the Amazon Web Services (AWS) Simple Email Service (SES) < <a href="http://aws.amazon.com/ses/">http://aws.amazon.com/ses/</a> > REST API. / GPL (>= 2)   | noarch                         |
| r-aws.signature   | 0.5.2   | Generates version 2 and version 4 request signatures for Amazon Web Services ('AWS') < <a href="https://aws.amazon.com/">https://aws.amazon.com/</a> > Application Programming Interfaces ('APIs') and provides a mechanism for retrieving credentials from environment variables, 'AWS' credentials files, and 'EC2' instance metadata. For use on 'EC2' instances, users will need to install the suggested package 'aws.ec2metadata' < <a href="https://cran.r-project.org/package=aws.ec2metadata">https://cran.r-project.org/package=aws.ec2metadata</a> >. / GPL (>= 2) | noarch                         |
| r-aws.sns         | 0.1.7   | A simple client package for the Amazon Web Services ('AWS') Simple Notification Service ('SNS') 'API' < <a href="https://aws.amazon.com/sns/">https://aws.amazon.com/sns/</a> >. / GPL (>= 2)   | noarch                         |
| r-aws.sqs         | 0.1.10  | A simple client package for the Amazon Web Services ('AWS') Simple Queue Service ('SQS') < <a href="https://aws.amazon.com/sqs/">https://aws.amazon.com/sqs/</a> > 'API'. / GPL (>= 2)  | noarch                         |
| r-aws.transcribe  | 0.1.2   | Client for 'AWS Transcribe' < <a href="https://aws.amazon.com/documentation/transcribe">https://aws.amazon.com/documentation/transcribe</a> >, a cloud transcription service that can convert an audio media file in English and other languages into a text transcript. / GPL (>= 2)   | noarch                         |
| r-aws.translate   | 0.1.3   | A client for 'AWS Translate' < <a href="https://aws.amazon.com/documentation/translate">https://aws.amazon.com/documentation/translate</a> >, a machine translation service that will convert a text input in one language into a text output in another language. / GPL (>= 2)   | noarch                         |
| r-awsjavasdk      | 0.2.0   | Provides boilerplate access to all of the classes included in the Amazon Web Services ('AWS') Java Software Development Kit (SDK) via package: 'rJava'. According to Amazon, the 'SDK helps take the complexity out of coding by providing Java APIs for many AWS services including Amazon S3, Amazon EC2, DynamoDB, and more'. You can read more about the included Java code on Amazon's website: < <a href="https://aws.amazon.com/sdk-for-java/">https://aws.amazon.com/sdk-for-java/</a> >. / GPL-2   | noarch                         |
| r-awsmethods      | 1.1_1   | Defines the method extract and provides 'openMP' support as needed in several packages. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64 |
| r-azurevmmetadata | 1.0.0   | A simple interface to the instance metadata for a virtual machine running in Microsoft's 'Azure' cloud. This provides information about the VM's configuration, such as its processors, memory, networking, storage, and so on. Part of the 'AzureR' family of packages. / MIT  | noarch                         |
| r-b2z             | 1.4     | This package fits the Bayesian two-Zone Models. / GPL-2   | noarch                         |
| r-b6e6rl          | 1.1     | This package contains b6e6rl algorithm, adaptive differential evolution for global optimization. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name                          | Version | Summary/License   | Platforms  |
|-------------------------------|---------|---|--|
| <a href="#">r-babar</a>       | 1.0     | Babar is designed to use nested sampling (a Bayesian analysis technique) to compare possible models for bacterial growth curves, as well as extracting parameters. It allows model evidence and parameter likelihood values to be extracted, and also contains helper functions for comparing distributions as well as direct access to the underlying nested sampling code. / GPL-2  | noarch   |
| <a href="#">r-backpipe</a>    | 0.2.3   | Provides a backward-pipe operator for ‘magrittr’ ( <code>%&lt;%</code> ) or ‘pipeR’ ( <code>%&lt;&lt;%</code> ) that allows for a performing operations from right-to-left. This allows writing more legible code where right-to-left ordering is natural. This is common with hierarchies and nested structures such as trees, directories or markup languages (e.g. HTML and XML). The package also includes a R-Studio add-in that can be bound to a keyboard shortcut. / GPL-2   file LICENSE   | noarch   |
| <a href="#">r-backports</a>   | 1.1.4   | Implementations of functions which have been introduced in R since version 3.0.0. The backports are conditionally exported which results in R resolving the function names to the version shipped with R (if available) and uses the implemented backports as fallback. This way package developers can make use of the new functions without worrying about the minimum required R version. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-backtest</a>    | 0.3_4   | The backtest package provides facilities for exploring portfolio-based conjectures about financial instruments (stocks, bonds, swaps, options, et cetera). / GPL (>= 2)   | noarch   |
| <a href="#">r-bacprior</a>    | 2.0     | The BACprior package provides an approximate sensitivity analysis of the Bayesian Adjustment for Confounding (BAC) algorithm (Wang et al., 2012) with regards to the hyperparameter omega. The package also provides functions to guide the user in their choice of an appropriate omega value. The method is based on Lefebvre, Atherton and Talbot (2014). / GPL (>= 2)   | noarch   |
| <a href="#">r-badgecreatr</a> | 0.2.0   | Tired of copy and pasting almost identical markdown for badges in every new R-package that you create, on Github or other code-sharing sites? This package allows you to easily paste badges. If you want to, it will also search your DESCRIPTION file and extract the package name, license, R-version, and current projectversion and transform that into badges. It will also search for a .travis.yml file and create a Travis badge, if you use Codecov.io to check your code coverage after a Travis build this package will also build a Codecov.io-badge. All the badges can be placed individually or can be placed below the top YAML content of your RMarkdown file (Readme.Rmd) or README.md file. Currently creates badges for Projectstatus (Repostatus.org), license Travis Build Status, Codecov, Minimal R version, CRAN status, CRAN downloads, Github stars and forks, Package rank, rdocumentation, current version of your package and last change of README.Rmd. / GPL-3 | noarch   |
| <a href="#">r-baessd</a>      | 1.0.1   | Implements sample size calculations following the approach described in Bayesian Average Error Based Approach to Hypothesis Testing and Sample Size Determination. / GPL-2  | noarch   |

| Name                              | Version | Summary/License   | Platforms                      |
|-----------------------------------|---------|---|--------------------------------|
| <a href="#">r-bagrboostR</a>      | 0.0.2   | bagRboostR is a set of ensemble classifiers for multinomial classification. The bagging function is the implementation of Breiman's ensemble as described by Opitz & Maclin (1999). The boosting function is the implementation of Stagewise Additive Modeling using a Multi-class Exponential loss function (SAMME) created by Zhu et al (2006). Both bagging and SAMME implementations use randomForest as the weak classifier and expect a character outcome variable. Each ensemble classifier returns a character vector of predictions for the test set. / MIT file LICENSE                   | noarch                         |
| <a href="#">r-bain</a>            | 0.2.1   | Computes approximated adjusted fractional Bayes factors for equality, inequality, and about equality constrained hypotheses. S3 methods are available for specific types of lm() models, namely ANOVA, ANCOVA, and multiple regression, and for the t_test(). The statistical underpinnings are described in Hoijtink, Mulder, van Lissa, and Gu, (2018) <doi:10.31234/osf.io/v3shc>, Gu, Mulder, and Hoijtink, (2018) <doi:10.1111/bmsp.12110>, Hoijtink, Gu, and Mulder, (2018) <doi:10.1111/bmsp.12145>, and Hoijtink, Gu, Mulder, and Rosseel, (2018) <doi:10.1037/met0000187>. / GPL (>= 3)    | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bairt</a>           | 0.1.2   | Bayesian estimation of the two and three parameter models of item response theory (IRT). Also, it is possible to use a web interactive application intended for the making of an MCMC estimation and model-fit of the IRT models. / GPL (>= 2)  | noarch                         |
| <a href="#">r-balancecheck</a>    | 0.2     | Two practical tests are provided for assessing whether multiple covariates in a treatment group and a matched control group are balanced in observational studies. / GPL (>= 2)   | noarch                         |
| <a href="#">r-bammtools</a>       | 2.1.6   | Provides functions for analyzing and visualizing complex macroevolutionary dynamics on phylogenetic trees. It is a companion package to the command line program BAMM (Bayesian Analysis of Macroevolutionary Mixtures) and is entirely oriented towards the analysis, interpretation, and visualization of evolutionary rates. Functionality includes visualization of rate shifts on phylogenies, estimating evolutionary rates through time, comparing posterior distributions of evolutionary rates across clades, comparing diversification models using Bayes factors, and more. / GPL (>= 2) | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bamp</a>            | 2.0.7   | Bayesian Age-Period-Cohort Modeling and Prediction using efficient Markov Chain Monte Carlo Methods. This is the R version of the previous BAMP software as described in Volker Schmid and Leonhard Held (2007) <DOI:10.18637/jss.v021.i08> Bayesian Age-Period-Cohort Modeling and Prediction - BAMP, Journal of Statistical Software 21:8. This package includes checks of convergence using Gelman's R. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bannercommenter</a> | 0.1.1   | A convenience package for use while drafting code. It facilitates making stand-out comment lines decorated with bands of characters. The input text strings are converted into R comment lines, suitably formatted. These are then displayed in a console window and, if possible, automatically transferred to a clipboard ready for pasting into an R script. Designed to save time when drafting R scripts that will need to be navigated and maintained by other programmers. / GPL (>= 2)  | noarch                         |
| <a href="#">r-banxicor</a>        | 0.9.0   | Provides functions to scrape IQY calls to Bank of Mexico, downloading and ordering the data conveniently. / CC0   | noarch                         |
| <a href="#">r-baprestopro</a>     | 0.1     | Bayesian estimation and prediction for stochastic processes based on the Euler approximation. Considered processes are: jump diffusion, (mixed) diffusion models, hidden (mixed) diffusion models, non-homogeneous Poisson processes (NHPP), (mixed) regression models for comparison and a regression model including a NHPP. / GPL (>= 2)   | noarch                         |

| Name                           | Version | Summary/License  | Platforms                      |
|--------------------------------|---------|--|--------------------------------|
| <code>r-barborgradient</code>  | 1.0.5   | Tool to find where a function has its lowest value(minimum). The functions can be any dimensions. Recommended use is with $\text{eps}=10^{-10}$ , but can be run with $10^{-20}$ , although this depends on the function. Two more methods are in this package, simple gradient method (Gradmod) and Powell method (Powell). These are not recommended for use, their purpose are purely for comparison. / GPL-3 | noarch                         |
| <code>r-barcode</code>         | 1.1     | This package includes the function <code>code{barcode()}</code> , which produces a histogram-like plot of a distribution that shows granularity in the data. / GPL ( $\geq 2$ )  | noarch                         |
| <code>r-barcodingr</code>      | 1.0.2   | To perform species identification using DNA barcodes. / GPL-2  | noarch                         |
| <code>r-barnard</code>         | 1.8     | Barnard's unconditional test for 2x2 contingency tables. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-barsurf</code>         | 0.3.1   | Produces heat maps, contour plots, bar plots (in 3D) and surface plots (also, in 3D). Is designed for plotting functions of two variables, however, can plot relatively arbitrary matrices. Uses HCL color space, extensively. Also, supports triangular plots and nested matrices. / GPL ( $\geq 2$ )   | noarch                         |
| <code>r-bart</code>            | 2.5     | Bayesian Additive Regression Trees (BART) provide flexible nonparametric modeling of covariates for continuous, binary, categorical and time-to-event outcomes. For more information on BART, see Chipman, George and McCulloch (2010) <doi:10.1214/09-AOAS285> and Sparapani, Logan, McCulloch and Laud (2016) <doi:10.1002/sim.6893>. / GPL ( $\geq 2$ )   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-bartmachinejars</code> | 1.1     | These are bartMachine's Java dependency libraries. Note: this package has no functionality of its own and should not be installed as a standalone package without bartMachine. / GPL-3   | noarch                         |
| <code>r-barycenter</code>      | 1.3.1   | Computations of entropy regularized Wasserstein Distances, a.k.a. dual-Sinkhorn divergences, and entropy regularized Wasserstein Barycenters. Relevant papers are Marco Cuturi (2013) <arXiv:1306.0895>, Marco Cuturi (2014) <arXiv:1310.4375> and Jason Altschuler et al. <arXiv:1705.09634>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

|-----------------------------|---------|--|--|
| <a href="#">r-bas</a>       | 1.5.3   | Package for Bayesian Variable Selection and Model Averaging in linear models and generalized linear models using stochastic or deterministic sampling without replacement from posterior distributions. Prior distributions on coefficients are from Zellner's g-prior or mixtures of g-priors corresponding to the Zellner-Siow Cauchy Priors or the mixture of g-priors from Liang et al (2008) <DOI:10.1198/016214507000001337> for linear models or mixtures of g-priors in GLMs of Li and Clyde (2018) <arXiv:1503.06913>. Other model selection criteria include AIC, BIC and Empirical Bayes estimates of g. Sampling probabilities may be updated based on the sampled models using Sampling w/out Replacement or an efficient MCMC algorithm samples models using the BAS tree structure as an efficient hash table. Uniform priors over all models or beta-binomial prior distributions on model size are allowed, and for large p truncated priors on the model space may be used. The user may force variables to always be included. Details behind the sampling algorithm are provided in Clyde, Ghosh and Littman (2010) <DOI:10.1198/jcgs.2010.09049>. This material is based upon work supported by the National Science Foundation under Grant DMS-1106891. Any opinions, findings, and conclusions or recommendations expressed in this material are those of the author(s) and do not necessarily reflect the views of the National Science Foundation. / GPL (>= 3) | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-base</a>      | 3.6.1   | R is a free software environment for statistical computing and graphics. / GPL-3.0   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-base64</a>    | 2.0     | Compatibility wrapper to replace the orphaned package by Romain Francois. New applications should use the 'openssl' or 'base64enc' package instead. / MIT file LICENSE   | noarch   |
| <a href="#">r-base64enc</a> | 0.1_3   | This package provides tools for handling base64 encoding. It is more flexible than the orphaned base64 package. / GPL-2   GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-base64url</a> | 1.4     | In contrast to RFC3548, the 62nd character () is replaced with -, the 63rd character (/) is replaced with _. Furthermore, the encoder does not fill the string with trailing =. The resulting encoded strings comply to the regular expression pattern [ <b>A-Za-z0-9_-</b> ] and thus are safe to use in URLs or for file names. The package also comes with a simple base32 encoder/decoder suited for case insensitive file systems. / GPL-3  | linux-64,<br>osx-64,<br>win-64                         |

| Name             | Version | Summary/License   | Platforms                      |
|------------------|---------|---|--------------------------------|
| r-baseline       | 1.2.1   | Collection of baseline correction algorithms, along with a framework and a GUI for optimising baseline algorithm parameters. Typical use of the package is for removing background effects from spectra originating from various types of spectroscopy and spectrometry, possibly optimizing this with regard to regression or classification results. Correction methods include polynomial fitting, weighted local smoothers and many more. / GPL-2   | noarch                         |
| r-basetheme      | 0.1.1   | Functions to create and select graphical themes for the base plotting system. Contains: 1) several custom pre-made themes 2) mechanism for creating new themes by making persistent changes to the graphical parameters of base plots. / GPL-2  | noarch                         |
| r-basismcmcplots | 0.2.2   | Provides a function for examining posterior MCMC samples from a single chain using trace plots and density plots, and from multiple chains by comparing posterior medians and credible intervals from each chain. These plotting functions have a variety of options, such as figure sizes, legends, parameters to plot, and saving plots to file. Functions interface with the NIMBLE software package, see de Valpine, Turek, Paciorek, Anderson-Bergman, Temple Lang and Bodik (2017) <doi:10.1080/10618600.2016.1172487>. / GPL-3 | noarch                         |
| r-basicspace     | 0.20    | Conducts Aldrich-McKelvey and Blackbox Scaling (Poole et al 2016) <doi:10.18637/jss.v069.i07> to recover latent dimensions of judgment. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-basix          | 1.1     | BASIX provides some efficient C/C implementations to speed up calculations in R. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-bass           | 0.2.2   | Bayesian fitting and sensitivity analysis methods for adaptive spline surfaces. Built to handle continuous and categorical inputs as well as functional or scalar output. An extension of the methodology in Denison, Mallick and Smith (1998) <doi:10.1023/A:1008824606259>. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-batch          | 1.1.5   | Functions to allow you to easily pass command-line arguments into R, and functions to aid in submitting your R code in parallel on a cluster and joining the results afterward (e.g. multiple parameter values for simulations running in parallel, splitting up a permutation test in parallel, etc.). See ‘parseCommandArgs(...)’ for the main example of how to use this package. / GPL  | noarch                         |
| r-batchmeans     | 1.0.3   | Provides consistent batch means estimation of Monte Carlo standard errors. / GPL (>= 2)   | noarch                         |
| r-batchscr       | 0.1.0   | Handy frameworks, such as error handling and log generation, for batch scripts. Use case: in scripts running in remote servers, set error handling mechanism for downloading and uploading and record operation log. / MIT file LICENSE   | noarch                         |

| Name                            | Version | Summary/License   | Platforms                      |
|---------------------------------|---------|---|--------------------------------|
| <a href="#">r-batman</a>        | 0.1.0   | Survey systems and other third-party data sources commonly use non-standard representations of logical values when it comes to qualitative data - Yes, No and N/A, say. batman is a package designed to seamlessly convert these into logicals. It is highly localised, and contains equivalents to boolean values in languages including German, French, Spanish, Italian, Turkish, Chinese and Polish. / MIT file LICENSE   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bayesbio</a>      | 1.0.0   | A hodgepodge of hopefully helpful functions. Two of these perform shrinkage estimation: one using a simple weighted method where the user can specify the degree of shrinkage required, and one using James-Stein shrinkage estimation for the case of unequal variances. / GPL-3   | noarch                         |
| <a href="#">r-bayescombo</a>    | 1.0     | Combine diverse evidence across multiple studies to test a high level scientific theory. The methods can also be used as an alternative to a standard meta-analysis. / GPL-3  | noarch                         |
| <a href="#">r-bayescomm</a>     | 0.1_2   | Bayesian multivariate binary (probit) regression models for analysis of ecological communities. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bayesda</a>       | 2012.04 | Functions for Bayesian Data Analysis, with datasets from the book Bayesian data Analysis (second edition) by Gelman, Carlin, Stern and Rubin. Not all datasets yet, hopefully completed soon. / GPL (>= 2)  | noarch                         |
| <a href="#">r-bayesdccgarch</a> | 2.0     | Bayesian estimation of dynamic conditional correlation GARCH model for multivariate time series volatility (Fioruci, J.A., Ehlers, R.S. and Andrade-Filho, M.G., (2014), DOI:10.1080/02664763.2013.839635). / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bayesdistreg</a>  | 0.1.0   | Implements Bayesian Distribution Regression methods. This package contains functions for three estimators (non-asymptotic, semi-asymptotic and asymptotic) and related routines for Bayesian Distribution Regression in Huang and Tsyawo (2018) <doi:10.2139/ssrn.3048658> which is also the recommended reference to cite for this package. The functions can be grouped into three (3) categories. The first computes the logit likelihood function and posterior densities under uniform and normal priors. The second contains Independence and Random Walk Metropolis-Hastings Markov Chain Monte Carlo (MCMC) algorithms as functions and the third category of functions are useful for semi-asymptotic and asymptotic Bayesian distribution regression inference. / GPL-2 | noarch                         |
| <a href="#">r-bayesgarch</a>    | 2.1.3   | Provides the bayesGARCH() function which performs the Bayesian estimation of the GARCH(1,1) model with Student's t innovations as described in Ardia (2008) <doi:10.1007/978-3-540-78657-3>. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64 |

|---------------------------------|---------|--|--------------------------------|
| <a href="#">r-bayesianetas</a>  | 1.0.3   | The Epidemic Type Aftershock Sequence (ETAS) model is one of the best-performing methods for modeling and forecasting earthquake occurrences. This package implements Bayesian estimation routines to draw samples from the full posterior distribution of the model parameters, given an earthquake catalog. The paper on which this package is based is Gordon J. Ross - Bayesian Estimation of the ETAS Model for Earthquake Occurrences (2016), available from the below URL. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bayesianpower</a> | 0.1.6   | A collection of methods to determine the required sample size for the evaluation of inequality constrained hypotheses by means of a Bayes factor. Alternatively, for a given sample size, the unconditional error probabilities or the expected conditional error probabilities can be determined. Additional material on the methods in this package is available in Klaassen, F., Hoijsink, H. & Gu, X. (2019) <doi:10.31219/osf.io/d5kf3>. / LGPL-3   | noarch                         |
| <a href="#">r-bayesimages</a>   | 0.6.0   | Various algorithms for segmentation of 2D and 3D images, such as computed tomography and satellite remote sensing. This package implements Bayesian image analysis using the hidden Potts model with external field prior of Moores et al. (2015) <doi:10.1016/j.cstda.2014.12.001>. Latent labels are sampled using checkerboard updating or Swendsen-Wang. Algorithms for the smoothing parameter include pseudolikelihood, path sampling, the exchange algorithm, approximate Bayesian computation (ABC-MCMC and ABC-SMC), and the parametric functional approximate Bayesian (PFAB) algorithm. Refer to <doi:10.1007/s11222-014-9525-6> and <doi:10.1214/18-BA1130> for further details. / GPL (>= 2)   file LICENSE   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bayesloglin</a>   | 1.0.1   | The function MC3() searches for log-linear models with the highest posterior probability. The function gibbsSampler() is a blocked Gibbs sampler for sampling from the posterior distribution of the log-linear parameters. The functions findPostMean() and findPostCov() compute the posterior mean and covariance matrix for decomposable models which, for these models, is available in closed form. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bayesm</a>        | 3.1.3   | Covers many important models used in marketing and micro-econometrics applications. The package includes: Bayes Regression (univariate or multivariate dep var), Bayes Seemingly Unrelated Regression (SUR), Binary and Ordinal Probit, Multinomial Logit (MNL) and Multinomial Probit (MNP), Multivariate Probit, Negative Binomial (Poisson) Regression, Multivariate Mixtures of Normals (including clustering), Dirichlet Process Prior Density Estimation with normal base, Hierarchical Linear Models with normal prior and covariates, Hierarchical Linear Models with a mixture of normals prior and covariates, Hierarchical Multinomial Logits with a mixture of normals prior and covariates, Hierarchical Multinomial Logits with a Dirichlet Process prior and covariates, Hierarchical Negative Binomial Regression Models, Bayesian analysis of choice-based conjoint data, Bayesian treatment of linear instrumental variables models, Analysis of Multivariate Ordinal survey data with scale usage heterogeneity (as in Rossi et al, JASA (01)), Bayesian Analysis of Aggregate Random Coefficient Logit Models as in BLP (see Jiang, Manchanda, Rossi 2009) For further reference, consult our book, Bayesian Statistics and Marketing by Rossi, Allenby and McCulloch (Wiley 2005) and Bayesian Non- and Semi-Parametric Methods and Applications (Princeton U Press 2014). / GPL (>= 2) | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bayesmams</a>     | 0.1     | Calculating Bayesian sample sizes for multi-arm trials where several experimental treatments are compared to a common control, perhaps even at multiple stages. / GPL (>= 2)   | noarch                         |

| Name                                  | Version | Summary/License   | Platforms                      |
|---------------------------------------|---------|---|--------------------------------|
| <a href="#">r-bayesmixsurv</a>        | 0.9.1   | Bayesian Mixture Survival Models using Additive Mixture-of-Weibull Hazards, with Lasso Shrinkage and Stratification. As a Bayesian dynamic survival model, it relaxes the proportional-hazard assumption. Lasso shrinkage controls overfitting, given the increase in the number of free parameters in the model due to presence of two Weibull components in the hazard function. / GPL (>= 2)   | noarch                         |
| <a href="#">r-bayesni</a>             | 0.1     | A Bayesian testing procedure for noninferiority trials with binary endpoints. The prior is constructed based on Bernstein polynomials with options for both informative and non-informative prior. The critical value of the test statistic (Bayes factor) is determined by minimizing total weighted error (TWE) criteria / GPL-2  | noarch                         |
| <a href="#">r-bayespiecehazselect</a> | 1.1.0   | Fits a piecewise exponential hazard to survival data using a Hierarchical Bayesian model with an Intrinsic Conditional Autoregressive formulation for the spatial dependency in the hazard rates for each piece. This function uses Metropolis- Hastings-Green MCMC to allow the number of split points to vary and also uses Stochastic Search Variable Selection to determine what covariates drive the risk of the event. This function outputs trace plots depicting the number of split points in the hazard and the number of variables included in the hazard. The function saves all posterior quantities to the desired path. / GPL-2  | noarch                         |
| <a href="#">r-bayespiecewiseicar</a>  | 0.2.1   | Fits a piecewise exponential hazard to survival data using a Hierarchical Bayesian model with an Intrinsic Conditional Autoregressive formulation for the spatial dependency in the hazard rates for each piece. This function uses Metropolis- Hastings-Green MCMC to allow the number of split points to vary. This function outputs graphics that display the histogram of the number of split points and the trace plots of the hierarchical parameters. The function outputs a list that contains the posterior samples for the number of split points, the location of the split points, and the log hazard rates corresponding to these splits. Additionally, this outputs the posterior samples of the two hierarchical parameters, Mu and Sigma^2. / GPL-2 | noarch                         |
| <a href="#">r-bayesqr</a>             | 2.3     | Bayesian quantile regression using the asymmetric Laplace distribution, both continuous as well as binary dependent variables are supported. The package consists of implementations of the methods of Yu & Moyeed (2001) <doi:10.1016/S0167-7152(01)00124-9>, Benoit & Van den Poel (2012) <doi:10.1002/jae.1216> and Al-Hamzawi, Yu & Benoit (2012) <doi:10.1177/1471082X1101200304>. To speed up the calculations, the Markov Chain Monte Carlo core of all algorithms is programmed in Fortran and called from R. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bayess</a>              | 1.4     | bayess contains a collection of functions that allows the reenactment of the R programs used in the book Bayesian Essentials with R (revision of Bayesian Core) without further programming. R code being available as well, they can be modified by the user to conduct one's own simulations. / GPL-2   | noarch                         |
| <a href="#">r-bayessae</a>            | 1.0_2   | Provides a variety of methods from Rao (2003, ISBN:0-471-41374-7) and some other research articles to deal with several specific small area area- level models in Bayesian framework. Models provided range from the basic Fay-Herriot model to its improvement such as You-Chapman models, unmatched models, spatial models and so on. Different types of priors for specific parameters could be chosen to obtain MCMC posterior draws. The main sampling function is written in C with GSL lib so as to facilitate the computation. Model internal checking and model comparison criteria are also involved. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name             | Version | Summary/License  | Platforms                      |
|------------------|---------|--|--------------------------------|
| r-bayest         | 1.0     | Provides an Markov-Chain-Monte-Carlo algorithm for Bayesian t-tests on the effect size. The underlying Gibbs sampler is based on a two-component Gaussian mixture and approximates the posterior distributions of the effect size, the difference of means and difference of standard deviations. A posterior analysis of the effect size via the region of practical equivalence is provided, too. For more details about the Gibbs sampler see Kelter (2019) <arXiv:1906.07524>. / GPL-2   | noarch                         |
| r-bayestree      | 0.3.1   | This is an implementation of BART:Bayesian Additive Regression Trees, by Chipman, George, McCulloch (2010). / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64 |
| r-bayestreeprior | 1.0.1   | Provides a way to simulate from the prior distribution of Bayesian trees by Chipman et al. (1998) <DOI:10.2307/2669832>. The prior distribution of Bayesian trees is highly dependent on the design matrix X, therefore using the suggested hyperparameters by Chipman et al. (1998) <DOI:10.2307/2669832> is not recommended and could lead to unexpected prior distribution. This work is part of my master thesis (expected 2016). / GPL-3  | noarch                         |
| r-bayesvalidate  | 0.0     | BayesValidate implements the software validation method described in the paper Validation of Software for Bayesian Models using Posterior Quantiles (Cook, Gelman, and Rubin, 2005). It inputs a function to perform Bayesian inference as well as functions to generate data from the Bayesian model being fit, and repeatedly generates and analyzes data to check that the Bayesian inference program works properly. / GPL (>= 2)  | noarch                         |
| r-bayesvarsel    | 1.8.0   | Conceived to calculate Bayes factors in linear models and then to provide a formal Bayesian answer to testing and variable selection problems. From a theoretical side, the emphasis in this package is placed on the prior distributions and it allows a wide range of them: Jeffreys (1961); Zellner and Siow(1980)<DOI:10.1007/bf02888369>; Zellner and Siow(1984); Zellner (1986)<DOI:10.2307/2233941>; Fernandez et al. (2001)<DOI:10.1016/s0304-4076(00)00076-2>; Liang et al. (2008)<DOI:10.1198/016214507000001337> and Bayarri et al. (2012)<DOI:10.1214/12-aos1013>. The interaction with the package is through a friendly interface that syntactically mimics the well-known lm() command of R. The resulting objects can be easily explored providing the user very valuable information (like marginal, joint and conditional inclusion probabilities of potential variables; the highest posterior probability model, HPM; the median probability model, MPM) about the structure of the true -data generating- model. Additionally, this package incorporates abilities to handle problems with a large number of potential explanatory variables through parallel and heuristic versions of the main commands, Garcia-Donato and Martinez-Beneito (2013)<DOI:10.1080/01621459.2012.742443>. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-bayesxsrc      | 3.0.1   | BayesX performs Bayesian inference in structured additive regression (STAR) models. The R package BayesXsrc provides the BayesX command line tool for easy installation. A convenient R interface is provided in package R2BayesX. / GPL-2   GPL-3   | linux-64,<br>osx-64,<br>win-64 |

| Name            | Version | Summary/License   | Platforms                      |
|-----------------|---------|---|--------------------------------|
| r-bayfoxr       | 0.0.1   | A Bayesian, global planktic foraminifera core top calibration to modern sea-surface temperatures. Includes four calibration models, considering species-specific calibration parameters and seasonality. / GPL (>= 3)   | noarch                         |
| r-bayhap        | 1.0.1   | The package BayHap performs simultaneous estimation of uncertain haplotype frequencies and association with haplotypes based on generalized linear models for quantitative, binary and survival traits. Bayesian statistics and Markov Chain Monte Carlo techniques are the theoretical framework for the methods of estimation included in this package. Prior values for model parameters can be included by the user. Convergence diagnostics and statistical and graphical analysis of the sampling output can be also carried out. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-bayhaz        | 0.1_3   | A suite of R functions for Bayesian estimation of smooth hazard rates via Compound Poisson Process (CPP) and Bayesian Penalized Spline (BPS) priors. / GPL (>= 2)   | noarch                         |
| r-bayloredpsych | 0.5     | Functions and data used for Baylor University Educational Psychology Quantitative Courses / GPL (>= 2)  | noarch                         |
| r-baystar       | 0.2_9   | The manuscript introduces the BAYSTAR package, which provides the functionality for Bayesian estimation in autoregressive threshold models. / GPL (>= 2)  | noarch                         |
| r-bb            | 2014.0  | Burilai-Borwein spectral methods for solving nonlinear system of equations, and for optimizing nonlinear objective functions subject to simple constraints. A tutorial style introduction to this package is available in a vignette on the CRAN download page or, when the package is loaded in an R session, with vignette(BB). / GPL-3   | noarch                         |
| r-bbefkr        | 4.2     | Estimating optimal bandwidths for the regression mean function approximated by the functional Nadaraya-Watson estimator and the error density approximated by a kernel density of residuals simultaneously in a scalar-on-function regression. As a by-product of Markov chain Monte Carlo, the optimal choice of semi-metric is selected based on largest marginal likelihood. / GPL (>= 2)  | noarch                         |
| r-bbemkr        | 2.0     | Bayesian bandwidth estimation for Nadaraya-Watson type multivariate kernel regression with Gaussian error density / GPL (>= 2)  | noarch                         |
| r-bbl           | 0.1.5   | Supervised learning using Boltzmann Bayes model inference, which extends naive Bayes model to include interactions. Enables classification of data into multiple response groups based on a large number of discrete predictors that can take factor values of heterogeneous levels. Either pseudo-likelihood and mean field inference can be used with L2 regularization, cross-validation, and prediction on new data. Woo et al. (2016) <doi:10.1186/s12864-016-2871-3>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-bbmisc        | 1.11    | Miscellaneous helper functions for and from B. Bischl and some other guys, mainly for package development. / BSD_2_clause file LICENSE  | linux-64,<br>osx-64,<br>win-64 |
| r-bbmle         | 1.0.20  | Methods and functions for fitting maximum likelihood models in R. This package modifies and extends the 'mle' classes in the 'stats4' package. / GPL  | noarch                         |
| r-bbmm          | 3.0     | The model provides an empirical estimate of a movement path using discrete location data obtained at relatively short time intervals. / GNU General Public License  | noarch                         |

Table 51 – continued from previous page

| Name                       | Version | Summary/License   | Platforms                      |
|----------------------------|---------|---|--------------------------------|
| <a href="#">r-bbm</a>      | 2.1     | Provides a set of functions to fit general macroevolutionary models for continuous traits evolving in adaptive landscapes of any shape. This package implements the Fokker-Planck-Kolmogorov model (FPK), in which the trait evolves under random diffusion but is also subject to a force that pulls it towards specific values - this force can be of any shape. FPK has a version in which hard reflective bounds exist at the extremes of the trait interval: this second model is called BBMV. / GPL-2   | noarch                         |
| <a href="#">r-bbo</a>      | 0.2     | This package provides an R implementation of Biogeography-Based Optimization (BBO), originally invented by Prof. Dan Simon, Cleveland State University, Ohio. This method is an application of the concept of biogeography, a study of the geographical distribution of biological organisms, to optimization problems. More information about this method can be found here: <a href="http://academic.csuohio.edu/simond/bbo/">http://academic.csuohio.edu/simond/bbo/</a> . / GPL (>= 3)  | noarch                         |
| <a href="#">r-bcaboot</a>  | 0.2.1   | Computation of bootstrap confidence intervals in an almost automatic fashion. / GPL (>= 2)  | noarch                         |
| <a href="#">r-bcbsf</a>    | 1.0.1   | Fully Bayesian Classification with a subset of high-dimensional features, such as expression levels of genes. The data are modeled with a hierarchical Bayesian models using heavy-tailed t distributions as priors. When a large number of features are available, one may like to select only a subset of features to use, typically those features strongly correlated with the response in training cases. Such a feature selection procedure is however invalid since the relationship between the response and the features has been exaggerated by feature selection. This package provides a way to avoid this bias and yield better-calibrated predictions for future cases when one uses F-statistic to select features. / GPL (>= 2) | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bcc1997</a>  | 0.1.1   | Calculates the prices of European options based on the universal solution provided by Bakshi, Cao and Chen (1997) <doi:10.1111/j.1540-6261.1997.tb02749.x>. This solution considers stochastic volatility, stochastic interest and random jumps. Please cite their work if this package is used. / GPL (>= 2)   | noarch                         |
| <a href="#">r-bcdating</a> | 0.9.8   | Tools for Dating Business Cycles using Harding-Pagan (Quarterly Business Review) method and various plotting features. / GPL-2  | noarch                         |
| <a href="#">r-bcf</a>      | 1.2.1   | Causal inference for a binary treatment and continuous outcome using Bayesian Causal Forests. See Hahn, Murray and Carvalho (2017) <arXiv:1706.09523> for additional information. This implementation relies on code originally accompanying Pratola et. al. (2013) <arXiv:1309.1906>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bcgee</a>    | 0.1     | Provides bias-corrected estimates for the regression coefficients of a marginal model estimated with generalized estimating equations. Details about the bias formula used are in Lunardon, N., Scharfstein, D. (2017) <doi:10.1002/sim.7366>. / GPL-2  | noarch                         |
| <a href="#">r-bclust</a>   | 1.5     | Builds a dendrogram using log posterior as a natural distance defined by the model and meanwhile waits the clustering variables. It is also capable to computing equivalent Bayesian discrimination probabilities. The adopted method suits small sample large dimension setting. The model parameter estimation maybe difficult, depending on data structure and the chosen distribution family. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name      | Version | Summary/License   | Platforms  |
|-----------|---------|---|--|
| r-bcp     | 4.0.3   | Provides an implementation of the Barry and Hartigan (1993) product partition model for the normal errors change point problem using Markov Chain Monte Carlo. It also extends the methodology to regression models on a connected graph (Wang and Emerson, 2015); this allows estimation of change point models with multivariate responses. Parallel MCMC, previously available in bcp v.3.0.0, is currently not implemented. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-bcpa    | 1.1     | The Behavioral Change Point Analysis (BCPA) is a method of identifying hidden shifts in the underlying parameters of a time series, developed specifically to be applied to animal movement data which is irregularly sampled. The method is based on: E. Gurarie, R. Andrews and K. Laidre A novel method for identifying behavioural changes in animal movement data (2009) Ecology Letters 12:5 395-408. / Unlimited   | linux-64,<br>osx-64,<br>win-64                         |
| r-bcpmeta | 1.0     | A Bayesian approach to detect mean shifts in AR(1) time series while accommodating metadata (if available). In addition, a linear trend component is allowed. / GPL (>= 2)  | noarch   |
| r-bcra    | 2.1     | Functions provide risk projections of invasive breast cancer based on Gail model according to National Cancer Institute's Breast Cancer Risk Assessment Tool algorithm for specified race/ethnic groups and age intervals. / GPL (>= 2)   | noarch   |
| r-bcrypt  | 1.1     | Bindings to the 'blowfish' password hashing algorithm derived from the 'OpenBSD' implementation. / BSD_2_clause file LICENSE  | linux-64,<br>osx-64,<br>win-64                         |
| r-bcv     | 1.0.1   | Methods for choosing the rank of an SVD approximation via cross validation. The package provides both Gabriel-style block holdouts and Wold-style speckled holdouts. It also includes an implementation of the SVDImpute algorithm. For more information about Bi-cross-validation, see Owen & Perry's 2009 AoAS article (at <a href="http://arxiv.org/abs/0908.2062">http://arxiv.org/abs/0908.2062</a> ) and Perry's 2009 PhD thesis (at <a href="http://arxiv.org/abs/0909.3052">http://arxiv.org/abs/0909.3052</a> ). / BSD_3_clause file LICENSE | linux-64,<br>osx-64,<br>win-64                         |
| r-bda     | 10.1.9  | Functions for density estimation based on grouped data, and next-generation gene expression data. / Unlimited   | linux-64,<br>osx-64,<br>win-64                         |
| r-bdgraph | 2.60    | Statistical tools for Bayesian structure learning in undirected graphical models for continuous, discrete, and mixed data. The package is implemented the recent improvements in the Bayesian graphical models literature, including Mohammadi and Wit (2015) <doi:10.1214/14-BA889>, Mohammadi and Wit (2019) <doi:10.18637/jss.v089.i03>. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64                         |
| r-bdots   | 0.1.19  | Analyze differences among time series curves with p-value adjustment for multiple comparisons introduced in Oleson et al (2015) <DOI:10.1177/0962280215607411>. / GPL-3   | noarch   |

Table 51 – continued from previous page

| Name        | Version | Summary/License  | Platforms  |
|-------------|---------|--|--|
| r-bdp2      | 0.1.3   | Tools and workflow to choose design parameters in Bayesian adaptive single-arm phase II trial designs with binary endpoint (response, success) with possible stopping for efficacy and futility at interim analyses. Also contains routines to determine and visualize operating characteristics. See Kopp-Schneider et al. (2018) <doi:10.1002/bimj.201700209>. / GPL-2   | noarch   |
| r-bdpv      | 1.3     | Computation of asymptotic confidence intervals for negative and positive predictive values in binary diagnostic tests in case-control studies. Experimental design for hypothesis tests on predictive values. / GPL (>= 2)   | noarch   |
| r-bdsmatrix | 1.3_3   | This is a special case of sparse matrices, used by coxme. / LGPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-beanplot  | 1.2     | Plots univariate comparison graphs, an alternative to boxplot/stripchart/violin plot. / GPL-2  | noarch   |
| r-beast     | 1.1     | Assume that a temporal process is composed of contiguous segments with differing slopes and replicated noise-corrupted time series measurements are observed. The unknown mean of the data generating process is modelled as a piecewise linear function of time with an unknown number of change-points. The package infers the joint posterior distribution of the number and position of change-points as well as the unknown mean parameters per time-series by MCMC sampling. A-priori, the proposed model uses an overfitting number of mean parameters but, conditionally on a set of change-points, only a subset of them influences the likelihood. An exponentially decreasing prior distribution on the number of change-points gives rise to a posterior distribution concentrating on sparse representations of the underlying sequence, but also available is the Poisson distribution. See Papastamoulis et al (2017) <arXiv:1709.06111> for a detailed presentation of the method. / GPL-2 | noarch   |
| r-bedmatrix | 1.6.1   | A matrix-like data structure that allows for efficient, convenient, and scalable subsetting of binary genotype/phenotype files generated by PLINK (< <a href="https://www.cog-genomics.org/plink2">https://www.cog-genomics.org/plink2</a> >), the whole genome association analysis toolset, without loading the entire file into memory. / MIT   | linux-64,<br>osx-64,<br>win-64                         |
| r-beep      | 1.3     | The main function of this package is beep(), with the purpose to make it easy to play notification sounds on whatever platform you are on. It is intended to be useful, for example, if you are running a long analysis in the background and want to know when it is ready. / GPL-3   | noarch   |
| r-beeswarm  | 0.2.3   | The bee swarm plot is a one-dimensional scatter plot like stripchart, but with closely-packed, non-overlapping points. / Artistic-2.0  | noarch   |
| r-beginr    | 0.1.7   | Useful functions for R beginners, including hints for the arguments of the 'plot()' function, self-defined functions for error bars, user-customized pair plots and hist plots, enhanced linear regression figures, etc.. This package could be helpful to R experts as well. / MIT  | noarch   |
| r-behavr    | 0.3.2   | Implements an S3 class based on 'data.table' to store and process efficiently ethomics (high-throughput behavioural) data. / GPL-3   | noarch   |

Table 51 – continued from previous page

| Name                               | Version | Summary/License   | Platforms                      |
|------------------------------------|---------|---|--------------------------------|
| <a href="#">r-belex</a>            | 0.1.0   | Tools for downloading historical financial data from the <a href="http://www.belex.rs">www.belex.rs</a> . / GPL-3   | noarch                         |
| <a href="#">r-belg</a>             | 0.2.3   | Calculates the Boltzmann entropy of a landscape gradient. This package uses the analytical method created by Gao, P., Zhang, H. and Li, Z., 2018 (< <a href="https://doi.org/10.1111/tgis.12315">doi:10.1111/tgis.12315</a> >). It also extend the original idea by allowing calculations on data with missing values. / MIT file LICENSE   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-benchden</a>         | 1.0.5   | Full implementation of the 28 distributions introduced as benchmarks for non-parametric density estimation by Berlinet and Devroye (1994). Includes densities, cdfs, quantile functions and generators for samples as well as additional information on features of the densities. Also contains the 4 histogram densities used in Rozenholc/Mildenberger/Gather (2010). / GPL (>= 2)   | noarch                         |
| <a href="#">r-benchr</a>           | 0.2.3   | Provides infrastructure to accurately measure and compare the execution time of R expressions. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bender</a>           | 0.1.1   | R client for Bender Hyperparameters optimizer : < <a href="https://bender.dreem.com">https://bender.dreem.com</a> > The R client allows you to communicate with the Bender API and therefore submit some new trials within your R script itself. / MIT file LICENSE   | noarch                         |
| <a href="#">r-benford.analysis</a> | 0.1.5   | Provides tools that make it easier to validate data using Benford's Law. / GPL-3  | noarch                         |
| <a href="#">r-benfordtests</a>     | 1.2.0   | Several specialized statistical tests and support functions for determining if numerical data could conform to Benford's law. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bentcablear</a>      | 0.3.0   | Included are two main interfaces for fitting and diagnosing bent-cable regressions for autoregressive time-series data or independent data (time series or otherwise): 'bentcable.ar()' and 'bentcable.dev.plot()'. Some components in the package can also be used as stand-alone functions. The bent cable (linear-quadratic-linear) generalizes the broken stick (linear-linear), which is also handled by this package. Version 0.2 corrects a glitch in the computation of confidence intervals for the CTP. References that were updated from Versions 0.2.1 and 0.2.2 appear in Version 0.2.3 and up. Version 0.3.0 improves robustness of the error-message producing mechanism. It is the author's intention to distribute any future updates via GitHub. / GPL (>= 3) | noarch                         |
| <a href="#">r-beqi2</a>            | 2.0_0   | Tool for analysing benthos data. It estimates several quality indices like the total abundance of species, species richness, Margalef's d, AZTI Marine Biotic Index (AMBI), and the BEQI-2 index. Furthermore, additional (optional) features are provided that enhance data preprocessing: (1) genus to species conversion, i.e., taxa counts at the taxonomic genus level can optionally be converted to the species level and (2) pooling: small samples are combined to bigger samples with a standardized size to (a) meet the data requirements of the AMBI, (b) generate comparable species richness values and (c) give a higher benthos signal to noise ratio. / GPL (>= 3)  | noarch                         |

Table 51 – continued from previous page

| Name             | Version | Summary/License  | Platforms  |
|------------------|---------|--|--|
| r-ber            | 4.0     | The functions in this package remove batch effects from microarray normalized data. The expression levels of the genes are represented in a matrix where rows correspond to independent samples and columns to genes (variables). The batches are represented by categorical variables (objects of class factor). When further covariates of interest are available they can be used to remove efficiently the batch effects and adjust the data. / GPL-2  | noarch   |
| r-berryfunctions | 1.18.2  | Draw horizontal histograms, color scattered points by 3rd dimension, enhance date- and log-axis plots, zoom in X11 graphics, trace errors and warnings, use the unit hydrograph in a linear storage cascade, convert lists to data.frames and arrays, fit multiple functions. / GPL (>= 2)   | noarch   |
| r-bess           | 1.0.6   | An implementation of best subset selection in generalized linear model and Cox proportional hazard model via the primal dual active set algorithm proposed by Wen, C., Zhang, A., Quan, S. and Wang, X. (2017) <arXiv:1709.06254>. The algorithm formulates coefficient parameters and residuals as primal and dual variables and utilizes efficient active set selection strategies based on the complementarity of the primal and dual variables. / GPL-3  | linux-64,<br>osx-64,<br>win-64                         |
| r-bestglm        | 0.37    | Best subset glm using information criteria or cross-validation. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-bestree        | 0.5.2   | Decision tree algorithm with a major feature added. Allows for users to define an ordering on the partitioning process. Resulting in Branch-Exclusive Splits Trees (BEST). Cedric Beaulac and Jeffrey S. Rosentahl (2019) <arXiv:1804.10168>. / MIT file LICENSE   | noarch   |
| r-betabit        | 1.3     | Three games: proton, frequon and regression. Each one is a console-based data-crunching game for younger and older data scientists. Act as a data-hacker and find Slawomir Pietraszko's credentials to the Proton server. In proton you have to solve four data-based puzzles to find the login and password. There are many ways to solve these puzzles. You may use loops, data filtering, ordering, aggregation or other tools. Only basics knowledge of R is required to play the game, yet the more functions you know, the more approaches you can try. In frequon you will help to perform statistical cryptanalytic attack on a corpus of ciphered messages. This time seven sub-tasks are pushing the bar much higher. Do you accept the challenge? In regression you will test your modeling skills in a series of eight sub-tasks. Try only if ANOVA is your close friend. It's a part of Beta and Bit project. You will find more about the Beta and Bit project at < <a href="http://betabit.wiki">http://betabit.wiki</a> >. / GPL-2 | noarch   |
| r-betacal        | 0.1.0   | Fit beta calibration models and obtain calibrated probabilities from them. / MIT file LICENSE  | noarch   |
| r-betafam        | 1.0     | To detecting rare variants for quantitative traits using nuclear families, the linear combination methods are proposed using the estimated regression coefficients from the multiple regression and regularized regression as the weights. / GPL (>= 2)  | noarch   |

Table 51 – continued from previous page

| Name                            | Version | Summary/License   | Platforms                      |
|---------------------------------|---------|---|--------------------------------|
| <a href="#">r-betalink</a>      | 2.2.1   | Measures of beta-diversity in networks, and easy visualization of why two networks are different. / BSD_2_clause file LICENSE   | noarch                         |
| <a href="#">r-betategarch</a>   | 3.3     | Simulation, estimation and forecasting of first-order Beta-Skew-t-EGARCH models with leverage (one-component, two-component, skewed versions). / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bethel</a>        | 0.2     | The sample size according to the Bethel's procedure. / GPL (>= 2)   | noarch                         |
| <a href="#">r-bevimed</a>       | 5.3     | A fast integrative genetic association test for rare diseases based on a model for disease status given allele counts at rare variant sites. Probability of association, mode of inheritance and probability of pathogenicity for individual variants are all inferred in a Bayesian framework - 'A Fast Association Test for Identifying Pathogenic Variants Involved in Rare Diseases', Greene et al 2017 <doi:10.1016/j.ajhg.2017.05.015>. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-beyondbenford</a> | 1.1     | Allows to compare the goodness of fit of Benford's and Blondeau Da Silva's digit distributions in a dataset. It is used to check whether the data distribution is consistent with theoretical distributions highlighted by Blondeau Da Silva or not (through the <code>dat.distr()</code> function): this ideal theoretical distribution must be at least approximately followed by the data for the use of Blondeau Da Silva's model to be well-founded. It also enables to plot histograms of digit distributions, both observed in the dataset and given by the two theoretical approaches (with the <code>digit.ditr()</code> function). Finally, it proposes to quantify the goodness of fit via Pearson's chi-squared test (with the <code>chi2()</code> function). / GPL-2 | noarch                         |
| <a href="#">r-bezier</a>        | 1.1.2   | The bezier package is a toolkit for working with Bezier curves and splines. The package provides functions for point generation, arc length estimation, degree elevation and curve fitting. / GPL (>= 2)  | noarch                         |
| <a href="#">r-bfa</a>           | 0.4     | Provides model fitting for several Bayesian factor models including Gaussian, ordinal probit, mixed and semiparametric Gaussian copula factor models under a range of priors. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bfp</a>           | 0.0_40  | Implements the Bayesian paradigm for fractional polynomial models under the assumption of normally distributed error terms, see Sabanes Bove, D. and Held, L. (2011) <doi:10.1007/s11222-010-9170-7>. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bfsl</a>          | 0.1.0   | Provides the solution from York (1968) <doi:10.1016/S0012-821X(68)80059-7> for fitting a straight line to bivariate data with errors in both coordinates. It gives unbiased estimates of the intercept, slope and standard errors of the best-fit straight line to independent points with (possibly correlated) normally distributed errors in both x and y. Other commonly used errors-in-variables methods, such as orthogonal distance regression, geometric mean regression or Deming regression are special cases of York's solution. / GPL-3   | noarch                         |

Table 51 – continued from previous page

| Name        | Version    | Summary/License   | Platforms   |
|-------------|------------|---|---|
| r-bgge      | 0.6.5      | Application of genome prediction for a continuous variable, focused on genotype by environment (GE) genomic selection models (GS). It consists a group of functions that help to create regression kernels for some GE genomic models proposed by Jarquín et al. (2014) <doi:10.1007/s00122-013-2243-1> and Lopez-Cruz et al. (2015) <doi:10.1534/g3.114.016097>. Also, it computes genomic predictions based on Bayesian approaches. The prediction function uses an orthogonal transformation of the data and specific priors present by Cuevas et al. (2014) <doi:10.1534/g3.114.013094>. / GPL-3  | noarch  |
| r-bgmfiles  | 0.0.6      | A collection of box-geometry model (BGM) files for the Atlantis ecosystem model. Atlantis is a deterministic, biogeochemical, whole-of-ecosystem model (see < <a href="http://atlantis.cmar.csiro.au/">http://atlantis.cmar.csiro.au/</a> > for more information). / CC0  | noarch  |
| r-bgphazard | 1.2.3      | Computes the hazard rate estimate as described by Nieto-Barajas and Walker (2002) and Nieto-Barajas (2003). / GPL (>= 2)  | noarch  |
| r-bgsimd    | 1.0        | Implement an efficient block Gibbs sampler with incomplete data from a multinomial distribution taking values from the k categories 1,2,...,k, where data are assumed to miss at random and each missing datum belongs to one and only one of m distinct non-empty proper subsets A1, A2,..., Am of 1,2,...,k and the k categories are labelled such that only consecutive A's may overlap. / GPL (>= 2)  | noarch  |
| r-bh        | 1.69.0     | Boost provides free peer-reviewed portable C source libraries. A large part of Boost is provided as C template code which is resolved entirely at compile-time without linking. This package aims to provide the most useful subset of Boost libraries for template use among CRAN package. By placing these libraries in this package, we offer a more efficient distribution system for CRAN as replication of this code in the sources of other packages is avoided. As of release 1.69.0-1, the following Boost libraries are included: 'algorithm' 'align' 'any' 'atomic' 'bimap' 'bind' 'circular_buffer' 'compute' 'concept' 'config' 'container' 'date_time' 'detail' 'dynamic_bitset' 'exception' 'filesystem' 'flyweight' 'foreach' 'functional' 'fusion' 'geometry' 'graph' 'heap' 'icl' 'integer' 'interprocess' 'intrusive' 'io' 'iostreams' 'iterator' 'math' 'move' 'mpl' 'multiprecision' 'numeric' 'pending' 'phoenix' 'preprocessor' 'property_tree' 'random' 'range' 'scope_exit' 'smart_ptr' 'sort' 'spirit' 'tuple' 'type_traits' 'typeof' 'unordered' 'utility' 'uuid'. / BSL-1.0 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-bhat      | 0.9_10     | Functions for MLE, MCMC, CIs (originally in Fortran) / GPL (>= 2)   | noarch  |
| r-bhh2      | 2016.05.14 | Functions and data sets reproducing some examples in Box, Hunter and Hunter II. Useful for statistical design of experiments, especially factorial experiments. / GPL (>= 2)  | noarch  |
| r-bhm       | 1.15       | Contains tools to fit both predictive and prognostic biomarker effects using biomarker threshold models. Evaluate the treatment effect, biomarker effect and treatment-biomarker interaction using probability index measurement. Test for treatment-biomarker interaction using residual bootstrap method. / GPL (>= 2)  | noarch  |
| r-bhsbvar   | 1.0.4      | Provides a function for estimating the parameters of Structural Bayesian Vector Autoregression models with the method developed by Baumeister and Hamilton (2015) <doi:10.3982/ECTA12356>, Baumeister and Hamilton (2017) <doi:10.3386/w24167>, and Baumeister and Hamilton (2018) <doi:10.1016/j.jmoneco.2018.06.005>. Functions for plotting impulse responses, historical decompositions, and posterior distributions of model parameters are also provided. / GPL (>= 3)  | linux-64,<br>osx-64,<br>win-64                                    |

| Name                              | Version | Summary/License  | Platforms                                 |
|-----------------------------------|---------|--|---|
| <a href="#">r-biasedurn</a>       | 1.07    | Statistical models of biased sampling in the form of univariate and multivariate noncentral hypergeometric distributions, including Wallenius' noncentral hypergeometric distribution and Fisher's noncentral hypergeometric distribution (also called extended hypergeometric distribution). See vignette(UrnTheory) for explanation of these distributions. / GPL-3  | linux-64,<br>osx-64,<br>win-64            |
| <a href="#">r-bibplots</a>        | 0.0.6   | Currently, the package provides four functions for plotting and analyzing bibliometric data (JIF, Journal Impact Factor, and paper percentile values), beam-plots with citations, and two plot function to visualize the result of a reference publication year spectroscopy (RPYS) analysis performed in the free software 'CRExplorer' (see < <a href="http://crexplorer.net">http://crexplorer.net</a> >). Further extension to more plot variants is planned. / EUPL | noarch                                    |
| <a href="#">r-bibtex</a>          | 0.4.2   | Utility to parse a bibtex file. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-biclique</a>        | 1.0.3   | A tool for enumerating maximal complete bipartite graphs. The input should be a edge list file or a binary matrix file. The output are maximal complete bipartite graphs. Algorithms used can be found in this paper Y Zhang et al. BMC Bioinformatics 2014 15:110 <doi:10.1186/1471-2105-15-110>. / GPL-2   | linux-64,<br>osx-64,<br>win-64            |
| <a href="#">r-bicorn</a>          | 0.1.0   | Prior transcription factor binding knowledge and target gene expression data are integrated in a Bayesian framework for functional cis-regulatory module inference. Using Gibbs sampling, we iteratively estimate transcription factor associations for each gene, regulation strength for each binding event and the hidden activity for each transcription factor. / GPL-2   | noarch                                    |
| <a href="#">r-bidimregression</a> | 2.0.0   | Calculates the bidimensional regression between two 2D configurations following the approach by Tobler (1965). / GPL-3   | noarch                                    |
| <a href="#">r-bife</a>            | 0.6     | Estimates fixed effects binary choice models (logit and probit) with potentially many individual fixed effects and computes average partial effects. Incidental parameter bias can be reduced with an asymptotic bias-correction proposed by Fernandez-Val (2009) <doi:10.1016/j.jeconom.2009.02.007>. / GPL-2   | linux-64,<br>osx-64,<br>win-64            |
| <a href="#">r-bigalgebra</a>      | 0.8.4   | This package provides arithmetic functions for R matrix and big.matrix objects. / LGPL-3   | linux-64,<br>osx-64,<br>win-64            |
| <a href="#">r-biganalytics</a>    | 1.1.14  | Extend the 'bigmemory' package with various analytics. Functions 'bigk-means' and 'binit' may also be used with native R objects. For 'tapply'-like functions, the bigtabulate package may also be helpful. For linear algebra support, see 'bigalgebra'. For mutex (locking) support for advanced shared-memory usage, see 'synchronicity'. / LGPL-3  | linux-64,<br>osx-64,<br>win-64            |

| Name                              | Version | Summary/License   | Platforms                      |
|-----------------------------------|---------|---|--------------------------------|
| <a href="#">r-bigintegeralgos</a> | 0.1.2   | Features the multiple polynomial quadratic sieve algorithm for factoring large integers and a vectorized factoring function that returns the complete factorization of an integer. Utilizes the C library GMP (GNU Multiple Precision Arithmetic) and classes created by Antoine Lucas et al. found in the ‘gmp’ package. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-biglm</a>           | 0.9_1   | Regression for data too large to fit in memory / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-biglmm</a>          | 0.9_1   | Regression for data too large to fit in memory. This package functions exactly like the ‘biglm’ package, but works with later versions of R. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bigmap</a>          | 2.1.0   | Unsupervised clustering protocol for large scale structured data, based on a low dimensional representation of the data. Dimensionality reduction is performed using a parallelized implementation of the t-Stochastic Neighboring Embedding algorithm (Garriga J. and Bartumeus F. (2018), <arXiv:1812.09869>). / GPL-3          | linux-64,<br>osx-64            |
| <a href="#">r-bigmemory</a>       | 4.5.33  | Create, store, access, and manipulate massive matrices. Matrices are allocated to shared memory and may use memory-mapped files. Packages ‘biganalytics’, ‘bigtabulate’, ‘synchronicity’, and ‘bigalgebra’ provide advanced functionality. / LGPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bigmemory.sri</a>   | 0.1.3   | This package provides a shared resource interface for the bigmemory and synchronicity packages. / LGPL-3  | noarch                         |
| <a href="#">r-bigml</a>           | 0.1.2   | The ‘bigml’ package contains bindings for the BigML API. The package includes methods that provide straightforward access to basic API functionality, as well as methods that accommodate idiomatic R data types and concepts. / LGPL-3   | noarch                         |
| <a href="#">r-bigreadr</a>        | 0.1.9   | Read large text files by splitting them in smaller files. Package bigreadr also provides some convenient wrappers of fread/fwrite. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name          | Version | Summary/License  | Platforms                      |
|---------------|---------|--|--------------------------------|
| r-bigreg      | 0.1.2   | Allows the user to carry out GLM on very large data sets. Data can be created using the <code>data_frame()</code> function and appended to the object with <code>object\$append(data)</code> ; <code>data_frame</code> and <code>data_matrix</code> objects are available that allow the user to store large data on disk. The data is stored as doubles in binary format and any character columns are transformed to factors and then stored as numeric (binary) data while a look-up table is stored in a separate <code>.meta_data</code> file in the same folder. The data is stored in blocks and GLM regression algorithm is modified and carries out a MapReduce- like algorithm to fit the model. The functions <code>bglm()</code> , and <code>summary()</code> and <code>bglm_predict()</code> are available for creating and post-processing of models. The library requires Armadillo installed on your system. It probably won't function on windows since multi-core processing is done using <code>mclapply()</code> which forks R on Unix/Linux type operating systems. / GPL-2 | linux-64,<br>osx-64            |
| r-bigsplines  | 1.1.1   | Fits smoothing spline regression models using scalable algorithms designed for large samples. Seven marginal spline types are supported: linear, cubic, different cubic, cubic periodic, cubic thin-plate, ordinal, and nominal. Random effects and parametric effects are also supported. Response can be Gaussian or non-Gaussian: Binomial, Poisson, Gamma, Inverse Gaussian, or Negative Binomial. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-bigtabulate | 1.1.5   | Extend the bigmemory package with 'table', 'tapply', and 'split' support for 'big.matrix' objects. The functions may also be used with native R matrices for improving speed and memory-efficiency. / LGPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-bigtcr      | 1.1     | For studying recurrent disease and death with competing risks, comparisons based on the well-known cumulative incidence function can be confounded by different prevalence rates of the competing events. Alternatively, comparisons of the conditional distribution of the survival time given the failure event type are more relevant for investigating the prognosis of different patterns of recurrence disease. This package implements a nonparametric estimator for the conditional cumulative incidence function and a nonparametric conditional bivariate cumulative incidence function for the bivariate gap times proposed in Huang et al. (2016) <doi:10.1111/biom.12494>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-bigtime     | 0.1.0   | Estimation of large Vector AutoRegressive (VAR), Vector AutoRegressive with Exogenous Variables X (VARX) and Vector AutoRegressive Moving Average (VARMA) Models with Structured Lasso Penalties, see Nicholson, Bien and Matteson (2017) <arXiv:1412.5250v2> and Wilms, Basu, Bien and Matteson (2017) <arXiv:1707.09208>. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-bigvar      | 1.0.4   | Estimates VAR and VARX models with structured Lasso Penalties. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-bikeshare14 | 0.1.2   | Anonymised Bay Area bike share trip data for the year 2014. Also contains additional metadata on stations and weather. / CC0   | noarch                         |

Table 51 – continued from previous page

| Name                         | Version | Summary/License  | Platforms                      |
|------------------------------|---------|--|--------------------------------|
| <a href="#">r-bild</a>       | 1.1_5   | Performs logistic regression for binary longitudinal data, allowing for serial dependence among observations from a given individual and a random intercept term. Estimation is via maximization of the exact likelihood of a suitably defined model. Missing values and unbalanced data are allowed, with some restrictions. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bimetallic</a> | 1.0     | A power calculator for Genome-wide association studies (GWAs) with combined gold (error-free) and silver (erroneous) phenotyping per McDavid A, Crane PK, Newton KM, Crosslin DR, et al. (2011) / GPL-2  | noarch                         |
| <a href="#">r-bimets</a>     | 1.4.0   | Time series analysis, (dis)aggregation and manipulation, e.g. time series extension, merge, projection, lag, lead, delta, moving and cumulative average and product, selection by index, date and year-period, conversion to daily, monthly, quarterly, (semi)annually. Simultaneous equation models definition, estimation, simulation and forecasting with coefficient restrictions, error autocorrelation, exogenization, add-factors, impact and interim multipliers analysis, conditional equation evaluation, endogenous targeting and model renormalization. / EUPL   | noarch                         |
| <a href="#">r-bimixt</a>     | 1.0     | Estimates non-Gaussian mixture models of case-control data. The four types of models supported are binormal, two component constrained, two component unconstrained, and four component. The most general model is the four component model, under which both cases and controls are distributed according to a mixture of two unimodal distributions. In the four component model, the two component distributions of the control mixture may be distinct from the two components of the case mixture distribution. In the two component unconstrained model, the components of the control and case mixtures are the same; however the mixture probabilities may differ for cases and controls. In the two component constrained model, all controls are distributed according to one of the two components while cases follow a mixture distribution of the two components. In the binormal model, cases and controls are distributed according to distinct unimodal distributions. These models assume that Box-Cox transformed case and control data with a common lambda parameter are distributed according to Gaussian mixture distributions. Model parameters are estimated using the expectation-maximization (EM) algorithm. Likelihood ratio test comparison of nested models can be performed using the lr.test function. AUC and PAUC values can be computed for the model-based and empirical ROC curves using the auc and pauc functions, respectively. The model-based and empirical ROC curves can be graphed using the roc.plot function. Finally, the model-based density estimates can be visualized by plotting a model object created with the bimixt.model function. / GPL-3 | noarch                         |
| <a href="#">r-binarize</a>   | 1.3     | Provides methods for the binarization of one-dimensional data and some visualization functions. / Artistic-2.0   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-binaryemvs</a> | 0.1     | Implements variable selection for high dimensional datasets with a binary response variable using the EM algorithm. Both probit and logit models are supported. Also included is a useful function to generate high dimensional data with correlated variables. / GPL-3  | noarch                         |

Table 51 – continued from previous page

| Name                          | Version | Summary/License  | Platforms   |
|-------------------------------|---------|--|---|
| <a href="#">r-binarylogic</a> | 0.3.9   | Provides the binary S3 class. The instance of binary is used to convert a decimal number (Base10) to a binary number (Base2). The Class provides some features e.G. shift(), rotate(), summary(). Based on logical vectors. / GPL-3  | noarch  |
| <a href="#">r-binb</a>        | 0.0.4   | A collection of ‘LaTeX’ styles using ‘Beamer’ customization for pdf-based presentation slides in ‘RMarkdown’. At present it contains ‘RMarkdown’ adaptations of the LaTeX themes ‘Metropolis’ (formerly ‘mtheme’) theme by Matthias Vogelgesang and others (now included in ‘TeXLive’), the ‘IQSS’ by Ista Zahn (which is included here), and the ‘Monash’ theme by Rob J Hyndman. Additional (free) fonts may be needed: ‘Metropolis’ prefers ‘Fira’, and ‘IQSS’ requires ‘Libertinus’. / GPL-2 | noarch  |
| <a href="#">r-binda</a>       | 1.0.3   | The binda package implements functions for multi-class discriminant analysis using binary predictors, for corresponding variable selection, and for dichotomizing continuous data. / GPL-3   | noarch  |
| <a href="#">r-bindata</a>     | 0.9_1   | Generation of correlated artificial binary data. / GPL-2   | noarch  |
| <a href="#">r-bindr</a>       | 0.1.1   | Provides a simple interface for creating active bindings where the bound function accepts additional arguments. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-bindrcpp</a>    | 0.2.2   | Provides an easy way to fill an environment with active bindings that call a C function. / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-binford</a>     | 0.1.0   | Binford’s hunter-gatherer data includes more than 200 variables coding aspects of hunter-gatherer subsistence, mobility, and social organization for 339 ethnographically documented groups of hunter-gatherers. / GPL-3   | noarch  |
| <a href="#">r-binmto</a>      | 0.0_7   | Asymptotic simultaneous confidence intervals for comparison of many treatments with one control, for the difference of binomial proportions, allows for Dunnett-like-adjustment, Bonferroni or unadjusted intervals. Simulation of power of the above interval methods, approximate calculation of any-pair-power, and sample size iteration based on approximate any-pair power. Exact conditional maximum test for many-to-one comparisons to a control. / GPL-2                               | noarch  |
| <a href="#">r-binnonnor</a>   | 1.5.1   | Generation of multiple binary and continuous non-normal variables simultaneously given the marginal characteristics and association structure based on the methodology proposed by Demirtas et al. (2012) <DOI:10.1002/sim.5362>. / GPL-2   GPL-3  | noarch  |

Table 51 – continued from previous page

| Name           | Version | Summary/License   | Platforms                      |
|----------------|---------|---|--------------------------------|
| r-binnor       | 2.3.1   | Generating multiple binary and normal variables simultaneously given marginal characteristics and association structure based on the methodology proposed by Demirtas and Doganay (2012) <DOI:10.1080/10543406.2010.521874>. / GPL-2  | noarch                         |
| r-binom        | 1.1_1   | Constructs confidence intervals on the probability of success in a binomial experiment via several parameterizations / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-binomialcftp | 1.0     | Binomial random numbers are generated via the perfect sampling algorithm. At each iteration dual markov chains are generated and coalescence is checked. In case coalescence occurs, the resulting number is outputted. In case not, then the algorithm is restarted from $T(t)=2*T(t)$ until coalescence occurs. / GPL-2   | noarch                         |
| r-binomlogit   | 1.2     | The R package contains different MCMC schemes to estimate the regression coefficients of a binomial (or binary) logit model within a Bayesian framework: a data-augmented independence MH-sampler, an auxiliary mixture sampler and a hybrid auxiliary mixture (HAM) sampler. All sampling procedures are based on algorithms using data augmentation, where the regression coefficients are estimated by rewriting the logit model as a latent variable model called difference random utility model (dRUM). / GPL-3 | noarch                         |
| r-binomsamsize | 0.1_5   | A suite of functions to compute confidence intervals and necessary sample sizes for the parameter p of the Bernoulli B(p) distribution under simple random sampling or under pooled sampling. Such computations are e.g. of interest when investigating the incidence or prevalence in populations. The package contains functions to compute coverage probabilities and coverage coefficients of the provided confidence intervals procedures. Sample size calculations are based on expected length. / GPL-3        | linux-64,<br>osx-64,<br>win-64 |
| r-binostics    | 0.1.2   | Calculates graph theoretic scagnostics. Scagnostics describe various measures of interest for pairs of variables, based on their appearance on a scatterplot. They are useful tool for discovering interesting or unusual scatterplots from a scatterplot matrix, without having to look at every individual plot. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-binr         | 1.1     | Implementation of algorithms for cutting numerical values exhibiting a potentially highly skewed distribution into evenly distributed groups (bins). This functionality can be applied for binning discrete values, such as counts, as well as for discretization of continuous values, for example, during generation of features used in machine learning algorithms. / Apache License (== 2.0)   | noarch                         |
| r-binseqtest   | 1.0.3   | For a series of binary responses, create stopping boundary with exact results after stopping, allowing updating for missing assessments. / GPL-3  | noarch                         |
| r-binst        | 0.2.1   | Various supervised and unsupervised binning tools including using entropy, recursive partition methods and clustering. / MIT  | noarch                         |
| r-bio.infer    | 1.3_3   | Imports benthic count data, reformats this data, and computes environmental inferences from this data. / GPL-2  | noarch                         |

| Name          | Version | Summary/License   | Platforms                      |
|---------------|---------|---|--------------------------------|
| r-bio3d       | 2.3_4   | Utilities to process, organize and explore protein structure, sequence and dynamics data. Features include the ability to read and write structure, sequence and dynamic trajectory data, perform sequence and structure database searches, data summaries, atom selection, alignment, superposition, rigid core identification, clustering, torsion analysis, distance matrix analysis, structure and sequence conservation analysis, normal mode analysis, principal component analysis of heterogeneous structure data, and correlation network analysis from normal mode and molecular dynamics data. In addition, various utility functions are provided to enable the statistical and graphical power of the R environment to work with biological sequence and structural data. Please refer to the URLs below for more information. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-biocircos   | 0.3.4   | Implement in 'R' interactive Circos-like visualizations of genomic data, to map information such as genetic variants, genomic fusions and aberrations to a circular genome, as proposed by the 'JavaScript' library 'BioCircos.js', based on the 'JQuery' and 'D3' technologies. The output is by default displayed in stand-alone HTML documents or in the 'RStudio' viewer pane. Moreover it can be integrated in 'R Markdown' documents and 'Shiny' applications. / GPL-2  | noarch                         |
| r-biocmanager | 1.30.4  | A convenient tool to install and update Bioconductor packages. / Artistic-2.0   | noarch                         |
| r-biodem      | 0.4     | The Biodem package provides a number of functions for Biodemographic analysis. / GPL-2  | noarch                         |
| r-biodry      | 0.6     | Multilevel ecological data series (MEDS) are sequences of observations ordered according to temporal/spatial hierarchies that are defined by sample designs, with sample variability confined to ecological factors. Dendroclimatic MEDS of tree rings and climate are modeled into normalized fluctuations of tree growth and aridity. Modeled fluctuations (model frames) are compared with Mantel correlograms on multiple levels defined by sample design. Package implementation can be understood by running examples in modelFrame(), and muleMan() functions. / GPL-3   | noarch                         |
| r-bioftf      | 1.2_0   | The main drawback of the most common biodiversity indices is that different measures may lead to different rankings among communities. This instrument overcomes this limit using some functional tools with the diversity profiles. In particular, the derivatives, the curvature, the radius of curvature, the arc length, and the surface area are proposed. The goal of this method is to interpret in detail the diversity profiles and obtain an ordering between different ecological communities on the basis of diversity. In contrast to the typical indices of diversity, the proposed method is able to capture the multidimensional aspect of biodiversity, because it takes into account both the evenness and the richness of the species present in an ecological community. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name         | Version | Summary/License  | Platforms                      |
|--------------|---------|--|--------------------------------|
| r-biogas     | 1.10.3  | High- and low-level functions for processing biogas data and predicting biogas production. Molar mass and calculated oxygen demand (COD') can be determined from a chemical formula. Measured gas volume can be corrected for water vapor and to (possibly user-defined) standard temperature and pressure. Gas quantity can be converted between volume, mass, and moles. Gas composition, cumulative production, or other variables can be interpolated to a specified time. Cumulative biogas and methane production (and rates) can be calculated using volumetric, manometric, or gravimetric methods for any number of reactors. With cumulative methane production data and data on reactor contents, biochemical methane potential (BMP) can be calculated and summarized, including subtraction of the inoculum contribution and normalization by substrate mass. Cumulative production and production rates can be summarized in several different ways (e.g., omitting normalization) using the same function. Biogas quantity and composition can be predicted from substrate composition and additional, optional data. Lastly, inoculum and substrate mass can be determined for planning BMP experiments. / GPL-2 | noarch                         |
| r-biom.utils | 0.9     | Provides utilities to facilitate import, export and computation with the BIOM (Biological Observation Matrix) format ( <a href="http://biom-format.org">http://biom-format.org</a> ). / BSD_2_clause   | noarch                         |
| r-bionetdata | 1.0.1   | Data Package that includes several examples of chemical and biological data networks, i.e. data graph structured. / GPL-2  | noarch                         |
| r-biopn      | 1.2.0   | bioPN is a package suited to perform simulation of deterministic and stochastic systems of biochemical reaction networks. Models are defined using a subset of Petri Nets, in a way that is close at how chemical reactions are defined. For deterministic solutions, bioPN creates the associated system of differential equations on the fly, and solves it with a Runge Kutta Dormand Prince 45 explicit algorithm. For stochastic solutions, bioPN offers variants of Gillespie algorithm, or SSA. For hybrid deterministic/stochastic, it employs the Haseltine and Rawlings algorithm, that partitions the system in fast and slow reactions. bioPN algorithms are developed in C to achieve adequate performance. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-bios2cor   | 1.2     | Utilities for computation and analysis of correlation/co-variation in multiple sequence alignments and in side chain motions during molecular dynamics simulations. Features include the computation of correlation/co-variation scores using a variety of scoring functions between either sequence positions in alignments or side chain dihedral angles in molecular dynamics simulations and to analyze the correlation/co-variation matrix through a variety of tools including network representation and principal components analysis. In addition, several utility functions are based on the R graphical environment to provide friendly tools for help in data interpretation. Examples of sequence co-variation analysis and utility tools are provided in: Pele J, Moreau M, Abdi H, Rodien P, Castel H, Chabbert M. (2014) <doi:10.1002/prot.24570>. This work was supported by the French National Research Agency (Grant number: ANR-11-BSV2-026). / GPL-2   | noarch                         |
| r-biotic     | 0.1.2   | Calculates a range of UK freshwater invertebrate biotic indices including BMWP, Whalley, WHPT, Habitat-specific BMWP, AWIC, LIFE and PSI. / GPL-3  | noarch                         |
| r-birk       | 2.1.2   | Collection of tools to make R more convenient. Includes tools to summarize data using statistics not available with base R and manipulate objects for analyses. / GPL-3  | noarch                         |

Table 51 – continued from previous page

| Name                      | Version | Summary/License   | Platforms  |
|---------------------------|---------|---|--|
| <a href="#">r-birt</a>    | 1.0.0   | R functions for The Basics of Item Response Theory Using R by Frank B. Baker and Seock-Ho Kim (Springer, 2017, ISBN-13: 978-3-319-54204-1) including iccplot(), icccal(), icc(), iccfit(), groupinv(), tcc(), ability(), tif(), and rasch(). For example, iccplot() plots an item characteristic curve under the two-parameter logistic model. / GPL-2  | noarch   |
| <a href="#">r-bisect</a>  | 0.9.0   | An implementation of Bisect, a method for inferring cell type composition of samples based on methylation sequencing data (Whole Genome Bisulfite Sequencing and Reduced Representation Sequencing). The method is specifically tailored for sequencing data, and therefore works better than methods developed for methylation arrays. It contains a supervised mode that requires a reference (the methylation probabilities in the pure cell types), and a semi-supervised mode, that requires cell counts for a subset of the samples, but does not require a reference. / GPL-3  | noarch   |
| <a href="#">r-bisectr</a> | 0.1.0   | Tools to find bad commits with git bisect. See <a href="https://github.com/wch/bisectr">https://github.com/wch/bisectr</a> for examples and test script templates. / GPL-2  | noarch   |
| <a href="#">r-bisrma</a>  | 0.2.2   | Bisulfite-treated RNA non-conversion in a set of samples is analysed as follows : each sample's non-conversion distribution is identified to a Poisson distribution. P-values adjusted for multiple testing are calculated in each sample. Combined non-conversion P-values and standard errors are calculated on the intersection of the set of samples. For further details, see C Legrand, F Tuorto, M Hartmann, R Liebers, D Jakob, M Helm and F Lyko (2017) <doi:10.1101/gr.210666.116>. / GPL-2   | noarch   |
| <a href="#">r-bit</a>     | 1.1_1   | Bitmapped vectors of booleans (no NAs), coercion from and to logicals, integers and integer subscripts; fast boolean operators and fast summary statistics. With 'bit' vectors you can store true binary booleans {FALSE,TRUE} at the expense of 1 bit only, on a 32 bit architecture this means factor 32 less RAM and ~ factor 32 more speed on boolean operations. Due to overhead of R calls, actual speed gain depends on the size of the vector: expect gains for vectors of size > 10000 elements. Even for one-time boolean operations it can pay-off to convert to bit, the pay-off is obvious, when such components are used more than once. Reading from and writing to bit is approximately as fast as accessing standard logicals - mostly due to R's time for memory allocation. The package allows to work with pre-allocated memory for return values by calling .Call() directly: when evaluating the speed of C-access with pre-allocated vector memory, coping from bit to logical requires only 70% of the time for copying from logical to logical; and copying from logical to bit comes at a performance penalty of 150%. the package now contains further classes for representing logical selections: 'bitwhich' for very skewed selections and 'ri' for selecting ranges of values for chunked processing. All three index classes can be used for subsetting 'ff' objects (ff-2.1-0 and higher). / GPL-2 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-bit64</a>   | 0.9_7   | Package 'bit64' provides serializable S3 atomic 64bit (signed) integers. These are useful for handling database keys and exact counting in $-2^{63}$ . WARNING: do not use them as replacement for 32bit integers, integer64 are not supported for subscripting by R-core and they have different semantics when combined with double, e.g. integer64 double => integer64. Class integer64 can be used in vectors, matrices, arrays and data.frames. Methods are available for coercion from and to logicals, integers, doubles, characters and factors as well as many elementwise and summary functions. Many fast algorithmic operations such as 'match' and 'order' support inter- active data exploration and manipulation and optionally leverage caching. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

| Name               | Version | Summary/License  | Platforms  |
|--------------------|---------|--|--|
| r-bitops           | 1.0.6   | Functions for bitwise operations on integer vectors. / GPL ( $\geq 2$ )  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-bittrina         | 1.3     | Provides methods for the binarization and trinarization of one-dimensional data and some visualization functions. / Artistic-2.0   | linux-64,<br>osx-64,<br>win-64                         |
| r-bitrugs          | 0.1     | MCMC methods to estimate transmission dynamics and infection routes in hospitals using genomic sampling data. / GPL-3  | linux-64,<br>osx-64,<br>win-64                         |
| r-bitsqueezr       | 0.1.0   | Provides a implementation of floating-point quantization algorithms for use in precision-preserving compression, similar to the approach taken in the ‘netCDF operators’ (NCO) software package and described in Zender (2016) <doi:10.5194/gmd-2016-63>. / GPL-3  | linux-64,<br>osx-64,<br>win-64                         |
| r-bivariate.pareto | 1.0.2   | Perform competing risks analysis under bivariate Pareto models. See Shih et al. (2018) <doi:10.1080/03610926.2018.1425450> for details. / GPL-2  | noarch   |
| r-bivarp           | 1.0     | Parameter estimation of bivariate distribution functions modeled as a Archimedean copula function. The input data may contain values from right censored. Used marginal distributions are two-parameter. Methods for density, distribution, survival, random sample generation. / GPL-3  | noarch   |
| r-bivarripower     | 1.2     | Implements sample size calculations for bivariate random intercept regression model that are described in Comulada and Weiss (2010) / GPL-2  | noarch   |
| r-bivgeo           | 2.0.1   | Computes the joint probability mass function (pmf), the joint cumulative function (cdf), the joint survival function (sf), the correlation coefficient, the covariance, the cross-factorial moment and generate random deviates for the Basu-Dhar bivariate geometric distribution as well the joint probability mass, cumulative and survival function assuming the presence of a cure fraction given by the standard bivariate mixture cure fraction model. The package also computes the estimators based on the method of moments. / GPL-2 | noarch   |
| r-bivgeom          | 1.0     | Implements Roy’s bivariate geometric model (Roy (1993) <doi:10.1006/jmva.1993.1065>): joint probability mass function, distribution function, survival function, random generation, parameter estimation, and more. / GPL-3  | noarch   |

|------------------|---------|---|--------------------------------|
| r-bivrec         | 1.0.0   | Alternating recurrent event data arise frequently in biomedical and social sciences where 2 types of events such as hospital admissions and discharge occur alternatively over time. As such we implement a collection of non-parametric and semiparametric methods to analyze such data. The main functions are <code>biv.rec.fit()</code> and <code>biv.rec.np()</code> . Use <code>biv.rec.fit()</code> for estimation of covariate effects on the two alternating event gap times ( $x_{ij}$ and $y_{ij}$ ) using semiparametric methods. The method options are Lee.et.al and Chang. Use <code>biv.rec.np()</code> for estimation of the joint cumulative distribution function (cdf) for the two alternating events gap times ( $x_{ij}$ and $y_{ij}$ ) as well as the marginal survival function for type I gap times ( $x_{ij}$ ) and the conditional cdf of the type II gap times ( $y_{ij}$ ) given an interval of type I gap times ( $x_{ij}$ ) in a non-parametric fashion. The package also provides options to simulate and visualize the data and results of analysis. / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| r-bizdays        | 1.0.6   | Business days calculations based on a list of holidays and nonworking weekdays. Quite useful for fixed income and derivatives pricing. / MIT  | noarch                         |
| r-bkpc           | 1.0.1   | Bayesian kernel projection classifier is a nonlinear multiclass classifier which performs the classification of the projections of the data to the principal axes of the feature space. A Gibbs sampler is implemented to find the posterior distributions of the parameters. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-blakerci       | 1.0_6   | Fast and accurate calculation of Blaker's binomial and Poisson confidence limits (and some related stuff). / GPL-3  | noarch                         |
| r-blandaltmanleh | 0.3.1   | Bland-Altman Plots using either base graphics or ggplot2, augmented with confidence intervals, with detailed return values and a sunflowerplot option for data with ties. / GPL-3   | noarch                         |
| r-blattr         | 1.0.1   | A wrapper around the 'Blat' command line SMTP mailer for Windows. 'Blat' is public domain software, but be sure to read the license before use. It can be found at the Blat website <a href="http://www.blatt.net">http://www.blatt.net</a> . / MIT   | win-64                         |
| r-blendedlink    | 1.0     | A new link function that equals one specified link function up to a cutover then a linear rescaling of another specified link function. For use in <code>glm()</code> or <code>glm2()</code> . The intended use is in binary regression, in which case the first link should be set to log and the second to logit. This ensures that fitted probabilities are between 0 and 1 and that exponentiated coefficients can be interpreted as relative risks for probabilities up to the cutoff. / GPL-2   GPL-3   | noarch                         |
| r-blendstat      | 1.0.2   | Performs a joint analysis of experiments with mixtures and random effects, taking on a process variable represented by a covariable. / GPL-2  | noarch                         |
| r-blin           | 0.0.1   | Estimate influence networks from longitudinal bipartite relational data, where the longitudinal relations are continuous. The outputs are estimates of weighted influence networks among each actor type in the data set. The generative model is the Bipartite Longitudinal Influence Network (BLIN) model, a linear autoregressive model for these type of data. The supporting paper is "Inferring Influence Networks from Longitudinal Bipartite Relational Data", which is in preparation by the same authors. The model may be estimated using maximum likelihood methods and Bayesian methods. For more detail on methods, see Marrs et. al. <arXiv:1809.03439>. / MIT   | noarch                         |
| r-blmm           | 2013.1  | Implements regression models for binary data on the absolute risk scale. These models are applicable to cohort and population-based case-control data. / GPL-2  | noarch                         |

| Name           | Version | Summary/License  | Platforms   |
|----------------|---------|--|---|
| r-blme         | 1.0.4   | Maximum a posteriori estimation for linear and generalized linear mixed-effects models in a Bayesian setting. Extends 'lme4' by Douglas Bates, Martin Maechler, Ben Bolker, and Steve Walker. / GPL-2  | noarch  |
| r-blmodel      | 1.0.2   | Posterior distribution in the Black-Litterman model is computed from a prior distribution given in the form of a time series of asset returns and a continuous distribution of views provided by the user as an external function. / GNU General Public License version 3  | noarch  |
| r-blob         | 1.1.1   | R's raw vector is useful for storing a single binary object. What if you want to put a vector of them in a data frame? The 'blob' package provides the blob object, a list of raw vectors, suitable for use as a column in data frame. / GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-blockfest    | 1.6     | An R implementation of an extension of the 'BayeScan' software (Foll, 2008) <DOI:10.1534/genetics.108.092221> for codominant markers, adding the option to group individual SNPs into pre-defined blocks. A typical application of this new approach is the identification of genomic regions, genes, or gene sets containing one or more SNPs that evolved under directional selection. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-blockforest  | 0.2.3   | A random forest variant 'block forest' ('BlockForest') tailored to the prediction of binary, survival and continuous outcomes using block-structured covariate data, for example, clinical covariates plus measurements of a certain omics data type or multi-omics data, that is, data for which measurements of different types of omics data and/or clinical data for each patient exist. Examples of different omics data types include gene expression measurements, mutation data and copy number variation measurements. Block forest are presented in Hornung & Wright (2019). The package includes four other random forest variants for multi-omics data: 'RandomBlock', 'BlockVarSel', 'VarProb', and 'SplitWeights'. These were also considered in Hornung & Wright (2019), but performed worse than block forest in their comparison study based on 20 real multi-omics data sets. Therefore, we recommend to use block forest ('BlockForest') in applications. The other random forest variants can, however, be consulted for academic purposes, for example, in the context of further methodological developments. Reference: Hornung, R. & Wright, M. N. (2019) Block Forests: random forests for blocks of clinical and omics covariate data. | r-blockmatrix  | 1.0     | Some elementary matrix algebra tools are implemented to manage block matrices or partitioned matrix, i.e. matrix of matrices ( <a href="http://en.wikipedia.org/wiki/Block_matrix">http://en.wikipedia.org/wiki/Block_matrix</a> ). The block matrix is here defined as a new S3 object. In this package, some methods for matrix object are rewritten for blockmatrix object. New methods are implemented. This package was created to solve equation systems with block matrices for the analysis of environmental vector time series. Bugs/comments/questions/collaboration of any kind are warmly welcomed. / GPL-2  | noarch  |
| r-blockmessage | 1.0     | Creates strings that show a text message in 8 by 8 block letters / GPL-2   | noarch  |

Table 51 – continued from previous page

| Name                            | Version | Summary/License  | Platforms                      |
|---------------------------------|---------|--|--------------------------------|
| <a href="#">r-blockmodeling</a> | 0.3.4   | This is primarily meant as an implementation of generalized block-modeling for valued networks. In addition, measures of similarity or dissimilarity based on structural equivalence and regular equivalence (REGE algorithms) can be computed and partitioned matrices can be plotted: Žiberna (2007)<doi:10.1016/j.socnet.2006.04.002>, Žiberna (2008)<doi:10.1080/00222500701790207>, Žiberna (2014)<doi:10.1016/j.socnet.2014.04.002>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-blockmodels</a>   | 1.1.1   | Latent and Stochastic Block Model estimation by a Variational EM algorithm. Various probability distribution are provided (Bernoulli, Poisson...), with or without covariates. / LGPL-2.1  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-blockrand</a>     | 1.3     | Create randomizations for block random clinical trials. Can also produce a pdf file of randomization cards. / GPL-2  | noarch                         |
| <a href="#">r-blocksdesign</a>  | 3.5     | Constructs D-optimal or near D-optimal nested and crossed block designs for unstructured or general factorial treatment designs. The treatment design, if required, is found from a model matrix design formula and can be added sequentially, if required. The block design is found from a defined set of block factors and is conditional on the defined treatment design. The block factors are added in sequence and each added block factor is optimized conditional on all previously added block factors. The block design can have repeated nesting down to any required depth of nesting with either simple nested blocks or a crossed blocks design at each level of nesting. Outputs include a table showing the allocation of treatments to blocks and tables showing the achieved D-efficiency factors for each block and treatment design. / GPL-2  | noarch                         |
| <a href="#">r-blr</a>           | 1.5     | Bayesian Linear Regression. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-blrpm</a>         | 1.0     | Due to a limited availability of observed high-resolution precipitation records with adequate length, simulations with stochastic precipitation models are used to generate series for subsequent studies [e.g. Khaliq and Cunmae, 1996, <doi:10.1016/0022-1694(95)02894-3>, Vandenberghe et al., 2011, <doi:10.1029/2009WR008388>]. This package contains an R implementation of the original Bartlett-Lewis rectangular pulse model (BLRPM), developed by Rodriguez-Iturbe et al. (1987) <doi:10.1098/rspa.1987.0039>. It contains a function for simulating a precipitation time series based on storms and cells generated by the model with given or estimated model parameters. Additionally BLRPM parameters can be estimated from a given or simulated precipitation time series. The model simulations can be plotted in a three-layer plot including an overview of generated storms and cells by the model (which can also be plotted individually), a continuous step-function and a discrete precipitation time series at a chosen aggregation level. / GPL-2 | noarch                         |
| <a href="#">r-blsapi</a>        | 0.2.1   | Allows users to request data for one or multiple series through the U.S. Bureau of Labor Statistics API. Users provide parameters as specified in < <a href="https://www.bls.gov/developers/api_signature.htm">https://www.bls.gov/developers/api_signature.htm</a> > and the function returns a JSON string. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name                       | Version | Summary/License  | Platforms                      |
|----------------------------|---------|--|--------------------------------|
| <a href="#">r-blsm</a>     | 0.1.0   | Provides a Bayesian latent space model for complex networks, either weighted or unweighted. Given an observed input graph, the estimates for the latent coordinates of the nodes are obtained through a Bayesian MCMC algorithm. The overall likelihood of the graph depends on a fundamental probability equation, which is defined so that ties are more likely to exist between nodes whose latent space coordinates are close. The package is mainly based on the model by Hoff, Raftery and Handcock (2002) <doi:10.1198/016214502388618906> and contains some extra features (e.g., removal of the Procrustean step, weights implemented as coefficients of the latent distances, 3D plots). The original code related to the above model was retrieved from < <a href="https://www.stat.washington.edu/people/pdhoff/Code/hoff_raftery_handcock_2002_jasa/">https://www.stat.washington.edu/people/pdhoff/Code/hoff_raftery_handcock_2002_jasa/</a> >. Users can inspect the MCMC simulation, create and customize insightful graphical representations or apply clustering techniques. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bmamevt</a>  | 1.0.3   | Toolkit for Bayesian estimation of the dependence structure in multivariate extreme value parametric models. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bmass</a>    | 1.0.3   | Multivariate tool for analyzing genome-wide association study results in the form of univariate summary statistics. The goal of ‘bmass’ is to comprehensively test all possible multivariate models given the phenotypes and datasets provided. Multivariate models are determined by assigning each phenotype to being either Unassociated (U), Directly associated (D) or Indirectly associated (I) with the genetic variant of interest. Test results for each model are presented in the form of Bayes factors, thereby allowing direct comparisons between models. The underlying framework implemented here is based on the modeling developed in A Unified Framework for Association Analysis with Multiple Related Phenotypes, M. Stephens (2013) <doi:10.1371/journal.pone.0065245>. / GPL-3  | noarch                         |
| <a href="#">r-bmix</a>     | 0.6     | This is a bare-bones implementation of sampling algorithms for a variety of Bayesian stick-breaking (marginally DP) mixture models, including particle learning and Gibbs sampling for static DP mixtures, particle learning for dynamic BAR stick-breaking, and DP mixture regression. The software is designed to be easy to customize to suit different situations and for experimentation with stick-breaking models. Since particles are repeatedly copied, it is not an especially efficient implementation. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bmixture</a> | 1.3     | Provides statistical tools for Bayesian estimation for finite mixture of distributions, mainly mixture of Gamma, Normal and t-distributions. The package is implemented the recent improvements in Bayesian literature for the finite mixture of distributions, including Mohammadi and et al. (2013) <doi:10.1007/s00180-012-0323-3> and Mohammadi and Salehi-Rad (2012) <doi:10.1080/03610918.2011.588358>. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bmk</a>      | 1.0     | MCMC diagnostic package that contains tools to diagnose convergence as well as to evaluate sensitivity studies, Includes summary functions which output mean, median, 95percentCI, Gelman & Rubin diagnostics and the Hellinger distance based diagnostics, Also contains functions to determine when an MCMC chain has converged via Hellinger distance, A function is also provided to compare outputs from identically dimensioned chains for determining sensitivity to prior distribution assumptions / GPL-2   | noarch                         |

Table 51 – continued from previous page

| Name                    | Version | Summary/License   | Platforms                      |
|-------------------------|---------|---|--------------------------------|
| <a href="#">r-bmp</a>   | 0.3     | Reads Windows BMP format images. Currently limited to 8 bit greyscale images and 24,32 bit (A)RGB images. Pure R implementation without external dependencies. / GPL-2  | noarch                         |
| <a href="#">r-bmrbr</a> | 0.2.0   | Nuclear magnetic resonance (NMR) is a highly versatile analytical technique for studying molecular configuration, conformation, and dynamics, especially those of biomacromolecules such as proteins. Biological Magnetic Resonance Data Bank ('BMRB') is a repository for Data from NMR Spectroscopy on Proteins, Peptides, Nucleic Acids, and other Biomolecules. Currently, 'BMRB' offers an R package 'RBMBr' to fetch data, however, it doesn't easily offer individual data file downloading and storing in a local directory. When using 'RBMBr', the data will stored as an R object, which fundamentally hinders the NMR researches to access the rich information from raw data, for example, the metadata. Here, 'BMRBr' File Downloader ('BMRBr') offers a more fundamental, low level downloader, which will download original deposited .str format file. This type of file contains information such as entry title, authors, citation, protein sequences, and so on. Many factors affect NMR experiment outputs, such as temperature, resonance sensitivity and etc., approximately 40% of the entries in the 'BMRB' have chemical shift accuracy problems [1,2] Unfortunately, current reference correction methods are heavily dependent on the availability of assigned protein chemical shifts or protein structure. This is my current research project is going to solve, which will be included in the future release of the package. The current version of the package is sufficient and robust enough for downloading individual 'BMRB' data file from the 'BMRB' database < <a href="http://www.bmrbr.wisc.edu">http://www.bmrbr.wisc.edu</a> >. The functionalities of this package includes but not limited: * To simplifies NMR researches by combine data downloading and results analysis together. * To allows NMR data reaches a broader audience that could utilize more than just chemical shifts but also metadata. * To offer reference corrected data for entries without assignment or structure information (future release). Reference: [1] E.L. Ulrich, H. Akutsu, J.F. Doreleijers, Y. Harano, Y.E. Ioannidis, J. Lin, et al., BioMagResBank, Nucl. Acids Res. 36 (2008) D402–8. <doi:10.1093/nar/gkm957>. [2] L. Wang, H.R. Markley, Linear analysis of carbon-13 chemical shift differences and its application to the detection and correction of errors in referencing and spin system identifications, J. Biomol. NMR. 32 (2005) 13–22. <doi:10.1007/s10858-005-1717-0>. / GPL-3 | noarch                         |
| <a href="#">r-bmrbr</a> | 1.32    | Provides two Bayesian models for detecting the association between rare genetic variants and a trait that can be continuous, ordinal or binary. Bayesian latent variable collapsing model (BLVCM) detects interaction effect and is dedicated to twin design while it can also be applied to independent samples. Hierarchical Bayesian multiple regression model (HBMR) incorporates genotype uncertainty information and can be applied to either independent or family samples. Furthermore, it deals with continuous, binary and ordinal traits. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bms</a>   | 0.3.4   | Bayesian model averaging for linear models with a wide choice of (customizable) priors. Built-in priors include coefficient priors (fixed, flexible and hyper-g priors), 5 kinds of model priors, moreover model sampling by enumeration or various MCMC approaches. Post-processing functions allow for inferring posterior inclusion and model probabilities, various moments, coefficient and predictive densities. Plotting functions available for posterior model size, MCMC convergence, predictive and coefficient densities, best models representation, BMA comparison. / Artistic-2.0  | noarch                         |

| Name           | Version | Summary/License   | Platforms   |
|----------------|---------|---|---|
| r-bootres      | 1.2.4   | Bootstrapped correlation and response functions are widely used in dendrochronology to calibrate tree-ring proxy data against multiple instrumental time series of climatic variables. With this package, we provide functionality similar to DENDROCLIM2002 (Biondi and Waikul (2004) <10.1016/j.cageo.2003.11.004>). A full description with examples is given in Zang and Biondi (2013) <10.1016/j.dendro.2012.08.001>. / GPL-3  | noarch  |
| r-bootruin     | 1.2_4   | We provide a framework for testing the probability of ruin in the classical (compound Poisson) risk process. It also includes some procedures for assessing and comparing the performance between the bootstrap test and the test using asymptotic normality. / AGPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| r-bootspecdens | 3.0     | Bootstrap for testing the hypothesis that the spectral densities of a number $m$ , $m \geq 2$ , not necessarily independent time series are equal / GPL-2   | noarch  |
| r-bootsteptic  | 1.2_0   | Model selection by bootstrapping the stepAIC() procedure. / GPL-2   | noarch  |
| r-bootstrap    | 2019.6  | Software (bootstrap, cross-validation, jackknife) and data for the book An Introduction to the Bootstrap by B. Efron and R. Tibshirani, 1993, Chapman and Hall. This package is primarily provided for projects already based on it, and for support of the book. New projects should preferentially use the recommended package boot. / BSD_3_clause   | linux-64,<br>osx-64,<br>win-64                                    |
| r-boottol      | 2.0     | Used to create bootstrap tolerance levels for the Kolmogorov-Smirnov (KS) statistic, the area under receiver operator characteristic curve (AUROC) statistic, and the Gini coefficient for each score cutoff. Also provides a bootstrap alternative to the Vasicek test. / GPL-2  | noarch  |
| r-bor          | 0.1.0   | Transforms focal observations' data, where different types of social interactions can be recorded by multiple observers, into asymmetric data matrices. Each cell in these matrices provides counts on the number of times a specific type of social interaction was initiated by the row subject and directed to the column subject. / GPL-3   | noarch  |
| r-borrowr      | 0.1.0   | Estimate population average treatment effects from a primary data source with borrowing from supplemental sources. Causal estimation is done with either a Bayesian linear model or with Bayesian additive regression trees (BART) to adjust for confounding. Borrowing is done with multisource exchangeability models (MEMs). For information on BART, see Chipman, George, & McCulloch (2010) <doi:10.1214/09-AOAS285>. For information on MEMs, see Kaizer, Koopmeiners, & Hobbs (2018) <doi:10.1093/biostatistics/kxx031>. / GPL-3 | linux-64,<br>osx-64,<br>win-64                                    |
| r-boruta       | 6.0.0   | An all relevant feature selection wrapper algorithm. It finds relevant features by comparing original attributes' importance with importance achievable at random, estimated using their permuted copies (shadows). / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                            | Version | Summary/License   | Platforms                      |
|---------------------------------|---------|---|--------------------------------|
| <a href="#">r-bosonsampling</a> | 0.1.1   | Classical Boson Sampling using the algorithm of Clifford and Clifford (2017) <arXiv:1706.01260>. Also provides functions for generating random unitary matrices, evaluation of matrix permanents (both real and complex) and evaluation of complex permanent minors. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-boussinesq</a>    | 1.0.3   | This package is a collection of R functions implemented from published and available analytic solutions for the One-Dimensional Boussinesq Equation (ground-water). In particular, the function beq.lin is the analytic solution of the linearized form of Boussinesq Equation between two different head-based boundary (Dirichlet) conditions; beq.song is the non-linear power-series analytic solution of the motion of a wetting front over a dry bedrock (Song at al, 2007, see complete reference on function documentation). Bugs/comments/questions/collaboration of any kind are warmly welcomed. / GPL-2   | noarch                         |
| <a href="#">r-boxoffice</a>     | 1.2.2   | Download daily box office information (how much each movie earned in theaters) using data from either Box Office Mojo (< <a href="http://www.boxofficemojo.com/">http://www.boxofficemojo.com/</a> >) or The Numbers (< <a href="http://www.the-numbers.com/">http://www.the-numbers.com/</a> >). / GPL-3   | noarch                         |
| <a href="#">r-boxplotdbl</a>    | 1.3.0   | Correlation chart of two set (x and y) of data. Using Quartiles with boxplot style. Visualize the effect of factor. / MIT (FOSS)  | noarch                         |
| <a href="#">r-bpa</a>           | 0.1.1   | Run basic pattern analyses on character sets, digits, or combined input containing both characters and numeric digits. Useful for data cleaning and for identifying columns containing multiple or nonstandard formats. / GPL-2   | noarch                         |
| <a href="#">r-bpbounds</a>      | 0.1.3   | Implementation of the nonparametric bounds for the average causal effect under an instrumental variable model by Balke and Pearl (Bounds on Treatment Effects from Studies with Imperfect Compliance, JASA, 1997, 92, 439, 1171-1176). The package can calculate bounds for a binary outcome, a binary treatment/phenotype, and an instrument with either 2 or 3 categories. The package implements bounds for situations where these 3 variables are measured in the same dataset (trivariate data) or where the outcome and instrument are measured in one study and the treatment/phenotype and instrument are measured in another study (bivariate data). / GPL-3 | noarch                         |
| <a href="#">r-bpcp</a>          | 1.3.4   | Calculates nonparametric pointwise confidence intervals for the survival distribution for right censored data. Has two-sample tests for dissimilarity (e.g., difference, ratio or odds ratio) in survival at a fixed time. Especially important for small sample sizes or heavily censored data. Includes mid-p options. / GPL-2  | noarch                         |
| <a href="#">r-bpeaks</a>        | 1.2     | bPeaks is a simple approach to identify transcription factor binding sites from ChIP-seq data. Our general philosophy is to provide an easy-to-use tool, well-adapted for small eukaryotic genomes (< 20 Mb). bPeaks uses a combination of 4 cutoffs (T1, T2, T3 and T4) to mimic good peak properties as described by biologists who visually inspect the ChIP-seq data on a genome browser. For yeast genomes, bPeaks calculates the proportion of peaks that fall in promoter sequences. These peaks are good candidates as transcription factor binding sites. / GPL-3  | noarch                         |
| <a href="#">r-bpkde</a>         | 1.0_7   | Nonparametric multivariate kernel density estimation using a back-projected kernel. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

| Name            | Version | Summary/License  | Platforms   |
|-----------------|---------|--|---|
| r-bpp           | 1.0.0   | Implements functions to update Bayesian Predictive Power Computations after not stopping a clinical trial at an interim analysis. Such an interim analysis can either be blinded or unblinded. Code is provided for Normally distributed endpoints with known variance, with a prominent example being the hazard ratio. / GPL-2   | noarch  |
| r-bqtl          | 1.0_3   | QTL mapping toolkit for inbred crosses and recombinant inbred lines. Includes maximum likelihood and Bayesian tools. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-bracer        | 1.0.1   | Performs brace expansions on strings. Made popular by Unix shells, brace expansion allows users to quickly generate certain character vectors by taking a single string and (recursively) expanding the comma-separated lists and double-period-separated integer and character sequences enclosed within braces in that string. The double-period-separated numeric integer expansion also supports padding the resulting numbers with zeros. / MIT | noarch  |
| r-bradleyterry2 | 1.0_9   | Specify and fit the Bradley-Terry model, including structured versions in which the parameters are related to explanatory variables through a linear predictor and versions with contest-specific effects, such as a home advantage. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-braidrm       | 0.71    | Contains functions for evaluating, analyzing, and fitting combined action dose response surfaces with the Bivariate Response to Additive Interacting Dose (BRAID) model of combined action. / GPL-3  | noarch  |
| r-branching     | 0.9.4   | Simulation and parameter estimation of multitype Bienayme - Galton - Watson processes. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-brandwatchr   | 0.3.0   | Interact with the 'Brandwatch' API < <a href="https://developers.brandwatch.com/docs">https://developers.brandwatch.com/docs</a> >. Allows you to authenticate to the API and obtain data for projects, queries, query groups tags and categories. Also allows you to directly obtain mentions and aggregate data for a specified query or query group. / MIT  | noarch  |
| r-brant         | 0.2_0   | Tests the parallel regression assumption for ordinal logit models generated with the function polr() from the package 'MASS'. / GPL-2  | noarch  |
| r-brea          | 0.2.0   | A function to produce MCMC samples for posterior inference in semiparametric Bayesian discrete time competing risks recurrent events models. / GPL-3   | noarch  |

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms   |
|-----------------------------|---------|---|---|
| <a href="#">r-breakaway</a> | 3.0     | Species richness estimation is an important problem in biodiversity analysis. This package provides methods for total species richness estimation (observed plus unobserved) and a method for modelling total diversity with covariates. <code>breakaway()</code> estimates total (observed plus unobserved) species richness. Microbial diversity datasets are characterized by a large number of rare species and a small number of highly abundant species. The class of models implemented by <code>breakaway()</code> is flexible enough to model both these features. <code>breakaway_nof1()</code> implements a similar procedure however does not require a singleton count. <code>betta()</code> provides a method for modelling total diversity with covariates in a way that accounts for its estimated nature and thus accounts for unobserved taxa, and <code>betta_random()</code> permits random effects modelling. / GPL-2  | noarch  |
| <a href="#">r-breakfast</a> | 1.0.0   | The breakfast package performs multiple change-point detection in data sequences, or sequence segmentation, using computationally efficient multiscale methods. This version of the package implements the Tail-Greedy Unbalanced Haar, Wild Binary Segmentation and Adaptive Wild Binary Segmentation change-point detection and segmentation methodologies. To start with, see the function <code>segment.mean</code> . / GPL-3   | noarch  |
| <a href="#">r-breeze</a>    | 0.4_3   | A collection of functions to analyse, visualize and interpret wind data and to calculate the potential energy production of wind turbines. / MIT  | noarch  |
| <a href="#">r-bretigea</a>  | 1.0.0   | Analysis of relative cell type proportions in bulk gene expression data. Provides a well-validated set of brain cell type-specific marker genes derived from multiple types of experiments, as described in McKenzie (2018) <doi:10.1038/s41598-018-27293-5>. For brain tissue data sets, there are marker genes available for astrocytes, endothelial cells, microglia, neurons, oligodendrocytes, and oligodendrocyte precursor cells, derived from each of human, mice, and combination human/mouse data sets. However, if you have access to your own marker genes, the functions can be applied to bulk gene expression data from any tissue. Also implements multiple options for relative cell type proportion estimation using these marker genes, adapting and expanding on approaches from the ‘CellCODE’ R package described in Chikina (2015) <doi:10.1093/bioinformatics/btv015>. The number of cell type marker genes used in a given analysis can be increased or decreased based on your preferences and the data set. Finally, provides functions to use the estimates to adjust for variability in the relative proportion of cell types across samples prior to downstream analyses. / MIT | noarch  |
| <a href="#">r-brew</a>      | 1.0_6   | brew implements a templating framework for mixing text and R code for report generation. brew template syntax is similar to PHP, Ruby’s <code>erb</code> module, Java Server Pages, and Python’s <code>psp</code> module. / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name                          | Version | Summary/License  | Platforms   |
|-------------------------------|---------|--|---|
| <a href="#">r-brglm</a>       | 0.6.2   | Fit generalized linear models with binomial responses using either an adjusted-score approach to bias reduction or maximum penalized likelihood where penalization is by Jeffreys invariant prior. These procedures return estimates with improved frequentist properties (bias, mean squared error) that are always finite even in cases where the maximum likelihood estimates are infinite (data separation). Fitting takes place by fitting generalized linear models on iteratively updated pseudo-data. The interface is essentially the same as 'glm'. More flexibility is provided by the fact that custom pseudo-data representations can be specified and used for model fitting. Functions are provided for the construction of confidence intervals for the reduced-bias estimates. / GPL (>= 2) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-bridgedist</a>  | 0.1.0   | An implementation of the bridge distribution with logit-link in R. In Wang and Louis (2003) <DOI:10.1093/biomet/90.4.765>, such a univariate bridge distribution was derived as the distribution of the random intercept that 'bridged' a marginal logistic regression and a conditional logistic regression. The conditional and marginal regression coefficients are a scalar multiple of each other. Such is not the case if the random intercept distribution was Gaussian. / GPL-2  | noarch  |
| <a href="#">r-brlrmr</a>      | 0.1.5   | Provides two main functions, il() and fil(). The il() function implements the EM algorithm developed by Ibrahim and Lipsitz (1996) <DOI:10.2307/2533068> to estimate the parameters of a logistic regression model with the missing response when the missing data mechanism is nonignorable. The fil() function implements the algorithm proposed by Maity et. al. (2017) <https://github.com/arnabkrmaity/brlrmr> to reduce the bias produced by the method of Ibrahim and Lipsitz (1996) <DOI:10.2307/2533068>. / GPL-3   | noarch  |
| <a href="#">r-brm</a>         | 1.0     | Fits novel models for the conditional relative risk, risk difference and odds ratio. / MIT   | noarch  |
| <a href="#">r-brnn</a>        | 0.7     | Bayesian regularization for feed-forward neural networks. / GPL-2  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-brobdingnag</a> | 1.2_6   | Handles very large numbers in R. Real numbers are held using their natural logarithms, plus a logical flag indicating sign. The package includes a vignette that gives a step-by-step introduction to using S4 methods. / GPL-3  | noarch  |
| <a href="#">r-broom</a>       | 0.5.2   | Summarizes key information about statistical objects in tidy tibbles. This makes it easy to report results, create plots and consistently work with large numbers of models at once. Broom provides three verbs that each provide different types of information about a model. tidy() summarizes information about model components such as coefficients of a regression. glance() reports information about an entire model, such as goodness of fit measures like AIC and BIC. augment() adds information about individual observations to a dataset, such as fitted values or influence measures. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

|----------------------------------|-----------|--|--------------------------------|
| <a href="#">r-brotli</a>         | 1.2       | A lossless compressed data format that uses a combination of the LZ77 algorithm and Huffman coding. Brotli is similar in speed to deflate (gzip) but offers more dense compression. / MIT  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-browndog</a>       | 0.2.1     | An R interface for the Brown Dog which allows researchers to leverage Brown Dog Services that provides modules to identify the conversion options for a file, to convert file to appropriate format, or to extract data from a file. See <a href="http://browndog.ncsa.illinois.edu/">http://browndog.ncsa.illinois.edu/</a> for more information. / FreeBSD   file LICENSE  | noarch                         |
| <a href="#">r-brq</a>            | 2.5       | Bayesian estimation and variable selection for quantile regression models. / GPL-2   | noarch                         |
| <a href="#">r-brunnersmunzel</a> | 1.3.5     | Provides the functions for Brunner-Munzel test and permuted Brunner-Munzel test, which enable to use formula, matrix, and table as argument. These functions are based on Brunner and Munzel (2000) <doi:10.1002/(SICI)1521-4036(200001)42:1%3C17::AID-BIMJ17%3E3.0.CO;2-U> and Neubert and Brunner (2007) <doi:10.1016/j.csda.2006.05.024>, and are written with FORTRAN. / GPL-2   GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bs4dash</a>        | 0.4.0     | Make 'Bootstrap 4' dashboards. Use the full power of 'AdminLTE3', a dashboard template built on top of 'Bootstrap 4' < <a href="https://github.com/almasaeed2010/AdminLTE/tree/v3-dev">https://github.com/almasaeed2010/AdminLTE/tree/v3-dev</a> >. / GPL-2  | noarch                         |
| <a href="#">r-bsda</a>           | 1.2.0     | Data sets for book Basic Statistics and Data Analysis by Larry J. Kitchens. / GPL-2  | noarch                         |
| <a href="#">r-bsearchtools</a>   | 0.0.61    | Exposes the binary search functions of the C standard library (std::lower_bound, std::upper_bound) plus other convenience functions, allowing faster lookups on sorted vectors. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bsmd</a>           | 2013.0718 | Bayesian screening and model discrimination follow-up designs. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bspec</a>          | 1.5       | Bayesian inference on the (discrete) power spectrum of time series. / GPL-2  | noarch                         |
| <a href="#">r-bsplinepsd</a>     | 0.6.0     | Implementation of a Metropolis-within-Gibbs MCMC algorithm to flexibly estimate the spectral density of a stationary time series. The algorithm updates a nonparametric B-spline prior using the Whittle likelihood to produce pseudo-posterior samples and is based on the work presented in Edwards, M.C., Meyer, R. and Christensen, N., Statistics and Computing (2018). <doi.org/10.1007/s11222-017-9796-9>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bsplus</a>         | 0.1.1     | The Bootstrap framework lets you add some JavaScript functionality to your web site by adding attributes to your HTML tags - Bootstrap takes care of the JavaScript < <a href="https://getbootstrap.com/javascript">https://getbootstrap.com/javascript</a> >. If you are using R Markdown or Shiny, you can use these functions to create collapsible sections, accordion panels, modals, tooltips, popovers, and an accordion sidebar framework (not described at Bootstrap site). / MIT | noarch                         |
| <a href="#">r-bspmma</a>         | 0.1_2     | The main functions carry out Gibbs' sampler routines for nonparametric and semiparametric Bayesian models for random effects meta-analysis. / GPL-2  | noarch                         |

| Name                       | Version | Summary/License   | Platforms                      |
|----------------------------|---------|---|--------------------------------|
| <a href="#">r-bsts</a>     | 0.9.1   | Time series regression using dynamic linear models fit using MCMC. See Scott and Varian (2014) <DOI:10.1504/IJMMNO.2014.059942>, among many other sources. / LGPL-2.1   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-btm</a>      | 0.2.1   | Biterm Topic Models find topics in collections of short texts. It is a word co-occurrence based topic model that learns topics by modeling word-word co-occurrences patterns which are called biterms. This in contrast to traditional topic models like Latent Dirichlet Allocation and Probabilistic Latent Semantic Analysis which are word-document co-occurrence topic models. A biterm consists of two words co-occurring in the same short text window. This context window can for example be a twitter message, a short answer on a survey, a sentence of a text or a document identifier. The techniques are explained in detail in the paper ‘A Biterm Topic Model For Short Text’ by Xiaohui Yan, Jiafeng Guo, Yanyan Lan, Xueqi Cheng (2013) < <a href="https://github.com/xiaohuiyan/xiaohuiyan.github.io/blob/master/paper/BTM-WWW13.pdf">https://github.com/xiaohuiyan/xiaohuiyan.github.io/blob/master/paper/BTM-WWW13.pdf</a> >. / Apache License 2.0   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bucky</a>    | 1.0.5   | Provides functions for various statistical techniques commonly used in the social sciences, including functions to compute clustered robust standard errors, combine results across multiply-imputed data sets, and simplify the addition of robust and clustered robust standard errors. The package was originally developed, in part, to assist porting of replication code from ‘Stata’ and attempts to replicate default options from ‘Stata’ where possible. / GPL-3  | noarch                         |
| <a href="#">r-bucss</a>    | 1.1.0   | Implements a method of correcting for publication bias and uncertainty when planning sample sizes in a future study from an original study. See Anderson, Kelley, & Maxwell (2017; Psychological Science, 28, 1547-1562). / GPL-3   | noarch                         |
| <a href="#">r-buddle</a>   | 1.0     | Statistical classification has been popular among various fields and stayed in the limelight of scientists of those fields. Examples of the fields include clinical trials where the statistical classification of patients is indispensable to predict the clinical courses of diseases. Considering the negative impact of diseases on performing daily tasks, correctly classifying patients based on the clinical information is vital in that we need to identify patients of the high-risk group to develop a severe state and arrange medical treatment for them at an opportune moment. Deep learning - a part of artificial intelligence - has gained much attention, and research on it burgeons during past decades. It is a veritable technique which was originally designed for the classification, and hence, the EzDL package can provide sublime solutions to various challenging classification problems encountered in the clinical trials. The EzDL package is based on the back-propagation algorithm which performs a multi-layer feed-forward neural network. This package contains two functions: Buddle_Main() and Buddle_Predict(). Buddle_Main() builds a feed-forward neural network model and trains the model. Buddle_Predict() provokes the trained model which is the output of Buddle_Main(), classifies given data, and make a final prediction for the data. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-buildmer</a> | 1.2     | Finds the largest possible regression model that will still converge for various types of regression analyses (including mixed models and generalized additive models) and then optionally performs stepwise elimination similar to the forward and backward effect selection methods in SAS, based on the change in log-likelihood or its significance, Akaike’s Information Criterion, or the Bayesian Information Criterion. / FreeBSD   | noarch                         |

|--------------------|---------|---|--------------------------------|
| r-bullwhipgame     | 0.1.0   | The bullwhipgame is an educational game that has as purpose the illustration and exploration of the bullwhip effect, i.e., the increase in demand variability along the supply chain. Marchena Marlene (2010) <arXiv:1009.3977>. / GPL-3  | noarch                         |
| r-bunchr           | 1.2.0   | View and analyze data where bunching is expected. Estimate counter-factual distributions. For earnings data, estimate the compensated elasticity of earnings w.r.t. the net-of-tax rate. / MIT  | noarch                         |
| r-bundesbank       | 0.1.9   | Download data from the time-series databases of the Bundesbank, the German central bank. See the overview at the Bundesbank website (< <a href="https://www.bundesbank.de/en/statistics/time-series-databases">https://www.bundesbank.de/en/statistics/time-series-databases</a> >) for available series. The package provides only a single function, getSeries(), which supports both traditional and real-time datasets; it will also download meta data if available. Downloaded data can automatically be arranged in various formats, such as data frames or 'zoo' series. The data may optionally be cached, so as to avoid repeated downloads of the same series. / GPL-3 | noarch                         |
| r-bundesligr       | 0.1.0   | All final tables of Germany's highest football (soccer!) league, the Bundesliga. Contains data from 1964 to 2016. / GPL-3   | noarch                         |
| r-burstfin         | 1.02    | A suite of functions for finance, including the estimation of variance matrices via a statistical factor model or Ledoit-Wolf shrinkage. / Unlimited  | noarch                         |
| r-burstmisc        | 1.1     | Script search, corner, genetic optimization, permutation tests, write expect test. / Unlimited  | noarch                         |
| r-bursts           | 1.0.1   | An implementation of Jon Kleinberg's burst detection algorithm. Uses an infinite Markov model to detect periods of increased activity in a series of discrete events with known times, and provides a simple visualization of the results. / MIT  | noarch                         |
| r-busdater         | 0.2.0   | Get a current financial year, start of current month, End of current month, start of financial year and end of it. Allow for offset from the date. / MIT  | noarch                         |
| r-businessduration | 0.2.0   | Calculates business duration between two dates. This excluding weekends, public holidays and non-business hours. / AGPL-3   | noarch                         |
| r-buysetest        | 1.7     | Implementation of the Generalized Pairwise Comparisons (GPC). GPC compare two groups of observations (intervention vs. control group) regarding several prioritized endpoints. The net benefit and win ratio statistics can then be estimated and corresponding confidence intervals and p-values can be estimated using resampling methods or the asymptotic U-statistic theory. The software enables the use of thresholds of minimal importance difference, stratification, and corrections to deal with right-censored endpoints or missing values. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-bvar             | 0.1.5   | Toolkit for the estimation of hierarchical Bayesian vector autoregressions. Implements hierarchical prior selection for conjugate priors in the fashion of Giannone, Lenza & Primiceri (2015) <doi:10.1162/REST_a_00483>. Allows for the computation of impulse responses and forecasts and provides functionality for assessing results. / GPL-3   | noarch                         |
| r-bvars            | 1.1     | R/C implementation of the model proposed by Primiceri (Time Varying Structural Vector Autoregressions and Monetary Policy, Review of Economic Studies, 2005), with functionality for computing posterior predictive distributions and impulse responses. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                          | Version | Summary/License   | Platforms                      |
|-------------------------------|---------|---|--------------------------------|
| <a href="#">r-bvartools</a>   | 0.0.2   | Assists in the set-up of algorithms for Bayesian inference of vector autoregressive (VAR) models. Functions for posterior simulation, forecasting, impulse response analysis and forecast error variance decomposition are largely based on the introductory texts of Koop and Korobilis (2010) <doi:10.1561/08000000013> and Luetkepohl (2007, ISBN: 9783540262398). / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bvenn</a>       | 0.1     | This package implements a simple alternative to the traditional Venn diagram. It depicts each overlap as a separate bubble with area proportional to the overlap size. Relation of the bubbles to input sets is shown by their arrangement. / GPL-2   | noarch                         |
| <a href="#">r-bvls</a>        | 1.4     | An R interface to the Stark-Parker implementation of an algorithm for bounded-variable least squares / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bwd</a>         | 0.1.0   | Implements a backward procedure for single and multiple change point detection proposed by Shin et al. <arXiv:1812.10107>. The backward approach is particularly useful to detect short and sparse signals which is common in copy number variation (CNV) detection. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bwgr</a>        | 1.6.5   | Whole-genome regression methods on Bayesian framework fitted via EM or Gibbs sampling, univariate and multivariate, with optional kernel term and sampling techniques. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bwimage</a>     | 1.0     | A computational tool to describe patterns in black and white images from natural structures. 'bwimage' implemented functions for exceptionally broad subject. For instance, 'bwimage' provide examples that range from calculation of canopy openness, description of patterns in vertical vegetation structure, to patterns in bird nest structure. / GPL-2  | noarch                         |
| <a href="#">r-bwstest</a>     | 0.2.2   | Performs the 'Baumgartner-Weiss-Schindler' two-sample test of equal probability distributions, <doi:10.2307/2533862>. Also performs similar rank-based tests for equal probability distributions due to Neuhauser <doi:10.1080/10485250108832874> and Murakami <doi:10.1080/00949655.2010.551516>. / LGPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-bytescircle</a> | 1.1     | Shows statistics about bytes contained in a file as a circle graph of deviations from mean in sigma increments. The function can be useful for statistically analyze the content of files in a glimpse: text files are shown as a green centered crown, compressed and encrypted files should be shown as equally distributed variations with a very low CV (sigma/mean), and other types of files can be classified between these two categories depending on their text vs binary content, which can be useful to quickly determine how information is stored inside them (databases, multimedia files, etc). / GPL-3 | linux-64,<br>osx-64,<br>win-64 |

Continued on next page

Table 51 – continued from previous page

| Name        | Version | Summary/License   | Platforms  |
|-------------|---------|---|--|
| r-bzinb     | 1.0.3   | Provides a maximum likelihood estimation of Bivariate Zero-Inflated Negative Binomial (BZINB) model or the nested model parameters. Also estimates the underlying correlation of the a pair of count data. See Cho, H., Liu, C., Preisser, J., and Wu, D. (In preparation) for details. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| r-c212      | 0.95    | Methods for detecting safety signals in clinical trials using groupings of adverse events by body-system or system organ class.The package title c212 is in reference to the original Engineering and Physical Sciences Research Council (UK) funded project which was named CASE 2/12. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| r-c2c       | 0.1.0   | Compare two classifications or clustering solutions that may or may not have the same number of classes, and that might have hard or soft (fuzzy, probabilistic) membership. Calculate various metrics to assess how the clusters compare to each other. The calculations are simple, but provide a handy tool for users unfamiliar with matrix multiplication. This package is not geared towards traditional accuracy assessment for classification/ mapping applications - the motivating use case is for comparing a probabilistic clustering solution to a set of reference or existing class labels that could have any number of classes (that is, without having to degrade the probabilistic clustering to hard classes). / GPL-3                | noarch   |
| r-c3net     | 1.1.1   | This package allows inferring gene regulatory networks with direct physical interactions from microarray expression data using C3NET. / GPL-3   | noarch   |
| r-ca        | 0.71    | Computation and visualization of simple, multiple and joint correspondence analysis. / GPL-3  | noarch   |
| r-cabooters | 1.0     | Performs correspondence analysis on a two-way contingency table and produces bootstrap-based elliptical confidence regions around the projected coordinates for the category points. Includes routines to plot the results in a variety of styles. Also reports the standard numerical output for correspondence analysis. / GPL-2  | noarch   |
| r-cacirt    | 1.4     | Computes classification accuracy and consistency indices under Item Response Theory. Implements the total score IRT-based methods in Lee, Hanson & Brennan (2002) and Lee (2010), the IRT-based methods in Rudner (2001, 2005), and the total score nonparametric methods in Lathrop & Cheng (2014). For dichotomous and polytomous tests. / GPL-2  | noarch   |
| r-caic4     | 0.8     | Provides functions for the estimation of the conditional Akaike information in generalized mixed-effect models fitted with (g)lmer() from 'lme4'. / GPL-2   | noarch   |
| r-cairo     | 1.5_1   | Cairo graphics device that can be use to create high-quality vector (PDF, PostScript and SVG) and bitmap output (PNG,JPEG,TIFF), and high-quality rendering in displays (X11 and Win32). Since it uses the same back-end for all output, copying across formats is WYSIWYG. Files are created without the dependence on X11 or other external programs. This device supports alpha channel (semi-transparent drawing) and resulting images can contain transparent and semi-transparent regions. It is ideal for use in server environments (file output) and as a replacement for other devices that don't have Cairo's capabilities such as alpha support or anti-aliasing. Backends are modular such that any subset of backends is supported. / GPL-2 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                               | Version | Summary/License   | Platforms   |
|------------------------------------|---------|---|---|
| <a href="#">r-calacs</a>           | 2.2.2   | Implements several string comparison algorithms, including calACS (count all common subsequences), lenACS (calculate the lengths of all common subsequences), and lenLCS (calculate the length of the longest common subsequence). Some algorithms differentiate between the more strict definition of subsequence, where a common subsequence cannot be separated by any other items, from its looser counterpart, where a common subsequence can be interrupted by other items. This difference is shown in the suffix of the algorithm (-Strict vs -Loose). For example, q-w is a common subsequence of q-w-e-r and q-e-w-r on the looser definition, but not on the more strict definition. calACSLoose Algorithm from Wang, H. All common subsequences (2007) IJ-CAI International Joint Conference on Artificial Intelligence, pp. 635-640. / GPL-3 | noarch  |
| <a href="#">r-calculator.lrfns</a> | 1.3     | Arithmetic operations scalar multiplication, addition, subtraction, multiplication and division of LR fuzzy numbers (which are on the basis of extension principle) have a complicate form for using in fuzzy Statistics, fuzzy Mathematics, machine learning, fuzzy data analysis and etc. Calculator for LR Fuzzy Numbers package relieve and aid applied users to achieve a simple and closed form for some complicated operator based on LR fuzzy numbers and also the user can easily draw the membership function of the obtained result by this package. / LGPL-3  | noarch  |
| <a href="#">r-calibrate</a>        | 1.7.2   | Package for drawing calibrated scales with tick marks on (non-orthogonal) variable vectors in scatterplots and biplots. / GPL-2   | noarch  |
| <a href="#">r-calibrator</a>       | 1.2.8   | Performs Bayesian calibration of computer models as per Kennedy and O'Hagan 2001. The package includes routines to find the hyperparameters and parameters; see the help page for stage1() for a worked example using the toy dataset. A tutorial is provided in the calex.Rnw vignette; and a suite of especially simple one dimensional examples appears in inst/doc/one.dim/. / GPL-2  | noarch  |
| <a href="#">r-callr</a>            | 3.2.0   | It is sometimes useful to perform a computation in a separate R process, without affecting the current R process at all. This packages does exactly that. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-caman</a>            | 0.74    | Tools for the analysis of finite semiparametric mixtures. These are useful when data is heterogeneous, e.g. in pharmacokinetics or meta-analysis. The NPMLE and VEM algorithms (flexible support size) and EM algorithms (fixed support size) are provided for univariate and bivariate data. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |

Table 51 – continued from previous page

| Name                           | Version | Summary/License  | Platforms |
|--------------------------------|---------|--|-----------|
| <a href="#">r-camsrad</a>      | 0.3.0   | Copernicus Atmosphere Monitoring Service (CAMS) radiations service provides time series of global, direct, and diffuse irradiances on horizontal surface, and direct irradiation on normal plane for the actual weather conditions as well as for clear-sky conditions. The geographical coverage is the field-of-view of the Meteosat satellite, roughly speaking Europe, Africa, Atlantic Ocean, Middle East. The time coverage of data is from 2004-02-01 up to 2 days ago. Data are available with a time step ranging from 15 min to 1 month. For license terms and to create an account, please see < <a href="http://www.soda-pro.com/web-services/radiation/cams-radiation-service">http://www.soda-pro.com/web-services/radiation/cams-radiation-service</a> >. / MIT | noarch    |
| <a href="#">r-canprot</a>      | 0.1.2   | Datasets are collected here for differentially (up- and down-) expressed proteins identified in proteomic studies of cancer and in cell culture experiments. Tables of amino acid compositions of proteins are used for calculations of chemical composition, projected into selected basis species. Plotting functions are used to visualize the compositional differences and thermodynamic potentials for proteomic transformations. / GPL-3  | noarch    |
| <a href="#">r-canvasxpress</a> | 1.24.8  | Enables creation of visualizations using the CanvasXpress framework in R. CanvasXpress is a standalone JavaScript library for reproducible research with complete tracking of data and end-user modifications stored in a single PNG image that can be played back. See < <a href="http://canvasxpress.org">http://canvasxpress.org</a> > for more information. / GPL-3  | noarch    |
| <a href="#">r-caper</a>        | 1.0.1   | Functions for performing phylogenetic comparative analyses. / GPL-2  | noarch    |
| <a href="#">r-capitalr</a>     | 1.2.0   | Provides Capital Budgeting Analysis functionality and the essential Annuity loan functions. Also computes Loan Amortization Schedules including schedules with irregular payments. / GPL-3   | noarch    |
| <a href="#">r-capn</a>         | 1.0.0   | Implements approximation methods for natural capital asset prices suggested by Fenichel and Abbott (2014) <doi:10.1086/676034> in Journal of the Associations of Environmental and Resource Economists (JAERE), Fenichel et al. (2016) <doi:10.1073/pnas.1513779113> in Proceedings of the National Academy of Sciences (PNAS), and Yun et al. (2017) in PNAS (accepted), and their extensions: creating Chebyshev polynomial nodes and grids, calculating basis of Chebyshev polynomials, approximation and their simulations for: V-approximation (single and multiple stocks, PNAS), P-approximation (single stock, PNAS), and Pdot-approximation (single stock, JAERE). Development of this package was generously supported by the Knobloch Family Foundation. / GPL-2    | noarch    |
| <a href="#">r-captioner</a>    | 2.2.3   | Provides a method for automatically numbering figures, tables, or other objects. Captions can be displayed in full, or as citations. This is especially useful for adding figures and tables to R markdown documents without having to numbering them manually. / MIT  | noarch    |
| <a href="#">r-captr</a>        | 0.3.0   | Get text from images of text using Captricity Optical Character Recognition (OCR) API. Captricity allows you to get text from handwritten forms — think surveys — and other structured paper documents. And it can output data in form a delimited file keeping field information intact. For more information, read < <a href="https://shreddr.captricity.com/developer/overview/">https://shreddr.captricity.com/developer/overview/</a> >. / MIT  | noarch    |
| <a href="#">r-capushe</a>      | 1.1.1   | Calibration of penalized criteria for model selection. The calibration methods available are based on the slope heuristics. / GPL (>= 2.0)   | noarch    |

Table 51 – continued from previous page

| Name                          | Version | Summary/License  | Platforms   |
|-------------------------------|---------|--|---|
| <a href="#">r-capwire</a>     | 1.1.4   | Fits models from Miller et al. 2005 to estimate population sizes from natural populations. Several models are implemented. Package also includes functions to perform a likelihood ratio test to choose between models, perform parametric bootstrapping to obtain confidence intervals and multiple functions to simulate data. / GPL-2   | noarch  |
| <a href="#">r-car</a>         | 3.0_2   | Functions to Accompany J. Fox and S. Weisberg, An R Companion to Applied Regression, Third Edition, Sage, in press. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-cardata</a>     | 3.0_2   | Datasets to Accompany J. Fox and S. Weisberg, An R Companion to Applied Regression, Third Edition, Sage (forthcoming). / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-cardiomodel</a> | 1.4     | Includes over 100 mixed-effects model structures describing the relationship between drug concentration and QT interval, heart rate/pulse rate or blood pressure. Given an exposure-response dataset, the tool fits each model structure to the observed data. / GPL-3   | noarch  |
| <a href="#">r-care</a>        | 1.1.10  | Implements the regression approach of Zuber and Strimmer (2011) High-dimensional regression and variable selection using CAR scores SAGMB 10: 34, <DOI:10.2202/1544-6115.1730>. CAR scores measure the correlation between the response and the Mahalanobis-decorrelated predictors. The squared CAR score is a natural measure of variable importance and provides a canonical ordering of variables. This package provides functions for estimating CAR scores, for variable selection using CAR scores, and for estimating corresponding regression coefficients. Both shrinkage as well as empirical estimators are available. / GPL-3 | noarch  |
| <a href="#">r-care1</a>       | 1.1.0   | The R package CARE1, the first part of the program CARE (Capture-Recapture) in <a href="http://chao.stat.nthu.edu.tw/softwareCE.html">http://chao.stat.nthu.edu.tw/softwareCE.html</a> , can be used to analyze epidemiological data via sample coverage approach (Chao et al. 2001a). Based on the input of records from several incomplete lists (or samples) of individuals, the R package CARE1 provides output of population size estimate and related statistics. / GPL-3  | noarch  |

Table 51 – continued from previous page

| Name                            | Version | Summary/License  | Platforms  |
|---------------------------------|---------|--|--|
| <a href="#">r-careless</a>      | 1.1.3   | When taking online surveys, participants sometimes respond to items without regard to their content. These types of responses, referred to as careless or insufficient effort responding, constitute significant problems for data quality, leading to distortions in data analysis and hypothesis testing, such as spurious correlations. The 'R' package 'careless' provides solutions designed to detect such careless / insufficient effort responses by allowing easy calculation of indices proposed in the literature. It currently supports the calculation of longstring, even-odd consistency, psychometric synonyms/antonyms, Mahalanobis distance, and intra-individual response variability (also termed inter-item standard deviation). For a review of these methods, see Curran (2016) <doi:10.1016/j.jesp.2015.07.006>. / MIT | noarch   |
| <a href="#">r-caret</a>         | 6.0_83  | Misc functions for training and plotting classification and regression models. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-caribou</a>       | 1.1     | This is a package for estimating the population size of migratory caribou herds based on large scale aggregations monitored by radio telemetry. It implements the methodology found in the article by Rivest et al. (1998) about caribou abundance estimation. It also includes a function based on the Lincoln-Petersen Index as applied to radio telemetry data by White and Garrott (1990). / GPL-2   | noarch   |
| <a href="#">r-carletonstats</a> | 2.0     | Includes commands for bootstrapping and permutation tests, a command for created grouped bar plots, and a demo of the quantile-normal plot for data drawn from different distributions. / GPL-2  | noarch   |
| <a href="#">r-carlit</a>        | 1.0     | Functions to calculate and plot ecological quality ratios (EQR) as specified by Ballesteros et al. 2007. / GPL-2   | noarch   |
| <a href="#">r-caroline</a>      | 0.7.6   | The caroline R library contains dozens of functions useful for: database migration (dbWriteTable2), database style joins & aggregation (nerge, groupBy & bestBy), data structure conversion (nv, tab2df), legend table making (sstable & leghead), plot annotation (labsegs & mvlabs), data visualization (violins, pies & raPlot), character string manipulation (m & pad), file I/O (write.delim), batch scripting and more. The package's greatest contributions lie in the database style merge, aggregation and interface functions as well as in it's extensive use and propagation of row, column and vector names in most functions. / Artistic-2.0  | noarch   |
| <a href="#">r-carrier</a>       | 0.1.0   | Sending functions to remote processes can be wasteful of resources because they carry their environments with them. With the carrier package, it is easy to create functions that are isolated from their environment. These isolated functions, also called crates, print at the console with their total size and can be easily tested locally before being sent to a remote. / GPL-3  | noarch   |

|---------------------------------|---------|---|--------------------------------|
| <a href="#">r-cascadedata</a>   | 1.2     | These experimental expression data (5 leukemic ‘CLL’ B-lymphocyte of aggressive form from ‘GSE39411’, <doi:10.1073/pnas.1211130110>), after B-cell receptor stimulation, are used as examples by packages such as the ‘Cascade’ one, a modeling tool allowing gene selection, reverse engineering, and prediction in cascade networks. Jung, N., Bertrand, F., Bahram, S., Vallat, L., and Maumy-Bertrand, M. (2014) <doi:10.1093/bioinformatics/btt705>. / GPL-2   | noarch                         |
| <a href="#">r-casematch</a>     | 1.0.7   | Allows users to identify similar cases for qualitative case studies using statistical matching methods. / GPL-2   | noarch                         |
| <a href="#">r-casmap</a>        | 0.6.0   | A significant pattern mining-based toolbox for region-based genome-wide association studies and higher-order epistasis analyses, implementing the methods described in Llinares-López et al. (2017) <doi:10.1093/bioinformatics/btx071>. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cat</a>           | 0.0_6   | Analysis of categorical-variable with missing values / file LICENSE   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-catchr</a>        | 0.2.1   | R has a unique way of dealing with warnings, errors, messages, and other conditions, but it can often be troublesome to users coming from different programming backgrounds. The purpose of this package is to provide flexible and useful tools for handling R conditions with less hassle. In order to lower the barrier of entry, keep code clean and readable, and reduce the amount of typing required, <i>catchr</i> uses a very simple domain-specific language that simplifies things on the front-end. This package aims to maintain a continuous learning curve that lets new users jump straight in to condition-handling, while simultaneously offering depth and complexity for more advanced users. / MIT | noarch                         |
| <a href="#">r-catdap</a>        | 1.3.4   | Categorical data analysis by AIC. The methodology is described in Sakamoto (1992) <ISBN 978-0-7923-1429-5>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-catdata</a>       | 1.2.1   | This R-package contains examples from the book Regression for Categorical Data, Tutz 2011, Cambridge University Press. The names of the examples refer to the chapter and the data set that is used. / GPL-2  | noarch                         |
| <a href="#">r-catencoders</a>   | 0.1.1   | Contains some commonly used categorical variable encoders, such as ‘LabelEncoder’ and ‘OneHotEncoder’. Inspired by the encoders implemented in Python ‘sklearn.preprocessing’ package (see < <a href="http://scikit-learn.org/stable/modules/preprocessing.html">http://scikit-learn.org/stable/modules/preprocessing.html</a> >). / GPL-2   GPL-3  | noarch                         |
| <a href="#">r-cateselection</a> | 1.0     | A multi-factor dimensionality reduction based forward selection method for genetic association mapping. / GPL-2   | noarch                         |
| <a href="#">r-catirt</a>        | 0.5_0   | Functions designed to simulate data that conform to basic unidimensional IRT models (for now 3-parameter binary response models and graded response models) along with Post-Hoc CAT simulations of those models with various item selection methods, ability estimation methods, and termination criteria. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

| <a href="#">r-catnet</a>   | 1.15.5  | Structure learning and parameter estimation of discrete Bayesian networks using likelihood-based criteria. Exhaustive search for fixed node orders and stochastic search of optimal orders via simulated annealing algorithm are implemented. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-catools</a>  | 1.17.1  | Contains several basic utility functions including: moving (rolling, running) window statistic functions, read/write for GIF and ENVI binary files, fast calculation of AUC, LogitBoost classifier, base64 encoder/decoder, round-off-error-free sum and cumsum, etc. / GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-catr</a>     | 3.16    | Provides routines for the generation of response patterns under unidimensional dichotomous and polytomous computerized adaptive testing (CAT) framework. It holds many standard functions to estimate ability, select the first item(s) to administer and optimally select the next item, as well as several stopping rules. Options to control for item exposure and content balancing are also available (Magis and Barrada (2017) <doi:10.18637/jss.v076.c01>). / GPL-2   | noarch   |
| <a href="#">r-catseyes</a> | 0.2.3   | Provides the tools to produce catseye plots, principally by catseyesplot() function which calls R's standard plot() function internally, or alternatively by the catseyes() function to overlay the catseye plot onto an existing R plot window. Catseye plots illustrate the normal distribution of the mean (picture a normal bell curve reflected over its base and rotated 90 degrees), with a shaded confidence interval; they are an intuitive way of illustrating and comparing normally distributed estimates, and are arguably a superior alternative to standard confidence intervals, since they show the full distribution rather than fixed quantile bounds. The catseyesplot and catseyes functions require pre-calculated means and standard errors (or standard deviations), provided as numeric vectors; this allows the flexibility of obtaining this information from a variety of sources, such as direct calculation or prediction from a model. Catseye plots, as illustrations of the normal distribution of the means, are described in Cumming (2013 & 2014). Cumming, G. (2013). The new statistics: Why and how. Psychological Science, 27, 7-29. <doi:10.1177/0956797613504966> pmid:24220629. / GPL-3 | noarch   |
| <a href="#">r-catspec</a>  | 0.97    | 'ctab' creates (multiway) percentage tables. 'sqtab' contains a set of functions for estimating models for square tables such as quasi-independence, symmetry, uniform association. Examples show how to use these models in a loglinear model using glm or in a multinomial logistic model using mlogit or clogit / GPL-2   | noarch   |
| <a href="#">r-catt</a>     | 2.0     | This function conducts the Cochran-Armitage trend test to a 2 by k contingency table. It will report the test statistic (Z) and p-value. A linear trend in the frequencies will be calculated, because the weights (0,1,2) will be used by default. / GPL-3  | noarch   |

| Name                         | Version | Summary/License  | Platforms                      |
|------------------------------|---------|--|--------------------------------|
| <a href="#">r-cattexact</a>  | 0.1.0   | Provides functions for computing the one-sided p-values of the Cochran-Armitage trend test statistic for the asymptotic and the exact conditional test. The computation of the p-value for the exact test is performed using an algorithm following an idea by Mehta, et al. (1992) <doi:10.2307/1390598>. / GPL-2   GPL-3   | noarch                         |
| <a href="#">r-causalmgm</a>  | 0.1.1   | Allows users to learn undirected and directed (causal) graphs over mixed data types (i.e., continuous and discrete variables). To learn a directed graph over mixed data, it first calculates the undirected graph (Sedgewick et al, 2016) and then it uses local search strategies to prune-and-orient this graph (Sedgewick et al, 2017). AJ Sedgewick, I Shi, RM Donovan, PV Benos (2016) <doi:10.1186/s12859-016-1039-0>. AJ Sedgewick, JD Ramsey, P Spirtes, C Glymour, PV Benos (2017) <arXiv:1704.02621>. / GPL-2   | noarch                         |
| <a href="#">r-causalsens</a> | 0.1.2   | The causalsens package provides functions to perform sensitivity analyses and to study how various assumptions about selection bias affects estimates of causal effects. / GPL-2   | noarch                         |
| <a href="#">r-cbanalysis</a> | 0.2.0   | A set of functions that helps you to generate descriptive statistics based on the variable types. / GPL-2  | noarch                         |
| <a href="#">r-cbinom</a>     | 1.3     | Implementation of the d/p/q/r family of functions for a continuous analog to the standard discrete binomial with continuous size parameter and continuous support with x in [0, size 1], following Iliencko (2013) <arXiv:1303.5990>. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cbird</a>      | 1.0     | The clustering of binary data with reducing the dimensionality (CLUSBIRD) proposed by Yamamoto and Hayashi (2015) <doi:10.1016/j.patcog.2015.05.026>. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cblasr</a>     | 1.0.0   | Provides the 'cblas.h' header file as C interface to the underlying internal 'BLAS' library in R. 'CBLAS' < <a href="https://www.netlib.org/blas/cblas.h">https://www.netlib.org/blas/cblas.h</a> > is a collection of wrappers originally written by Keita Teranishi and provides a C interface to the FORTRAN 'BLAS' library < <a href="https://www.netlib.org/blas/">https://www.netlib.org/blas/</a> >. Note that as internal 'BLAS' library provided by R < <a href="https://svn.r-project.org/R/trunk/src/include/R_ext/BLAS.h">https://svn.r-project.org/R/trunk/src/include/R_ext/BLAS.h</a> > is used and only the double precision / double complex 'BLAS' routines are supported. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cbsem</a>      | 1.0.0   | The composites are linear combinations of their indicators in composite based structural equation models. Structural models are considered consisting of two blocks. The indicators of the exogenous composites are named by X, the indicators of the endogenous by Y. Reflective relations are given by arrows pointing from the composite to their indicators. Their values are called loadings. In a reflective-reflective scenario all indicators have loadings. Arrows are pointing to their indicators only from the endogenous composites in the formative-reflective scenario. There are no loadings at all in the formative-formative scenario. The covariance matrices are computed for these three scenarios. They can be used to simulate these models. These models can also be estimated and a segmentation procedure is included as well. / GPL-3 | noarch                         |
| <a href="#">r-cbsodatar</a>  | 0.3.4   | The data and meta data from Statistics Netherlands (< <a href="https://www.cbs.nl">https://www.cbs.nl</a> >) can be browsed and downloaded. The client uses the open data API of Statistics Netherlands. / GPL-2   | noarch                         |

Table 51 – continued from previous page

| Name        | Version | Summary/License   | Platforms                      |
|-------------|---------|---|--------------------------------|
| r-cbt       | 1.0     | The Confidence Bound Target (CBT) algorithm is designed for infinite arms bandit problem. It is shown that CBT algorithm achieves the regret lower bound for general reward distributions. Reference: Hock Peng Chan and Shouri Hu (2018) <arXiv:1805.11793>. / GPL-2   | noarch                         |
| r-cc        | 1.0     | Tools for creating and visualizing statistical process control charts. Control charts are used for monitoring measurement processes, such as those occurring in manufacturing. The objective is to monitor the history of such processes and flag outlying measurements: out-of-control signals. Montgomery, D. (2009, ISBN:978-0-470-16992-6) contains an extensive discussion of the methodology. / GPL-2   | noarch                         |
| r-ccagfa    | 1.0.8   | Variational Bayesian algorithms for learning canonical correlation analysis (CCA), inter-battery factor analysis (IBFA), and group factor analysis (GFA). Inference with several random initializations can be run with the functions CCAexperiment() and GFAexperiment(). / GPL-2  | noarch                         |
| r-ccapp     | 0.3.2   | Canonical correlation analysis and maximum correlation via projection pursuit, as well as fast implementations of correlation estimators, with a focus on robust and non-parametric methods. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-ccchooser | 0.2.6   | ccChooser can be used to developing and evaluation of core collections for germplasm collections (entire collection). This package used to develop a core collection for biological resources like genbanks. A core collection is defined as a sample of accessions that represent, with the lowest possible level of redundancy, the genetic diversity (the richness of gene or genotype categories) of the entire collection. The establishing a core collection that represents genetic diversity of the entire collection with minimum loss of its original diversity and minimum redundancies is an important problem for gene-banks curators and crop breeders. ccChooser establish core collection base on phenotypic data (agronomic, morphological, phenological). / GPL-2 | noarch                         |
| r-cccp      | 0.2.4   | Routines for solving convex optimization problems with cone constraints by means of interior-point methods. The implemented algorithms are partially ported from CVXOPT, a Python module for convex optimization (see < <a href="http://cvxopt.org">http://cvxopt.org</a> > for more information). / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-cccrm     | 1.2.1   | Estimates the Concordance Correlation Coefficient to assess agreement. The scenarios considered are non-repeated measures, non-longitudinal repeated measures (replicates) and longitudinal repeated measures. The estimation approaches implemented are variance components and U-statistics approaches. / GPL-2   | noarch                         |
| r-ccda      | 1.1     | This package implements the combined cluster and discriminant analysis method for finding homogeneous groups of data with known origin as described in Kovacs et. al (2014): Classification into homogeneous groups using combined cluster and discriminant analysis (CCDA). Environmental Modelling & Software. DOI: <a href="http://dx.doi.org/10.1016/j.envsoft.2014.01.010">http://dx.doi.org/10.1016/j.envsoft.2014.01.010</a> / GPL-2   | noarch                         |
| r-cchs      | 0.4.1   | Contains a function, also called 'cchs', that calculates Estimator III of Borgan et al (2000), <DOI:10.1023/A:1009661900674>. This estimator is for fitting a Cox proportional hazards model to data from a case-cohort study where the subcohort was selected by stratified simple random sampling. / GPL-3  | noarch                         |

Table 51 – continued from previous page

| Name        | Version | Summary/License   | Platforms                      |
|-------------|---------|---|--------------------------------|
| r-cclust    | 0.6.2   | Convex Clustering methods, including K-means algorithm, On-line Update algorithm (Hard Competitive Learning) and Neural Gas algorithm (Soft Competitive Learning), and calculation of several indexes for finding the number of clusters in a data set. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-ccm       | 1.2     | Classification method described in Dancik et al (2011) <doi:10.1158/0008-5472.CAN-11-2427> that classifies a sample according to the class with the maximum mean (or any other function of) correlation between the test and training samples with known classes. / GPL-2   | noarch                         |
| r-ccmm      | 1.0     | Estimate the direct and indirect (mediation) effects of treatment on the outcome when intermediate variables (mediators) are compositional and high-dimensional. Sohn, M.B. and Li, H. (2017). Compositional Mediation Analysis for Microbiome Studies. (AOAS: In revision). / GPL-2  | noarch                         |
| r-ccp       | 1.1     | Significance tests for canonical correlation analysis, including asymptotic tests and a Monte Carlo method / GPL-3  | noarch                         |
| r-ccpop     | 1.0     | Tests of association between SNPs or pairs of SNPs and binary phenotypes, in case-control / case-population / case-control-population studies. / GPL-2  | noarch                         |
| r-ccremover | 1.0.4   | Implements a method for identifying and removing the cell-cycle effect from scRNA-Seq data. The description of the method is in Barron M. and Li J. (2016) <doi:10.1038/srep33892>. Identifying and removing the cell-cycle effect from single-cell RNA-Sequencing data. Submitted. Different from previous methods, ccRemover implements a mechanism that formally tests whether a component is cell-cycle related or not, and thus while it often thoroughly removes the cell-cycle effect, it preserves other features/signals of interest in the data. / GPL-3  | noarch                         |
| r-cdb       | 0.0.1   | A constant database is a data structure created by Daniel J. Bernstein in his cdb package. Its format consists on a sequence of (key,value)-pairs. This R package replicates the basic utilities for reading (cdbget) and writing (cddbump) constant databases. / GPL-2   | noarch                         |
| r-cde       | 0.4.1   | Facilitates searching, download and plotting of Water Framework Directive (WFD) reporting data for all waterbodies within the UK Environment Agency area. The types of data that can be downloaded are: WFD status classification data, Reasons for Not Achieving Good (RNAG) status, objectives set for waterbodies, measures put in place to improve water quality and details of associated protected areas. The site accessed is < <a href="https://environment.data.gov.uk/catchment-planning/">https://environment.data.gov.uk/catchment-planning/</a> >. The data are made available under the Open Government Licence v3.0 < <a href="https://www.nationalarchives.gov.uk/doc/open-government-licence/version/3/">https://www.nationalarchives.gov.uk/doc/open-government-licence/version/3/</a> >. This package has been peer-reviewed by rOpenSci (v. 0.4.0). / GPL-3 | noarch                         |
| r-cdft      | 1.0.1   | This package proposes a statistical downscaling method for cumulative distribution functions (CDF), as well as the computation of the Cramér-von Mises statistics U, and the Kolmogorov-Smirnov statistics KS. / GPL-2  | noarch                         |
| r-cdlasso   | 1.1     | Coordinate Descent Algorithms for Lasso Penalized L1, L2, and Logistic Regression / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                               | Version | Summary/License   | Platforms                      |
|------------------------------------|---------|---|--------------------------------|
| <a href="#">r-cdltools</a>         | 0.14    | Downloads USDA National Agricultural Statistics Service (NASS) cropscape data for a specified state. Utilities for fips, abbreviation, and name conversion are also provided. Full functionality requires an internet connection, but data sets can be cached for later off-line use. / Unlimited   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cdnmoney</a>         | 2012.4  | Components of Canadian Credit Aggregates and Monetary Aggregates with continuity adjustments. / GPL-2   | noarch                         |
| <a href="#">r-cdrom</a>            | 1.1     | Classification is based on the recently developed phylogenetic approach by Assis and Bachtrog (2013). The method classifies the evolutionary mechanisms retaining pairs of duplicate genes (conservation, neofunctionalization, subfunctionalization, or specialization) by comparing gene expression profiles of duplicate genes in one species to those of their single-copy ancestral genes in a sister species. / GPL-2   | noarch                         |
| <a href="#">r-cdvine</a>           | 1.4     | Functions for statistical inference of canonical vine (C-vine) and D-vine copulas. Tools for bivariate exploratory data analysis and for bivariate as well as vine copula selection are provided. Models can be estimated either sequentially or by joint maximum likelihood estimation. Sampling algorithms and plotting methods are also included. Data is assumed to lie in the unit hypercube (so-called copula data). / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cec</a>              | 0.10.2  | CEC divides data into Gaussian type clusters. The implementation allows the simultaneous use of various type Gaussian mixture models, performs the reduction of unnecessary clusters and it's able to discover new groups. Based on Spurek, P. and Tabor, J. (2014) <doi:10.1016/j.patcog.2014.03.006>. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cec2005benchmark</a> | 1.0.4   | This package is a wrapper for the C implementation of the 25 benchmark functions for the CEC 2005 Special Session on Real-Parameter Optimization. The original C code by Santosh Tiwari and related documentation are available at <a href="http://www.ntu.edu.sg/home/EPNSugan/index_files/CEC-05/CEC05.htm">http://www.ntu.edu.sg/home/EPNSugan/index_files/CEC-05/CEC05.htm</a> . / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cec2013</a>          | 0.1.5   | This package provides R wrappers for the C implementation of 28 benchmark functions defined for the Special Session and Competition on Real-Parameter Single Objective Optimization at CEC-2013. The focus of this package is to provide an open-source and multi-platform implementation of the CEC2013 benchmark functions, in order to make easier for researchers to test the performance of new optimization algorithms in a reproducible way. The original C code (Windows only) was provided by Jane Jing Liang, while GNU/Linux comments were made by Janez Brest. This package was gently authorised for publication on CRAN by Ponnuthurai Nagaratnam Suganthan. The official documentation is available at <a href="http://www.ntu.edu.sg/home/EPNSugan/index_files/CEC2013/CEC2013.htm">http://www.ntu.edu.sg/home/EPNSugan/index_files/CEC2013/CEC2013.htm</a> . Bugs reports/comments/questions are very welcomed (in English, Spanish or Italian). / GPL-3 | linux-64,<br>osx-64,<br>win-64 |

| Name           | Version | Summary/License  | Platforms   |
|----------------|---------|--|---|
| r-cellranger   | 1.1.0   | Helper functions to work with spreadsheets and the A1:D10 style of cell range specification. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-cengam       | 0.5.3   | Implementation of Tobit type I and type II families for censored regression using the ‘mgcv’ package, based on methods detailed in Woods (2016) <doi:10.1080/01621459.2016.1180986>. / GPL-2   | noarch  |
| r-censcov      | 1.0_0   | Implementations of threshold regression approaches for linear regression models with a covariate subject to random censoring, including deletion threshold regression and completion threshold regression. Reverse survival regression, which flip the role of response variable and the covariate, is also considered. / GPL-3  | noarch  |
| r-censnid      | 0_0     | Implements AS138, AS139. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-censorcopula | 2.0     | Implement an interval censor method to break ties when using data with ties to fitting a bivariate copula. / GPL-2   | noarch  |
| r-censregmod   | 1.0     | Fits univariate censored linear regression model under Normal or Student-t distribution / GPL (>= 3.0)   | noarch  |
| r-census2016   | 0.2.0   | Contains selected variables from the time series profiles for statistical areas level 2 from the 2006, 2011, and 2016 censuses of population and housing, Australia. Also provides methods for viewing the questions asked for convenience during analysis. / CC BY 4.0  | noarch  |
| r-censusapi    | 0.6.0   | A wrapper for the U.S. Census Bureau APIs that returns data frames of Census data and metadata. Available datasets include the Decennial Census, American Community Survey, Small Area Health Insurance Estimates, Small Area Income and Poverty Estimates, Population Estimates and Projections, and more. / GPL-3  | noarch  |
| r-censys       | 0.1.0   | The ‘Censys’ public search engine enables researchers to quickly ask questions about the hosts and networks that compose the Internet. Details on how ‘Censys’ was designed and how it is operated are available at < <a href="https://www.censys.io/about">https://www.censys.io/about</a> >. Both basic and extended research access queries are made available. More information on the SQL dialect used by the ‘Censys’ engine can be found at < <a href="https://cloud.google.com/bigquery/docs/reference/legacy-sql">https://cloud.google.com/bigquery/docs/reference/legacy-sql</a> >. / AGPL-3 | noarch  |
| r-centiserve   | 1.0.0   | Calculates centrality indices additional to the ‘igraph’ package centrality functions. / GPL-2   | noarch  |

| Name                      | Version | Summary/License  | Platforms                      |
|---------------------------|---------|--|--------------------------------|
| r-cents                   | 0.1_4   | Fit censored time series / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-cepreader               | 1.1_3   | Read Condensed Cornell Ecology Program ('CEP') and legacy 'CANOCO' files into R data frames. / MIT   | linux-64,<br>osx-64            |
| r-ceriolioutlierdetection | 1.1.9   | Implements the iterated RMCD method of Cerioli (2010) for multivariate outlier detection via robust Mahalanobis distances. Also provides the finite-sample RMCD method discussed in the paper, as well as the methods provided in Hardin and Rocke (2005) <doi:10.1198/106186005X77685> and Green and Martin (2017). / GPL-2   | noarch                         |
| r-cernaseek               | 2.1     | Provides several functions to identify and analyse miRNA sponge, including popular methods for identifying miRNA sponge interactions, two types of global ceRNA regulation prediction methods and four types of context-specific prediction methods( Li Y et al.(2017) <doi:10.1093/bib/bbx137>), which are based on miRNA-messenger RNA regulation alone, or by integrating heterogeneous data, respectively. In addition, For predictive ceRNA relationship pairs, this package provides several downstream analysis algorithms, including regulatory network analysis and functional annotation analysis, as well as survival prognosis analysis based on expression of ceRNA ternary pair. / GPL-3 | noarch                         |
| r-cernn                   | 0.1     | An implementation of the covariance estimation method proposed in Chi and Lange (2014), Stable estimation of a covariance matrix guided by nuclear norm penalties, Computational Statistics and Data Analysis 80:117-128. / MIT  | noarch                         |
| r-cetcolor                | 0.2.0   | Collection of perceptually uniform colour maps made by Peter Kovesi (2015) Good Colour Maps: How to Design Them <arXiv:1509.03700> at the Centre for Exploration Targeting (CET). / CC BY-SA 4.0   | noarch                         |
| r-cfa                     | 0.10    | Analysis of configuration frequencies for simple and repeated measures, multiple-samples CFA, hierarchical CFA, bootstrap CFA, functional CFA, Kieser-Victor CFA, and Lindner's test using a conventional and an accelerated algorithm. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-cfc                     | 1.1.2   | Numerical integration of cause-specific survival curves to arrive at cause-specific cumulative incidence functions, with three usage modes: 1) Convenient API for parametric survival regression followed by competing-risk analysis, 2) API for CFC, accepting user-specified survival functions in R, and 3) Same as 2, but accepting survival functions in C. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-cfestimatequantiles     | 1.0     | Estimate quantiles using formula (18) from <a href="http://www.jaschke-net.de/papers/CoFi.pdf">http://www.jaschke-net.de/papers/CoFi.pdf</a> (Yaschke; 2001) / GPL-2   | noarch                         |
| r-cfma                    | 1.0     | Performs causal functional mediation analysis (CFMA) for functional treatment, functional mediator, and functional outcome. This package includes two functional mediation model types: (1) a concurrent mediation model and (2) a historical influence mediation model. See Zhao et al. (2018), Functional Mediation Analysis with an Application to Functional Magnetic Resonance Imaging Data, <arXiv:1805.06923> for details. / GPL-2  | noarch                         |

| Name                      | Version | Summary/License   | Platforms                      |
|---------------------------|---------|---|--------------------------------|
| <a href="#">r-cgauc</a>   | 1.2.1   | The cgAUC can calculate the AUC-type measure of Obuchowski(2006) when gold standard is continuous, and find the optimal linear combination of variables with respect to this measure. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cgdsr</a>   | 1.3.0   | Provides a basic set of R functions for querying the Cancer Genomics Data Server (CGDS), hosted by the Computational Biology Center at Memorial-Sloan-Kettering Cancer Center (MSKCC) at <www.cbioportal.org>. / LGPL-3   | noarch                         |
| <a href="#">r-cge</a>     | 0.1.9   | Developing general equilibrium models, computing general equilibrium and simulating economic dynamics with structural dynamic models in LI (2019, ISBN: 9787521804225) General Equilibrium and Structural Dynamics: Perspectives of New Structural Economics. Beijing: Economic Science Press. / GPL-2   GPL-3  | noarch                         |
| <a href="#">r-cggp</a>    | 1.0.1   | Run computer experiments using the adaptive composite grid algorithm with a Gaussian process model. The algorithm works best when running an experiment that can evaluate thousands of points from a deterministic computer simulation. This package is an implementation of a forthcoming paper by Plumlee, Erickson, Ankenman, et al. For a preprint of the paper, contact the maintainer of this package. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cgh</a>     | 1.0_7   | Functions to analyze microarray comparative genome hybridization data using the Smith-Waterman algorithm / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cglasso</a> | 1.1.1   | The l1-penalized censored Gaussian graphical model is an extension of the graphical lasso estimator developed to handle datasets with censored observations. An EM-like algorithm is implemented to estimate the parameters of the censored Gaussian graphical models. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cgp</a>     | 2.1_1   | Fit composite Gaussian process (CGP) models as described in Ba and Joseph (2012) Composite Gaussian Process Models for Emulating Expensive Functions, Annals of Applied Statistics. The CGP model is capable of approximating complex surfaces that are not second-order stationary. Important functions in this package are CGP, print.CGP, summary.CGP, predict.CGP and plotCGP. / LGPL-2.1   | noarch                         |
| <a href="#">r-cgraph</a>  | 4.0.3   | Allows to create, evaluate, and differentiate computational graphs in R. A computational graph is a graph representation of a multivariate function decomposed by its (elementary) operations. Nodes in the graph represent arrays while edges represent dependencies among the arrays. An advantage of expressing a function as a computational graph is that this enables to differentiate the function by automatic differentiation. The 'cgraph' package supports various operations including basic arithmetic, trigonometry operations, and linear algebra operations. It differentiates computational graphs by reverse automatic differentiation. The flexible architecture of the package makes it applicable to solve a variety of problems including local sensitivity analysis, gradient-based optimization, and machine learning. / Apache License 2.0 | linux-64,<br>osx-64,<br>win-64 |

| Name                                 | Version | Summary/License  | Platforms                      |
|--------------------------------------|---------|--|--------------------------------|
| <a href="#">r-cgwttools</a>          | 3.0.1   | Functions for performing quick observations or evaluations of data, including a variety of ways to list objects by size, class, etc. In addition, functions which mimic Unix shell commands, including ‘head’, ‘tail’, ‘pushd’, and ‘popd’. The functions ‘seqle’ and ‘reverse.seqle’ mimic the base ‘rle’ but can search for linear sequences. The function ‘splatnd’ allows the user to generate zero-argument commands without the need for ‘makeActiveBinding’. / LGPL-3   | noarch                         |
| <a href="#">r-chandwich</a>          | 1.1.2   | Performs adjustments of a user-supplied independence loglikelihood function using a robust sandwich estimator of the parameter covariance matrix, based on the methodology in Chandler and Bate (2007) <doi:10.1093/biomet/asm015>. This can be used for cluster correlated data when interest lies in the parameters of the marginal distributions or for performing inferences that are robust to certain types of model misspecification. Functions for profiling the adjusted loglikelihoods are also provided, as are functions for calculating and plotting confidence intervals, for single model parameters, and confidence regions, for pairs of model parameters. Nested models can be compared using an adjusted likelihood ratio test. / GPL-2 | noarch                         |
| <a href="#">r-changepoint</a>        | 2.2.2   | Implements various mainstream and specialised changepoint methods for finding single and multiple changepoints within data. Many popular non-parametric and frequentist methods are included. The <code>cpt.mean()</code> , <code>cpt.var()</code> , <code>cpt.meanvar()</code> functions should be your first point of call. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-changepointshd</a>     | 0.3.1   | This implements the methods developed in, L. Bybee and Y. Atchade. (2018). Contains a series of methods for estimating change-points given user specified black-box models. The methods include binary segmentation for multiple change-point estimation. For estimating each individual change-point the package includes simulated annealing, brute force, and, for Gaussian graphical models, an applications specific rank-one update implementation. Additionally, code for estimating Gaussian graphical models is included. The goal of this package is to allow for the efficient estimation of change-points in complicated models with high dimensional data. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-changepointsvar</a>    | 0.1.0   | Detection of change-points for variance of heteroscedastic Gaussian variables with piecewise constant variance function. Adelfio, G. (2012), Change-point detection for variance piecewise constant models, Communications in Statistics, Simulation and Computation, 41:4, 437-448, <doi:10.1080/03610918.2011.592248>. / GPL-2   | noarch                         |
| <a href="#">r-changepointtesting</a> | 1.0     | A multiple testing procedure for clustered alternative hypotheses. It is assumed that the p-values under the null hypotheses follow U(0,1) and that the distributions of p-values from the alternative hypotheses are stochastically smaller than U(0,1). By aggregating information, this method is more sensitive to detecting signals of low magnitude than standard methods. Additionally, sporadic small p-values appearing within a null hypotheses sequence are avoided by averaging on the neighboring p-values. / GPL-2   | noarch                         |

|--------------------------------------|---------|--|--|
| <a href="#">r-channelattribution</a> | 1.16    | Advertisers use a variety of online marketing channels to reach consumers and they want to know the degree each channel contributes to their marketing success. This is called the online multi-channel attribution problem. This package contains a probabilistic algorithm for the attribution problem. The model uses a k-order Markov representation to identify structural correlations in the customer journey data. The package also contains three heuristic algorithms (first-touch, last-touch and linear-touch approach) for the same problem. The algorithms are implemented in C. / GPL-2 | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-chaos01</a>            | 1.2.1   | Computes and visualize the results of the 0-1 test for chaos proposed by Gottwald and Melbourne (2004) <DOI:10.1137/080718851>. The algorithm is available in parallel for the independent values of parameter c. Additionally, fast RQA is added to distinguish chaos from noise. / GPL-3   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-chargetransport</a>    | 1.0.2   | This package provides functions to compute Marcus, Marcus-Levich-Jortner or Landau-Zener charge transfer rates. These rates can then be used to perform kinetic Monte Carlo simulations to estimate charge carrier mobilities in molecular materials. The preparation of this package was supported by the the Fondazione Cariplo (PLENOS project, ref. 2011-0349). / GPL-3  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-chcn</a>               | 1.5     | A compilation of historical through contemporary climate measurements scraped from the Environment Canada Website Including tools for scraping data, creating metadata and forming temperature files. / GPL-2  | noarch   |
| <a href="#">r-cheb</a>               | 0.3     | Discrete Linear Chebyshev Approximation / GPL-3  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-checkarg</a>           | 0.1.0   | Utility functions that allow checking the basic validity of a function argument or any other value, including generating an error and assigning a default in a single line of code. The main purpose of the package is to provide simple and easily readable argument checking to improve code robustness. / GPL-2   | noarch   |
| <a href="#">r-checkdigit</a>         | 0.1_1   | A set of functions to calculate check digits according to various algorithms and to verify whether a string ends in a valid check digit / GPL-3  | noarch   |
| <a href="#">r-checkmate</a>          | 1.9.1   | Tests and assertions to perform frequent argument checks. A substantial part of the package was written in C to minimize any worries about execution time overhead. / BSD_3_clause file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

|---------------------|---------|--|---|
| r-checkpoint        | 0.4.6   | The goal of checkpoint is to solve the problem of package reproducibility in R. Specifically, checkpoint allows you to install packages as they existed on CRAN on a specific snapshot date as if you had a CRAN time machine. To achieve reproducibility, the checkpoint() function installs the packages required or called by your project and scripts to a local library exactly as they existed at the specified point in time. Only those packages are available to your project, thereby avoiding any package updates that came later and may have altered your results. In this way, anyone using checkpoint's checkpoint() can ensure the reproducibility of your scripts or projects at any time. To create the snapshot archives, once a day (at midnight UTC) Microsoft refreshes the Austria CRAN mirror on the Microsoft R Archived Network server (< <a href="https://mran.microsoft.com/">https://mran.microsoft.com/</a> >). Immediately after completion of the rsync mirror process, the process takes a snapshot, thus creating the archive. Snapshot archives exist starting from 2014-09-17. / GPL-2 | linux-64,<br>noarch,<br>osx-64,<br>win-64 |
| r-cheddar           | 0.1.6   | Provides a flexible, extendable representation of an ecological community and a range of functions for analysis and visualisation, focusing on food web, body mass and numerical abundance data. Allows inter-web comparisons such as examining changes in community structure over environmental, temporal or spatial gradients. / BSD_2_clause   | linux-64,<br>osx-64,<br>win-64            |
| r-chemical          | 0.2.1   | Simple functions for plotting linear calibration functions and estimating standard errors for measurements according to the Handbook of Chemometrics and Qualimetrics: Part A by Massart et al. There are also functions estimating the limit of detection (LOD) and limit of quantification (LOQ). The functions work on model objects from - optionally weighted - linear regression (lm) or robust linear regression ('rlm' from the 'MASS' package). / GPL-2   | noarch                                    |
| r-chemometricswithr | 0.1.13  | Functions and scripts used in the book Chemometrics with R - Multivariate Data Analysis in the Natural Sciences and Life Sciences by Ron Wehrens, Springer (2011). Data used in the package are available from github. / GPL-2   | noarch                                    |
| r-chemospec         | 5.1.48  | A collection of functions for top-down exploratory data analysis of spectral data including nuclear magnetic resonance (NMR), infrared (IR), Raman, X-ray fluorescence (XRF) and other similar types of spectroscopy. Includes functions for plotting and inspecting spectra, peak alignment, hierarchical cluster analysis (HCA), principal components analysis (PCA) and model-based clustering. Robust methods appropriate for this type of high-dimensional data are available. ChemoSpec is designed for structured experiments, such as metabolomics investigations, where the samples fall into treatment and control groups. Graphical output is formatted consistently for publication quality plots. ChemoSpec is intended to be very user friendly and to help you get usable results quickly. A vignette covering typical operations is available. / GPL-3   | noarch                                    |

|----------------------------------|---------|--|--------------------------------|
| <a href="#">r-chemospec2d</a>    | 0.3.16  | A collection of functions for exploratory chemometrics of 2D spectroscopic data sets such as COSY (correlated spectroscopy) and HSQC (heteronuclear single quantum coherence) 2D NMR (nuclear magnetic resonance) spectra. ‘ChemoSpec2D’ deploys methods aimed primarily at classification of samples and the identification of spectral features which are important in distinguishing samples from each other. Each 2D spectrum (a matrix) is treated as the unit of observation, and thus the physical sample in the spectrometer corresponds to the sample from a statistical perspective. In addition to chemometric tools, a few tools are provided for plotting 2D spectra, but these are not intended to replace the functionality typically available on the spectrometer. ‘ChemoSpec2D’ takes many of its cues from ‘ChemoSpec’ and tries to create consistent graphical output and to be very user friendly. / GPL-3  | noarch                         |
| <a href="#">r-chemospecutils</a> | 0.3.39  | Functions supporting the common needs of packages ‘ChemoSpec’ and ‘ChemoSpec2D’. / GPL-3   | noarch                         |
| <a href="#">r-cherry</a>         | 0.6.1   | Provides an alternative approach to multiple testing by calculating a simultaneous upper confidence bounds for the number of true null hypotheses among any subset of the hypotheses of interest, using the methods of Goeman and Solari (2011) <doi:10.1214/11-STS356>. / GPL-2   | noarch                         |
| <a href="#">r-chff</a>           | 0.1.0   | The software matches the current history to the closest history in a time series to build a forecast. / GPL-3  | noarch                         |
| <a href="#">r-chi</a>            | 0.1     | Light weight implementation of the standard distribution functions for the chi distribution, wrapping those for the chi-squared distribution in the stats package. / GPL-2   | noarch                         |
| <a href="#">r-chi2x3way</a>      | 1.1     | Provides two index partitions for three-way contingency tables: partition of the association measure chi-squared and of the predictability index tau under several representative hypotheses about the expected frequencies (hypothesized probabilities). / GPL (> 2)  | noarch                         |
| <a href="#">r-chillmodels</a>    | 1.0.0   | Calculates the chilling and heat accumulation for studies of the temperate fruit trees. The models in this package are: Utah (Richardson et al., 1974, ISSN:0018-5345), Positive Chill Units - PCU (Linsley-Noaks et al., 1995, ISSN:1017-0316), GDH-A - Growing Degree Hours by Anderson et al.(1986, ISSN:0567-7572), GDH-R - Growing Degree Hours by Richardson et al.(1975, ISSN:0018-5345), North Carolina (Shaltout e Unrath, 1983, ISSN:0003-1062), Landsberg Model (Landsberg, 1974, ISSN:0305-7364), Q10 Model (Bidabe, 1967, ISSN:0031-9368), Jones Model (Jones et al., 2013 <DOI:10.1111/j.1438-8677.2012.00590.x>), Low-Chill Model (Gilreath and Buchanan, 1981, ISSN:0003-1062), Model for Cherry Sweetheart (Guak and Nielsen, 2013 <DOI:10.1007/s13580-013-0140-9>), Model for apple Gala (Guak and Nielsen, 2013 <DOI:10.1007/s13580-013-0140-9>), Taiwan Model (Lu et al., 2012 <DOI:10.17660/ActaHortic.2012.962.35>), Dynamic Model (Fishman et al., 1987, ISSN:0022-5193) adapted from the function Dynamic_Model() of the ‘chillR’ package (Luedeling, 2018), Unified Model (Chuine et al., 2016 <DOI:10.1111/gcb.13383>) and Heat Restriction model. / GPL-3 | noarch                         |
| <a href="#">r-chiptest</a>       | 1.0     | Nonparametric Tests to identify the differential enrichment region for two conditions or time-course ChIP-seq data. It includes: data preprocessing function, estimation of a small constant used in hypothesis testing, a kernel-based two sample nonparametric test, two assumption-free two sample nonparametric test. / GPL (>= 2.15.1)  | linux-64,<br>osx-64,<br>win-64 |

|------------------|---------|---|--------------------------------|
| r-chnosz         | 1.3.3   | An integrated set of tools for thermodynamic calculations in aqueous geochemistry and geobiochemistry. Functions are provided for writing balanced reactions to form species from user-selected basis species and for calculating the standard molal properties of species and reactions, including the standard Gibbs energy and equilibrium constant. Calculations of the non-equilibrium chemical affinity and equilibrium chemical activity of species can be portrayed on diagrams as a function of temperature, pressure, or activity of basis species; in two dimensions, this gives a maximum affinity or predominance diagram. The diagrams have formatted chemical formulas and axis labels, and water stability limits can be added to Eh-pH, oxygen fugacity- temperature, and other diagrams with a redox variable. The package has been developed to handle common calculations in aqueous geochemistry, such as solubility due to complexation of metal ions, mineral buffers of redox or pH, and changing the basis species across a diagram (mosaic diagrams). CHNOSZ also has unique capabilities for comparing the compositional and thermodynamic properties of different proteins. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-choicedes      | 0.9_3   | Design functions for DCMs and other types of choice studies (including MaxDiff and other tradeoffs). / GPL-2  | noarch                         |
| r-choicemodelr   | 1.2     | Implements an MCMC algorithm to estimate a hierarchical multinomial logit model with a normal heterogeneity distribution. The algorithm uses a hybrid Gibbs Sampler with a random walk metropolis step for the MNL coefficients for each unit. Dependent variable may be discrete or continuous. Independent variables may be discrete or continuous with optional order constraints. Means of the distribution of heterogeneity can optionally be modeled as a linear function of unit characteristics variables. / GPL-3  | noarch                         |
| r-cholwishart    | 1.0.1   | Sampling from the Cholesky factorization of a Wishart random variable, sampling from the inverse Wishart distribution, sampling from the Cholesky factorization of an inverse Wishart random variable, sampling from the pseudo Wishart distribution, sampling from the generalized inverse Wishart distribution, computing densities for the Wishart and inverse Wishart distributions, and computing the multivariate gamma and digamma functions. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-choplump       | 1.0_0   | Choplump Tests are Permutation Tests for Comparing Two Groups with Some Positive but Many Zero Responses / GPL-3  | noarch                         |
| r-chopthin       | 0.2.2   | Resampling is a standard step in particle filtering and in sequential Monte Carlo. This package implements the chopthin resampler, which keeps a bound on the ratio between the largest and the smallest weights after resampling. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-chor           | 0.0_4   | Learning the structure of graphical models from datasets with thousands of variables. More information about the research papers detailing the theory behind Chordalysis is available at < <a href="http://www.francois-petitjean.com/Research">http://www.francois-petitjean.com/Research</a> > (KDD 2016, SDM 2015, ICDM 2014, ICDM 2013). The R package development site is < <a href="https://github.com/HerrmannM/Monash-Chor">https://github.com/HerrmannM/Monash-Chor</a> >. / GPL-3   | noarch                         |
| r-chords         | 0.95_4  | Maximum likelihood estimation in respondent driven samples. / GPL-2   | noarch                         |
| r-choroplethmaps | 1.0.1   | Contains 3 maps. 1) US States 2) US Counties 3) Countries of the world. / BSD_3_clause  | noarch                         |

|----------------------------------|---------|---|--|
| <a href="#">r-chromomap</a>      | 0.2     | Provides interactive, configurable and elegant graphics visualization of the chromosomes or chromosome regions of any living organism allowing users to map chromosome elements (like genes, SNPs etc.) on the chromosome plot. It introduces a special plot viz. the chromosome heatmap that, in addition to mapping elements, can visualize the data associated with chromosome elements (like gene expression) in the form of heat colors which can be highly advantageous in the scientific interpretations and research work. Because of the large size of the chromosomes, it is impractical to visualize each element on the same plot. However, the plot provides a magnified view for each of chromosome locus to render additional information and visualization specific for that location. You can map thousands of genes and can view all mappings easily. Users can investigate the detailed information about the mappings (like gene names or total genes mapped on a location) or can view the magnified single or double stranded view of the chromosome at a location showing each mapped element in sequential order. The package provide multiple features like visualizing multiple sets, chromosome heat-maps, group annotations, adding hyperlinks, and labelling. The plots can be saved as HTML documents that can be customized and shared easily. In addition, you can include them in R Markdown or in R ‘Shiny’ applications. / GPL-3 | noarch   |
| <a href="#">r-chron</a>          | 2.3_5   | Provides chronological objects which can handle dates and times. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-chunkr</a>         | 1.1.1   | Read tables chunk by chunk using a C backend and a simple R interface. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-ciaawconsensus</a> | 1.3     | Calculation of consensus values for atomic weights, isotope amount ratios, and isotopic abundances with the associated uncertainties using multivariate meta-regression approach for consensus building. / Unlimited  | noarch   |

|--------------------------------|---------|---|--------------------------------|
| <a href="#">r-ciee</a>         | 0.1.1   | In many studies across different disciplines, detailed measures of the variables of interest are available. If assumptions can be made regarding the direction of effects between the assessed variables, this has to be considered in the analysis. The functions in this package implement the novel approach CIEE (causal inference using estimating equations; Konigorski et al., 2018, <DOI:10.1002/gepi.22107>) for estimating and testing the direct effect of an exposure variable on a primary outcome, while adjusting for indirect effects of the exposure on the primary outcome through a secondary intermediate outcome and potential factors influencing the secondary outcome. The underlying directed acyclic graph (DAG) of this considered model is described in the vignette. CIEE can be applied to studies in many different fields, and it is implemented here for the analysis of a continuous primary outcome and a time-to-event primary outcome subject to censoring. CIEE uses estimating equations to obtain estimates of the direct effect and robust sandwich standard error estimates. Then, a large-sample Wald-type test statistic is computed for testing the absence of the direct effect. Additionally, standard multiple regression, regression of residuals, and the structural equation modeling approach are implemented for comparison. / GPL-2 | noarch                         |
| <a href="#">r-cifsmry</a>      | 1.0.1   | Estimate of cumulative incidence function in two samples. Provide weighted summary statistics based on various methods and weights. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cim</a>          | 1.0.0   | Produces statistical indicators of the impact of migration on the socio-demographic composition of an area. Three measures can be used: ratios, percentages and the Duncan index of dissimilarity. The input data files are assumed to be in an origin-destination matrix format, with each cell representing a flow count between an origin and a destination area. Columns are expected to represent origins, and rows are expected to represent destinations. The first row and column are assumed to contain labels for each area. See Rodriguez-Vignoli and Rowe (2018) <doi:10.1080/00324728.2017.1416155> for technical details. / GPL-2   | noarch                         |
| <a href="#">r-cin</a>          | 0.1     | Many experiments in neuroscience involve randomized and fast stimulation while the continuous outcome measures respond at much slower time scale, for example event-related fMRI. This package provide valid statistical tools with causal interpretation under these challenging settings, without imposing model assumptions. / GPL-2   | noarch                         |
| <a href="#">r-cinid</a>        | 1.2     | This package provides functions to compute a method for identifying the instar of Curculionid larvae from the observed distribution of the headcapsule size of mature larvae. / GPL (>= 2.0)  | noarch                         |
| <a href="#">r-cinterpolate</a> | 1.0.0   | Simple interpolation methods designed to be used from C code. Supports constant, linear and spline interpolation. An R wrapper is included but this package is primarily designed to be used from C code using 'LinkingTo'. The spline calculations are classical cubic interpolation, e.g., Forsythe, Malcolm and Moler (1977) <ISBN: 9780131653320>. / MIT  | linux-64,<br>osx-64,<br>win-64 |

|------------------------------|---------|---|--------------------------------|
| <code>r-cit</code>           | 2.2     | A likelihood-based hypothesis testing approach is implemented for assessing causal mediation. For example, it could be used to test for mediation of a known causal association between a DNA variant, the ‘instrumental variable’, and a clinical outcome or phenotype by gene expression or DNA methylation, the potential mediator. Another example would be testing mediation of the effect of a drug on a clinical outcome by the molecular target. The hypothesis test generates a p-value or permutation-based FDR value with confidence intervals to quantify uncertainty in the causal inference. The outcome can be represented by either a continuous or binary variable, the potential mediator is continuous, and the instrumental variable can be continuous or binary and is not limited to a single variable but may be a design matrix representing multiple variables. / Artistic-2.0   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-citbcmst</code>      | 1.0.4   | This package implements the approach to assign tumor gene expression dataset to the 6 CIT Breast Cancer Molecular Subtypes described in Guedj et al 2012. / GPL-2   | noarch                         |
| <code>r-citccmst</code>      | 1.0.2   | This package implements the approach to assign tumor gene expression dataset to the 6 CIT Colon Cancer Molecular Subtypes described in Marisa et al 2013. / GPL-2   | noarch                         |
| <code>r-cityplot</code>      | 2.0     | Input: a csv-file for each database table and a controlfile describing relations between tables. Output: An extended ER diagram / LGPL-3  | noarch                         |
| <code>r-cklrt</code>         | 0.2.3   | Composite Kernel Machine Regression based on Likelihood Ratio Test (CKLRT): in this package, we develop a kernel machine regression framework to model the overall genetic effect of a SNP-set, considering the possible GE interaction. Specifically, we use a composite kernel to specify the overall genetic effect via a nonparametric function and we model additional covariates parametrically within the regression framework. The composite kernel is constructed as a weighted average of two kernels, one corresponding to the genetic main effect and one corresponding to the GE interaction effect. We propose a likelihood ratio test (LRT) and a restricted likelihood ratio test (RLRT) for statistical significance. We derive a Monte Carlo approach for the finite sample distributions of LRT and RLRT statistics. (N. Zhao, H. Zhang, J. Clark, A. Maity, M. Wu. Composite Kernel Machine Regression based on Likelihood Ratio Test with Application for Combined Genetic and Gene-environment Interaction Effect (Submitted).) / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| <code>r-ckmeans.1d.dp</code> | 4.2.2   | Fast optimal univariate clustering and segmentation by dynamic programming. Three types of problem including univariate k-means, k-median, and k-segments are solved with guaranteed optimality and reproducibility. The core algorithm minimizes the sum of within-cluster distances using respective metrics. Its advantage over heuristic clustering algorithms in efficiency and accuracy is increasingly pronounced as the number of clusters k increases. Weighted k-means and unweighted k-segments algorithms can also optimally segment time series and perform peak calling. An auxiliary function generates histograms that are adaptive to patterns in data. In contrast to heuristic methods, this package provides a powerful set of tools for univariate data analysis with guaranteed optimality. Use four spaces when indenting paragraphs within the Description. / LGPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-cla</code>           | 0.95    | Implements ‘Markovitz’ Critical Line Algorithm (‘CLA’) for classical mean-variance portfolio optimization, see Markovitz (1952) <doi:10.2307/2975974>. Care has been taken for correctness in light of previous buggy implementations. / GPL-3  | noarch                         |

|-----------------------------|---------|---|--|
| <a href="#">r-cladorcpp</a> | 0.15.1  | Various cladogenesis-related calculations that are slow in pure R are implemented in C with Rcpp. These include the calculation of the probability of various scenarios for the inheritance of geographic range at the divergence events on a phylogenetic tree, and other calculations necessary for models which are not continuous-time markov chains (CTMC), but where change instead occurs instantaneously at speciation events. Typically these models must assess the probability of every possible combination of (ancestor state, left descendent state, right descendent state). This means that there are up to $(\# \text{ of states})^3$ combinations to investigate, and in biogeographical models, there can easily be hundreds of states, so calculation time becomes an issue. C implementation plus clever tricks (many combinations can be eliminated a priori) can greatly speed the computation time over naive R implementations. CITATION INFO: This package is the result of my Ph.D. research, please cite the package if you use it! Type: <code>citation(package=cladoRcpp)</code> to get the citation information. / GPL-2 | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-clam</a>      | 2.3.2   | Performs ‘classical’ age-depth modelling of dated sediment deposits - prior to applying more sophisticated techniques such as Bayesian age-depth modelling. Any radiocarbon dated depths are calibrated. Age-depth models are constructed by sampling repeatedly from the dated levels, each time drawing age-depth curves. Model types include linear interpolation, linear or polynomial regression, and a range of splines. See Blaauw (2010). <doi:10.1016/j.quageo.2010.01.002>. / GPL-2   | noarch   |
| <a href="#">r-clamr</a>     | 2.1.1   | Implementation of the Wilkinson and Ivany (2002) approach to paleoclimate analysis, applied to isotope data extracted from clams. / GPL-3   | noarch   |
| <a href="#">r-clarifai</a>  | 0.4.2   | Get description of images from Clarifai API. For more information, see < <a href="http://clarifai.com">http://clarifai.com</a> >. Clarifai uses a large deep learning cloud to come up with descriptive labels of the things in an image. It also provides how confident it is about each of the labels. / MIT  | noarch   |
| <a href="#">r-class</a>     | 7.3.1   | Various functions for classification, including k-nearest neighbour, Learning Vector Quantization and Self-Organizing Maps. / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-classify</a>  | 0.4     | Given $p$ -dimensional training data containing $d$ groups (the design space), a classification algorithm (classifier) predicts which group new data belongs to. Generally the input to these algorithms is high dimensional, and the boundaries between groups will be high dimensional and perhaps curvilinear or multi-faceted. This package implements methods for understanding the division of space between the groups. / MIT  | noarch   |

|-----------------------------|---------|---|--|
| <a href="#">r-classint</a>  | 0.3.1   | Selected commonly used methods for choosing univariate class intervals for mapping or other graphics purposes. / GPL ( $\geq 2$ )   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-cld2</a>      | 1.2     | Bindings to Google's C library Compact Language Detector 2 (see <a href="https://github.com/cld2owners/cld2#readme">https://github.com/cld2owners/cld2#readme</a> for more information). Probabilistically detects over 80 languages in plain text or HTML. For mixed-language input it returns the top three detected languages and their approximate proportion of the total classified text bytes (e.g. 80% English and 20% French out of 1000 bytes). There is also a 'cld3' package on CRAN which uses a neural network model instead. / Apache License 2.0  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-cld3</a>      | 1.2     | Google's Compact Language Detector 3 is a neural network model for language identification and the successor of 'cld2' (available from CRAN). The algorithm is still experimental and takes a novel approach to language detection with different properties and outcomes. It can be useful to combine this with the Bayesian classifier results from 'cld2'. See <a href="https://github.com/google/cld3#readme">https://github.com/google/cld3#readme</a> for more information. / Apache License 2.0  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-cleancall</a> | 0.1.0   | Wrapper of .Call() that runs exit handlers to clean up C resources. Helps managing C (non-R) resources while using the R API. / MIT   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-cleandata</a> | 0.3.0   | Functions to work with data frames to prepare data for further analysis. The functions for imputation, encoding, partitioning, and other manipulation can produce log files to keep track of process. / MIT   | noarch   |
| <a href="#">r-cleanerr</a>  | 0.1.1   | How to deal with missing data?Based on the concept of almost functional dependencies, a method is proposed to fill missing data, as well as help you see what data is missing. The user can specify a measure of error and how many combinations he wish to test the dependencies against, the closer to the length of the dataset, the more precise. But the higher the number, the more time it will take for the process to finish. If the program cannot predict with the accuracy determined by the user it shall not fill the data, the user then can choose to increase the error or deal with the data another way. / MIT   | noarch   |
| <a href="#">r-cleanr</a>    | 1.2.0   | Check your R code for some of the most common layout flaws. Many tried to teach us how to write code less dreadful, be it implicitly as B. W. Kernighan and D. M. Ritchie (1988) <ISBN:0-13-110362-8> in 'The C Programming Language' did, be it explicitly as R.C. Martin (2008) <ISBN:0-13-235088-2> in 'Clean Code: A Handbook of Agile Software Craftsmanship' did. So we should check our code for files too long or wide, functions with too many lines, too wide lines, too many arguments or too many levels of nesting. Note: This is not a static code analyzer like pylint or the like. Checkout <a href="https://cran.r-project.org/package=lintr">https://cran.r-project.org/package=lintr</a> instead. / BSD_2_clause | noarch   |

| Name                        | Version | Summary/License  | Platforms                      |
|-----------------------------|---------|--|--------------------------------|
| <code>r-clrdag</code>       | 0.6.0   | Provides MLEdag() for constrained maximum likelihood estimation and likelihood ratio test of a large directed acyclic graph. The algorithms are described in the paper by Li, Shen, and Pan (2019) <doi:10.1080/01621459.2019.1623042>. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-clsocp</code>       | 1.0     | This package provides an implementation of a one step smoothing newton method for the solution of second order cone programming problems, originally described by Xiaoni Chi and Sanyang Liu. / GPL-3  | noarch                         |
| <code>r-clttools</code>     | 1.3     | Central limit theorem experiments presented by data frames or plots. Functions include generating theoretical sample space, corresponding probability, and simulated results as well. / GPL-2  | noarch                         |
| <code>r-clubsandwich</code> | 0.3.5   | Provides several cluster-robust variance estimators (i.e., sandwich estimators) for ordinary and weighted least squares linear regression models, including the bias-reduced linearization estimator introduced by Bell and McCaffrey (2002) < <a href="http://www.statcan.gc.ca/pub/12-001-x/2002002/article/9058-eng.pdf">http://www.statcan.gc.ca/pub/12-001-x/2002002/article/9058-eng.pdf</a> > and developed further by Pustejovsky and Tipton (2017) <DOI:10.1080/07350015.2016.1247004>. The package includes functions for estimating the variance-covariance matrix and for testing single- and multiple-contrast hypotheses based on Wald test statistics. Tests of single regression coefficients use Satterthwaite or saddle-point corrections. Tests of multiple-contrast hypotheses use an approximation to Hotelling's T-squared distribution. Methods are provided for a variety of fitted models, including lm() and mlm objects, glm(), ivreg() (from package 'AER'), plm() (from package 'plm'), gls() and lme() (from 'nlme'), robu() (from 'robustmeta'), and rma.uni() and rma.mv() (from 'metafor'). / GPL-3 | noarch                         |
| <code>r-clue</code>         | 0.3.5   | CLUster Ensembles. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-cluer</code>        | 1.4     | CLUster Evaluation (CLUE) is a computational method for identifying optimal number of clusters in a given time-course dataset clustered by cmeans or kmeans algorithms and subsequently identify key kinases or pathways from each cluster. Its implementation in R is called ClueR. See README on < <a href="https://github.com/PengyiYang/ClueR">https://github.com/PengyiYang/ClueR</a> > for more details. P Yang et al. (2015) <doi:10.1371/journal.pcbi.1004403>. / GPL-3  | noarch                         |
| <code>r-clues</code>        | 0.5.9   | We developed the clues R package to provide functions for automatically estimating the number of clusters and getting the final cluster partition without any input parameter except the stopping rule for convergence. The package also provides functions to evaluate and compare the performances of partitions of a data set both numerically and graphically. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-cluscov</code>      | 1.1.0   | Clustered covariate regression enables estimation and inference in both linear and non-linear models with linear predictor functions even when the design matrix is column rank deficient. Routines in this package implement algorithms in Soale and Tsyawo (2019) <doi:10.13140/RG.2.2.32355.81441>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

| Name                             | Version | Summary/License  | Platforms  |
|----------------------------------|---------|--|--|
| <code>r-clustrank</code>         | 0.6_2   | Non-parametric tests (Wilcoxon rank sum test and Wilcoxon signed rank test) for clustered data. / GPL-3  | linux-64,<br>osx-64,<br>win-64                         |
| <code>r-clust.bin.pair</code>    | 0.1.2   | Tests, utilities, and case studies for analyzing significance in clustered binary matched-pair data. The central function <code>clust.bin.pair</code> uses one of several tests to calculate a Chi-square statistic. Implemented are the tests Eliasziw (1991) <doi:10.1002/sim.4780101211>, Obuchowski (1998) <doi:10.1002/(SICI)1097-0258(19980715)17:13%3C1495::AID-SIM863%3E3.0.CO;2-I>, Durkalski (2003) <doi:10.1002/sim.1438>, and Yang (2010) <doi:10.1002/bimj.201000035> with McNemar (1947) <doi:10.1007/BF02295996> included for comparison. The utility functions <code>nested.to.contingency</code> and <code>paired.to.contingency</code> convert data between various useful formats. Thyroids and psychiatry are the canonical datasets from Obuchowski and Petryshen (1989) <doi:10.1016/0165-1781(89)90196-0> respectively. / MIT | noarch   |
| <code>r-cluster</code>           | 2.0.8   | Methods for Cluster analysis. Much extended the original from Peter Rousseeuw, Anja Struyf and Mia Hubert, based on Kaufman and Rousseeuw (1990) Finding Groups in Data. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-cluster.datasets</code>  | 1.0_1   | A collection of data sets for teaching cluster analysis. / GPL-2   | noarch   |
| <code>r-clusterbootstrap</code>  | 1.0.0   | Provides functionality for the analysis of clustered data using the cluster bootstrap. / GPL-3   | noarch   |
| <code>r-clustercrit</code>       | 1.2.8   | Compute clustering validation indices. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| <code>r-clustergeneration</code> | 1.3.4   | We developed the <code>clusterGeneration</code> package to provide functions for generating random clusters, generating random covariance/correlation matrices, calculating a separation index (data and population version) for pairs of clusters or cluster distributions, and 1-D and 2-D projection plots to visualize clusters. The package also contains a function to generate random clusters based on factorial designs with factors such as degree of separation, number of clusters, number of variables, number of noisy variables. / GPL-2  | noarch   |
| <code>r-clustergenomics</code>   | 1.0     | The Partitioning Algorithm based on Recursive Thresholding (PART) is used to recursively uncover clusters and subclusters in the data. Functionality is also available for visualization of the clustering. / Artistic-2.0   | noarch   |

| Name                               | Version | Summary/License   | Platforms                      |
|------------------------------------|---------|---|--------------------------------|
| <a href="#">r-clusterhap</a>       | 0.1     | One haplotype is a combination of SNP (Single Nucleotide Polymorphisms) within the QTL (Quantitative Trait Loci). clusterhap groups together all individuals of a population with the same haplotype. Each group contains individual with the same allele in each SNP, whether or not missing data. Thus, clusterhap groups individuals, that to be imputed, have a non-zero probability of having the same alleles in the entire sequence of SNP's. Moreover, clusterhap calculates such probability from relative frequencies. / GPL-3  | noarch                         |
| <a href="#">r-clustering.sc.dp</a> | 1.0     | A dynamic programming algorithm for optimal clustering multidimensional data with sequential constraint. The algorithm minimizes the sum of squares of within-cluster distances. The sequential constraint allows only subsequent items of the input data to form a cluster. The sequential constraint is typically required in clustering data streams or items with time stamps such as video frames, GPS signals of a vehicle, movement data of a person, e-pen data, etc. The algorithm represents an extension of Ckmeans.1d.dp to multiple dimensional spaces. Similarly to the one-dimensional case, the algorithm guarantees optimality and repeatability of clustering. Method clustering.sc.dp can find the optimal clustering if the number of clusters is known. Otherwise, methods findwithinss.sc.dp and backtracking.sc.dp can be used. / LGPL-3 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-clusternomics</a>    | 0.1.1   | Integrative context-dependent clustering for heterogeneous biomedical datasets. Identifies local clustering structures in related datasets, and a global clusters that exist across the datasets. / MIT   | noarch                         |
| <a href="#">r-clusternor</a>       | 0.0.3   | The clustering 'NUMA' Optimized Routines package or 'clusternor' is a highly optimized package for performing clustering in parallel with accelerations specifically targeting multi-core Non-Uniform Memory Access ('NUMA') hardware architectures. Disa Mhembere, Da Zheng, Carey E. Priebe, Joshua T. Vogelstein, Randal Burns (2019) <arXiv:1902.09527>. / Apache License 2.0   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-clusterpower</a>     | 0.6.1   | Calculate power for cluster randomized trials (CRTs) that compare two means, two proportions, or two counts using closed-form solutions. In addition, calculate power for cluster randomized crossover trials using Monte Carlo methods. For more information, see Reich et al. (2012) <doi:10.1371/journal.pone.0035564>. / GPL-2  | noarch                         |
| <a href="#">r-clusterranktest</a>  | 1.0     | Nonparametric rank based tests (rank-sum tests and signed-rank tests) for clustered data, especially useful for clusters having informative cluster size and intra-cluster group size. / GPL-2   GPL-3  | noarch                         |
| <a href="#">r-clusterrepro</a>     | 0.9     | This is a function for validating microarray clusters via reproducibility, based on the paper referenced below. / GPL-2   | noarch                         |
| <a href="#">r-clustertend</a>      | 1.4     | Calculate some statistics aiming to help analyzing the clustering tendency of given data. In the first version, Hopkins' statistic is implemented. / GPL-2  | noarch                         |
| <a href="#">r-clusteval</a>        | 0.1     | An R package that provides a suite of tools to evaluate clustering algorithms, clusterings, and individual clusters. / MIT  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-clustmixtype</a>     | 0.2.1   | Functions to perform k-prototypes partitioning clustering for mixed variable-type data according to Z.Huang (1998): Extensions to the k-Means Algorithm for Clustering Large Data Sets with Categorical Variables, Data Mining and Knowledge Discovery 2, 283-304, <DOI:10.1023/A:1009769707641>. / GPL-2   | noarch                         |

| Name                         | Version | Summary/License  | Platforms                      |
|------------------------------|---------|--|--------------------------------|
| <a href="#">r-clustmmdd</a>  | 1.0.4   | An implementation of a variable selection procedure in clustering by mixture models for discrete data (clustMMDD). Genotype data are examples of such data with two unordered observations (alleles) at each locus for diploid individual. The two-fold problem of variable selection and clustering is seen as a model selection problem where competing models are characterized by the number of clusters K, and the subset S of clustering variables. Competing models are compared by penalized maximum likelihood criteria. We considered asymptotic criteria such as Akaike and Bayesian Information criteria, and a family of penalized criteria with penalty function to be data driven calibrated. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-clustsig</a>   | 1.1     | A complimentary package for use with hclust; simprof tests to see which (if any) clusters are statistically different. The null hypothesis is that there is no a priori group structure. See Clarke, K.R., Somerfield, P.J., and Gorley R.N. 2008. Testing of null hypothesis in exploratory community analyses: similarity profiles and biota-environment linkage. J. Exp. Mar. Biol. Ecol. 366, 56-69. / GPL-2   | noarch                         |
| <a href="#">r-clustvarlv</a> | 2.0.0   | Functions for the clustering of variables around Latent Variables, for 2-way or 3-way data. Each cluster of variables, which may be defined as a local or directional cluster, is associated with a latent variable. External variables measured on the same observations or/and additional information on the variables can be taken into account. A noise cluster or sparse latent variables can also be defined. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-clv</a>        | 0.3_2   | Package contains most of the popular internal and external cluster validation methods ready to use for the most of the outputs produced by functions coming from package cluster. Package contains also functions and examples of usage for cluster stability approach that might be applied to algorithms implemented in cluster package as well as user defined clustering algorithms. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-clvalid</a>    | 0.6_6   | Statistical and biological validation of clustering results. / LGPL-3  | noarch                         |
| <a href="#">r-cmaes</a>      | 1.0_1   | Single objective optimization using a CMA-ES. / GPL-2  | noarch                         |
| <a href="#">r-cmc</a>        | 1.0     | Calculation and plot of the stepwise Cronbach-Mesbah Curve / GPL-2   | noarch                         |
| <a href="#">r-cmce</a>       | 0.1.0   | Implements the Bayesian calibration model described in Pratola and Chkrebtii (2018) <DOI:10.5705/ss.202016.0403> for stochastic and deterministic simulators. Additive and multiplicative discrepancy models are currently supported. See < <a href="http://www.matthewpratola.com/software">http://www.matthewpratola.com/software</a> > for more information and examples. / AGPL-3  | noarch                         |
| <a href="#">r-cmf</a>        | 1.0     | Collective matrix factorization (CMF) finds joint low-rank representations for a collection of matrices with shared row or column entities. This code learns variational Bayesian approximation for CMF, supporting multiple likelihood potentials and missing data, while identifying both factors shared by multiple matrices and factors private for each matrix. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

|------------------------------|---------|--|--------------------------------|
| <a href="#">r-cmls</a>       | 1.0_0   | Solves multivariate least squares (MLS) problems subject to constraints on the coefficients, e.g., non-negativity, orthogonality, equality, inequality, monotonicity, unimodality, smoothness, etc. Includes flexible functions for solving MLS problems subject to user-specified equality and/or inequality constraints, as well as a wrapper function that implements 24 common constraint options. Also does k-fold or generalized cross-validation to tune constraint options for MLS problems. See ten Berge (1993, ISBN:9789066950832) for an overview of MLS problems, and see Goldfarb and Idnani (1983) <doi:10.1007/BF02591962> for a discussion of the underlying quadratic programming algorithm. / GPL-2   | noarch                         |
| <a href="#">r-cmm</a>        | 0.12    | Quite extensive package for maximum likelihood estimation and weighted least squares estimation of categorical marginal models (CMMs; e.g., Bergsma and Rudas, 2002, < <a href="http://www.jstor.org/stable/2700006?">http://www.jstor.org/stable/2700006?</a> ; Bergsma, Croon and Hagenars, 2009, <DOI:10.1007/b12532>. / GPL-2  | noarch                         |
| <a href="#">r-cmna</a>       | 1.0.2   | Provides the source and examples for James P. Howard, II, Computational Methods for Numerical Analysis with R, < <a href="http://howardjp.github.io/cmna/">http://howardjp.github.io/cmna/</a> >, a book on numerical methods in R. / BSD_2_clause   | noarch                         |
| <a href="#">r-cmocean</a>    | 0.2     | Perceptually uniform palettes for commonly used variables in oceanography as functions taking an integer and producing character vectors of colours. See Thyng, K.M., Greene, C.A., Hetland, R.D., Zimmerle, H.M. and S.F. DiMarco (2016) <doi:10.5670/oceanog.2016.66> for the guidelines adhered to when creating the palettes. / MIT  | noarch                         |
| <a href="#">r-cmpcontrol</a> | 1.0     | The main purpose of this package is to juxtapose the different control limits obtained by modelling a data set through the COM-Poisson distribution vs. the classical Poisson distribution. Accordingly, this package offers the ability to compute the COM-Poisson parameter estimates and plot associated Shewhart control charts for a given data set. / GPL-2   GPL-3  | noarch                         |
| <a href="#">r-cmplot</a>     | 3.3.3   | Manhattan plot, a type of scatter plot, was widely used to display the association results. However, it is usually time-consuming and laborious for a non-specialist user to write scripts and adjust parameters of an elaborate plot. Moreover, the ever-growing traits measured have necessitated the integration of results from different Genome-wide association study researches. Circle Manhattan Plot is the first open R package that can lay out Genome-wide association study P-value results in both traditional rectangular patterns, QQ-plot and novel circular ones. United in only one bull's eye style plot, association results from multiple traits can be compared interactively, thereby to reveal both similarities and differences between signals. / GPL-2 | noarch                         |
| <a href="#">r-cmpprocess</a> | 1.0     | A toolkit for flexible modeling of count processes where data (over- or under-) dispersion exists. Estimations can be obtained under two data constructs where one has: (1) data on number of events in an s-unit time interval, or (2) only wait-time data. This package is supplementary to the work set forth in Zhu et al. (2016) <doi:10.1080/00031305.2016.1234976>. / GPL-3   | noarch                         |
| <a href="#">r-cmprsk</a>     | 2.2_8   | Estimation, testing and regression modeling of subdistribution functions in competing risks, as described in Gray (1988), A class of K-sample tests for comparing the cumulative incidence of a competing risk, Ann. Stat. 16:1141-1154 <DOI:10.1214/aos/1176350951>, and Fine JP and Gray RJ (1999), A proportional hazards model for the subdistribution of a competing risk, JASA, 94:496-509, <DOI:10.1080/01621459.1999.10474144>. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms                      |
|-----------------------------|---------|---|--------------------------------|
| <a href="#">r-cmprskqr</a>  | 0.9.1   | Estimation, testing and regression modeling of subdistribution functions in competing risks using quantile regressions, as described in Peng and Fine (2009) <DOI:10.1198/jasa.2009.tm08228>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cmrutils</a>  | 1.3.1   | A collection of useful helper routines developed by students of the Center for Mathematical Research, Stankin, Moscow. / GPL-3  | noarch                         |
| <a href="#">r-cmvnorm</a>   | 1.0.6   | Various utilities for the complex multivariate Gaussian distribution. / GPL-2   | noarch                         |
| <a href="#">r-cna</a>       | 2.2.0   | Provides comprehensive functionalities for causal modeling with Coincidence Analysis (CNA), which is a configurational comparative method of causal data analysis that was first introduced in Baumgartner (2009) <doi:10.1177/0049124109339369>, and generalized in Baumgartner & Ambuehl (2018) <doi:10.1017/psrm.2018.45>. CNA is related to Qualitative Comparative Analysis (QCA), but contrary to the latter, it is custom-built for uncovering causal structures with multiple outcomes and it builds causal models from the bottom up by gradually combining single factors to complex dependency structures until the requested thresholds of model fit are met. The new functionalities provided by this package version include functions for evaluating and benchmarking the correctness of CNA's output, a function determining whether a solution is an INUS model, a function bringing non-INUS expressions into INUS form, and a function for identifying cyclic models. The package vignette has been updated accordingly. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cnrm</a>      | 1.2.0   | Conventional methods for producing standard scores in psychometrics or biometrics are often plagued with jumps or gaps (i.e., discontinuities) in norm tables and low confidence for assessing extreme scores. The continuous norming method introduced by A. Lenhard et al. (2016), <doi:10.1177/1073191116656437>, generates continuous test norm scores on the basis of the raw data from standardization samples, without requiring assumptions about the distribution of the raw data: Norm scores are directly established from raw data by modeling the latter ones as a function of both percentile scores and an explanatory variable (e.g., age). The method minimizes bias arising from sampling and measurement error, while handling marked deviations from normality, addressing bottom or ceiling effects and capturing almost all of the variance in the original norm data sample. / AGPL-3  | noarch                         |
| <a href="#">r-cobiclust</a> | 0.1.0   | Implementation of a probabilistic method for biclustering adapted to overdispersed count data. It is a Gamma-Poisson Latent Block Model. It also implements two selection criteria in order to select the number of biclusters. / GPL-2   | noarch                         |
| <a href="#">r-cobra</a>     | 0.99.4  | This package performs prediction for regression-oriented problems, aggregating in a nonlinear scheme any basic regression machines suggested by the context and provided by the user. If the user has no valuable knowledge on the data, four defaults machines wrappers are implemented so as to cover a minimal spectrum of prediction methods. If necessary, the computations may be parallelized. The method is described in Biau, Fischer, Guedj and Malley (2013), COBRA: A Nonlinear Aggregation Strategy. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

| r-cobs      | 1.3_3   | Qualitatively Constrained (Regression) Smoothing Splines via Linear Programming and Sparse Matrices. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-coclust   | 0.3_2   | A copula based clustering algorithm that finds clusters according to the complex multivariate dependence structure of the data generating process. The updated version of the algorithm is described in Di Lascio, F.M.L. and Gianerini, S. (2016). Clustering dependent observations with copula functions. Statistical Papers, p.1-17. <doi:10.1007/s00362-016-0822-3>. / GPL-2  | noarch  |
| r-coconut   | 1.0.2   | Allows for pooled analysis of microarray data by batch-correcting control samples, and then applying the derived correction parameters to non-control samples to obtain bias-free, inter-dataset corrected data. / GPL-3   | noarch  |
| r-cocor     | 1.1_3   | Statistical tests for the comparison between two correlations based on either independent or dependent groups. Dependent correlations can either be overlapping or nonoverlapping. A web interface is available on the website <a href="http://comparingcorrelations.org">http://comparingcorrelations.org</a> . A plugin for the R GUI and IDE RKWard is included. Please install RKWard from <a href="https://rkward.kde.org">https://rkward.kde.org</a> to use this feature. The respective R package 'rkward' cannot be installed directly from a repository, as it is a part of RKWard. / GPL-3 | noarch  |
| r-cocron    | 1.0_1   | Statistical tests for the comparison between two or more alpha coefficients based on either dependent or independent groups of individuals. A web interface is available at <a href="http://comparingcronbachalphas.org">http://comparingcronbachalphas.org</a> . A plugin for the R GUI and IDE RKWard is included. Please install RKWard from <a href="https://rkward.kde.org">https://rkward.kde.org</a> to use this feature. The respective R package 'rkward' cannot be installed directly from a repository, as it is a part of RKWard. / GPL-3  | noarch  |
| r-coda      | 0.19_2  | Provides functions for summarizing and plotting the output from Markov Chain Monte Carlo (MCMC) simulations, as well as diagnostic tests of convergence to the equilibrium distribution of the Markov chain. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-coda.base | 0.2.1   | A minimum set of functions to perform compositional data analysis using the log-ratio approach introduced by John Aitchison (1982) < <a href="http://www.jstor.org/stable/2345821">http://www.jstor.org/stable/2345821</a> >. Main functions have been implemented in c for better performance. / GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| r-codadiags | 1.0     | Markov chain Monte Carlo burn-in based on bridge statistics, in the way of coda::heidel.diag, but including non asymptotic tabulated statistics. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |

|---------------|---------|---|---|
| r-codatags    | 1.43    | Computes genomic breeding values using external information on the markers. The package fits a linear mixed model with heteroscedastic random effects, where the random effect variance is fitted using a linear predictor and a log link. The method is described in Mouresan, Selle and Ronnegard (2019) <doi:10.1101/636746>. / GPL-3                                  | noarch  |
| r-code        | 1.0.0   | Generates all necessary C functions allowing the user to work with the compiled-code interface of ode() and bvptwp(). The implementation supports forcings and events. Also provides functions to symbolically compute Jacobians, sensitivity equations and adjoint sensitivities being the basis for sensitivity analysis. / GPL-2                                       | noarch  |
| r-codep       | 0.9_1   | Computation of Multiscale Codependence Analysis and spatial eigenvector maps, as an additional feature. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| r-codetools   | 0.2_1   | Code analysis tools for R. / GPL  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-codina      | 1.1.1   | Categorize links and nodes from multiple networks in 3 categories: Common links (alpha) specific links (gamma), and different links (beta). Also categorizes the links into sub-categories and groups. The package includes a visualization tool for the networks. More information about the methodology can be found at: Gysi et. al., 2018 <arXiv:1802.00828>. / GPL-2 | noarch  |
| r-coenocliner | 0.2_2   | Simulate species occurrence and abundances (counts) along gradients. / GPL-2  | noarch  |
| r-coenoflex   | 2.2_0   | Simulates the composition of samples of vegetation according to gradient-based vegetation theory. Features a flexible algorithm incorporating competition and complex multi-gradient interaction. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-coexist     | 1.0     | species coexistence modeling under asymmetric dispersal and fluctuating source-sink dynamics;testing the proportion of coexistence scenarios driven by neutral and niche processes / GPL (>= 2.0)   | noarch  |
| r-cofad       | 0.1.0   | Contrast analysis for factorial designs is an alternative to the classical ANOVA approach with the advantage of testing focused hypothesis. The method is mainly based on Rosenthal, Rosnow and Rubin (2000, ISBN:978-0521659802) and Sedlmeier and Renkewitz (2018, ISBN:978-3868943214). / GPL-2  | noarch  |

| Name                           | Version | Summary/License  | Platforms  |
|--------------------------------|---------|--|--|
| <a href="#">r-cofra</a>        | 0.100   | Calculates complete functional regulation analysis and visualize the results in a single heatmap. The provided example data is for biological data but the methodology can be used for large data sets to compare quantitative entities that can be grouped. For example, a store might divide entities into cloth, food, car products etc and want to see how sales changes in the groups after some event. The theoretical background for the calculations are provided in New insights into functional regulation in MS-based drug profiling, Ana Sofia Carvalho, Henrik Molina & Rune Matthiesen, Scientific Reports <doi:10.1038/srep18826>. / GPL-2  | noarch   |
| <a href="#">r-coin</a>         | 1.3_0   | Conditional inference procedures for the general independence problem including two-sample, K-sample (non-parametric ANOVA), correlation, censored, ordered and multivariate problems. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-coindesk</a>     | 0.1.0   | Extract real-time Bitcoin price details by accessing ‘CoinDesk’ Bitcoin price Index API < <a href="https://www.coindesk.com/api/">https://www.coindesk.com/api/</a> >. / CC0   | noarch   |
| <a href="#">r-cointmonitor</a> | 0.1.0   | We propose a consistent monitoring procedure to detect a structural change from a cointegrating relationship to a spurious relationship. The procedure is based on residuals from modified least squares estimation, using either Fully Modified, Dynamic or Integrated Modified OLS. It is inspired by Chu et al. (1996) <DOI:10.2307/2171955> in that it is based on parameter estimation on a pre-break calibration period only, rather than being based on sequential estimation over the full sample. See the discussion paper <DOI:10.2139/ssrn.2624657> for further information. This package provides the monitoring procedures for both the cointegration and the stationarity case (while the latter is just a special case of the former one) as well as printing and plotting methods for a clear presentation of the results. / GPL-3 | noarch   |

| Name                          | Version | Summary/License   | Platforms                      |
|-------------------------------|---------|---|--------------------------------|
| <a href="#">r-cointreg</a>    | 0.2.0   | Cointegration methods are widely used in empirical macroeconomics and empirical finance. It is well known that in a cointegrating regression the ordinary least squares (OLS) estimator of the parameters is super-consistent, i.e. converges at rate equal to the sample size $T$ . When the regressors are endogenous, the limiting distribution of the OLS estimator is contaminated by so-called second order bias terms, see e.g. Phillips and Hansen (1990) <DOI:10.2307/2297545>. The presence of these bias terms renders inference difficult. Consequently, several modifications to OLS that lead to zero mean Gaussian mixture limiting distributions have been proposed, which in turn make standard asymptotic inference feasible. These methods include the fully modified OLS (FM-OLS) approach of Phillips and Hansen (1990) <DOI:10.2307/2297545>, the dynamic OLS (D-OLS) approach of Phillips and Loretan (1991) <DOI:10.2307/2298004>, Saikkonen (1991) <DOI:10.1017/S0266466600004217> and Stock and Watson (1993) <DOI:10.2307/2951763> and the new estimation approach called integrated modified OLS (IM-OLS) of Vogelsang and Wagner (2014) <DOI:10.1016/j.jeconom.2013.10.015>. The latter is based on an augmented partial sum (integration) transformation of the regression model. IM-OLS is similar in spirit to the FM- and D-OLS approaches, with the key difference that it does not require estimation of long run variance matrices and avoids the need to choose tuning parameters (kernels, bandwidths, lags). However, inference does require that a long run variance be scaled out. This package provides functions for the parameter estimation and inference with all three modified OLS approaches. That includes the automatic bandwidth selection approaches of Andrews (1991) <DOI:10.2307/2938229> and of Newey and West (1994) <DOI:10.2307/2297912> as well as the calculation of the long run variance. / GPL-3 | noarch                         |
| <a href="#">r-cold</a>        | 2.0_0   | Performs regression analysis for longitudinal count data, allowing for serial dependence among observations from a given individual and two dimensional random effects on the linear predictor. Estimation is via maximization of the exact likelihood of a suitably defined model. Missing values and unbalanced data are allowed; M. Helena Goncalves et al.(2007) <doi:10.1016/j.csda.2007.03.002>. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-collectargs</a> | 0.4.0   | We often want to take all (or most) of the objects in one environment (such as the parameter values of a function) and pass them to another. This might be calling a second function, or iterating over a list, calling the same function. These functions wrap often repeated code. Current stable version (committed on October 14, 2017). / MIT  | noarch                         |
| <a href="#">r-collections</a> | 0.1.6   | Provides high performance container data types such as Queue, Stack, Deque, Dict and OrderedDict. Benchmarks < <a href="https://randy3k.github.io/collections/articles/benchmark.html">https://randy3k.github.io/collections/articles/benchmark.html</a> > have shown that these containers are asymptotically more efficient than those offered by other packages. / MIT   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-collesslike</a> | 1.0     | Computation of Colless-Like, Sackin and cophenetic balance indices of a phylogenetic tree and study of the distribution of these balance indices under the alpha-gamma model. For more details see A. Mir, F. Rossello, L. Rotger (2013) <doi:10.1016/j.mbs.2012.10.005>, M. J. Sackin (1972) <doi:10.1093/sysbio/21.2.225>, D. H. Colless (1982) <doi:10.2307/2413420>. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name               | Version | Summary/License   | Platforms  |
|--------------------|---------|---|--|
| r-collutils        | 1.0.5   | Provides some low level functions for processing PLINK input and output files. / GPL-3  | linux-64   |
| r-colmozzie        | 1.1.1   | Weekly notified dengue cases and climate variables in Colombo district Sri Lanka from 2008/ week-52 to 2014/ week-21. / CC0   | noarch   |
| r-coloredica       | 1.0.0   | It implements colored Independent Component Analysis (Lee et al., 2011) and spatial colored Independent Component Analysis (Shen et al., 2014). They are two algorithms to perform ICA when sources are assumed to be temporal or spatial stochastic processes, respectively. / GPL-2   | noarch   |
| r-colorfulvennplot | 2.4     | Given 2-,3- or 4-dimensional data, plots a Venn diagram, i.e. ‘crossing circles’. The user can specify values, labels for each circle-group and unique colors for each plotted part. Here is what it would look like for a 3-dimensional plot: <a href="http://elliottnoma.files.wordpress.com/2011/02/venndiagram.png">http://elliottnoma.files.wordpress.com/2011/02/venndiagram.png</a> . To see what the 4-dimensional plot looks like, go to <a href="http://elliottnoma.files.wordpress.com/2013/03/4dplot.png">http://elliottnoma.files.wordpress.com/2013/03/4dplot.png</a> . / GPL-2   | noarch   |
| r-colorhclplot     | 1.3.1   | Build dendrograms with sample groups highlighted by different colors. Visualize results of hierarchical clustering analyses as dendrograms whose leaves and labels are colored according to sample grouping. Assess whether data point grouping aligns to naturally occurring clusters. / GPL-2   | noarch   |
| r-colorpalette     | 1.0.1   | Different methods to generate a color palette based on a specified base color and a number of colors that should be created. / MIT  | noarch   |
| r-colorr           | 1.0.0   | Color palettes for EPL, MLB, NBA, NHL, and NFL teams. / MIT   | noarch   |
| r-colorramps       | 2.3     | Builds gradient color maps / GPL-3  | noarch   |
| r-colorspace       | 1.4.1   | Carries out mapping between assorted color spaces including RGB, HSV, HLS, CIEXYZ, CIELUV, HCL (polar CIELUV), CIELAB and polar CIELAB. Qualitative, sequential, and diverging color palettes based on HCL colors are provided along with an interactive palette picker (with either a Tcl/Tk or a shiny GUI). / BSD_3_clause file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-colortools       | 0.1.5   | R package with handy functions to help users select and play with color schemes in an HSV color model / GPL-3   | noarch   |
| r-colourlovers     | 0.3.5   | Provides access to the COLOURlovers < <a href="http://www.colourlovers.com/">http://www.colourlovers.com/</a> > API, which offers color inspiration and color palettes. / GPL-2   | noarch   |
| r-colourvalues     | 0.2.2   | Maps one of the viridis colour palettes, or a user-specified palette to values. Viridis colour maps are created by StÃ©fan van der Walt and Nathaniel Smith. They were set as the default palette for the ‘Python’ ‘Matplotlib’ library, introduced at SciPy 2015 conference < <a href="http://scipy2015.scipy.org/ehome/index.php?eventid=115969&amp;">http://scipy2015.scipy.org/ehome/index.php?eventid=115969&amp;</a> >. Other palettes available in this library have been derived from ‘RColorBrewer’ < <a href="https://CRAN.R-project.org/package=RColorBrewer">https://CRAN.R-project.org/package=RColorBrewer</a> > and ‘colorspace’ < <a href="https://CRAN.R-project.org/package=colorspace">https://CRAN.R-project.org/package=colorspace</a> > packages. / GPL-3 | linux-64,<br>osx-64,<br>win-64                         |
| r-colr             | 0.1.900 | Powerful functions to select and rename columns in dataframes, lists and numeric types by ‘Perl’ regular expression. Regular expression (‘regex’) are a very powerful grammar to match strings, such as column names. / GPL-2   | noarch   |
| r-colt             | 0.1.1   | A collection of command-line color styles based on the ‘crayon’ package. ‘Colt’ styles are defined in themes that can easily be switched, to ensure command line output looks nice on dark as well as light consoles. / MIT   | noarch   |

Table 51 – continued from previous page

| Name               | Version | Summary/License   | Platforms                |
|--------------------|---------|---|--------------------------|
| r-comat            | 0.3.0   | Builds co-occurrence matrices based on spatial raster data. It includes creation of weighted co-occurrence matrices (wecoma) and integrated co-occurrence matrices (incoma; Vadivel et al. (2007) <doi:10.1016/j.patrec.2007.01.004>). / MIT  | linux-64, osx-64, win-64 |
| r-combat           | 0.0.4   | Genome-wide association studies (GWAS) have been widely used for identifying common variants associated with complex diseases. Due to the small effect sizes of common variants, the power to detect individual risk variants is generally low. Complementary to SNP-level analysis, a variety of gene-based association tests have been proposed. However, the power of existing gene-based tests is often dependent on the underlying genetic models, and it is not known a priori which test is optimal. Here we proposed COMBined Association Test (COMBAT) to incorporate strengths from multiple existing gene-based tests, including VEGAS, GATES and simpleM. Compared to individual tests, COMBAT shows higher overall performance and robustness across a wide range of genetic models. The algorithm behind this method is described in Wang et al (2017) <doi:10.1534/genetics.117.300257>. / GPL-2 | noarch                   |
| r-combinat         | 0.0.8   | 8 routines for combinatorics / GPL-2  | noarch                   |
| r-combineportfolio | 0.4     | Estimation of optimal portfolio weights as combination of simple portfolio strategies, like the tangency, global minimum variance (GMV) or naive (1/N) portfolio. It is based on a utility maximizing 8-fund rule. Popular special cases like the Kan-Zhou(2007) 2-fund and 3-fund rule or the Tu-Zhou(2011) estimator are nested. / GPL-2  | noarch                   |
| r-combinepvalue    | 1.0     | We offer two statistical tests to combine p-values: selfcontained.test vs competitive.test. The goal is to test whether a vector of pvalues are jointly significant when we combine them together. / GPL-3  | noarch                   |
| r-combins          | 1.1.1   | Series of partially balanced incomplete block designs (PBIB) based on the combinatorial method (S) introduced in (Imane Rezgui et al, 2014) <doi:10.3844/jmssp.2014.45.48>; and it gives their associated U-type design. / GPL-3  | noarch                   |
| r-combmsc          | 1.4.2   | Functions for computing optimal convex combinations of model selection criteria based on ranks, along with utility functions for constructing model lists, MSCs, and priors on model lists. / GPL-2   | noarch                   |
| r-comclim          | 0.9.5   | Computes community climate statistics for volume and mismatch using species' climate niches either unscaled or scaled relative to a regional species pool. These statistics can be used to describe biogeographic patterns and infer community assembly processes. Includes a vignette outlining usage. / GPL-3   | noarch                   |
| r-comf             | 0.1.9   | Functions to calculate various common and less common thermal comfort indices, convert physical variables, and evaluate the performance of thermal comfort indices. / GPL-2   | noarch                   |
| r-comics           | 1.0.4   | Provided are Computational methods for Immune Cell-type Subsets, including:(1) DCQ (Digital Cell Quantifier) to infer global dynamic changes in immune cell quantities within a complex tissue; and (2) VoCAL (Variation of Cell-type Abundance Loci) a deconvolution-based method that utilizes transcriptome data to infer the quantities of immune-cell types, and then uses these quantitative traits to uncover the underlying DNA loci. / GPL-2   | noarch                   |

Table 51 – continued from previous page

| Name                             | Version | Summary/License  | Platforms  |
|----------------------------------|---------|--|--|
| <a href="#">r-commandr</a>       | 1.0.1   | An S4 representation of the Command design pattern. The Operation class is a simple implementation using closures and supports forward and reverse (undo) evaluation. The more complicated Protocol framework represents each type of command (or analytical protocol) by a formal S4 class. Commands may be grouped and consecutively executed using the Pipeline class. Example use cases include logging, do/undo, analysis pipelines, GUI actions, parallel processing, etc. / Artistic-2.0  | noarch   |
| <a href="#">r-commentr</a>       | 1.0.4   | Functions to produce nicely formatted comments to use in R-scripts (or LaTeX/HTML/markdown etc). A comment with formatting is printed to the console and can then be copied to a script. / GPL-2   | noarch   |
| <a href="#">r-commonjavajars</a> | 1.0.6   | Useful libraries for building a Java based GUI under R are provided. / GPL-2   | noarch   |
| <a href="#">r-commonmark</a>     | 1.7     | The CommonMark specification defines a rationalized version of markdown syntax. This package uses the 'cmark' reference implementation for converting markdown text into various formats including html, latex and groff man. In addition it exposes the markdown parse tree in xml format. The latest version of this package also adds support for Github extensions including tables, autolinks and strikethrough text. / BSD_2_clause file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-commonsmath</a>    | 1.2.4   | Java JAR files for the Apache Commons Mathematics Library for use by users and other packages. / Apache License 2.0   file LICENSE   | noarch   |
| <a href="#">r-commontrend</a>    | 0.7.1   | Directly extract and plot stochastic common trends from a cointegration system using different approaches, currently including Kasa (1992) and Gonzalo and Granger (1995). The approach proposed by Gonzalo and Granger, also known as Permanent-Transitory Decomposition, is widely used in macroeconomics and market microstructure literature. Kasa's approach, on the other hand, has a nice property that it only uses the super consistent estimator: the cointegration vector 'beta'. This package also provides functions calculate P-value from Johansen Statistics according to the approximation method proposed by Doornik (1998). Update: 0.7-1: Fix bugs in calculation alpha. Add formulas and more explanations. 0.6-1: Rewrite the description file. 0.5-1: Add functions to calculate P-value from Johansen statistic, and vice versa. / GPL-2 | noarch   |
| <a href="#">r-comorbidity</a>    | 0.5.0   | Computing comorbidity scores such as the weighted Charlson score (Charlson, 1987 <doi:10.1016/0021-9681(87)90171-8>) and the Elixhauser comorbidity score (Elixhauser, 1998 <doi:10.1097/00005650-199801000-00004>) using ICD-9-CM or ICD-10 codes (Quan, 2005 <doi:10.1097/01.mlr.0000182534.19832.83>). / GPL-3  | noarch   |
| <a href="#">r-comp2roc</a>       | 1.1.4   | Comparison of two ROC curves through the methodology proposed by Ana C. Braga. / GPL-2   | noarch   |
| <a href="#">r-compactr</a>       | 0.1     | Creates empty plots with compact axis notation to which users can add whatever they like (points, lines, text, etc.) The notation is more compact in the sense that the axis-labels and tick-labels are closer to the axis and the tick-marks are shorter. Also, if the plot appears as part of a matrix, the x-axis notation is suppressed unless the plot appears along the bottom row and the y-axis notation is suppress unless the plot appears along the left column. / GPL-2  | noarch   |

Table 51 – continued from previous page

| Name                           | Version | Summary/License   | Platforms                      |
|--------------------------------|---------|---|--------------------------------|
| <a href="#">r-compare</a>      | 0.2.6   | Functions to compare a model object to a comparison object. If the objects are not identical, the functions can be instructed to explore various modifications of the objects (e.g., sorting rows, dropping names) to see if the modified versions are identical. / GPL-2   | noarch                         |
| <a href="#">r-comparec</a>     | 1.3.1   | Proposed by Harrell, the C index or concordance C, is considered an overall measure of discrimination in survival analysis between a survival outcome that is possibly right censored and a predictive-score variable, which can represent a measured biomarker or a composite-score output from an algorithm that combines multiple biomarkers. This package aims to statistically compare two C indices with right-censored survival outcome, which commonly arise from a paired design and thus resulting two correlated C indices. / GPL (>= 2.0)   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-compareodm</a>   | 1.2     | Input: 2 ODM files (ODM version 1.3) Output: list of identical, matching, similar and differing data items / GPL-3  | noarch                         |
| <a href="#">r-comparer</a>     | 0.2.0   | Quickly run experiments to compare the run time and output of code blocks. The function mbc() can make fast comparisons of code, and will calculate statistics comparing the resulting outputs. It can be used to compare model fits to the same data or see which function runs faster. The function ffexp() runs a function using all possible combinations of selected inputs. This is useful for comparing the effect of different parameter values. It can also run in parallel and automatically save intermediate results, which is very useful for long computations. / GPL-3   | noarch                         |
| <a href="#">r-comparetests</a> | 1.2     | A standard test is observed on all specimens. We treat the second test (or sampled test) as being conducted on only a stratified sample of specimens. Verification Bias is this situation when the specimens for doing the second (sampled) test is not under investigator control. We treat the total sample as stratified two-phase sampling and use inverse probability weighting. We estimate diagnostic accuracy (category-specific classification probabilities; for binary tests reduces to specificity and sensitivity, and also predictive values) and agreement statistics (percent agreement, percent agreement by category, Kappa (unweighted), Kappa (quadratic weighted) and symmetry tests (reduces to McNemar's test for binary tests)). See: Katki HA, Li Y, Edelstein DW, Castle PE. Estimating the agreement and diagnostic accuracy of two diagnostic tests when one test is conducted on only a subsample of specimens. Stat Med. 2012 Feb 28; 31(5) <doi:10.1002/sim.4422>. / GPL-3 | noarch                         |
| <a href="#">r-compas</a>       | 0.1     | Manipulate and analyze 3-D structural geometry of Protein Data Bank (PDB) files. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-compboost</a>    | 0.1.0   | C implementation of component-wise boosting implementation of component-wise boosting written in C to obtain high runtime performance and full memory control. The main idea is to provide a modular class system which can be extended without editing the source code. Therefore, it is possible to use R functions as well as C functions for custom base-learners, losses, logging mechanisms or stopping criteria. / MIT   | linux-64,<br>osx-64,<br>win-64 |

| Name            | Version | Summary/License  | Platforms                      |
|-----------------|---------|--|--------------------------------|
| r-compglm       | 2.0     | A function (which uses a similar interface to the ‘glm’ function) for the fitting of a Conway-Maxwell-Poisson GLM. There are also various methods for analysis of the model fit. The package also contains functions for the Conway-Maxwell-Poisson distribution in a similar interface to functions ‘dpois’, ‘ppois’ and ‘rpois’. The functions are generally quick, since the workhorse functions are written in C (thanks to the Rcpp package). / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-comphclust    | 1.0.3   | Performs the complementary hierarchical clustering procedure and returns X’ (the expected residual matrix) and a vector of the relative gene importances. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-complexity    | 1.1.1   | Allows for the easy computation of complexity: the proportion of the parameter space in line with the hypothesis by chance. The package comes with a Shiny application in which the calculations can be conducted as well. / GPL-2   | noarch                         |
| r-complognormal | 3.0     | Computes the probability density function, cumulative distribution function, quantile function, random numbers of any composite model based on the log-normal distribution. / GPL-2  | noarch                         |
| r-compoisson    | 0.3     | Provides routines for density and moments of the Conway-Maxwell-Poisson distribution as well as functions for fitting the COM-Poisson model for over/under-dispersed count data. / BSD   | noarch                         |
| r-compoissonreg | 0.6.1   | Fit Conway-Maxwell Poisson (COM-Poisson or CMP) regression models to count data (Sellers & Shmueli, 2010) <doi:10.1214/09-AOAS306>. The package provides functions for model estimation, dispersion testing, and diagnostics. Zero-inflated CMP regression (Sellers & Raim, 2016) <doi:10.1016/j.csda.2016.01.007> is also supported. / GPL-2   GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-compound.cox  | 3.18    | Univariate feature selection and compound covariate methods under the Cox model with high-dimensional features (e.g., gene expressions). Available are survival data for non-small-cell lung cancer patients with gene expressions (Chen et al 2007 New Engl J Med) <DOI:10.1056/NEJMoa060096>, statistical methods in Emura et al (2012 PLoS ONE) <DOI:10.1371/journal.pone.0047627>, Emura & Chen (2016 Stat Methods Med Res) <DOI:10.1177/0962280214533378>, and Emura et al. (2019)<DOI:10.1016/j.cmpb.2018.10.020>. Algorithms for generating correlated gene expressions are also available. / GPL-2 | noarch                         |
| r-compquadform  | 1.4.3   | Computes the distribution function of quadratic forms in normal variables using Imhof’s method, Davies’s algorithm, Farebrother’s algorithm or Liu et al.’s algorithm. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-compr         | 1.0     | Different tools for describing and analysing paired comparison data are presented. Main methods are estimation of products scores according Bradley Terry Luce model. A segmentation of the individual could be conducted on the basis of a mixture distribution approach. The number of classes can be tested by the use of Monte Carlo simulations. This package deals also with multi-criteria paired comparison data. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name            | Version | Summary/License   | Platforms                      |
|-----------------|---------|---|--------------------------------|
| r-comprehenr    | 0.6.7   | Provides ‘Python’-style list comprehensions. List comprehension expressions use usual loops (for(), while() and repeat()) and usual if() as list producers. In many cases it gives more concise notation than standard *apply filter strategy. / GPL-2  | noarch                         |
| r-compute.es    | 0.2.4   | This package contains several functions for calculating the most widely used effect sizes (ES), along with their variances, confidence intervals and p-values. The output includes ES’s of d (mean difference), g (unbiased estimate of d), r (correlation coefficient), z’ (Fisher’s z), and OR (odds ratio and log odds ratio). In addition, NNT (number needed to treat), U3, CLES (Common Language Effect Size) and Cliff’s Delta are computed. This package uses recommended formulas as described in The Handbook of Research Synthesis and Meta-Analysis (Cooper, Hedges, & Valentine, 2009). / GPL-2                        | noarch                         |
| r-comtradr      | 0.2.2   | Interface with and extract data from the United Nations Comtrade API < <a href="https://comtrade.un.org/data/">https://comtrade.un.org/data/</a> >. Comtrade provides country level shipping data for a variety of commodities, these functions allow for easy API query and data returned as a tidy data frame. / GPL-3  | noarch                         |
| r-con2aqi       | 0.1.0   | To calculate the AQI (Air Quality Index) from pollutant concentration data. O3, PM2.5, PM10, CO, SO2, and NO2 are available currently. The method can be referenced at Environmental Protection Agency, United States as follows: EPA (2016) < <a href="https://www3.epa.gov/airnow/aqi-technical-assistance-document-may2016.pdf">https://www3.epa.gov/airnow/aqi-technical-assistance-document-may2016.pdf</a> >. / GPL-3   | noarch                         |
| r-conake        | 1.0     | Continuous smoothing of probability density function on a compact or semi-infinite support is performed using four continuous associated kernels: extended beta, gamma, lognormal and reciprocal inverse Gaussian. The cross-validation technique is also implemented for bandwidth selection. / GPL-2  | noarch                         |
| r-concatenate   | 1.0.0   | Simple functions for joining strings. Construct human-friendly messages whose elements aren’t known in advance, like in stop, warning, or message, from clean code. / GPL (>= 3.2)  | noarch                         |
| r-conclust      | 1.1     | There are 4 main functions in this package: ckmeans(), lcvqe(), mpckm() and ccls(). They take an unlabeled dataset and two lists of must-link and cannot-link constraints as input and produce a clustering as output. / GPL-3  | noarch                         |
| r-conconpiwifun | 0.4.6   | Continuous convex piecewise linear (ccpl) resp. quadratic (ccpq) functions can be implemented with sorted breakpoints and slopes. This includes functions that are ccpl (resp. ccpq) on a convex set (i.e. an interval or a point) and infinite out of the domain. These functions can be very useful for a large class of optimisation problems. Efficient manipulation (such as log(N) insertion) of such data structure is obtained with map standard template library of C (that hides balanced trees). This package is a wrapper on such a class based on Rcpp modules. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-concor        | 1.0_0   | The four functions svdcp (cp for column partitioned), svdbip or svdbip2 (bip for bi-partitioned), and svdbips (s for a simultaneous optimization of one set of r solutions), correspond to a SVD by blocks notion, by supposing each block depending on relative subspaces, rather than on two whole spaces as usual SVD does. The other functions, based on this notion, are relative to two column partitioned data matrices x and y defining two sets of subsets xi and yj of variables and amount to estimate a link between xi and yj for the pair (xi, yj) relatively to the links associated to all the other pairs. / GPL-3 | noarch                         |

| Name                            | Version | Summary/License  | Platforms   |
|---------------------------------|---------|--|---|
| <a href="#">r-concordance</a>   | 1.6     | A set of utilities for matching products in different classification codes used in international trade research. It supports concordance between HS (Combined), ISIC Rev. 2,3, and SITC1,2,3,4 product classification codes, as well as BEC, NAICS, and SIC classifications. It also provides code nomenclature / descriptions look-up, Rauch classification look-up (via concordance to SITC2) and trade elasticity look-up (via concordance to SITC2/3 or HS3.ss). / GPL-2 | noarch  |
| <a href="#">r-concreg</a>       | 0.6     | Implements concordance regression which can be used to estimate generalized odds of concordance. Can be used for non- and semi-parametric survival analysis with non-proportional hazards, for binary and for continuous outcome data. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-conditionz</a>    | 0.1.0   | Provides ability to control how many times in function calls conditions are thrown (shown to the user). Includes control of warnings and messages. / MIT   | noarch  |
| <a href="#">r-condmvnorm</a>    | 2015.1  | Computes conditional multivariate normal probabilities, random deviates and densities. / GPL-2   | noarch  |
| <a href="#">r-condreg</a>       | 0.20    | Based on url{ <a href="http://statistics.stanford.edu/~ckirby/techreports/GEN/2012/2012-10.pdf">http://statistics.stanford.edu/~ckirby/techreports/GEN/2012/2012-10.pdf</a> } / GPL-3  | noarch  |
| <a href="#">r-condvis</a>       | 0.5_1   | Exploring fitted models by interactively taking 2-D and 3-D sections in data space. / GPL-2  | noarch  |
| <a href="#">r-coneproj</a>      | 1.14    | Routines doing cone projection and quadratic programming, as well as doing estimation and inference for constrained parametric regression and shape-restricted regression problems. See Mary C. Meyer (2013)<doi:10.1080/03610918.2012.659820> for more details. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-conf.design</a>   | 2.0.0   | This small library contains a series of simple tools for constructing and manipulating confounded and fractional factorial designs. / GPL-2  | noarch  |
| <a href="#">r-config</a>        | 0.3     | Manage configuration values across multiple environments (e.g. development, test, production). Read values using a function that determines the current environment and returns the appropriate value. / GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-configparser</a>  | 1.0.0   | Enhances the ‘ini’ package by adding the ability to interpolate variables. The INI configuration file is read into an R6 ConfigParser object (loosely inspired by Python's ConfigParser module) and the keys can be read, where ‘%(...)s’ instances are interpolated by other included options or outside variables. / GPL-3   | noarch  |
| <a href="#">r-confinterpret</a> | 1.0.0   | Produces descriptive interpretations of confidence intervals. Includes (extensible) support for various test types, specified as sets of interpretations dependent on where the lower and upper confidence limits sit. Provides plotting functions for graphical display of interpretations. / AGPL-3  | noarch  |

Table 51 – continued from previous page

| Name                           | Version | Summary/License  | Platforms |
|--------------------------------|---------|--|-----------|
| <code>r-confintvariance</code> | 1.0.2   | Surrounds the usual sample variance of a univariate numeric sample with a confidence interval for the population variance. This has been done so far only under the assumption that the underlying distribution is normal. Under the hood, this package implements the unique least-variance unbiased estimator of the variance of the sample variance, in a formula that is equivalent to estimating kurtosis and square of the population variance in an unbiased way and combining them according to the classical formula into an estimator of the variance of the sample variance. Both the sample variance and the estimator of its variance are U-statistics. By the theory of U-statistic, the resulting estimator is unique. See Fuchs, Krautenbacher (2016) <doi:10.1080/15598608.2016.1158675> and the references therein for an overview of unbiased estimation of variances of U-statistics. / GPL-3  | noarch    |
| <code>r-conflicted</code>      | 1.0.4   | R's default conflict management system gives the most recently loaded package precedence. This can make it hard to detect conflicts, particularly when they arise because a package update creates ambiguity that did not previously exist. 'conflicted' takes a different approach, making every conflict an error and forcing you to choose which function to use. / GPL-3   | noarch    |
| <code>r-confreq</code>         | 1.5.4   | Offers several functions for Configural Frequencies Analysis (CFA), which is a useful statistical tool for the analysis of multiway contingency tables. CFA was introduced by G. A. Lienert as 'Konfigurations Frequenz Analyse - KFA'. Lienert, G. A. (1971). Die Konfigurationsfrequenzanalyse: I. Ein neuer Weg zu Typen und Syndromen. Zeitschrift für Klinische Psychologie und Psychotherapie, 19(2), 99–115. / GPL-3  | noarch    |
| <code>r-confsam</code>         | 0.2     | For multiple testing. Computes estimates and confidence bounds for the False Discovery Proportion (FDP), the fraction of false positives among all rejected hypotheses. The methods in the package use permutations of the data. Doing so, they take into account the dependence structure in the data. / GPL-3  | noarch    |
| <code>r-conics</code>          | 0.3     | plot conics (ellipses, hyperbolas, parabolas) / GPL-2  | noarch    |
| <code>r-conjointchecks</code>  | 0.0.9   | Implementation of a procedure (Domingue, 2012; see also Karabatsos, 2001 and Kyngdon, 2011) to test the single and double cancellation axioms of conjoint measure in data that is dichotomously coded and measured with error. / GPL-2   | noarch    |
| <code>r-connmatttools</code>   | 0.3.3   | Collects several different methods for analyzing and working with connectivity data in R. Though primarily oriented towards marine larval dispersal, many of the methods are general and useful for terrestrial systems as well. / GPL-2   | noarch    |
| <code>r-conover.test</code>    | 1.1.5   | Computes the Conover-Iman test (1979) for stochastic dominance and reports the results among multiple pairwise comparisons after a Kruskal-Wallis test for stochastic dominance among k groups (Kruskal and Wallis, 1952). The interpretation of stochastic dominance requires an assumption that the CDF of one group does not cross the CDF of the other. <code>conover.test</code> makes $k(k-1)/2$ multiple pairwise comparisons based on Conover-Iman t-test-statistic of the rank differences. The null hypothesis for each pairwise comparison is that the probability of observing a randomly selected value from the first group that is larger than a randomly selected value from the second group equals one half; this null hypothesis corresponds to that of the Wilcoxon-Mann-Whitney rank-sum test. Like the rank-sum test, if the data can be assumed to be continuous, and the distributions are assumed identical except for a difference in location, Conover-Iman test may be understood as a test for median difference. <code>conover.test</code> accounts for tied ranks. The Conover-Iman test is strictly valid if and only if the corresponding Kruskal-Wallis null hypothesis is rejected. / GPL-2 | noarch    |

Table 51 – continued from previous page

| Name               | Version | Summary/License   | Platforms                      |
|--------------------|---------|---|--------------------------------|
| r-conquestr        | 0.3.7   | Extends ‘ACER ConQuest’ by allowing R users to call ‘ACER ConQuest’ from within R. The user can also access ‘ACER ConQuest’ data objects by reading ‘ACER ConQuest’ System Files (generated by the ‘ACER ConQuest’ command ‘put’). This is of particular use to those who are parsing text file output (e.g., ‘show’ files) as this is not consistent across releases of ‘ACER ConQuest’. Requires ‘ACER ConQuest’ version 4.29.3 or later. A demonstration version can be downloaded from < <a href="https://shop.acer.edu.au/acer-conquest-4">https://shop.acer.edu.au/acer-conquest-4</a> >. / GPL-3   | noarch                         |
| r-conspline        | 1.2     | Given response y, continuous predictor x, and covariate matrix, the relationship between E(y) and x is estimated with a shape constrained regression spline. Function outputs fits and various types of inference. / GPL-2   GPL-3  | noarch                         |
| r-constants        | 0.0.2   | CODATA internationally recommended values of the fundamental physical constants, provided as symbols for direct use within the R language. Optionally, the values with errors and/or the values with units are also provided if the ‘errors’ and/or the ‘units’ packages are installed. The Committee on Data for Science and Technology (CODATA) is an interdisciplinary committee of the International Council for Science which periodically provides the internationally accepted set of values of the fundamental physical constants. This package contains the 2014 CODATA version, published on 25 June 2015: Mohr, P. J., Newell, D. B. and Taylor, B. N. (2016) <DOI:10.1103/RevModPhys.88.035009>, <DOI:10.1063/1.4954402>. / MIT | noarch                         |
| r-constellation    | 0.2.0   | Examine any number of time series data frames to identify instances in which various criteria are met within specified time frames. In clinical medicine, these types of events are often called constellations of signs and symptoms, because a single condition depends on a series of events occurring within a certain amount of time of each other. This package was written to work with any number of time series data frames and is optimized for speed to work well with data frames with millions of rows. / GPL-2  | noarch                         |
| r-container        | 0.3.0   | Common container data structures deque, set and dict (resembling ‘Python’s dict type) with typical member functions to insert, delete and access container elements. Provides iterators and reference semantics. / GPL-3  | noarch                         |
| r-contfrac         | 1.1_12  | Various utilities for evaluating continued fractions. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-conting          | 1.7     | Bayesian analysis of complete and incomplete contingency tables. / GPL-2  | noarch                         |
| r-contourfunctions | 0.1.1   | Provides functions for making contour plots. The contour plot can be created from grid data, a function, or a data set. If non-grid data is given, then a Gaussian process is fit to the data and used to create the contour plot. / GPL-3  | noarch                         |
| r-controltest      | 1.1.0   | Nonparametric two-sample procedure for comparing survival quantiles. / GPL-3  | noarch                         |
| r-convergenceclubs | 1.4.3   | Functions for clustering regions that form convergence clubs, according to the definition of Phillips and Sul (2009) <doi:10.1002/jae.1080>. / GPL-3  | noarch                         |

Table 51 – continued from previous page

| Name                                  | Version | Summary/License   | Platforms  |
|---------------------------------------|---------|---|--|
| <a href="#">r-convergenceconcepts</a> | 1.2.1   | This is a pedagogical package, designed to help students understanding convergence of random variables. It provides a way to investigate interactively various modes of convergence (in probability, almost surely, in law and in mean) of a sequence of i.i.d. random variables. Visualisation of simulated sample paths is possible through interactive plots. The approach is illustrated by examples and exercises through the function ‘investigate’, as described in Lafaye de Micheaux and Lique (2009) < <a href="http://dx.doi.org/10.1198/tas.2009.0032">http://dx.doi.org/10.1198/tas.2009.0032</a> >. The user can study his/her own sequences of random variables. / GPL-2   | noarch   |
| <a href="#">r-convertgraph</a>        | 0.1     | Converts graphical file formats (SVG, PNG, JPEG, BMP, GIF, PDF, etc) to one another. The exceptions are the SVG file format that can only be converted to other formats and in contrast, PDF format, which can only be created from others graphical formats. The main purpose of the package was to provide a solution for converting SVG file format to PNG which is often needed for exporting graphical files produced by R widgets. / MIT  | noarch   |
| <a href="#">r-coop</a>                | 0.6_2   | Fast implementations of the co-operations: covariance, correlation, and cosine similarity. The implementations are fast and memory-efficient and their use is resolved automatically based on the input data, handled by R’s S3 methods. Full descriptions of the algorithms and benchmarks are available in the package vignettes. / BSD_2_clause  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-coppecosenzar</a>       | 0.1.3   | The program implements the COPPE-Cosenza Fuzzy Hierarchy Model. The model was based on the evaluation of local alternatives, representing regional potentialities, so as to fulfill demands of economic projects. After defining demand profiles in terms of their technological coefficients, the degree of importance of factors is defined so as to represent the productive activity. The method can detect a surplus of supply without the restriction of the distance of classical algebra, defining a hierarchy of location alternatives. In COPPE-Cosenza Model, the distance between factors is measured in terms of the difference between grades of memberships of the same factors belonging to two or more sets under comparison. The required factors are classified under the following linguistic variables: Critical (CR); Conditioning (C); Little Conditioning (LC); and Irrelevant (I). And the alternatives can assume the following linguistic variables: Excellent (Ex), Good (G), Regular (R), Weak (W), Empty (Em), Zero (Z) and Inexistent (In). The model also provides flexibility, allowing different aggregation rules to be performed and defined by the Decision Maker. Such feature is considered in this package, allowing the user to define other aggregation matrices, since it considers the same linguistic variables mentioned. / GPL-2 | noarch   |
| <a href="#">r-copula</a>              | 0.999_1 | Copulas (S4) of commonly used elliptical, Archimedean, extreme-value and other copula families, as well as their rotations, mixtures and asymmetrizations. Nested Archimedean copulas, related tools and special functions. Methods for density, distribution, random number generation, bivariate dependence measures, Rosenblatt transform, Kendall distribution function, perspective and contour plots. Fitting of copula models with potentially partly fixed parameters, including standard errors. Serial independence tests, copula specification tests (independence, exchangeability, radial symmetry, extreme-value dependence, goodness-of-fit) and model selection based on cross-validation. Empirical copula, smoothed versions, and non-parametric estimators of the Pickands dependence function. / GPL (>= 3)   file LICENCE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                            | Version | Summary/License  | Platforms                      |
|---------------------------------|---------|--|--------------------------------|
| <a href="#">r-copula.markov</a> | 2.4     | Estimation and statistical process control are performed under copula-based time-series models. Available are statistical methods in Long and Emura (2014 JCSA), Emura et al. (2017 Commun Stat-Simul) <DOI:10.1080/03610918.2015.1073303>, Huang and Emura(2019, in revision) and Huang, Chen and Emura (2019-, in revision). / GPL-2   | noarch                         |
| <a href="#">r-copula.surv</a>   | 1.0     | Perform association analysis of bivariate survival data based on copula models. Two different ways to estimate the association parameter in copula models are implemented. A goodness-of-fit test for a given copula model is implemented. See Emura, Lin and Wang (2010) <doi.org/10.1016/j.csda.2010.03.013> for details. / GPL-2  | noarch                         |
| <a href="#">r-copuladata</a>    | 0.0.1   | Data sets used for copula modeling in addition to those in the package ‘copula’. These include a random subsample from the US National Education Longitudinal Study (NELS) of 1988 and nursing home data from Wisconsin. / GPL-3   | noarch                         |
| <a href="#">r-coranking</a>     | 0.1.4   | Calculates the co-ranking matrix to assess the quality of a dimensionality reduction. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-corbin</a>        | 0.3.1   | We design algorithms with linear time complexity with respect to the dimension for three commonly studied correlation structures, including exchangeable, decaying-product and K-dependent correlation structures, and extend the algorithms to generate binary data of general non-negative correlation matrices with quadratic time complexity. Jiang, W., Song, S., Hou, L. and Zhao, H. CorBin: An efficient R package to generate high-dimensional binary data with correlation structures. Submitted to Journal of Statistical Software. / GPL-3 | noarch                         |
| <a href="#">r-corclass</a>      | 0.1.1   | Perform a correlational class analysis of the data, resulting in a partition of the data into separate modules. / GPL-2  | noarch                         |
| <a href="#">r-cord</a>          | 0.1.1   | Partition data points (variables) into communities/clusters, similar to clustering algorithms, such as k-means and hierarchical clustering. This package implements a clustering algorithm based on a new metric CORD, defined for high dimensional parametric or semi-parametric distributions. Read <a href="http://arxiv.org/abs/1508.01939">http://arxiv.org/abs/1508.01939</a> for more details. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-core</a>          | 3.0     | given a collection of intervals with integer start and end positions, find recurrently targeted regions and estimate the significance of finding. Randomization is implemented by parallel methods, either using local host machines, or submitting grid engine jobs. / GPL-2  | noarch                         |

| Name          | Version | Summary/License   | Platforms                      |
|---------------|---------|---|--------------------------------|
| r-corelearn   | 1.53.1  | A suite of machine learning algorithms written in C with the R interface contains several learning techniques for classification and regression. Predictive models include e.g., classification and regression trees with optional constructive induction and models in the leaves, random forests, kNN, naive Bayes, and locally weighted regression. All predictions obtained with these models can be explained and visualized with the ‘ExplainPrediction’ package. This package is especially strong in feature evaluation where it contains several variants of Relief algorithm and many impurity based attribute evaluation functions, e.g., Gini, information gain, MDL, and DKM. These methods can be used for feature selection or discretization of numeric attributes. The OrdEval algorithm and its visualization is used for evaluation of data sets with ordinal features and class, enabling analysis according to the Kano model of customer satisfaction. Several algorithms support parallel multithreaded execution via OpenMP. The top-level documentation is reachable through ?CORElearn. / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| r-corenlp     | 0.4.2   | Provides a minimal interface for applying annotators from the ‘Stanford CoreNLP’ java library. Methods are provided for tasks such as tokenisation, part of speech tagging, lemmatisation, named entity recognition, coreference detection and sentiment analysis. / GPL-2  | noarch                         |
| r-coretdt     | 1.0     | Use to analysis case-parent trio sequencing studies. Test the compound heterozygous and recessive disease models / GPL-3  | noarch                         |
| r-corlink     | 1.0.0   | A matrix of agreement patterns and counts for record pairs is the input for the procedure. An EM algorithm is used to impute plausible values for missing record pairs. A second EM algorithm, incorporating possible correlations between per-field agreement, is used to estimate posterior probabilities that each pair is a true match - i.e. constitutes the same individual. / CC0  | noarch                         |
| r-coroica     | 1.0.1   | Contains an implementation of a confounding robust independent component analysis (ICA) for noisy and grouped data. The main function corolICA() performs a blind source separation, by maximizing an independence across sources and allows to adjust for varying confounding based on user-specified groups. Additionally, the package contains the function uwedge() which can be used to approximately jointly diagonalize a list of matrices. For more details see the project website < <a href="https://sweichwald.de/corolICA/">https://sweichwald.de/corolICA/</a> >. / AGPL-3   | noarch                         |
| r-corpcor     | 1.6.9   | Implements a James-Stein-type shrinkage estimator for the covariance matrix, with separate shrinkage for variances and correlations. The details of the method are explained in Schafer and Strimmer (2005) <DOI:10.2202/1544-6115.1175> and Opgen-Rhein and Strimmer (2007) <DOI:10.2202/1544-6115.1252>. The approach is both computationally as well as statistically very efficient, it is applicable to small n, large p data, and always returns a positive definite and well-conditioned covariance matrix. In addition to inferring the covariance matrix the package also provides shrinkage estimators for partial correlations and partial variances. The inverse of the covariance and correlation matrix can be efficiently computed, as well as any arbitrary power of the shrinkage correlation matrix. Furthermore, functions are available for fast singular value decomposition, for computing the pseudoinverse, and for checking the rank and positive definiteness of a matrix. / GPL-3  | noarch                         |
| r-corpora     | 0.5     | Utility functions for the statistical analysis of corpus frequency data. This package is a companion to the open-source course Statistical Inference: A Gentle Introduction for Computational Linguists and Similar Creatures (‘SIGIL’). / GPL-3  | noarch                         |
| r-corporacoco | 1.1_0   | A set of functions used to compare co-occurrence between two corpora. / GPL-3   | noarch                         |

| Name                     | Version | Summary/License  | Platforms                      |
|--------------------------|---------|--|--------------------------------|
| r-corpus                 | 0.10.0  | Text corpus data analysis, with full support for international text (Unicode). Functions for reading data from newline-delimited ‘JSON’ files, for normalizing and tokenizing text, for searching for term occurrences, and for computing term occurrence frequencies, including n-grams. / Apache License (== 2.0)   file LICENSE   | linux-64,<br>osx-64,<br>win-64 |
| r-corrcoverage           | 1.0.0   | Using a computationally efficient method, the package can be used to find the corrected coverage estimate of a credible set of putative causal variants from Bayesian genetic fine-mapping. The package can also be used to obtain a corrected credible set if required; that is, the smallest set of variants required such that the corrected coverage estimate of the resultant credible set is within some user defined accuracy of the desired coverage. Maller et al. (2012) <doi:10.1038/ng.2435>, Wakefield (2009) <doi:10.1002/gepi.20359>, Fortune and Wallace (2018) <doi:10.1093/bioinformatics/bty898>. / MIT | linux-64,<br>osx-64            |
| r-corr dna               | 1.0.1   | Can be useful for finding associations among different positions in a position-wise aligned sequence dataset. The approach adopted for finding associations among positions is based on the latent multivariate normal distribution. / GPL-2   | noarch                         |
| r-correctedfdr           | 1.0     | There are many estimators of false discovery rate. In this package we compute the Nonlocal False Discovery Rate (NFDR) and the estimators of local false discovery rate: Corrected False discovery Rate (CFDR), Re-ranked False Discovery rate (RFDR) and the blended estimator. Bickel, D. R. (2016) < <a href="http://hdl.handle.net/10393/34277">http://hdl.handle.net/10393/34277</a> >. / LGPL-3  | noarch                         |
| r-correctoverloadedpeaks | 1.2.17  | Analyzes and modifies metabolomics raw data (generated using GC-APCI-MS, Gas Chromatography-Atmospheric Pressure Chemical Ionization-Mass Spectrometry) to correct overloaded signals, i.e. ion intensities exceeding detector saturation leading to a cut-off peak. Data in xcmsRaw format are accepted as input and mzXML files can be processed alternatively. Overloaded signals are detected automatically and modified using an Gaussian or Isotopic-Ratio approach, QC plots are generated and corrected data are stored within the original xcmsRaw or mzXML respectively to allow further processing. / GPL-3     | noarch                         |
| r-correlplot             | 1.0_2   | Correlplot contains diverse routines for the construction of different plots for representing correlation matrices. / GPL-2  | noarch                         |
| r-corrmixed              | 0.1_13  | In clinical practice and research settings in medicine and the behavioral sciences, it is often of interest to quantify the correlation of a continuous endpoint that was repeatedly measured (e.g., test-retest correlations, ICC, etc.). This package allows for estimating these correlations based on mixed-effects models. Part of this software has been developed using funding provided from the European Union’s 7th Framework Programme for research, technological development and demonstration under Grant Agreement no 602552. / GPL-2   | noarch                         |
| r-corrplot               | 0.84    | A graphical display of a correlation matrix or general matrix. It also contains some algorithms to do matrix reordering. In addition, corrplot is good at details, including choosing color, text labels, color labels, layout, etc. / GPL-3   | noarch                         |
| r-corrsieve              | 1.6_8   | Statistical summary of Structure output. / GPL-3   | noarch                         |
| r-corset                 | 0.1_4   | Set of methods to constrain numerical series and time series within arbitrary boundaries. / GPL-3  | noarch                         |

Table 51 – continued from previous page

| Name                            | Version | Summary/License   | Platforms                      |
|---------------------------------|---------|---|--------------------------------|
| <a href="#">r-cortest</a>       | 0.9.8   | There are 6 novel robust tests for equal correlation. They are all based on logistic regressions. U are proportion to different types of correlation in 6 methods. The ST1() is based on Pearson correlation. ST2() improved ST1() by using median absolute deviation. ST3() utilized type M correlation and ST4() used Spearman correlation. ST5() and ST6() used two different ways to combine ST3() and ST4(). We highly recommend ST5() according to the passage New Statistical Methods for Constructing Robust Differential Correlation Networks to characterize the interactions among microRNAs published in Scientific Reports. / GPL-2  | noarch                         |
| <a href="#">r-cortools</a>      | 1.0     | Designed for analysis of the results of a Genome Wide Association Study. Includes tools to pull lists of Chromosome number and SNP position below a certain significance threshold, refine gene networks (including data I/O for Cytoscape), and check SNP base pair changes. / Artistic-2.0  | noarch                         |
| <a href="#">r-cosmofns</a>      | 1.0.1   | Package encapsulates standard expressions for distances, times, luminosities, and other quantities useful in observational cosmology, including molecular line observations. Currently coded for a flat universe only. / GPL-2  | noarch                         |
| <a href="#">r-cost</a>          | 0.1.0   | Parameter estimation, one-step ahead forecast and new location prediction methods for spatio-temporal data. / GPL-3   | noarch                         |
| <a href="#">r-costsensitive</a> | 0.1.2   | Reduction-based techniques for cost-sensitive multi-class classification, in which each observation has a different cost for classifying it into one class, and the goal is to predict the class with the minimum expected cost for each new observation. Implements Weighted All-Pairs (Beygelzimer, A., Langford, J., & Zadrozny, B., 2008, <doi:10.1007/978-0-387-79361-0_1>), Weighted One-Vs-Rest (Beygelzimer, A., Dani, V., Hayes, T., Langford, J., & Zadrozny, B., 2005, <https://dl.acm.org/citation.cfm?id=1102358>) and Regression One-Vs-Rest. Works with arbitrary classifiers taking observation weights, or with regressors. Also implements cost-proportionate rejection sampling for working with classifiers that don't accept observation weights. / BSD_2_clause | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-cotrend</a>       | 1.0.1   | Implements cointegration/cotrending rank selection algorithm in Guo and Shintani (2013) Consistant cotrending rank selection when both stochastic and nonlinear deterministic trends are present. The Econometrics Journal 16: 473-483 <doi:10.1111/j.1368-423X.2012.00392.x>. Numbered examples correspond to Feb 2011 preprint <http://www.fas.nus.edu.sg/ecs/events/seminar/seminar-papers/05Apr11.pdf>. / GPL-3   | noarch                         |
| <a href="#">r-couchdb</a>       | 1.4.1   | Interface to the couchDB document database < <a href="http://couchdb.apache.org">http://couchdb.apache.org</a> >. / AGPL-3  | noarch                         |
| <a href="#">r-countgmifs</a>    | 0.0.1   | Provides a function for fitting Poisson and negative binomial regression models when the number of parameters exceeds the sample size, using the the generalized monotone incremental forward stagewise method. / GPL-2   | noarch                         |
| <a href="#">r-counthmm</a>      | 0.1.0   | Provides tools for penalized estimation of flexible hidden Markov models for time series of counts w/o the need to specify a (parametric) family of distributions. These include functions for model fitting, model checking, and state decoding. For details, see Adam, T., Langrock, R., and WeiÃY, C.H. (2019): Penalized Estimation of Flexible Hidden Markov Models for Time Series of Counts. <arXiv:1901.03275>. / GPL-3   | noarch                         |
| <a href="#">r-countrycode</a>   | 1.1.0   | Standardize country names, convert them into one of eleven coding schemes, convert between coding schemes, and assign region descriptors. / GPL-3   | noarch                         |

| Name                        | Version | Summary/License   | Platforms                      |
|-----------------------------|---------|---|--------------------------------|
| <a href="#">r-covfillr</a>  | 0.4.3   | Facilitates local polynomial regression for state dependent covariates in state-space models. The functionality can also be used from ‘C’ based model builder tools such as ‘Rcpp’/‘inline’, ‘TMB’, or ‘JAGS’. / BSD_2_clause   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-covbm</a>     | 0.1.0   | Allows Brownian motion, fractional Brownian motion, and integrated Ornstein-Uhlenbeck process components to be added to linear and non-linear mixed effects models using the structures and methods of the ‘nlme’ package. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-covfefe</a>   | 0.1.0   | Converts any word, sentence or speech into Trump’s infamous covfefe format. Reference: < <a href="https://www.nytimes.com/2017/05/31/us/politics/covfefe-trump-twitter.html">https://www.nytimes.com/2017/05/31/us/politics/covfefe-trump-twitter.html</a> >. Inspiration thanks to: < <a href="https://codegolf.stackexchange.com/questions/123685/covfefify-a-string">https://codegolf.stackexchange.com/questions/123685/covfefify-a-string</a> >. / GPL-3   | noarch                         |
| <a href="#">r-covr</a>      | 3.3.1   | Track and report code coverage for your package and (optionally) upload the results to a coverage service like ‘Codecov’ < <a href="http://codecov.io">http://codecov.io</a> > or ‘Coveralls’ < <a href="http://coveralls.io">http://coveralls.io</a> >. Code coverage is a measure of the amount of code being exercised by a set of tests. It is an indirect measure of test quality and completeness. This package is compatible with any testing methodology or framework and tracks coverage of both R code and compiled C/C/FORTRAN code. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-covreg</a>    | 1.0     | This package fits a simultaneous regression model for the mean vectors and covariance matrices of multivariate response variables, as described in Hoff and Niu (2012). The explanatory variables can be continuous or discrete. The current version of the package provides the Bayesian estimates. / GPL-2  | noarch                         |
| <a href="#">r-covrobust</a> | 1.1_3   | The cov.nnve() function implements robust covariance estimation by the nearest neighbor variance estimation (NNVE) method of Wang and Raftery (2002) <DOI:10.1198/016214502388618780>. / GPL-2  | noarch                         |
| <a href="#">r-covsep</a>    | 1.1.0   | Functions for testing if the covariance structure of 2-dimensional data (e.g. samples of surfaces $X_i = X_i(s,t)$ ) is separable, i.e. if $\text{covariance}(X) = C_1 \times C_2$ . A complete descriptions of the implemented tests can be found in the paper Aston, John A. D.; Pigoli, Davide; Tavakoli, Shahin. Tests for separability in nonparametric covariance operators of random surfaces. Ann. Statist. 45 (2017), no. 4, 1431–1461. <doi:10.1214/16-AOS1495> < <a href="https://projecteuclid.org/euclid.aos/1498636862">https://projecteuclid.org/euclid.aos/1498636862</a> > <arXiv:1505.02023>. / GPL-2 | noarch                         |
| <a href="#">r-covtestr</a>  | 0.1.4   | Testing functions for Covariance Matrices. These tests include high-dimension homogeneity of covariance matrix testing described by Schott (2007) <doi:10.1016/j.csda.2007.03.004> and high-dimensional one-sample tests of covariance matrix structure described by Fisher, et al. (2010) <doi:10.1016/j.jmva.2010.07.004>. Covariance matrix tests use C to speed performance and allow larger data sets. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-coxboost</a>  | 1.4     | This package provides routines for fitting Cox models by likelihood based boosting for a single endpoint or in presence of competing risks / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                       | Version | Summary/License  | Platforms                      |
|----------------------------|---------|--|--------------------------------|
| <a href="#">r-coxme</a>    | 2.2.14  | This package fits Cox proportional hazards models containing both fixed and random effects. The random effects can have a general form, of which familial interactions (a kinship matrix) is a particular special case. Note that the simplest case of a mixed effects Cox model, i.e. a single random per-group intercept, is also called a frailty model. The approach is based on Rippatti and Palgren, Biometrics 2002. / LGPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-coxphf</a>   | 1.13    | Implements Firth's penalized maximum likelihood bias reduction method for Cox regression which has been shown to provide a solution in case of monotone likelihood (nonconvergence of likelihood function). The program fits profile penalized likelihood confidence intervals which were proved to outperform Wald confidence intervals. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-coxphlb</a>  | 1.2.0   | Performs analysis of right-censored length-biased data using Cox model. It contains model fitting and checking, and the stationarity assumption test. The model fitting and checking methods are described in Qin and Shen (2010) <doi:10.1111/j.1541-0420.2009.01287.x> and Lee, Ning, and Shen (2018) <doi:10.1007/s10985-018-9422-y>. / GPL-2   | noarch                         |
| <a href="#">r-coxphmic</a> | 0.1.0   | Sparse estimation for Cox PH models is done via Minimum approximated Information Criterion (MIC) by Su, Wijayasinghe, Fan, and Zhang (2016) <DOI:10.1111/biom.12484>. MIC mimics the best subset selection using a penalized likelihood approach yet with no need of a tuning parameter. The problem is further reformulated with a re-parameterization step so that it reduces to one unconstrained non-convex yet smooth programming problem, which can be solved efficiently. Furthermore, the re-parameterization tactic yields an additional advantage in terms of circumventing post-selection inference. / GPL-2  | noarch                         |
| <a href="#">r-coxphsgd</a> | 0.2.1   | Estimate coefficients of Cox proportional hazards model using stochastic gradient descent algorithm for batch data. / GPL-2  | noarch                         |
| <a href="#">r-coxphw</a>   | 4.0.1   | Implements weighted estimation in Cox regression as proposed by Schemper, Wakounig and Heinze (Statistics in Medicine, 2009, <doi:10.1002/sim.3623>) and as described in Dunkler, Ploner, Schemper and Heinze (Journal of Statistical Software, 2018, <doi:10.18637/jss.v084.i02>). Weighted Cox regression provides unbiased average hazard ratio estimates also in case of non-proportional hazards. Approximated generalized concordance probability an effect size measure for clear-cut decisions can be obtained. The package provides options to estimate time-dependent effects conveniently by including interactions of covariates with arbitrary functions of time, with or without making use of the weighting option. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-coxplus</a>  | 1.1.1   | A high performance package estimating Cox Model when an even has more than one causes. It also supports random and fixed effects, tied events, and time-varying variables. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |

|--------------------------|---------|--|--------------------------------|
| <code>r-coxridge</code>  | 0.9.2   | A package for fitting Cox models with penalized ridge-type partial likelihood. The package includes functions for fitting simple Cox models with all covariates controlled by a ridge penalty. The weight of the penalty is optimised by using a REML type-algorithm. Models with time varying effects of the covariates can also be fitted. Some of the covariates may be allowed to be fixed and thus not controlled by the penalty. There are three different penalty functions, ridge, dynamic and weighted dynamic. Time varying effects can be fitted without the need of an expanded dataset. / GPL-2 | noarch                         |
| <code>r-coxrobust</code> | 1.0     | Fit robustly proportional hazards regression model / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-coxsei</code>    | 0.1     | It fits a CoxSEI (Cox type Self-Exciting Intensity) model to right-censored counting process data. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-cp</code>        | 1.6     | Functions for calculating the conditional power for different models in survival time analysis within randomized clinical trials with two different treatments to be compared and survival as an endpoint. / GPL-3   | noarch                         |
| <code>r-cpa</code>       | 1.0     | The package includes functions to test and compare causal models. / GPL-2  | noarch                         |
| <code>r-cpca</code>      | 0.1.2   | This package contains methods to perform Common Principal Component Analysis (CPCA). The stepwise method by Trendafilov is published in the current version. Please see Trendafilov (2010). Stepwise estimation of common principal components. Computational Statistics & Data Analysis, 54(12), 3446-3457. doi:10.1016/j.csda.2010.03.010 / GPL-3  | noarch                         |
| <code>r-cpcg</code>      | 1.0     | Solves system of linear equations using (preconditioned) conjugate gradient algorithm, with improved efficiency using Armadillo templated 'C' linear algebra library, and flexibility for user-specified preconditioning method. Please check < <a href="https://github.com/styvonn/cPCG">https://github.com/styvonn/cPCG</a> > for latest updates. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-cpgassoc</code>  | 2.60    | Is designed to test for association between methylation at CpG sites across the genome and a phenotype of interest, adjusting for any relevant covariates. The package can perform standard analyses of large datasets very quickly with no need to impute the data. It can also handle mixed effects models with chip or batch entering the model as a random intercept. Also includes tools to apply quality control filters, perform permutation tests, and create QQ plots, manhattan plots, and scatterplots for individual CpG sites. / GPL-2  | noarch                         |
| <code>r-cpgfilter</code> | 1.1     | Filter CpGs based on Intra-class Correlation Coefficients (ICCs) when replicates are available. ICCs are calculated by fitting linear mixed effects models to all samples including the un-replicated samples. Including the large number of un-replicated samples improves ICC estimates dramatically. The method accommodates any replicate design. / GPL-3  | noarch                         |

| Name         | Version | Summary/License   | Platforms                      |
|--------------|---------|---|--------------------------------|
| r-cpk        | 1.3.1   | The package cpk provides simplified clinical pharmacokinetic functions for dose regimen design and modification at the point-of-care. Currently, the following functions are available: (1) ttc.fn for target therapeutic concentration, (2) dr.fn for dose rate, (3) di.fn for dosing interval, (4) dm.fn for maintenance dose, (5) bc.ttc.fn for back calculation, (6) ar.fn for accumulation ratio, (7) dpo.fn for orally administered dose, (8) cmax.fn for peak concentration, (9) css.fn for steady-state concentration, (10) cmin.fn for trough, (11) ct.fn for concentration-time predictions, (12) dlcmax.fn for calculating loading dose based on drug's maximum concentration, (13) dlar.fn for calculating loading dose based on drug's accumulation ratio, and (14) R0.fn for calculating drug infusion rate. Reference: Linares O, Linares A. Computational opioid prescribing: A novel application of clinical pharmacokinetics. J Pain Palliat Care Pharmacother 2011;25:125-135. / GPL-2 | noarch                         |
| r-cplots     | 0.4.0   | Provides functions to produce some circular plots for circular data, in a height- or area-proportional manner. They include barplots, smooth density plots, stacked dot plots, histograms, multi-class stacked smooth density plots, and multi-class stacked histograms. The new methodology for general area-proportional circular visualization is described in an article submitted (after revision) to Journal of Computational and Graphical Statistics. / GPL-2   | noarch                         |
| r-cpm        | 2.2     | Sequential and batch change detection for univariate data streams, using the change point model framework. Functions are provided to allow nonparametric distribution-free change detection in the mean, variance, or general distribution of a given sequence of observations. Parametric change detection methods are also provided for Gaussian, Bernoulli and Exponential sequences. Both the batch (Phase I) and sequential (Phase II) settings are supported, and the sequences may contain either a single or multiple change points. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-cpmcglm    | 1.2     | We propose to determine the correction of the significance level after multiple coding of an explanatory variable in Generalized Linear Model. The different methods of correction of the p-value are the Single step Bonferroni procedure, and resampling based methods developed by P.H.Westfall in 1993. Resampling methods are based on the permutation and the parametric bootstrap procedure. If some continuous, and dichotomous transformations are performed this package offers an exact correction of the p-value developed by B.Liquet & D.Commenges in 2005. The naive method with no correction is also available. / GPL (> 2)  | noarch                         |
| r-cpprouting | 1.1     | Calculation of distances, shortest paths and isochrones on weighted graphs using several variants of Dijkstra algorithm. Proposed algorithms are unidirectional Dijkstra (Dijkstra, E. W. (1959) <doi:10.1007/BF01386390>), bidirectional Dijkstra (Goldberg, Andrew & Fonseca F. Werneck, Renato (2005) < <a href="https://pdfs.semanticscholar.org/0761/18dfbe1d5a220f6ac59b4de4ad07b50283a1.pdf">https://pdfs.semanticscholar.org/0761/18dfbe1d5a220f6ac59b4de4ad07b50283a1.pdf</a> >), A* search (P. E. Hart, N. J. Nilsson et B. Raphael (1968) <doi:10.1109/TSSC.1968.300136>), new bidirectional A* (Pijls & Post (2009) < <a href="http://repub.eur.nl/pub/16100/ei2009-10.pdf">http://repub.eur.nl/pub/16100/ei2009-10.pdf</a> >). / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-cpr        | 0.2.0   | Calculate date of birth, age, and gender, and generate anonymous sequence numbers from CPR numbers. < <a href="https://en.wikipedia.org/wiki/Personal_identification_number_(Denmark)">https://en.wikipedia.org/wiki/Personal_identification_number_(Denmark)</a> >. / GPL-3  | noarch                         |
| r-cpt        | 1.0.2   | Non-parametric test for equality of multivariate distributions. Trains a classifier to classify (multivariate) observations as coming from one of several distributions. If the classifier is able to classify the observations better than would be expected by chance (using permutation inference), then the null hypothesis that the distributions are equal is rejected. / GPL-3   | noarch                         |

Table 51 – continued from previous page

| Name         | Version | Summary/License  | Platforms   |
|--------------|---------|--|---|
| r-cptcity    | 1.0.4   | Incorporates colour gradients from the ‘cpt-city’ web archive available at <a href="http://soliton.vm.bytemark.co.uk/pub/cpt-city/">http://soliton.vm.bytemark.co.uk/pub/cpt-city/</a> . / GPL-3   | noarch  |
| r-cptec      | 0.1.0   | Allows to retrieve data from the ‘CPTEC/INPE’ weather forecast API. ‘CPTEC’ stands for ‘Centro de Previsão de Tempo e Estudos Climáticos’ and ‘INPE’ for ‘Instituto Nacional de Pesquisas Espaciais’. ‘CPTEC’ is the most advanced numerical weather and climate forecasting center in Latin America, with high-precision short and medium-term weather forecasting since the beginning of 1995. See <a href="http://www.cptec.inpe.br/">http://www.cptec.inpe.br/</a> for more information. / GPL-3   | noarch  |
| r-cqrreg     | 1.2     | Estimate quantile regression(QR) and composite quantile regression (cqr) and with adaptive lasso penalty using interior point (IP), majorize and minimize(MM), coordinate descent (CD), and alternating direction method of multipliers algorithms(ADMM). / GPL-2  | linux-64,<br>osx-64,<br>win-64                                    |
| r-cr         | 1.0     | This package contains R-functions to perform power calculation in a group sequential clinical trial with censored survival data and possibly unequal patient allocation between treatment and control groups. The functions can also be used to determine the study duration in a clinical trial with censored survival data as the sum of the accrual duration, which determines the sample size in a traditional sense, and the follow-up duration, which more or less controls the number of events to be observed. This package also contains R functions and methods to display the computed results. / GPL-2 | noarch  |
| r-crack      | 1.0     | R functions for cosmological research. The main functions are similar to the python library, cosmology. / GPL-2  | noarch  |
| r-cramer     | 0.9_3   | Provides R routine for the so called two-sample Cramer-Test. This nonparametric two-sample-test on equality of the underlying distributions can be applied to multivariate data as well as univariate data. It offers two possibilities to approximate the critical value both of which are included in this package. / GPL-2  | noarch  |
| r-crank      | 1.1_2   | Functions for completing and recalculating rankings and sorting. / GPL-2   | noarch  |
| r-cranlogs   | 2.1.1   | ‘API’ to the database of ‘CRAN’ package downloads from the ‘RStudio’ ‘CRAN mirror’. The database itself is at <a href="http://cranlogs.r-pkg.org">http://cranlogs.r-pkg.org</a> , see <a href="https://github.com/r-hub/cranlogs.app">https://github.com/r-hub/cranlogs.app</a> for the raw ‘API’. / MIT   | noarch  |
| r-crantastic | 0.1     | Various R tools for <a href="http://crantastic.org/">http://crantastic.org/</a> / GPL-2  | noarch  |
| r-crayon     | 1.3.4   | Colored terminal output on terminals that support ‘ANSI’ color and highlight codes. It also works in ‘Emacs’ ‘ESS’. ‘ANSI’ color support is automatically detected. Colors and highlighting can be combined and nested. New styles can also be created easily. This package was inspired by the ‘chalk’ ‘JavaScript’ project. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-crblocks   | 1.0_0   | Implements a statistical test for comparing bar plots or histograms of categorical data derived from a randomized block repeated measures layout. / GPL-3  | noarch  |

Table 51 – continued from previous page

| Name                            | Version | Summary/License  | Platforms                      |
|---------------------------------|---------|--|--------------------------------|
| <a href="#">r-cream</a>         | 1.1.1   | Provides a new method for identification of clusters of genomic regions within chromosomes. Primarily, it is used for calling clusters of cis-regulatory elements (COREs). ‘CREAM’ uses genome-wide maps of genomic regions in the tissue or cell type of interest, such as those generated from chromatin-based assays including DNaseI, ATAC or ChIP-Seq. ‘CREAM’ considers proximity of the elements within chromosomes of a given sample to identify COREs in the following steps: 1) It identifies window size or the maximum allowed distance between the elements within each CORE, 2) It identifies number of elements which should be clustered as a CORE, 3) It calls COREs, 4) It filters the COREs with lowest order which does not pass the threshold considered in the approach. / GPL-3 | noarch                         |
| <a href="#">r-credentials</a>   | 1.1     | Setup and retrieve HTTPS and SSH credentials for use with ‘git’ and other services. For HTTPS remotes the package interfaces the ‘git-credential’ utility which ‘git’ uses to store HTTP usernames and passwords. For SSH remotes we provide convenient functions to find or generate appropriate SSH keys. The package both helps the user to setup a local git installation, and also provides a back-end for git/ssh client libraries to authenticate with existing user credentials. / MIT   | noarch                         |
| <a href="#">r-creditmetrics</a> | 0.0_2   | A set of functions for computing the CreditMetrics risk model / Unlimited  | noarch                         |
| <a href="#">r-credsubs</a>      | 1.0.1   | Functions for constructing simultaneous credible bands and identifying subsets via the credible subsets (also called credible subgroups) method. / GPL-3   | noarch                         |
| <a href="#">r-credule</a>       | 0.1.3   | It provides functions to bootstrap Credit Curves from market quotes (Credit Default Swap - CDS - spreads) and price Credit Default Swaps - CDS. / MIT  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-crf</a>           | 0.4_2   | Implements modeling and computational tools for conditional random fields (CRF) model as well as other probabilistic undirected graphical models of discrete data with pairwise and unary potentials. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-crfsuite</a>      | 0.3     | Wraps the ‘CRFsuite’ library < <a href="https://github.com/chokkan/crfsuite">https://github.com/chokkan/crfsuite</a> > allowing users to fit a Conditional Random Field model and to apply it on existing data. The focus of the implementation is in the area of Natural Language Processing where this R package allows you to easily build and apply models for named entity recognition, text chunking, part of speech tagging, intent recognition or classification of any category you have in mind. Next to training, a small web application is included in the package to allow you to easily construct training data. / BSD_3_clause   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-crimcv</a>        | 0.9.6   | A finite mixture of Zero-Inflated Poisson (ZIP) models for analyzing criminal trajectories. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

| Name         | Version | Summary/License  | Platforms                      |
|--------------|---------|--|--------------------------------|
| r-crisp      | 1.0.0   | Implements convex regression with interpretable sharp partitions (CRISP), which considers the problem of predicting an outcome variable on the basis of two covariates, using an interpretable yet non-additive model. CRISP partitions the covariate space into blocks in a data-adaptive way, and fits a mean model within each block. Unlike other partitioning methods, CRISP is fit using a non-greedy approach by solving a convex optimization problem, resulting in low-variance fits. More details are provided in Petersen, A., Simon, N., and Witten, D. (2016). Convex Regression with Interpretable Sharp Partitions. Journal of Machine Learning Research, 17(94): 1-31 < <a href="http://jmlr.org/papers/volume17/15-344/15-344.pdf">http://jmlr.org/papers/volume17/15-344/15-344.pdf</a> >. / GPL-2 | noarch                         |
| r-crm        | 1.2.4   | Functions for phase I clinical trials using the continual reassessment method. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-crn        | 1.1     | The crn package provides the core functions required to download and format data from the Climate Reference Network. Both daily and hourly data are downloaded from the ftp, a consolidated file of all stations is created, station metadata is extracted. In addition functions for selecting individual variables and creating R friendly datasets for them is provided. / GPL-2  | noarch                         |
| r-crochet    | 2.2.0   | Functions to help implement the extraction / subsetting / indexing function '[' and replacement function '[<-' of custom matrix-like types (based on S3, S4, etc.), modeled as closely to the base matrix class as possible (with tests to prove it). / MIT  | noarch                         |
| r-crone      | 0.1.1   | Functions to carry out the most important crystallographic calculations for crystal structures made of 1d Gaussian-shaped atoms, especially useful for methods development. Main reference: E. Smith, G. Evans, J. Foadi (2017) <doi:10.1088/1361-6404/aa8188>. / GPL-2  | noarch                         |
| r-cronr      | 0.4.0   | Create, edit, and remove 'cron' jobs on your unix-alike system. The package provides a set of easy-to-use wrappers to 'crontab'. It also provides an RStudio add-in to easily launch and schedule your scripts. / MIT  | noarch                         |
| r-crop       | 0.0_2   | A device closing function which is able to crop graphics (e.g., PDF, PNG files) on Unix-like operating systems with the required underlying command-line tools installed. / GPL-2   GPL-3  | noarch                         |
| r-cropdatape | 1.0.0   | Provides peruvian agricultural production data from the Agriculture Ministry of Peru (MINAGRI). The first version includes 6 crops: rice, quinoa, potato, sweet potato, tomato and wheat; all of them across 24 departments. Initially, in excel files which has been transformed and assembled using tidy data principles, i.e. each variable is in a column, each observation is a row and each value is in a cell. The variables variables are sowing and harvest area per crop, yield, production and price per plot, every one year, from 2004 to 2014. / MIT   | noarch                         |
| r-crossdes   | 1.1_1   | Contains functions for the construction of carryover balanced crossover designs. In addition contains functions to check given designs for balance. / GPL-2  | noarch                         |
| r-crossreg   | 1.0     | This package provides functions to calculate confidence intervals for crossover points of two simple linear regression lines using the non-linear regression, the delta method, the Fieller method, and the bootstrap methods. / GPL-2   | noarch                         |

Table 51 – continued from previous page

| Name                        | Version | Summary/License  | Platforms   |
|-----------------------------|---------|--|---|
| <a href="#">r-crosstalk</a> | 1.0.0   | Provides building blocks for allowing HTML widgets to communicate with each other, with Shiny or without (i.e. static .html files). Currently supports linked brushing and filtering. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-crossva</a>   | 0.9.9   | Enables transformation of Verbal Autopsy data collected with the WHO 2016 questionnaire (versions 1.4.1 & 1.5.1) or the WHO 2014 questionnaire for automated coding of Cause of Death using the InSilicoVA (data.type = WHO2016) and InterVA5 algorithms. Previous versions of this package supported user-supplied mappings (via the map_records function), but this functionality has been removed. This package is made available by WHO and the Bloomberg Data for Health Initiative. / GPL-3  | noarch  |
| <a href="#">r-crossval</a>  | 1.0.3   | Contains generic functions for performing cross validation and for computing diagnostic errors. / GPL-3  | noarch  |
| <a href="#">r-crov</a>      | 0.1.3   | Fits a constrained regression model for an ordinal response with ordinal predictors and possibly others, Espinosa and Hennig (2018) <arXiv:1804.08715>. The parameter estimates associated with an ordinal predictor are constrained to be monotonic. If a monotonicity direction (isotonic or antitonic) is not specified for an ordinal predictor by the user, then the monotonicity direction classification procedure establishes it. A monotonicity test is also available to test the null hypothesis of monotonicity over a set of parameters associated with an ordinal predictor. / GPL-2 | noarch  |
| <a href="#">r-crp.csfp</a>  | 2.0.2   | Modelling credit risks based on the concept of CreditRisk, First Boston Financial Products, 1997 and CreditRisk in the Banking Industry, Gundlach & Lehrbass, Springer, 2003. / GPL-2  | noarch  |
| <a href="#">r-crrp</a>      | 1.0     | In competing risks regression, the proportional subdistribution hazards(PSH) model is popular for its direct assessment of covariate effects on the cumulative incidence function. This package allows for penalized variable selection for the PSH model. Penalties include LASSO, SCAD, MCP, and their group versions. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-crrsc</a>     | 1.1     | Extension of cmprsk to Stratified and Clustered data. Goodness of fit test for Fine-Gray model. / GPL-2  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-crrstep</a>   | 2015    | Performs forward and backwards stepwise regression for the Proportional subdistribution hazards model in competing risks (Fine & Gray 1999). Procedure uses AIC, BIC and BICcr as selection criteria. BICcr has a penalty of $k = \log(n^*)$ , where $n^*$ is the number of primary events. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name                            | Version | Summary/License  | Platforms                      |
|---------------------------------|---------|--|--------------------------------|
| <a href="#">r-crseventstudy</a> | 1.2     | Based on Dutta et al. (2018) <doi:10.1016/j.jempfin.2018.02.004>, this package provides their standardized test for abnormal returns in long-horizon event studies. The methods used improve the major weaknesses of size, power, and robustness of long-run statistical tests described in Kothari/Warner (2007) <doi:10.1016/B978-0-444-53265-7.50015-9>. Abnormal returns are weighted by their statistical precision (i.e., standard deviation), resulting in abnormal standardized returns. This procedure efficiently captures the heteroskedasticity problem. Clustering techniques following Cameron et al. (2011) <doi:10.1198/jbes.2010.07136> are adopted for computing cross-sectional correlation robust standard errors. The statistical tests in this package therefore accounts for potential biases arising from returns' cross-sectional correlation, autocorrelation, and volatility clustering without power loss. / BSD_3_clause  | noarch                         |
| <a href="#">r-crskdiag</a>      | 1.0.1   | Provides the implementation of analytical and graphical approaches for checking the assumptions of the Fine and Gray model. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-crsnls</a>        | 0.2     | Functions for nonlinear regression parameters estimation by algorithms based on Controlled Random Search algorithm. Both functions (crs4hc(), crs4hce()) adapt current search strategy by four heuristics competition. In addition, crs4hce() improves adaptability by adaptive stopping condition. / GPL-2  | noarch                         |
| <a href="#">r-crso</a>          | 0.1.1   | An algorithm for identifying candidate driver combinations in cancer. CRSO is based on a theoretical model of cancer in which a cancer rule is defined to be a collection of two or more events (i.e., alterations) that are minimally sufficient to cause cancer. A cancer rule set is a set of cancer rules that collectively are assumed to account for all of ways to cause cancer in the population. In CRSO every event is designated explicitly as a passenger or driver within each patient. Each event is associated with a patient-specific, event-specific passenger penalty, reflecting how unlikely the event would have happened by chance, i.e., as a passenger. CRSO evaluates each rule set by assigning all samples to a rule in the rule set, or to the null rule, and then calculating the total statistical penalty from all unassigned event. CRSO uses a three phase procedure find the best rule set of fixed size K for a range of Ks. A core rule set is then identified from among the best rule sets of size K as the rule set that best balances rule set size and statistical penalty. Users should consult the 'crso' vignette for an example walk through of a full CRSO run. The full description, of the CRSO algorithm is presented in: Klein MI, Cannataro V, Townsend J, Stern DF and Zhao H. Identifying combinations of cancer driver in individual patients. BioRxiv 674234 [Preprint]. June 19, 2019. <doi:10.1101/674234>. Please cite this article if you use 'crso'. / GPL-2 | noarch                         |
| <a href="#">r-crtsize</a>       | 1.0     | Sample size estimation in cluster (group) randomized trials. Contains traditional power-based methods, empirical smoothing (Rotondi and Donner, 2009), and updated meta-analysis techniques (Rotondi and Donner, 2012). / GPL-2  | noarch                         |
| <a href="#">r-crwrn</a>         | 0.0.1   | To re-calculate the coefficients and the standard deviation when changing the reference group. / GPL-3   | noarch                         |
| <a href="#">r-cseqpat</a>       | 0.1.2   | Mines contiguous sequential patterns in text. / MIT  | noarch                         |
| <a href="#">r-cshapes</a>       | 0.6     | Package for CShapes, a GIS dataset of country boundaries (1946-today). Includes functions for data extraction and the computation of distance matrices and -lists. / GPL-2   | noarch                         |

Table 51 – continued from previous page

| Name        | Version | Summary/License   | Platforms                      |
|-------------|---------|---|--------------------------------|
| r-csn       | 1.1.3   | Provides functions for computing the density and the log-likelihood function of closed-skew normal variates, and for generating random vectors sampled from this distribution. See Gonzalez-Farias, G., Dominguez-Molina, J., and Gupta, A. (2004). The closed skew normal distribution, Skew-elliptical distributions and their applications: a journey beyond normality, Chapman and Hall/CRC, Boca Raton, FL, pp. 25-42. / GPL-2   | noarch                         |
| r-csp       | 0.1.0   | Provides the Correlates of State Policy data set for easy use in R. / CC0   | noarch                         |
| r-csrplus   | 1.03    | Includes two functions to evaluate the hypothesis of complete spatial randomness (csr) in point processes. The function 'mwin' calculates quadrat counts to estimate the intensity of a spatial point process through the moving window approach proposed by Bailey and Gatrell (1995). Event counts are computed within a window of a set size over a fine lattice of points within the region of observation. The function 'pielou' uses the nearest neighbor test statistic and asymptotic distribution proposed by Pielou (1959) to compare the observed point process to one generated under csr. The value can be compared to that given by the more widely used test proposed by Clark and Evans (1954). / GPL-2   | noarch                         |
| r-cssam     | 1.2.4   | Cell-type specific differential expression of a microarray experiment of heterogeneous tissue samples, using SAM. / LGPL-3  | noarch                         |
| r-cstar     | 1.0     | Functions that allow a researcher to examine the robustness of the substantive significance of their findings. Implements ideas set out in Esarey and Danne-man (2014). / GPL-2   | noarch                         |
| r-csv       | 0.5.3   | Reads and writes CSV with selected conventions. Uses the same generic function for reading and writing to promote consistent formats. / GPL-3   | noarch                         |
| r-csvread   | 1.2.1   | Functions for loading large (10M lines) CSV and other delimited files, similar to read.csv, but typically faster and using less memory than the standard R loader. While not entirely general, it covers many common use cases when the types of columns in the CSV file are known in advance. In addition, the package provides a class 'int64', which represents 64-bit integers exactly when reading from a file. The latter is useful when working with 64-bit integer identifiers exported from databases. The CSV file loader supports common column types including 'integer', 'double', 'string', and 'int64', leaving further type transformations to the user. / Apache License (== 2.0)  | linux-64,<br>osx-64,<br>win-64 |
| r-csvy      | 0.3.0   | Support for import from and export to the CSVY file format. CSVY is a file format that combines the simplicity of CSV (comma-separated values) with the metadata of other plain text and binary formats (JSON, XML, Stata, etc.) by placing a YAML header on top of a regular CSV. / GPL-2  | noarch                         |
| r-cthrasher | 1.1.0   | Estimation and inference methods for the continuous threshold expectile regression. It can fit the continuous threshold expectile regression and test the existence of change point, for the paper, Feipeng Zhang and Qunhua Li (2016). A continuous threshold expectile regression, submitted. / GPL (>= 2.0)  | noarch                         |
| r-ctrdata   | 0.18.2  | Provides functions for querying, retrieving and analysing protocol- and results-related information on clinical trials from two public registers, the European Union Clinical Trials Register (EUCTR, < <a href="https://www.clinicaltrialsregister.eu/">https://www.clinicaltrialsregister.eu/</a> >) and ClinicalTrials.gov (CTGOV, < <a href="https://clinicaltrials.gov/">https://clinicaltrials.gov/</a> >). The information is transformed and then stored in a database (mongo). Functions are provided for accessing and analysing the locally stored information on the clinical trials, as well as for identifying duplicate records. The package is motivated by the need for aggregating and trend-analysing the design, conduct and outcomes across clinical trials. / MIT | noarch                         |

Table 51 – continued from previous page

| Name                      | Version | Summary/License  | Platforms   |
|---------------------------|---------|--|---|
| <code>r-ctrlgene</code>   | 1.0.1   | A simple way to assess the stability of candidate housekeeping genes is implemented in this package. / GPL-2   | noarch  |
| <code>r-cts</code>        | 1.0.2   | Functions to fit continuous time autoregressive models with the Kalman filter (Wang (2013) <doi:10.18637/jss.v053.i05>). / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| <code>r-ctt</code>        | 2.3.3   | A collection of common test and item analyses from a classical test theory (CTT) framework. Analyses can be applied to both dichotomous and polytomous data. Functions provide reliability analyses (alpha), item statistics, distractor analyses, disattenuated correlations, scoring routines, and empirical ICCs. / GPL-2   | noarch  |
| <code>r-cttinshiny</code> | 0.1.0   | A Shiny interface developed in close coordination with the CTT package, providing a GUI that guides the user through CTT analyses. / GPL-2   | noarch  |
| <code>r-ctv</code>        | 0.8.5   | Infrastructure for task views to CRAN-style repositories: Querying task views and installing the associated packages (client-side tools), generating HTML pages and storing task view information in the repository (server-side tools). / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-cub</code>        | 1.1.3   | For ordinal rating data, estimate and test models within the family of CUB models and their extensions (where CUB stands for Combination of a discrete Uniform and a shifted Binomial distributions). Simulation routines, plotting facilities and fitting measures are also provided. / GPL-2   GPL-3   | noarch  |
| <code>r-cubature</code>   | 2.0.3   | R wrappers around the cubature C library of Steven G. Johnson for adaptive multivariate integration over hypercubes and the Cuba C library of Thomas Hahn for deterministic and Monte Carlo integration. Scalar and vector interfaces for cubature and Cuba routines are provided; the vector interfaces are highly recommended as demonstrated in the package vignette. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| <code>r-cubeview</code>   | 0.1.0   | Creates a 3D data cube view of a RasterStack/Brick, typically a collection/array of RasterLayers (along z-axis) with the same geographical extent (x and y dimensions) and resolution, provided by package 'raster'. Slices through each dimension (x/y/z), freely adjustable in location, are mapped to the visible sides of the cube. The cube can be freely rotated. Zooming and panning can be used to focus on different areas of the cube. / MIT   | noarch  |
| <code>r-cubfits</code>    | 0.1.3   | Estimating mutation and selection coefficients on synonymous codon bias usage based on models of ribosome overhead cost (ROC). Multinomial logistic regression and Markov Chain Monte Carlo are used to estimate and predict protein production rates with/without the presence of expressions and measurement errors. Work flows with examples for simulation, estimation and prediction processes are also provided with parallelization speedup. The whole framework is tested with yeast genome and gene expression data of Yassour, et al. (2009) <doi:10.1073/pnas.0812841106>. / Mozilla Public License 2.0 | linux-64,<br>osx-64,<br>win-64                                    |

Table 51 – continued from previous page

| Name              | Version | Summary/License  | Platforms  |
|-------------------|---------|--|--|
| r-cubist          | 0.2.2   | Regression modeling using rules with added instance-based corrections. / GPL-3   | linux-64,<br>osx-64,<br>win-64                         |
| r-cump            | 2.0     | Combining Univariate Association Test Results of Multiple Phenotypes for Detecting Pleiotropy. / GPL-2   | noarch   |
| r-cumplyr         | 0.1.1   | Extends ddply to allow calculation of cumulative quantities. / MIT   | noarch   |
| r-cumseg          | 1.2     | Estimation of number and location of change points in mean-shift (piecewise constant) models. Particularly useful to model genomic sequences of continuous measurements. / GPL-3   | noarch   |
| r-cumstats        | 1.0     | Cumulative descriptive statistics for (arithmetic, geometric, harmonic) mean, median, mode, variance, skewness and kurtosis. / GPL-3   | noarch   |
| r-curl            | 3.3     | The curl() and curl_download() functions provide highly configurable drop-in replacements for base url() and download.file() with better performance, support for encryption (https, ftps), gzip compression, authentication, and other 'libcurl' goodies. The core of the package implements a framework for performing fully customized requests where data can be processed either in memory, on disk, or streaming via the callback or connection interfaces. Some knowledge of 'libcurl' is recommended; for a more-user-friendly web client see the 'httr' package which builds on this package with http specific tools and logic. / MIT file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-currentsurvival | 1.0     | The currentSurvival package contains functions for the estimation of the current cumulative incidence (CCI) and the current leukaemia-free survival (CLFS). The CCI is the probability that a patient is alive and in any disease remission (e.g. complete cytogenetic remission in chronic myeloid leukaemia) after initiating his or her therapy (e.g. tyrosine kinase therapy for chronic myeloid leukaemia). The CLFS is the probability that a patient is alive and in any disease remission after achieving the first disease remission. / GPL-2   | noarch   |
| r-curry           | 0.1.1   | Partial application is the process of reducing the arity of a function by fixing one or more arguments, thus creating a new function lacking the fixed arguments. The curry package provides three different ways of performing partial function application by fixing arguments from either end of the argument list (currying and tail currying) or by fixing multiple named arguments (partial application). This package provides this functionality through the %<%, %<%<%, and %>>% operators which allows for a programming style comparable to modern functional languages. Compared to other implementations such as purrr::partial() the operators in curry composes functions with named arguments, aiding in autocomplete etc. / GPL-2 | noarch   |
| r-curstatci       | 0.1.1   | Computes the maximum likelihood estimator, the smoothed maximum likelihood estimator and pointwise bootstrap confidence intervals for the distribution function under current status data. Groeneboom and Hendrickx (2017) <doi:10.1214/17-EJS1345>. / GPL-3   | linux-64,<br>osx-64,<br>win-64                         |

| Name                                  | Version | Summary/License   | Platforms                      |
|---------------------------------------|---------|---|--------------------------------|
| <code>r-curvecomp</code>              | 0.1.0   | Performs multiple comparison procedures on curve observations among different treatment groups. The methods are applicable in a variety of situations (such as independent groups with equal or unequal sample sizes, or repeated measures) by using parametric bootstrap. References to these procedures can be found at Konietzschke, Gel, and Brunner (2014) <doi:10.1090/conm/622/12431> and Westfall (2011) <doi:10.1080/10543406.2011.607751>. / GPL-2  | noarch                         |
| <code>r-cusp</code>                   | 2.3.3   | Cobb's maximum likelihood method for cusp-catastrophe modeling (Grasman, van der Maas, & Wagenmakers, 2009, JSS, 32:8; Cobb, L, 1981, Behavioral Science, 26:1, 75–78). Includes a cusp() function for model fitting, and several utility functions for plotting, and for comparing the model to linear regression and logistic curve models. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-customerscoringmetrics</code> | 1.0.0   | Functions for evaluating and visualizing predictive model performance (specifically: binary classifiers) in the field of customer scoring. These metrics include lift, lift index, gain percentage, top-decile lift, F1-score, expected misclassification cost and absolute misclassification cost. See Berry & Linoff (2004, ISBN:0-471-47064-3), Witten and Frank (2005, 0-12-088407-0) and Blattberg, Kim & Neslin (2008, ISBN:978-0-387-72578-9) for details. Visualization functions are included for lift charts and gain percentage charts. All metrics that require class predictions offer the possibility to dynamically determine cutoff values for transforming real-valued probability predictions into class predictions. / GPL-2 | noarch                         |
| <code>r-cusum</code>                  | 0.4.0   | Provides functions for constructing and evaluating CUSUM charts and RA-CUSUM charts with focus on false signal probability. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-cusumdesign</code>            | 1.1.3   | Computation of decision intervals (H) and average run lengths (ARL) for CUSUM charts. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-cutpointsoehr</code>          | 0.1.2   | Use optimal equal-HR method to determine two optimal cutpoints of a continuous predictor that has a U-shaped relationship with survival outcomes based on Cox regression model. The optimal equal-HR method estimates two optimal cut-points that have approximately the same log hazard value based on Cox regression model and divides individuals into different groups according to their HR values. / GPL-3  | noarch                         |
| <code>r-cuttlefish.model</code>       | 1.0     | This package can be used to standardize abundance indices using the delta-GLM method and to model the English Channel cuttlefish stock using a two-stage biomass model / GPL-3  | noarch                         |

| Name            | Version | Summary/License  | Platforms   |
|-----------------|---------|--|---|
| r-cvauc         | 1.1.0   | This package contains various tools for working with and evaluating cross-validated area under the ROC curve (AUC) estimators. The primary functions of the package are ci.cvAUC and ci.pooled.cvAUC, which report cross-validated AUC and compute confidence intervals for cross-validated AUC estimates based on influence curves for i.i.d. and pooled repeated measures data, respectively. One benefit to using influence curve based confidence intervals is that they require much less computation time than bootstrapping methods. The utility functions, AUC and cvAUC, are simple wrappers for functions from the ROCR package. / Apache License (== 2.0)   | noarch  |
| r-cvcalibration | 1.0.1   | Statistical inferences for estimating the calibration equation with error-in observations / GPL-2  | noarch  |
| r-cvd           | 1.0.2   | Methods for color vision deficiencies (CVD), to help understanding and mitigating issues with CVDs and to generate tests for diagnosis and interpretation. / GPL-3   | noarch  |
| r-cvequality    | 0.2.0   | Contains functions for testing for significant differences between multiple coefficients of variation. Includes Feltz and Miller's (1996) <DOI:10.1002/(SICI)1097-0258(19960330)15:6%3C647::AID-SIM184%3E3.0.CO;2-P> asymptotic test and Krishnamoorthy and Lee's (2014) <DOI:10.1007/s00180-013-0445-2> modified signed-likelihood ratio test. See the vignette for more, including full details of citations. / MIT  | noarch  |
| r-cvgee         | 0.3.0   | Calculates predictions from generalized estimating equations and internally cross-validates them using the logarithmic, quadratic and spherical proper scoring rules; Kung-Yee Liang and Scott L. Zeger (1986) <doi:10.1093/biomet/73.1.13>. / GPL-3   | noarch  |
| r-cvmgof        | 1.0.0   | It is devoted to Cramer-von Mises goodness-of-fit tests. It implements three statistical methods based on Cramer-von Mises statistics to estimate and test a regression model. / CeCILL  | noarch  |
| r-cvq2          | 1.2.0   | The external prediction capability of quantitative structure-activity relationship (QSAR) models is often quantified using the predictive squared correlation coefficient. This value can be calculated with an external data set or by cross validation. / GPL-3  | noarch  |
| r-cvst          | 0.2.2   | The fast cross-validation via sequential testing (CVST) procedure is an improved cross-validation procedure which uses non-parametric testing coupled with sequential analysis to determine the best parameter set on linearly increasing subsets of the data. By eliminating under-performing candidates quickly and keeping promising candidates as long as possible, the method speeds up the computation while preserving the capability of a full cross-validation. Additionally to the CVST the package contains an implementation of the ordinary k-fold cross-validation with a flexible and powerful set of helper objects and methods to handle the overall model selection process. The implementations of the Cochran's Q test with permutations and the sequential testing framework of Wald are generic and can therefore also be used in other contexts. / GPL (>= 2.0) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

|-------------------------------|---------|---|---|
| <a href="#">r-cvtools</a>     | 0.3.2   | Tools that allow developers to write functions for cross-validation with minimal programming effort and assist users with model selection. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-cvtuningcov</a> | 1.0     | This is a package for selecting tuning parameters based on cross-validation (CV) in regularized estimators of large covariance matrices. Four regularized methods are implemented: banding, tapering, hard-thresholding and soft-thresholding. Two types of matrix norms are applied: Frobenius norm and operator norm. Two types of CV are considered: K-fold CV and random CV. Usually K-fold CV use K-1 folds to train a model and the rest one fold to validate the model. The reverse version trains a model with 1 fold and validates with the rest with K-1 folds. Random CV randomly splits the data set to two parts, a training set and a validation set with user-specified sizes. / GPL-2 | noarch  |
| <a href="#">r-cvxbiclustr</a> | 0.0.1   | An iterative algorithm for solving a convex formulation of the biclustering problem. / MIT  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-cvxclustr</a>   | 1.1.1   | Alternating Minimization Algorithm (AMA) and Alternating Direction Method of Multipliers (ADMM) splitting methods for convex clustering. / CC BY-NC-SA 4.0  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-cwhmisc</a>     | 6.6     | Miscellaneous useful or interesting functions. / GPL-2  | noarch  |
| <a href="#">r-cxhull</a>      | 0.2.0   | Computes the convex hull in arbitrary dimension, based on the Qhull library ( <a href="http://www.qhull.org">http://www.qhull.org</a> ). The package provides a complete description of the convex hull: edges, ridges, facets, adjacencies. Triangulation is optional. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-cxxfunplus</a>  | 1.0     | extend cxxfunction by saving the dynamic shared objects for reusing across R sessions / GPL-3   | noarch  |
| <a href="#">r-cyclertools</a> | 1.1.1   | A suite of functions for analysing cycling data. / MIT  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-cyclocomp</a>   | 1.1.0   | Cyclomatic complexity is a software metric (measurement), used to indicate the complexity of a program. It is a quantitative measure of the number of linearly independent paths through a program's source code. It was developed by Thomas J. McCabe, Sr. in 1976. / MIT  | noarch  |

Table 51 – continued from previous page

| Name              | Version | Summary/License   | Platforms |
|-------------------|---------|---|-----------|
| r-cycloids        | 1.0     | Tools for calculating coordinate representations of hypocycloids, epicycloids, hypotrochoids, and epitrochoids (altogether called ‘cycloids’ here) with different scaling and positioning options. The cycloids can be visualised with any appropriate graphics function in R. / GPL-3  | noarch    |
| r-cytobankapi     | 1.3.0   | Tools to interface with Cytobank’s API via R, organized by various endpoints that represent various areas of Cytobank functionality. Learn more about Cytobank at < <a href="https://www.cytobank.org">https://www.cytobank.org</a> >. / Artistic-2.0   | noarch    |
| r-cytobankbridger | 1.0.0   | A collection of tools that leverage the CytobankAPI R package < <a href="https://cran.r-project.org/web/packages/CytobankAPI/vignettes/cytobank-quickstart.html">https://cran.r-project.org/web/packages/CytobankAPI/vignettes/cytobank-quickstart.html</a> > to complete more complex workflows, and add/extend various Cytobank features. / Artistic-2.0  | noarch    |
| r-d3network       | 0.5.2   | This packages is intended to make it easy to create D3 JavaScript network, tree, dendrogram, and Sankey graphs from R using data frames. !!! NOTE: Active development has moved to the networkD3 package. !!! / GPL-3   | noarch    |
| r-d3plus          | 0.1.0   | Provides functions that offer seamless ‘D3Plus’ integration. The examples provided here are taken from the official ‘D3Plus’ website < <a href="http://d3plus.org">http://d3plus.org</a> >. / MIT   | noarch    |
| r-daag            | 1.22    | Various data sets used in examples and exercises in the book Maindonald, J.H. and Braun, W.J. (2003, 2007, 2010) Data Analysis and Graphics Using R. / GPL-3  | noarch    |
| r-daagxtras       | 0.8_4   | various data sets used in additional exercises for the book Maindonald, J.H. and Braun, W.J. (3rd edn 2010) Data Analysis and Graphics Using R, and for a ‘Data Mining’ course. Note that a number of datasets that were in earlier versions of this package have been transferred to the DAAG package. / Un-limited  | noarch    |
| r-daarem          | 0.3     | Implements the DAAREM method for accelerating the convergence of slow, monotone sequences from smooth, fixed-point iterations such as the EM algorithm. For further details about the DAAREM method. see Henderson, N.C. and Varadhan, R. (2018) <arXiv:1803.06673>. / GPL-2  | noarch    |
| r-dacf            | 1.0.0   | An implementation of data analytic methods in R for analyses for data with ceiling/floor effects. The package currently includes functions for mean/variance estimation and mean comparison tests. Implemented methods are from Aitkin (1964) <doi:10.1007/BF02289723> and Liu & Wang (in prep). / GPL-2  | noarch    |
| r-dagr            | 1.1.3   | Functions to draw, manipulate, evaluate directed acyclic graphs and simulate corresponding data. / GPL-2  | noarch    |
| r-daime           | 1.1     | Reverse and model the effects of changing deposition rates on geological data and rates. Based on Hohmann (2018) <doi:10.13140/RG.2.2.23372.51841> . / CC BY 4.0  | noarch    |
| r-dalex2          | 0.9     | Machine Learning models are widely used and have various applications in classification or regression tasks. Due to increasing computational power, availability of new data sources and new methods, ML models are more and more complex. Models created with techniques like boosting, bagging of neural networks are true black boxes. It is hard to trace the link between input variables and model outcomes. They are used because of high performance, but lack of interpretability is one of their weakest sides. In many applications we need to know, understand or prove how input variables are used in the model and what impact do they have on final model prediction. DALEX2 is a collection of tools that help to understand how complex predictive models are working. DALEX2 is a part of DrWhy universe for tools for Explanation, Exploration and Visualisation for Predictive Models. / GPL-3 | noarch    |

Table 51 – continued from previous page

| Name    | Version | Summary/License  | Platforms                      |
|---------|---------|--|--------------------------------|
| r-daly  | 1.5.0   | The DALY Calculator is a free, open-source Graphical User Interface (GUI) for stochastic disability-adjusted life year (DALY) calculation. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-dam   | 0.0.1   | A collection of functions which aim to assist common computational workflow for analysis of matabolomic data.. / CC0   | noarch                         |
| r-dams  | 0.2     | The single largest source of dams in the United States is the National Inventory of Dams (NID) < <a href="http://nid.usace.army.mil">http://nid.usace.army.mil</a> > from the US Army Corps of Engineers. Entire data from the NID cannot be obtained all at once and NID's website limits extraction of more than a couple of thousand records at a time. Moreover, selected data from the NID's user interface cannot not be saved to a file. In order to make the analysis of this data easier, all the data from NID was extracted manually. Subsequently, the raw data was checked for potential errors and cleaned. This package provides sample cleaned data from the NID and provides functionality to access the entire cleaned NID data. / GPL-2   | noarch                         |
| r-dang  | 0.0.10  | A collection of utility functions. / GPL-2   | noarch                         |
| r-dap   | 1.0     | An implementation of Discriminant Analysis via Projections (DAP) method for high-dimensional binary classification in the case of unequal covariance matrices. See Irina Gaynanova and Tianying Wang (2018) < <a href="https://arxiv.org/abs/1711.04817v2">arXiv:1711.04817v2</a> >. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-dapr  | 0.0.3   | An easy-to-use, dependency-free set of functions for iterating over elements of various input objects. Functions are wrappers around base apply()/lapply()/vapply() functions but designed to have similar functionality to the mapping functions in the 'purrr' package < <a href="https://purrr.tidyverse.org/">https://purrr.tidyverse.org/</a> >. Specifically, function names more explicitly communicate the expected class of the output and functions also allow for the convenient shortcut of '~ .x' instead of the more verbose 'function(.x) .x'. / GPL-3  | noarch                         |
| r-dark  | 0.9.8   | The recovery of visual sensitivity in a dark environment is known as dark adaptation. In a clinical or research setting the recovery is typically measured after a dazzling flash of light and can be described by the Mahroo, Lamb and Pugh (MLP) model of dark adaptation. The functions in this package take dark adaptation data and use nonlinear regression to find the parameters of the model that 'best' describe the data. They do this by firstly, generating rapid initial objective estimates of data adaptation parameters, then a multi-start algorithm is used to reduce the possibility of a local minimum. There is also a bootstrap method to calculate parameter confidence intervals. The functions rely upon a 'dark' list or object. This object is created as the first step in the workflow and parts of the object are updated as it is processed. / GPL-3 | noarch                         |
| r-darts | 1.0     | Are you aiming at the right spot in darts? Maybe not! Use this package to find your optimal aiming location. For a better explanation, go to <a href="http://www-stat.stanford.edu/~ryantibs/darts/">http://www-stat.stanford.edu/~ryantibs/darts/</a> or see the paper A Statistician Plays Darts. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                    | Version | Summary/License   | Platforms  |
|-------------------------|---------|---|--|
| r-dashboad              | 0.1.0   | The dashboard package allows users to create web pages which display interactive data visualizations working in a standard modern browser. It displays them locally using the Rook server. No knowledge about web technologies nor Internet connection are required. D3.js is a JavaScript library for manipulating documents based on data. D3 helps the dashboard package bring data to life using HTML, SVG and CSS. / GPL-2   | noarch   |
| r-dasst                 | 0.3.3   | Provides methods for reading, displaying, processing and writing files originally arranged for the ‘DSSAT-CSM’ fixed width format. The ‘DSSAT-CSM’ cropping system model is described at J.W. Jones, G. Hoogenboom, C.H. Porter, K.J. Boote, W.D. Batchelor, L.A. Hunt, P.W. Wilkens, U. Singh, A.J. Gijssman, J.T. Ritchie (2003) <doi:10.1016/S1161-0301(02)00107-7>. / GPL-2   | noarch   |
| r-data.table            | 1.12.2  | Fast aggregation of large data (e.g. 100GB in RAM), fast ordered joins, fast add/modify/delete of columns by group using no copies at all, list columns, a fast friendly file reader and parallel file writer. Offers a natural and flexible syntax, for faster development. / MPL-2.0   file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-databaseconnectorjars | 1.1.0   | Provides external JAR dependencies for the ‘DatabaseConnector’ package. / Apache License  | noarch   |
| r-dataclean             | 1.0     | Includes functions that researchers or practitioners may use to clean raw data, transferring html, xlsx, txt data file into other formats. And it also can be used to manipulate text variables, extract numeric variables from text variables and other variable cleaning processes. It is originated from a author’s project which focuses on creative performance in online education environment. The resulting paper of that study will be published soon. / GPL-3 | noarch   |
| r-dataframes2xls        | 0.4.7   | Writes data frames to xls files. It supports multiple sheets and basic formatting. / BSD_3_clause   | noarch   |
| r-datagraph             | 1.0.1   | Functions to save either ‘.dtable’ or ‘.dtbin’ files that can be read by DataGraph, a graphing and analysis application for macOS. Can save a data frame, collection of data frames and sequences of data frames and individual vectors. For more information see < <a href="https://www.visualdatatools.com/DataGraph/Help/DataFiles/R/index.html">https://www.visualdatatools.com/DataGraph/Help/DataFiles/R/index.html</a> >. / GPL-2                                | linux-64,<br>osx-64,<br>win-64                         |
| r-datamap               | 0.1_1   | datamap utilizes variable bindings and objects of class UserDefinedDatabase to provide a simple mapping system to foreign objects. Maps can be used as environments or attached to the search path, and changes to either are persistent. Mapped foreign objects are fetched in real-time and are never cached by the mapping system. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| r-datamaps              | 0.0.3   | Easily create interactive choropleth maps then add bubbles and arcs by coordinates or region name. These maps can be used directly from the console, from ‘RStudio’, in ‘Shiny’ apps and ‘R Markdown’ documents. ‘Shiny’ proxies allow to interactively add arcs and bubbles, change choropleth values, or change labels. / MIT   | noarch   |

Table 51 – continued from previous page

| Name                             | Version | Summary/License  | Platforms                      |
|----------------------------------|---------|--|--------------------------------|
| <a href="#">r-dataquality</a>    | 1.0     | The package performs variable level data quality checks including missing values, unique values, frequency tables, and generates summary statistics / MIT  | noarch                         |
| <a href="#">r-datarium</a>       | 0.1.0   | Contains data organized by topics: categorical data, regression model, means comparisons, independent and repeated measures ANOVA, mixed ANOVA and ANCOVA. / GPL-2   | noarch                         |
| <a href="#">r-datarobot</a>      | 2.14.2  | For working with the ‘DataRobot’ predictive modeling platform’s API < <a href="https://www.datarobot.com/">https://www.datarobot.com/</a> >. / MIT   | noarch                         |
| <a href="#">r-datasaurus</a>     | 0.1.4   | The Datasaurus Dozen is a set of datasets with the same summary statistics. They retain the same summary statistics despite having radically different distributions. The datasets represent a larger and quirkier object lesson that is typically taught via Anscombe’s Quartet (available in the ‘datasets’ package). Anscombe’s Quartet contains four very different distributions with the same summary statistics and as such highlights the value of visualisation in understanding data, over and above summary statistics. As well as being an engaging variant on the Quartet, the data is generated in a novel way. The simulated annealing process used to derive datasets from the original Datasaurus is detailed in Same Stats, Different Graphs: Generating Datasets with Varied Appearance and Identical Statistics through Simulated Annealing <doi:10.1145/3025453.3025912>. / MIT | noarch                         |
| <a href="#">r-dataseries</a>     | 0.2.0   | Download and import time series from < <a href="http://www.dataseries.org">http://www.dataseries.org</a> >, a comprehensive and up-to-date collection of open data from Switzerland. / GPL-3   | noarch                         |
| <a href="#">r-datassim</a>       | 1.0     | For estimation of a variable of interest using Kalman filter by incorporating results from previous assessments, i.e. through development weighted estimates where weights are assigned inversely proportional to the variance of existing and new estimates. For reference see Ehlers et al. (2017) <doi:10.20944/preprints201710.0098.v1>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-datastructures</a> | 0.2.8   | Implementation of advanced data structures such as hashmaps, heaps, or queues. Advanced data structures are essential in many computer science and statistics problems, for example graph algorithms or string analysis. The package uses ‘Boost’ and ‘STL’ data types and extends these to R with ‘Rcpp’ modules. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-datautils</a>      | 0.1.5   | Contains facilities such as getting the current timestamp in decimal seconds, computing interval w.r.t. a reference timestamp, and custom plotting with error bars. / LGPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-dataverse</a>      | 0.2.0   | Provides access to Dataverse version 4 APIs < <a href="https://dataverse.org/">https://dataverse.org/</a> >, enabling data search, retrieval, and deposit. For Dataverse versions <= 4.0, use the deprecated ‘dvn’ package < <a href="https://cran.r-project.org/package=dvn">https://cran.r-project.org/package=dvn</a> >. / GPL-2  | noarch                         |
| <a href="#">r-date</a>           | 1.2_38  | Functions for handling dates. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

Continued on next page

Table 51 – continued from previous page

| Name            | Version | Summary/License   | Platforms   |
|-----------------|---------|---|---|
| r-datetime      | 0.1.4   | Provides methods for working with nominal dates, times, and durations. Base R has sophisticated facilities for handling time, but these can give unexpected results if, for example, timezone is not handled properly. This package provides a more casual approach to support cases which do not require rigorous treatment. It systematically deconstructs the concepts origin and timezone, and de-emphasizes the display of seconds. It also converts among nominal durations such as seconds, hours, days, and weeks. See ‘?datetime’ and ‘?duration’ for examples. Adapted from ‘metrumrg’ < <a href="http://r-forge.r-project.org/R/?group_id=1215">http://r-forge.r-project.org/R/?group_id=1215</a> >. / GPL-3 | noarch  |
| r-datetimeutils | 0.3.0   | Utilities for handling dates and times, such as selecting particular days of the week or month, formatting timestamps as required by RSS feeds, or converting timestamp representations of other software (such as ‘MATLAB’ and ‘Excel’) to R. The package is lightweight (no dependencies, pure R implementations) and relies only on R’s standard classes to represent dates and times (‘Date’ and ‘POSIXt’); it aims to provide efficient implementations, through vectorisation and the use of R’s native numeric representations of timestamps where possible. / GPL-3   | noarch  |
| r-datr          | 0.1.0   | Interface with the ‘Dat’ p2p network protocol < <a href="https://datproject.org">https://datproject.org</a> >. Clone archives from the network, share your own files, and install packages from the network. / GPL-3  | noarch  |
| r-davies        | 1.1.9   | Various utilities for the Davies distribution. / GPL-2  | noarch  |
| r-dbemlikegof   | 1.2.4   | Goodness-of-fit and two sample comparison tests using sample entropy / GPL-2  | noarch  |
| r-dbemplikenorm | 1.0.0   | Test for joint assessment of normality / GPL-2  | noarch  |
| r-dbest         | 1.8     | A program for analyzing vegetation time series, with two algorithms: 1) change detection algorithm that detects trend changes, determines their type (abrupt or non-abrupt), and estimates their timing, magnitude, number, and direction; 2) generalization algorithm that simplifies the temporal trend into main features. The user can set the number of major breakpoints or magnitude of greatest changes of interest for detection, and can control the generalization process by setting an additional parameter of generalization-percentage. / GPL-2  | noarch  |
| r-dbhydror      | 0.2.7   | Client for programmatic access to the South Florida Water Management District’s ‘DBHYDRO’ database at < <a href="https://www.sfwmd.gov/science-data/dbhydro">https://www.sfwmd.gov/science-data/dbhydro</a> >, with functions for accessing hydrologic and water quality data. / GPL-3  | noarch  |
| r-dbi           | 1.0.0   | A database interface definition for communication between R and relational database management systems. All classes in this package are virtual and need to be extended by the various R/DBMS implementations. / LGPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                      | Version | Summary/License  | Platforms   |
|---------------------------|---------|--|---|
| <a href="#">r-dblcens</a> | 1.1.7   | Use EM algorithm to compute the NPMLE of CDF and also the two censoring distributions. For doubly censored data (as described in Chang and Yang (1987) Ann. Stat. 1536-47). You can also specify a constraint, it will return the constrained NPMLE and the -2 log empirical likelihood ratio. This can be used to test the hypothesis about the constraint and find confidence intervals for probability or quantile via empirical likelihood ratio theorem. Influence function of hat F may also be calculated (but may be slow). / GPL-2          | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-dbpolyr</a> | 1.4.0   | A 'dplyr' back end for databases that allows you to work with remote database tables as if they are in-memory data frames. Basic features works with any database that has a 'DBI' back end; more advanced features require 'SQL' translation to be provided by the package author. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-dbscan</a>  | 1.1_4   | A fast reimplementation of several density-based algorithms of the DBSCAN family for spatial data. Includes the DBSCAN (density-based spatial clustering of applications with noise) and OPTICS (ordering points to identify the clustering structure) clustering algorithms HDBSCAN (hierarchical DBSCAN) and the LOF (local outlier factor) algorithm. The implementations use the kd-tree data structure (from library ANN) for faster k-nearest neighbor search. An R interface to fast kNN and fixed-radius NN search is also provided. / GPL-2 | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-dbstats</a> | 1.0.5   | Prediction methods where explanatory information is coded as a matrix of distances between individuals. Distances can either be directly input as a distances matrix, a squared distances matrix, an inner-products matrix or computed from observed predictors. / GPL-2   | noarch  |
| <a href="#">r-dbx</a>     | 0.2.5   | Provides select, insert, update, upsert, and delete database operations. Supports 'PostgreSQL', 'MySQL', 'SQLite', and more, and plays nicely with the 'DBI' package. / MIT  | noarch  |
| <a href="#">r-dcg</a>     | 0.9.3   | Data cloud geometry (DCG) applies random walks in finding community structures for social networks. Fushing, VanderWaal, McCowan, & Koehl (2013) (<doi:10.1371/journal.pone.0056259>). / GPL-2   | noarch  |
| <a href="#">r-dchipio</a> | 0.1.5   | Functions for reading DCP and CDF.bin files generated by the dChip software. / LGPL-2.1  | noarch  |
| <a href="#">r-dcl</a>     | 0.1.0   | Statistical modelling and forecasting in claims reserving in non-life insurance under the Double Chain Ladder framework by Martinez-Miranda, Nielsen and Verrall (2012). / GPL-2   | noarch  |
| <a href="#">r-dcovts</a>  | 1.1     | Computing and plotting the distance covariance and correlation function of a univariate or a multivariate time series. Both versions of biased and unbiased estimators of distance covariance and correlation are provided. Test statistics for testing pairwise independence are also implemented. Some data sets are also included. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name                       | Version | Summary/License  | Platforms  |
|----------------------------|---------|--|--|
| <a href="#">r-dcurver</a>  | 0.9.1   | A Davidian curve defines a seminonparametric density, whose shape and flexibility can be tuned by easy to estimate parameters. Since a special case of a Davidian curve is the standard normal density, Davidian curves can be used for relaxing normality assumption in statistical applications (Zhang & Davidian, 2001) <doi:10.1111/j.0006-341X.2001.00795.x>. This package provides the density function, the gradient of the loglikelihood and a random generator for Davidian curves. / GPL-3   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-dcv</a>      | 0.1.1   | This package performs several conventional Cross-validation statistical methods for climate-growth model in the climate reconstruction from tree rings, including Sign Test statistic, Reduction of Error statistic, Product Mean Test, Durbin-Watson statistic etc. This package is at its primary stage, the functions have not been tested exhaustively and more functions would be added in the coming days. / GPL-2   | noarch   |
| <a href="#">r-ddalpha</a>  | 1.3.9   | Contains procedures for depth-based supervised learning, which are entirely non-parametric, in particular the DDalpha-procedure (Lange, Mosler and Mozharovskiy, 2014 <doi:10.1007/s00362-012-0488-4>). The training data sample is transformed by a statistical depth function to a compact low-dimensional space, where the final classification is done. It also offers an extension to functional data and routines for calculating certain notions of statistical depth functions. 50 multivariate and 5 functional classification problems are included. / GPL-2 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-ddm</a>      | 1.0_0   | A set of three two-census methods to the estimate the degree of death registration coverage for a population. Implemented methods include the Generalized Growth Balance method (GGB), the Synthetic Extinct Generation method (SEG), and a hybrid of the two, GGB-SEG. Each method offers automatic estimation, but users may also specify exact parameters or use a graphical interface to guess parameters in the traditional way if desired. / GPL-2   | noarch   |
| <a href="#">r-ddrtree</a>  | 0.1.5   | Provides an implementation of the framework of reversed graph embedding (RGE) which projects data into a reduced dimensional space while constructs a principal tree which passes through the middle of the data simultaneously. DDRTree shows superiority to alternatives (Wishbone, DPT) for inferring the ordering as well as the intrinsic structure of the single cell genomics data. In general, it could be used to reconstruct the temporal progression as well as bifurcation structure of any datatype. / Artistic-2.0                                       | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-deadband</a> | 0.1.0   | Statistical deadband algorithms are based on the Send-On-Delta concept as in Miskowicz(2006,<doi:10.3390/s6010049>). A collection of functions compare effectiveness and fidelity of sampled signals using statistical deadband algorithms. / GPL-2  | noarch   |
| <a href="#">r-deal</a>     | 1.2_3   | Bayesian networks with continuous and/or discrete variables can be learned and compared from data. The method is described in Boettcher and Dethlefsen (2003), <doi:10.18637/jss.v008.i20>. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |

Continued on next page

Table 51 – continued from previous page

| Name                       | Version | Summary/License  | Platforms   |
|----------------------------|---------|--|---|
| <a href="#">r-deamer</a>   | 1.0     | deamer provides deconvolution algorithms for the non-parametric estimation of the density $f$ of an error-prone variable $x$ with additive noise $e$ . The model is $y = x + e$ where the noisy variable $y$ is observed, while $x$ is unobserved. Estimation may be performed for i) a known density of the error ii) with an auxiliary sample of pure noise and iii) with an auxiliary sample of replicate (repeated) measurements. Estimation is performed using adaptive model selection and penalized contrasts. / GPL-3          | noarch  |
| <a href="#">r-debugme</a>  | 1.1.0   | Specify debug messages as special string constants, and control debugging of packages via environment variables. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-debugr</a>   | 0.0.1   | Tool to print out the value of R objects/expressions while running an R script. Outputs can be made dependent on user-defined conditions/criteria. Debug messages only appear when a global option for debugging is set. This way, 'debugr' code can even remain in the debugged code for later use without any negative effects during normal runtime. / GPL-3  | noarch  |
| <a href="#">r-decide</a>   | 1.2     | Calculates various estimates for measures of educational differentials, the relative importance of primary and secondary effects in the creation of such differentials and compares the estimates obtained from two datasets. / GPL-2  | noarch  |
| <a href="#">r-decido</a>   | 0.2.0   | Provides constrained triangulation of polygons. Ear cutting (or ear clipping) applies constrained triangulation by successively 'cutting' triangles from a polygon defined by path/s. Holes are supported by introducing a bridge segment between polygon paths. This package wraps the 'header-only' library 'earcut.hpp' < <a href="https://github.com/mapbox/earcut.hpp.git">https://github.com/mapbox/earcut.hpp.git</a> > which includes a reference to the method used by Held, M. (2001) <doi:10.1007/s00453-001-0028-4>. / MIT | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-decision</a> | 0.1.0   | Contains a function called dmur() which accepts four parameters like possible values, probabilities of the values, selling cost and preparation cost. The dmur() function generates various numeric decision parameters like MEMV (Maximum (optimum) expected monetary value), best choice, EPPI (Expected profit with perfect information), EVPI (Expected value of the perfect information), EOL (Expected opportunity loss), which facilitate effective decision-making. / GPL-2  | noarch  |
| <a href="#">r-decode</a>   | 1.2     | Integrated differential expression (DE) and differential co-expression (DC) analysis on gene expression data based on DECODE (Differential CO-expression and Differential Expression) algorithm. / GPL-3   | noarch  |
| <a href="#">r-decoder</a>  | 1.1.13  | Main function decode is used to decode coded key values to plain text. Function code can be used to code plain text to code if there is a 1:1 relation between the two. The concept relies on 'keyvalue' objects used for translation. There are several 'keyvalue' objects included in the areas of geographical regional codes, administrative health care unit codes, diagnosis codes and more. It is also easy to extend the use by arbitrary code sets. / GPL-2   | noarch  |

Table 51 – continued from previous page

| Name          | Version | Summary/License   | Platforms                      |
|---------------|---------|---|--------------------------------|
| r-decompr     | 4.5.0   | Two global-value-chain decompositions are implemented. Firstly, the Wang-Wei-Zhu (Wang, Wei, and Zhu, 2013) algorithm splits bilateral gross exports into 16 value-added components. Secondly, the Leontief decomposition (default) derives the value added origin of exports by country and industry, which is also based on Wang, Wei, and Zhu (Wang, Z., S.-J. Wei, and K. Zhu. 2013. Quantifying International Production Sharing at the Bilateral and Sector Levels.). / GPL-3   | noarch                         |
| r-decon       | 1.2_4   | This package contains a collection of functions to deal with nonparametric measurement error problems using deconvolution kernel methods. We focus two measurement error models in the package: (1) an additive measurement error model, where the goal is to estimate the density or distribution function from contaminated data; (2) nonparametric regression model with errors-in-variables. The R functions allow the measurement errors to be either homoscedastic or heteroscedastic. To make the deconvolution estimators computationally more efficient in R, we adapt the Fast Fourier Transform (FFT) algorithm for density estimation with error-free data to the deconvolution kernel estimation. Several methods for the selection of the data-driven smoothing parameter are also provided in the package. See details in: Wang, X.F. and Wang, B. (2011). Deconvolution estimation in measurement error models: The R package decon. Journal of Statistical Software, 39(10), 1-24. / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| r-deconvolver | 1.1     | Empirical Bayes methods for learning prior distributions from data. An unknown prior distribution (g) has yielded (unobservable) parameters, each of which produces a data point from a parametric exponential family (f). The goal is to estimate the unknown prior (g-modeling) by deconvolution and Empirical Bayes methods. / GPL-2   | noarch                         |
| r-deepboost   | 0.1.6   | Provides deep boosting models training, evaluation, predicting and hyper parameter optimising using grid search and cross validation. Based on Google's Deep Boosting algorithm, and Google's C implementation. Cortes, C., Mohri, M., & Syed, U. (2014) < <a href="http://machinelearning.wustl.edu/mlpapers/papers/icml2014c2_cortesb14">http://machinelearning.wustl.edu/mlpapers/papers/icml2014c2_cortesb14</a> >. / Apache License (== 2.0)   | linux-64,<br>osx-64,<br>win-64 |
| r-deepgmm     | 0.1.56  | Deep Gaussian mixture models as proposed by Viroli and McLachlan (2019) < <a href="https://doi.org/10.1007/s11222-017-9793-z">doi:10.1007/s11222-017-9793-z</a> > provide a generalization of classical Gaussian mixtures to multiple layers. Each layer contains a set of latent variables that follow a mixture of Gaussian distributions. To avoid overparameterized solutions, dimension reduction is applied at each layer by way of factor models. / GPL-3  | noarch                         |
| r-deepnet     | 0.2     | Implement some deep learning architectures and neural network algorithms, including BP,RBM,DBN,Deep autoencoder and so on. / GPL-3  | noarch                         |
| r-deepnn      | 0.3     | Implementation of some Deep Learning methods. Includes multilayer perceptron, different activation functions, regularisation strategies, stochastic gradient descent and dropout. Thanks go to the following references for helping to inspire and develop the package: Ian Goodfellow, Yoshua Bengio, Aaron Courville, Francis Bach (2016, ISBN:978-0262035613) Deep Learning. Table 51 – continued from previous page

| Name         | Version | Summary/License  | Platforms                      |
|--------------|---------|--|--------------------------------|
| r-deepr      | 0.1     | Tests for, and describe differences in event count profiles in groups of reconstructed cophylogenies / GPL-2   | noarch                         |
| r-default    | 1.0.0   | A simple syntax to change the default values for function arguments, whether they are in packages or defined locally. / MIT  | noarch                         |
| r-deformula  | 0.1.1   | Numerical quadrature of functions of one variable over a finite or infinite interval with double exponential formulas. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-deisotoper | 0.0.7   | Provides a low-level interface for a deisotoper container implemented in the 'Java' programming language and means of S3 helper functions for plotting and debugging isotopes of mass spectrometric data. The deisotoper algorithm detects and aggregates peaks which belong to the same isotopic cluster of a given mass spectrum. / GPL-3  | linux-64                       |
| r-delaporte  | 7.0.2   | Provides probability mass, distribution, quantile, random-variate generation, and method-of-moments parameter-estimation functions for the Delaporte distribution. The Delaporte is a discrete probability distribution which can be considered the convolution of a negative binomial distribution with a Poisson distribution. Alternatively, it can be considered a counting distribution with both Poisson and negative binomial components. It has been studied in actuarial science as a frequency distribution which has more variability than the Poisson, but less than the negative binomial. / BSD_2_clause                                 | linux-64,<br>osx-64,<br>win-64 |
| r-deldir     | 0.1_2   | Calculates the Delaunay triangulation and the Dirichlet or Voronoi tessellation (with respect to the entire plane) of a planar point set. Plots triangulations and tessellations in various ways. Clips tessellations to sub-windows. Calculates perimeters of tessellations. Summarises information about the tiles of the tessellation. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-delt       | 0.8.2   | We implement methods for estimating multivariate densities. We include a discretized kernel estimator, an adaptive histogram (a greedy histogram and a CART-histogram), stagewise minimization, and bootstrap aggregation. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-delta      | 0.2.0.2 | Measure of agreement delta was originally by Mart'ın & Femia (2004) <DOI:10.1348/000711004849268>. Since then has been considered as agreement measure for different fields, since their behavior is usually better than the usual kappa index by Cohen (1960) <DOI:10.1177/001316446002000104>. The main issue with delta is that can not be computed by hand contrary to kappa. The current algorithm is based on the Version 5 of the delta windows program that can be found on < <a href="https://www.ugr.es/~bioest/software/delta/cmd.php?seccion=downloads">https://www.ugr.es/~bioest/software/delta/cmd.php?seccion=downloads</a> >. / GPL-3 | noarch                         |
| r-deltaplotr | 1.6     | The deltaPlotR package implements Angoff's Delta Plot method to detect dichotomous DIF. Several detection thresholds are included, either from multivariate normality assumption or by prior determination. Item purification is supported (Magis and Facon (2014) <doi:10.18637/jss.v059.c01>). / GPL-2   | noarch                         |

Table 51 – continued from previous page

| Name           | Version | Summary/License   | Platforms |
|----------------|---------|---|-----------|
| r-deldtd       | 0.1.0   | It plots densities by using asymmetrical kernels which belong to life time distributions and calculate its related MSE. For details see Chen (2000), Jin and Kawczak (2003) and Salha et al. (2014) <doi:10.12988/pms.2014.4616>. / GPL-2   | noarch    |
| r-demetics     | 0.8.7   | This package allows to calculate the fixation index $G_{st}$ (Nei, 1973) and the differentiation index $D$ (Jost, 2008) pairwise between or averaged over several populations. P-values, stating the significance of differentiation, and 95 percent confidence intervals can be estimated using bootstrap resamplings. In the case that more than two populations are compared pairwise, the p-values are adjusted by bonferroni correction and in several other ways due to the multiple comparison from one data set. / GPL-2  | noarch    |
| r-deming       | 1.4     | Generalized Deming regression, Theil-Sen regression and Passing-Bablok regression functions. / LGPL-2   | noarch    |
| r-demogr       | 0.6.0   | Construction and analysis of matrix population models in R. / GPL-2   | noarch    |
| r-demokde      | 0.9.4   | Demonstration code showing how (univariate) kernel density estimates are computed, at least conceptually, and allowing users to experiment with different kernels, should they so wish. NOTE: the density function in the stats package should be used for computational efficiency. / GPL-2  | noarch    |
| r-demova       | 1.0     | Tool for the development of multi-linear QSPR/QSAR models (Quantitative structure-property/activity relationship). These models are used in chemistry, biology and pharmacy to find a relationship between the structure of a molecule and its property (such as activity, toxicology but also physical properties). The various functions of this package allows: selection of descriptors based of variances, intercorrelation and user expertise; selection of the best multi-linear regression in terms of correlation and robustness; methods of internal validation (Leave-One-Out, Leave-Many-Out, Y-scrumbling) and external using test sets. / GPL-2 | noarch    |
| r-dendroextras | 0.2.3   | Provides extra functions to manipulate dendrograms that build on the base functions provided by the 'stats' package. The main functionality it is designed to add is the ability to colour all the edges in an object of class 'dendrogram' according to cluster membership i.e. each subtree is coloured, not just the terminal leaves. In addition it provides some utility functions to cut 'dendrogram' and 'hclust' objects and to set/get labels. / GPL-2   | noarch    |
| r-dendsort     | 0.3.3   | An implementation of functions to optimize ordering of nodes in a dendrogram, without affecting the meaning of the dendrogram. A dendrogram can be sorted based on the average distance of subtrees, or based on the smallest distance value. These sorting methods improve readability and interpretability of tree structure, especially for tasks such as comparison of different distance measures or linkage types and identification of tight clusters and outliers. As a result, it also introduces more meaningful reordering for a coupled heatmap visualization. / GPL-2   GPL-3  | noarch    |
| r-denoiseq     | 0.1.1   | Given count data from two conditions, it determines which transcripts are differentially expressed across the two conditions using Bayesian inference of the parameters of a bottom-up model for PCR amplification. This model is developed in Ndifon Wilfred, Hilah Gal, Eric Shifrut, Rina Aharoni, Nissan Yissachar, Nir Waysbort, Shlomit Reich Zeliger, Ruth Arnon, and Nir Friedman (2012), < <a href="http://www.pnas.org/content/109/39/15865.full">http://www.pnas.org/content/109/39/15865.full</a> >, and results in a distribution for the counts that is a superposition of the binomial and negative binomial distribution. / GPL-2             | noarch    |

Table 51 – continued from previous page

| Name                          | Version | Summary/License   | Platforms   |
|-------------------------------|---------|---|---|
| <a href="#">r-denpro</a>      | 0.9.2   | We provide tools to (1) visualize multivariate density functions and density estimates with level set trees, (2) visualize level sets with shape trees, (3) visualize multivariate data with tail trees, (4) visualize scales of multivariate density estimates with mode graphs and branching maps, and (5) visualize anisotropic spread with 2D volume functions and 2D probability content functions. Level set trees visualize mode structure, shape trees visualize shapes of level sets of unimodal densities, and tail trees visualize connected data sets. The kernel estimator is implemented but the package may also be applied for visualizing other density estimates. / GPL-2 | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-denseflmm</a>   | 0.1.2   | Estimation of functional linear mixed models for densely sampled data based on functional principal component analysis. / GPL-2   | noarch  |
| <a href="#">r-densparcorr</a> | 1.1     | Provide a Dens-based method for estimating functional connection in large scale brain networks using partial correlation. / GPL-2   | noarch  |
| <a href="#">r-densratio</a>   | 0.2.1   | Density ratio estimation. The estimated density ratio function can be used in many applications such as anomaly detection, change-point detection, covariate shift adaptation. The implemented methods are uLSIF (Hido et al. (2011) <doi:10.1007/s10115-010-0283-2>), RuLSIF (Yamada et al. (2011) <doi:10.1162/NECO_a_00442>), and KLIEP (Sugiyama et al. (2007) <doi:10.1007/s10463-008-0197-x>). / MIT  | noarch  |
| <a href="#">r-denstrip</a>    | 1.5.4   | Graphical methods for compactly illustrating probability distributions, including density strips, density regions, sectioned density plots and varying width strips. / GPL-2  | noarch  |
| <a href="#">r-denvax</a>      | 0.1.1   | Provides the mathematical model described by Serostatus Testing & Dengue Vaccine Cost-Benefit Thresholds in <doi:10.1098/rsif.2019.0234>. Using the functions in the package, that analysis can be repeated using sample life histories, either synthesized from local seroprevalence data using other functions in this package (as in the manuscript) or from some other source. The package provides a vignette which walks through the analysis in the publication, as well as a function to generate a project skeleton for such an analysis. / MIT  | noarch  |
| <a href="#">r-deoptim</a>     | 2.2_4   | Implements the differential evolution algorithm for global optimization of a real-valued function of a real-valued parameter vector. / GPL-2  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-deoptimr</a>    | 1.0_8   | Differential Evolution (DE) stochastic algorithms for global optimization of problems with and without constraints. The aim is to curate a collection of its state-of-the-art variants that (1) do not sacrifice simplicity of design, (2) are essentially tuning-free, and (3) can be efficiently implemented directly in the R language. Currently, it only provides an implementation of the ‘jDE’ algorithm by Brest et al. (2006) <doi:10.1109/TEVC.2006.872133>. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name                                  | Version | Summary/License   | Platforms                      |
|---------------------------------------|---------|---|--------------------------------|
| <a href="#">r-depend.truncation</a>   | 3.0     | Estimation and testing methods for dependently truncated data. Semi-parametric methods are based on Emura et al. (2011)<Stat Sinica 21:349-67>, Emura & Wang (2012)<doi:10.1016/j.jmva.2012.03.012>, and Emura & Murotani (2015)<doi:10.1007/s11749-015-0432-8>. Parametric approaches are based on Emura & Konno (2012)<doi:10.1007/s00362-014-0626-2> and Emura & Pan (2017)<doi:10.1007/s00362-017-0947-z>. A regression approach is based on Emura & Wang (2016)<doi:10.1007/s10463-015-0526-9>. Quasi-independence tests are based on Emura & Wang (2010)<doi:10.1016/j.jmva.2009.07.006>. Right-truncated data for Japanese male centenarians are given by Emura & Murotani (2015)<doi:10.1007/s11749-015-0432-8>. / GPL-2      | noarch                         |
| <a href="#">r-deplogo</a>             | 1.0     | Plots dependency logos from a set of input sequences. / GPL-3   | noarch                         |
| <a href="#">r-deployrrserve</a>       | 9.0.0   | Rserve acts as a socket server (TCP/IP or local sockets) which allows binary requests to be sent to R. Every connection has a separate workspace and working directory. Client-side implementations are available for popular languages such as C/C and Java, allowing any application to use facilities of R without the need of linking to R code. Rserve supports remote connection, user authentication and file transfer. A simple R client is included in this package as well. / GPL version 2   | linux-64,<br>win-64            |
| <a href="#">r-depmix</a>              | 0.9.15  | Fits (multigroup) mixtures of latent or hidden Markov models on mixed categorical and continuous (timeseries) data. The Rdonlp2 package can optionally be used for optimization of the log-likelihood and is available from R-forge. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-depth.plot</a>          | 0.1     | Could be used to obtain spatial depths, spatial ranks and outliers of multivariate random variables. Could also be used to visualize DD-plots (a multivariate generalization of QQ-plots). / GPL-2  | noarch                         |
| <a href="#">r-depthtools</a>          | 0.4     | depthTools is a package that implements different statistical tools for the description and analysis of gene expression data based on the concept of data depth, namely, the scale curves for visualizing the dispersion of one or various groups of samples (e.g. types of tumors), a rank test to decide whether two groups of samples come from a single distribution and two methods of supervised classification techniques, the DS and TAD methods. All these techniques are based on the Modified Band Depth, which is a recent notion of depth with a low computational cost, what renders it very appropriate for high dimensional data such as gene expression data. / GPL-2  | noarch                         |
| <a href="#">r-dequer</a>              | 2.0_1   | Queues, stacks, and ‘deque’s are list-like, abstract data types. These are meant to be very cheap to grow, or insert new objects into. A typical use case involves storing data in a list in a streaming fashion, when you do not necessarily know how many elements need to be stored. Unlike R’s lists, the new data structures provided here are not necessarily stored contiguously, making insertions and deletions at the front/end of the structure much faster. The underlying implementation is new and uses a head/tail doubly linked list; thus, we do not rely on R’s environments or hashing. To avoid unnecessary data copying, most operations on these data structures are performed via side-effects. / BSD_2_clause | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-derezen-de.ferreira</a> | 0.1.0   | Modeling the zero coupon yield curve using the dynamic De Rezende and Ferreira (2011) <doi:10.1002/for.1256> five factor model with variable or fixed decaying parameters. For explanatory purposes, the package also includes various short datasets of interest rates for the BRICS countries. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name           | Version | Summary/License  | Platforms   |
|----------------|---------|--|---|
| r-deriv        | 3.8.5   | R-based solution for symbolic differentiation. It admits user-defined function as well as function substitution in arguments of functions to be differentiated. Some symbolic simplification is part of the work. / GPL-3  | noarch  |
| r-derivmks     | 0.2.4   | A set of pricing and expository functions that should be useful in teaching a course on financial derivatives. / MIT   | noarch  |
| r-des          | 1.0.0   | Discrete event simulation (DES) involves modeling of systems having discrete, i.e. abrupt, state changes. For instance, when a job arrives to a queue, the queue length abruptly increases by 1. This package is an R implementation of the event-oriented approach to DES; see the tutorial in Matloff (2008) < <a href="http://heather.cs.ucdavis.edu/~matloff/156/PLN/DESimIntro.pdf">http://heather.cs.ucdavis.edu/~matloff/156/PLN/DESimIntro.pdf</a> >. / MIT                    | noarch  |
| r-desc         | 1.2.0   | Tools to read, write, create, and manipulate DESCRIPTION files. It is intended for packages that create or manipulate other packages. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-descomponer  | 1.5     | Decompose a time series into seasonal, trend and irregular components using transformations to amplitude-frequency domain. / GPL-2   | noarch  |
| r-desscr       | 1.1.4   | Weighted frequency and contingency tables of categorical variables and of the comparison of the mean value of a numerical variable by the levels of a factor, and methods to produce xtable objects of the tables and to plot them. There are also functions to facilitate the character encoding conversion of objects, to quickly convert fixed width files into csv ones, and to export a data.frame to a text file with the necessary R and SPSS codes to reread the data. / GPL-2 | linux-64,<br>osx-64,<br>win-64                                    |
| r-describer    | 0.2.0   | Allows users to quickly and easily describe data using common descriptive statistics. / MIT  | noarch  |
| r-designgg     | 1.1     | The package provides R scripts for designing genetical genomics experiments. / GPL-3   | noarch  |
| r-designlmm    | 0.1.0   | Use simulated annealing to find optimal designs for Poisson regression models with blocks. / GPL-3   | noarch  |
| r-desir        | 1.2.1   | Functions for (1) ranking, selecting, and prioritising genes, proteins, and metabolites from high dimensional biology experiments, (2) multivariate hit calling in high content screens, and (3) combining data from diverse sources. / GPL-3  | noarch  |
| r-desirability | 2.1     | S3 classes for multivariate optimization using the desirability function by Derriinger and Suich (1980). / GPL-2   | noarch  |
| r-desnowball   | 1.0     | This package implements a statistical data mining method to compare whole genome gene expression profiles, with respect to the presence of a recurrent genetic disturbance event, to identify the affected target genes. / GPL-3   | noarch  |

Table 51 – continued from previous page

| Name        | Version | Summary/License  | Platforms                      |
|-------------|---------|--|--------------------------------|
| r-desolve   | 1.24    | Functions that solve initial value problems of a system of first-order ordinary differential equations ('ODE'), of partial differential equations ('PDE'), of differential algebraic equations ('DAE'), and of delay differential equations. The functions provide an interface to the FORTRAN functions 'lsoda', 'lsodar', 'lsode', 'lsodes' of the 'ODEPACK' collection, to the FORTRAN functions 'dvide', 'zvode' and 'daspk' and a C-implementation of solvers of the 'Runge-Kutta' family with fixed or variable time steps. The package contains routines designed for solving 'ODEs' resulting from 1-D, 2-D and 3-D partial differential equations ('PDE') that have been converted to 'ODEs' by numerical differencing. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-det       | 2.0.1   | Builds both ROC (Receiver Operating Characteristic) and DET (Detection Error Tradeoff) curves from a set of predictors, which are the results of a binary classification system. The curves give a general vision of the performance of the classifier, and are useful for comparing performance of different systems. / GPL-2   | noarch                         |
| r-detector  | 0.1.0   | Allows users to quickly and easily detect data containing Personally Identifiable Information (PII) through convenience functions. / MIT   | noarch                         |
| r-detestset | 1.1.6   | Solvers and test set for stiff and non-stiff differential equations, and differential algebraic equations. 'Mazzia, F., Cash, J.R. and K. Soetaert, 2012. DOI: 10.1016/j.cam.2012.03.014'. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-detmcd    | 0.0.5   | Implementation of DetMCD, a new algorithm for robust and deterministic estimation of location and scatter. The benefits of robust and deterministic estimation are explained in Hubert, Rousseeuw and Verdonck (2012) <doi:10.1080/10618600.2012.672100>. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-detpack   | 1.1.3   | Density estimation for possibly large data sets and conditional/unconditional random number generation or bootstrapping with distribution element trees. The function 'det.construct' translates a dataset into a distribution element tree. To evaluate the probability density based on a previously computed tree at arbitrary query points, the function 'det.query' is available. The functions 'det1' and 'det2' provide density estimation and plotting for one- and two-dimensional datasets. Conditional/unconditional smooth bootstrapping from an available distribution element tree can be performed by 'det.rnd'. For more details on distribution element trees, see: Meyer, D.W. (2016) <arXiv:1610.00345> or Meyer, D.W., Statistics and Computing (2017) <doi:10.1007/s11222-017-9751-9> and Meyer, D.W. (2017) <arXiv:1711.04632> or Meyer, D.W., Journal of Computational and Graphical Statistics (2018) <doi:10.1080/10618600.2018.1482768>. / GPL-2 | noarch                         |
| r-detr      | 0.0.5   | DetLTS, DetMM (and DetS) Algorithms for Deterministic, Robust Linear Regression. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                       | Version | Summary/License   | Platforms   |
|----------------------------|---------|---|---|
| <a href="#">r-detsel</a>   | 1.0.3   | In the new era of population genomics, surveys of genetic polymorphism (genome scans) offer the opportunity to distinguish locus-specific from genome wide effects at many loci. Identifying presumably neutral regions of the genome that are assumed to be influenced by genome-wide effects only, and excluding presumably selected regions, is therefore critical to infer population demography and phylogenetic history reliably. Conversely, detecting locus-specific effects may help identify those genes that have been, or still are, targeted by natural selection. The software package DetSel has been developed to identify markers that show deviation from neutral expectation in pairwise comparisons of diverging populations. / GPL-2 | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-devemf</a>   | 3.6_3   | Output graphics to EMF/EMF. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-devfunc</a>  | 0.1     | A concise check of the format of one or multiple input arguments (data type, length or value) is provided. Since multiple input arguments can be tested simultaneously, a lengthy list of checks at the beginning of your function can be avoided, hereby enhancing the readability and maintainability of your code. / GPL-3   | noarch  |
| <a href="#">r-devoid</a>   | 0.1.0   | Provides a non-drawing graphic device for benchmarking purpose. In order to properly benchmark graphic drawing code it is necessary to factor out the device implementation itself so that results are not related to the specific graphics device used during benchmarking. The 'devoid' package implements a graphic device that accepts all the required calls from R's graphic engine but performs no action. Apart from benchmarking it is unlikely that this device has any practical use. / MIT  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-devore7</a>  | 0.7.6   | Data sets and sample analyses from Jay L. Devore (2008), Probability and Statistics for Engineering and the Sciences (7th ed), Thomson. / GPL-2   | noarch  |
| <a href="#">r-devrate</a>  | 0.1.10  | A set of functions to quantify the relationship between development rate and temperature and to build phenological models. The package comprises a set of models and estimated parameters borrowed from a literature review in ectotherms. The methods and literature review are described in Rebaudo et al. (2018) <doi:10.1111/2041-210X.12935> and Rebaudo and Rabhi (2018) <doi:10.1111/eea.12693>. An example can be found in Rebaudo et al. (2017) <doi:10.1007/s13355-017-0480-5>. / GPL-2   | noarch  |
| <a href="#">r-devtools</a> | 2.0.2   | Collection of package development tools. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-df2json</a>  | 0.0.2   | It handles numerics, characters, factors, and logicals. / GPL-3   | noarch  |

Table 51 – continued from previous page

| Name        | Version | Summary/License  | Platforms                      |
|-------------|---------|--|--------------------------------|
| r-dfadjust  | 1.0.0   | Computes small-sample degrees of freedom adjustment for heteroskedasticity robust standard errors, and for clustered standard errors in linear regression. See Imbens and Kolesár (1994) <doi:10.1162/REST_a_00552> for a discussion of these adjustments. / MIT   | noarch                         |
| r-dfcomb    | 3.0.0   | Phase I/II adaptive dose-finding design for combination studies where toxicity rates are supposed to increase with both agents. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-dfcompare | 1.0.0   | Compares two dataframes with a common key and returns the delta records. The package will return three dataframes that contain the added, changed, and deleted records. / GPL-3  | noarch                         |
| r-dferm     | 0.2.2   | Provides functions to run the CRM and TITE-CRM in phase I trials and calibration tools for trial planning purposes. / GPL-2  | noarch                         |
| r-dfmta     | 1.7.0   | Phase I/II adaptive dose-finding design for single-agent Molecularly Targeted Agent (MTA), according to the paper Phase I/II Dose-Finding Design for Molecularly Targeted Agent: Plateau Determination using Adaptive Randomization, Riviere Marie-Karelle et al. (2016) <doi:10.1177/0962280216631763>. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-dfoptim   | 2018.1  | Derivative-Free optimization algorithms. These algorithms do not require gradient information. More importantly, they can be used to solve non-smooth optimization problems. / GPL-2   | noarch                         |
| r-dfphase1  | 1.1.1   | Statistical methods for retrospectively detecting changes in location and/or dispersion of univariate and multivariate variables. Data values are assumed to be independent, can be individual (one observation at each instant of time) or subgrouped (more than one observation at each instant of time). Control limits are computed, often using a permutation approach, so that a prescribed false alarm probability is guaranteed without making any parametric assumptions on the stable (in-control) distribution. / LGPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-dga       | 1.2     | Performs Bayesian model averaging for capture-recapture. This includes code to stratify records, check the strata for suitable overlap to be used for capture-recapture, and some functions to plot the estimated population size. / GPL-2   | noarch                         |
| r-dglars    | 2.1.2   | Differential geometric least angle regression method for fitting sparse generalized linear models. In this version of the package, the user can fit models specifying Gaussian, Poisson, Binomial, Gamma and Inverse Gaussian family. Furthermore, several link functions can be used to model the relationship between the conditional expected value of the response variable and the linear predictor. The solution curve can be computed using an efficient predictor-corrector or a cyclic coordinate descent algorithm, as described in the paper linked to via the URL below. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-dgmb      | 1.2     | A set of functions have been implemented to generate random data to perform Monte Carlo simulations on structural models with formative constructs and interaction and nonlinear effects (Two-Step PLS Mode B structural models). The setup of the true model considers a simple structure with three formative exogenous constructs related to one formative endogenous construct. The routines take into account the interaction and nonlinear effects of the exogenous constructs on the endogenous construct. / GPL-2  | noarch                         |
| r-dgodata   | 0.0.2   | Provides data used by package ‘dgo’ in examples and vignettes. / GPL-3   | noarch                         |

| Name                         | Version | Summary/License   | Platforms   |
|------------------------------|---------|---|---|
| <a href="#">r-dgof</a>       | 1.2     | This package contains a proposed revision to the <code>stats::ks.test()</code> function and the associated <code>ks.test.Rd</code> help page. With one minor exception, it does not change the existing behavior of <code>ks.test()</code> , and it adds features necessary for doing one-sample tests with hypothesized discrete distributions. The package also contains <code>cvm.test()</code> , for doing one-sample Cramer-von Mises goodness-of-fit tests. / GPL (>= 2.0)  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-dhh</a>        | 0.0.1   | The density, cumulative distribution, quantiles, and i.i.d random variables of a heavy-headed distribution. For more information, please see the vignette. / GPL-2  | noarch  |
| <a href="#">r-dhsic</a>      | 2.1     | Contains an implementation of the d-variable Hilbert Schmidt independence criterion and several hypothesis tests based on it, as described in Pfister et al. (2017) <doi:10.1111/rssb.12235>. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-di</a>         | 1.1.4   | A set of utilities for calculating the Deficit (frailty) Index (DI) in gerontological studies. The deficit index was first proposed by Arnold Mitnitski and Kenneth Rockwood and represents a proxy measure of aging and also can be served as a sensitive predictor of survival. For more information, see (i) Accumulation of Deficits as a Proxy Measure of Aging by Arnold B. Mitnitski et al. (2001), The Scientific World Journal 1, <DOI:10.1100/tsw.2001.58>; (ii) Frailty, fitness and late-life mortality in relation to chronological and biological age by Arnold B Mitnitski et al. (2001), BMC Geriatrics 2002 2(1), <DOI:10.1186/1471-2318-2-1>. / GPL-3 | noarch  |
| <a href="#">r-diagonals</a>  | 0.4.0   | Several tools for handling block-matrix diagonals and similar constructs are implemented. Block-diagonal matrices can be extracted or removed using two small functions implemented here. In addition, non-square matrices are supported. Block diagonal matrices occur when two dimensions of a data set are combined along one edge of a matrix. For example, trade-flow data in the ‘decompr’ and ‘gvc’ packages have each country-industry combination occur along both edges of the matrix. / GPL-3  | noarch  |
| <a href="#">r-diagrammer</a> | 1.0.1   | Build graph/network structures using functions for stepwise addition and deletion of nodes and edges. Work with data available in tables for bulk addition of nodes, edges, and associated metadata. Use graph selections and traversals to apply changes to specific nodes or edges. A wide selection of graph algorithms allow for the analysis of graphs. Visualize the graphs and take advantage of any aesthetic properties assigned to nodes and edges. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-dialr</a>      | 0.3.0   | Parse, format, and validate international phone numbers using Google’s ‘libphonenumber’ java library, < <a href="https://github.com/google/libphonenumber">https://github.com/google/libphonenumber</a> >. / GPL-3  | noarch  |
| <a href="#">r-dialrjars</a>  | 8.10.1  | Collects ‘libphonenumber’ jars required for the ‘dialr’ package. / GPL-3  | noarch  |
| <a href="#">r-diaplt</a>     | 1.3.0   | Visualize one-factor data frame. Beads plot consists of diamonds of each factor of each data series. A diamond indicates average and range. Look over a data frame with many numeric columns and a factor column. / MIT (FOSS)  | noarch  |

| Name              | Version | Summary/License   | Platforms   |
|-------------------|---------|---|---|
| r-dice            | 1.2     | This package provides utilities to calculate the probabilities of various dice-rolling events, such as the probability of rolling a four-sided die six times and getting a 4, a 3, and either a 1 or 2 among the six rolls (in any order); the probability of rolling two six-sided dice three times and getting a 10 on the first roll, followed by a 4 on the second roll, followed by anything but a 7 on the third roll; or the probabilities of each possible sum of rolling five six-sided dice, dropping the lowest two rolls, and summing the remaining dice. / GPL-2 | noarch  |
| r-dicedesign      | 1.8_1   | Space-Filling Designs and Uniformity Criteria. / GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| r-diceeval        | 1.4     | Estimation, validation and prediction of models of different types : linear models, additive models, MARS, PolyMARS and Kriging. / GPL-3  | noarch  |
| r-dicekriging     | 1.5.6   | Estimation, validation and prediction of kriging models. Important functions : km, print.km, plot.km, predict.km. / GPL-2   GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| r-dichromat       | 2.0_0   | Collapse red-green or green-blue distinctions to simulate the effects of different types of color-blindness. / GPL-2  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-dicionariosibge | 1.6     | This package contains the dictionaries for reading microdata from IBGE (Brazilian Institute of Geography and Statistics) surveys PNAD, PME and POF. / GPL-2   | noarch  |
| r-didacticboost   | 0.1.1   | A basic, clear implementation of tree-based gradient boosting designed to illustrate the core operation of boosting models. Tuning parameters (such as stochastic subsampling, modified learning rate, or regularization) are not implemented. The only adjustable parameter is the number of training rounds. If you are looking for a high performance boosting implementation with tuning parameters, consider the 'xgboost' package. / GPL-3  | noarch  |
| r-dielectric      | 0.2.3   | Physical constants. Gold, silver and glass permittivities, together with spline interpolation functions. / GPL-3  | noarch  |
| r-diezeit         | 0.1_0   | A wrapper for the ZEIT ONLINE Content API, available at < <a href="http://developer.zeit.de">http://developer.zeit.de</a> >. 'diezeit' gives access to articles and corresponding metadata from the ZEIT archive and from ZEIT ONLINE. A personal API key is required for usage. / MIT  | noarch  |

| Name                         | Version | Summary/License   | Platforms                      |
|------------------------------|---------|---|--------------------------------|
| <a href="#">r-difconet</a>   | 1.0.4   | Estimation of DIFFerential COexpressed NETworks using diverse and user metrics. This package is basically used for three functions related to the estimation of differential coexpression. First, to estimate differential coexpression where the coexpression is estimated, by default, by Spearman correlation. For this, a metric to compare two correlation distributions is needed. The package includes 6 metrics. Some of them needs a threshold. A new metric can also be specified as a user function with specific parameters (see difconet.run). The significance is be estimated by permutations. Second, to generate datasets with controlled differential correlation data. This is done by either adding noise, or adding specific correlation structure. Third, to show the results of differential correlation analyses. Please see < <a href="http://bioinformatica.mty.itesm.mx/difconet">http://bioinformatica.mty.itesm.mx/difconet</a> > for further information. / GPL-2 | noarch                         |
| <a href="#">r-diffec</a>     | 1.1.0   | This is an R implementation of Fast and Scalable Learning of Sparse Changes in High-Dimensional Gaussian Graphical Model Structure (DIFFEE). The DIFFEE algorithm can be used to fast estimate the differential network between two related datasets. For instance, it can identify differential gene network from datasets of case and control. By performing data-driven network inference from two high-dimensional data sets, this tool can help users effectively translate two aggregated data blocks into knowledge of the changes among entities between two Gaussian Graphical Model. Please run demo(diffecDemo) to learn the basic functions provided by this package. For further details, please read the original paper: Beilun Wang, Arshdeep Sekhon, Yanjun Qi (2018) <arXiv:1710.11223>. / GPL-2   | noarch                         |
| <a href="#">r-diffmeshgp</a> | 0.1.0   | This R function implements the nonstationary Kriging model proposed by Tuo, Wu and Yu (2014) <DOI:10.1080/00401706.2013.842935> for analyzing multi-fidelity computer outputs. This function computes the maximum likelihood estimates for the model parameters as well as the predictive means and variances of the exact solution (i.e., the conceptually highest fidelity). / GPL-2  | noarch                         |
| <a href="#">r-diffobj</a>    | 0.2.3   | Generate a colored diff of two R objects for an intuitive visualization of their differences. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-diffpriv</a>   | 0.4.2   | An implementation of major general-purpose mechanisms for privatizing statistics, models, and machine learners, within the framework of differential privacy of Dwork et al. (2006) <doi:10.1007/11681878_14>. Example mechanisms include the Laplace mechanism for releasing numeric aggregates, and the exponential mechanism for releasing set elements. A sensitivity sampler (Rubinstein & Alda, 2017) <arXiv:1706.02562> permits sampling target non-private function sensitivity; combined with the generic mechanisms, it permits turn-key privatization of arbitrary programs. / MIT   | noarch                         |
| <a href="#">r-diffr</a>      | 0.1     | An R interface to the 'codediff' JavaScript library (a copy of which is included in the package, see < <a href="https://github.com/danvk/codediff.js">https://github.com/danvk/codediff.js</a> > for information). Allows for visualization of the difference between 2 files, usually text files or R scripts, in a browser. / GPL-2   | noarch                         |

Table 51 – continued from previous page

| Name         | Version | Summary/License   | Platforms  |
|--------------|---------|---|--|
| r-diffusr    | 0.1.4   | Implementation of network diffusion algorithms such as heat diffusion or Markov random walks. Network diffusion algorithms generally spread information in the form of node weights along the edges of a graph to other nodes. These weights can for example be interpreted as temperature, an initial amount of water, the activation of neurons in the brain, or the location of a random surfer in the internet. The information (node weights) is iteratively propagated to other nodes until a equilibrium state or stop criterion occurs. / GPL-3 | linux-64,<br>osx-64,<br>win-64                         |
| r-digest     | 0.6.18  | Implementation of a function 'digest()' for the creation of hash digests of arbitrary R objects (using the 'md5', 'sha-1', 'sha-256', 'crc32', 'xxhash' and 'murmurhash' algorithms) permitting easy comparison of R language objects, as well as a function 'hmac()' to create hash-based message authentication code. Please note that this package is not meant to be deployed for cryptographic purposes for which more comprehensive (and widely tested) libraries such as 'OpenSSL' should be used. / GPL (>= 2)                                  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-digitalpcr | 1.1.0   | The assay sensitivity is the minimum number of copies that the digital PCR assay can detect. Users provide serial dilution results in the format of counts of positive and total reaction wells. The output is the estimated assay sensitivity and the copy number per well in the initial dilute. / GPL-2  | noarch   |
| r-dils       | 0.8.1   | Combine multiple-relationship networks into a single weighted network. The approach is similar to factor analysis in the that contribution from each constituent network varies so as to maximize the information gleaned from the multiple-relationship networks. This implementation uses Principal Component Analysis calculated using 'prcomp' with bootstrap subsampling. Missing links are imputed using the method of Chen et al. (2012). / MIT  | linux-64,<br>osx-64,<br>win-64                         |
| r-dime       | 1.2     | A robust differential identification method that considers an ensemble of finite mixture models combined with a local false discovery rate (fdr) to analyze ChIP-seq (high-throughput genomic) data comparing two samples allowing for flexible modeling of data. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| r-dimred     | 0.2.2   | A collection of dimensionality reduction techniques from R packages and provides a common interface for calling the methods. / GPL-3   file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-dinamic    | 1.0     | This function implements the DiNAmIC procedure for assessing the statistical significance of recurrent DNA copy number aberrations (Bioinformatics (2011) 27(5) 678 - 685). / GPL-2   | noarch   |
| r-dint       | 2.1.0   | S3 classes and methods to create and work with year-quarter, year-month and year-isoweek vectors. Basic arithmetic operations (such as adding and subtracting) are supported, as well as formatting and converting to and from standard R date types. / MIT   | noarch   |

Table 51 – continued from previous page

| Name                    | Version    | Summary/License  | Platforms                      |
|-------------------------|------------|--|--------------------------------|
| r-diphiseq              | 0.2.0      | Implements the algorithm described in Jun Li and Alicia T. Lamere, DiPhiSeq: Robust comparison of expression levels on RNA-Seq data with large sample sizes (Unpublished). Detects not only genes that show different average expressions (differential expression, DE), but also genes that show different diversities of expressions in different groups (differentially dispersed, DD). DD genes can be important clinical markers. ‘DiPhiSeq’ uses a redescending penalty on the quasi-likelihood function, and thus has superior robustness against outliers and other noise. Updates from version 0.1.0: (1) Added the option of using adaptive initial value for phi. (2) Added a function for estimating the proportion of outliers in the data. (3) Modified the input parameter names for clarity, and modified the output format for the main function. / GPL-3 | noarch                         |
| r-diptest               | 0.75       | Compute Hartigan’s dip test statistic for unimodality / multimodality and provide a test with simulation based p-values, where the original public code has been corrected. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-direct                | 1.0.1      | A Bayesian clustering method for replicated time series or replicated measurements from multiple experimental conditions, e.g., time-course gene expression data. It estimates the number of clusters directly from the data using a Dirichlet-process prior. See Fu, A. Q., Russell, S., Bray, S. and Tavare, S. (2013) Bayesian clustering of replicated time-course gene expression data with weak signals. The Annals of Applied Statistics. 7(3) 1334-1361. <doi:10.1214/13-AOAS650>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-directedclustering    | 0.1.1      | Allows the computation of clustering coefficients for directed and weighted networks by using different approaches. It allows to compute clustering coefficients that are not present in ‘igraph’ package. A description of clustering coefficients can be found in Directed clustering in weighted networks: a new perspective, Clemente, G.P., Grassi, R. (2017), <doi:10.1016/j.chaos.2017.12.007>. / GPL-3   | noarch                         |
| r-directeffects         | 0.2        | A set of functions to estimate the controlled direct effect of treatment fixing a potential mediator to a specific value. Implements the sequential g-estimation estimator described in Vansteelandt (2009) <doi:10.1097/EDE.0b013e3181b6f4c9> and Acharya, Blackwell, and Sen (2016) <doi:10.1017/S0003055416000216>. / GPL-2   | noarch                         |
| r-directlabels          | 2018.05.22 | Extensible framework for automatically placing direct labels onto multi-color ‘lattice’ or ‘ggplot2’ plots. Label positions are described using Positioning Methods which can be re-used across several different plots. There are heuristics for examining trellis and ggplot objects and inferring an appropriate Positioning Method. / GPL-3  | noarch                         |
| r-directstandardisation | 1.2        | Calculate adjusted means and proportions of a variable by groups defined by another variable by direct standardisation, standardised to the structure of the dataset. / GPL-2  | noarch                         |
| r-dirmult               | 0.1.3      | Estimate parameters in Dirichlet-Multinomial and compute profile log-likelihoods. / GPL-2  | noarch                         |

|-------------------|---------|---|--------------------------------|
| r-discfrail       | 0.1     | Functions for fitting Cox proportional hazards models for grouped time-to-event data, where the shared group-specific frailties have a discrete nonparametric distribution. The methods proposed in the package is described by Gasperoni, F., Ieva, F., Paganoni, A. M., Jackson, C. H., Sharples, L. (2018) <doi:10.1093/biostatistics/kxy071>. There are also functions for simulating from these models, with a nonparametric or a parametric baseline hazard function. / GPL-3   | noarch                         |
| r-disclap         | 1.5     | Discrete Laplace exponential family for models such as a generalized linear model / GPL-2   | noarch                         |
| r-disclapmix      | 1.7.3   | Make inference in a mixture of discrete Laplace distributions using the EM algorithm. This can e.g. be used for modelling the distribution of Y chromosomal haplotypes as described in [1, 2] (refer to the URL section). / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-discretefdr     | 1.3_1   | Multiple testing procedures described in the paper Döhler, Durand and Roquain (2018) New FDR bounds for discrete and heterogeneous tests <doi:10.1214/18-EJS1441>. The main procedures of the paper (HSU and HSD), their adaptive counterparts (AHSU and AHSD), and the HBR variant are available and are coded to take as input a set of observed p-values and their discrete support under the null. A function to compute such p-values and supports for Fisher's exact tests is also provided, along with a wrapper allowing to apply discrete procedures directly from contingency tables. / MIT | linux-64,<br>osx-64,<br>win-64 |
| r-discretelaplace | 1.1.1   | Probability mass function, distribution function, quantile function, random generation and estimation for the skew discrete Laplace distributions. / GPL-3  | noarch                         |
| r-discretemput    | 0.1_2   | Multiple testing procedures for discrete test statistics, that use the known discrete null distribution of the p-values for simultaneous inference. / GPL-2   | noarch                         |
| r-discreteurv     | 1.2.2   | Create, manipulate, transform, and simulate from discrete random variables. The syntax is modeled after that which is used in mathematical statistics and probability courses, but with powerful support for more advanced probability calculations. This includes the creation of joint random variables, and the derivation and manipulation of their conditional and marginal distributions. / GPL-3   | noarch                         |
| r-discretization  | 1.0_1   | This package is a collection of supervised discretization algorithms. It can also be grouped in terms of top-down or bottom-up, implementing the discretization algorithms. / GPL-3   | noarch                         |
| r-discriminer     | 0.1_2   | Functions for Discriminant Analysis and Classification purposes covering various methods such as descriptive, geometric, linear, quadratic, PLS, as well as qualitative discriminant analyses / GPL-3   | noarch                         |
| r-discsurv        | 1.4.0   | Provides data transformations, estimation utilities, predictive evaluation measures and simulation functions for discrete time survival analysis. / GPL-3   | noarch                         |
| r-diseasemapping  | 1.4.6   | Formatting of population and case data, calculation of Standardized Incidence Ratios, and fitting the BYM model using INLA. / GPL-3   | noarch                         |
| r-dishet          | 1.0.0   | Model cell type heterogeneity of bulk renal cell carcinoma. The observed gene expression in bulk tumor sample is modeled by a log-normal distribution with the location parameter structured as a linear combination of the component-specific gene expressions. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name                   | Version | Summary/License  | Platforms                      |
|------------------------|---------|--|--------------------------------|
| r-dismo                | 1.1.4   | Functions for species distribution modeling, that is, predicting entire geographic distributions from occurrences at a number of sites and the environment at these sites. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-disparityfilter      | 2.2.3   | The disparity filter algorithm is a network reduction technique to identify the ‘backbone’ structure of a weighted network without destroying its multi-scale nature. The algorithm is documented in M. Angeles Serrano, Marian Boguna and Alessandro Vespignani in Extracting the multiscale backbone of complex weighted networks, Proceedings of the National Academy of Sciences 106 (16), 2009. This implementation of the algorithm supports both directed and undirected networks. / GPL-2  | noarch                         |
| r-displayhts           | 1.0     | A package containing R functions for displaying data and results from high-throughput screening experiments. / GPL-2   | noarch                         |
| r-dispmmod             | 1.2     | Functions for estimating Gaussian dispersion regression models (Aitkin, 1987 <doi:10.2307/2347792>), overdispersed binomial logit models (Williams, 1987 <doi:10.2307/2347977>), and overdispersed Poisson log-linear models (Breslow, 1984 <doi:10.2307/2347661>), using a quasi-likelihood approach. / GPL-2   | noarch                         |
| r-disposables          | 1.0.3   | Create disposable R packages for testing. You can create, install and load multiple R packages with a single function call, and then unload, uninstall and destroy them with another function call. This is handy when testing how some R code or an R package behaves with respect to other packages. / MIT   | noarch                         |
| r-dissutils            | 1.0     | This package has extensible C code for computing dissimilarities between vectors. It also has a number of C functions for assembling collections of dissimilarities. In particular, it lets you find a matrix of dissimilarities between the rows of two input matrices. There are also functions for finding the nearest neighbors of each row of a matrix, either within the matrix itself or within another matrix. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-distance.sample.size | 0.0     | Calculates the study size (either number of detections, or proportion of region that should be covered) to achieve a target precision for the estimated abundance. The calculation allows for the penalty due to unknown detection function, and for overdispersion. The user must specify a guess at the true detection function. / GPL-2   GPL-3   | noarch                         |
| r-distances            | 0.1.7   | Provides tools for constructing, manipulating and using distance metrics. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-distcomp             | 1.0.1   | Implementing algorithms and fitting models when sites (possibly remote) share computation summaries rather than actual data over HTTP with a master R process (using ‘opencpu’, for example). A stratified Cox model and a singular value decomposition are provided. The former makes direct use of code from the R ‘survival’ package. (That is, the underlying Cox model code is derived from that in the R ‘survival’ package.) Sites may provide data via several means: CSV files, Redcap API, etc. An extensible design allows for new methods to be added in the future. Web applications are provided (via ‘shiny’) for the implemented methods to help in designing and deploying the computations. / LGPL-2 | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                | Version | Summary/License   | Platforms                      |
|---------------------|---------|---|--------------------------------|
| r-distcrete         | 1.0.3   | Creates discretised versions of continuous distribution functions by mapping continuous values to an underlying discrete grid, based on a (uniform) frequency of discretisation, a valid discretisation point, and an integration range. For a review of discretisation methods, see Chakraborty (2015) <doi:10.1186/s40488-015-0028-6>. / MIT  | noarch                         |
| r-distdrawr         | 0.1.3   | Download data from the FlorKart database of the floristic field mapping in Germany in a convenient way. The database incorporates distribution data for plants in Germany on the basis of quadrants on a topographical map with a resolution of 1 : 25000 (TK 25). The data is owned and provided by the German Federal Agency for Nature Conservation (BfN) and the Network Phytodiversity in Germany (NetPhyD). For further information please visit < <a href="http://www.floraweb.de/pflanzenarten/hintergrundtexte_florkart_organisation.html">http://www.floraweb.de/pflanzenarten/hintergrundtexte_florkart_organisation.html</a> >. The author of this package is in no way associated with the BfN or NetPhyD. / GPL-2 | noarch                         |
| r-distfree.cr       | 1.5.1   | Constructs confidence regions without the need to know the sampling distribution of bivariate data. The method was proposed by Zhiqiu Hu & Rong-cai Yang (2013) <doi:10.1371/journal.pone.0081179.g001>. / GPL-2  | noarch                         |
| r-distillery        | 1.0_6   | Some very simple method functions for confidence interval calculation, bootstrap resampling, and to distill pertinent information from a potentially complex object; primarily used in common with packages extRemes and SpatialVx. / GPL-2   | noarch                         |
| r-distory           | 1.4.3   | Geodesic distance between phylogenetic trees and associated functions. / BSD  | linux-64,<br>osx-64,<br>win-64 |
| r-distrib           | 1.0     | A different way for calculating pdf/pmf, cdf, quantile and random data such that the user is able to consider the name of related distribution as an argument and so easily can be changed by a changing argument by user. It must be mentioned that the core and computation base of package 'DISTRIB' is package 'stats'. Although similar functions are introduced previously in package 'stats', but the package 'DISTRIB' has some special applications in some special computational programs. / LGPL-3   | noarch                         |
| r-distributions3    | 0.1.1   | Tools to create and manipulate probability distributions using S3. Generics random(), pdf(), cdf() and quantile() provide replacements for base R's r/d/p/q style functions. Functions and arguments have been named carefully to minimize confusion for students in intro stats courses. The documentation for each distribution contains detailed mathematical notes. / MIT   | noarch                         |
| r-distributiontest  | 1.0     | Provides new types of omnibus tests which are generally much more powerful than traditional tests (including the Kolmogorov-Smirnov, Cramer-von Mises and Anderson-Darling tests), see Zhang (2002) <doi:10.1111/1467-9868.00337>. / GPL-3  | noarch                         |
| r-distributionutils | 0.6_0   | Utilities are provided which are of use in the packages I have developed for dealing with distributions. Currently these packages are GeneralizedHyperbolic, VarianceGamma, and SkewHyperbolic and NormalLaplace. Each of these packages requires DistributionUtils. Functionality includes sample skewness and kurtosis, log-histogram, tail plots, moments by integration, changing the point about which a moment is calculated, functions for testing distributions using inversion tests and the Massart inequality. Also includes an implementation of the incomplete Bessel K function. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

| Name        | Version | Summary/License   | Platforms                      |
|-------------|---------|---|--------------------------------|
| r-disttools | 0.1.7   | Provides convenient methods for accessing the data in ‘dist’ objects with minimal memory and computational overhead. ‘disttools’ can be used to extract the distance between any pair or combination of points encoded by a ‘dist’ object using only the indices of those points. This is an improvement over existing functionality, which requires either coercing a ‘dist’ object into a matrix or calculating the one dimensional index corresponding to a pair of observations. Coercion to a matrix is undesirable because doing so doubles the amount of memory required for storage. In contrast, there is no inherent downside to the latter solution. However, in part due to several edge cases, correctly and efficiently implementing such a solution can be challenging. ‘disttools’ abstracts away these challenges and provides a simple interface to access the data in a ‘dist’ object using the latter approach. / MIT | noarch                         |
| r-divdyn    | 0.8.0   | Functions to describe sampling and diversity dynamics of fossil occurrence datasets (e.g. from the Paleobiology Database). The package includes methods to calculate range- and occurrence-based metrics of taxonomic richness, extinction and origination rates, along with traditional sampling measures. A powerful subsampling tool is also included that implements frequently used sampling standardization methods in a multiple bin-framework. The plotting of time series and the occurrence data can be simplified by the functions incorporated in the package, as well other calculations, such as environmental affinities and extinction selectivity testing. Details can be found in: Kocsis, A.T.; Reddin, C.J.; Alroy, J. and Kiessling, W. (2019) <doi:10.1101/423780>. / CC BY 4.0   | linux-64,<br>osx-64,<br>win-64 |
| r-divmelt   | 1.0.3   | This package has tools for analyzing DNA melting data to generate HRM scores, the DNA diversity measure output of the HRM Diversity Assay. For additional documentation visit <a href="http://code.google.com/p/divmelt/">http://code.google.com/p/divmelt/</a> . / GPL-2   | noarch                         |
| r-divo      | 1.0.0   | A set of tools for empirical analysis of diversity (a number and frequency of different types in population) and similarity (a number and frequency of shared types in two populations) in biological or ecological systems. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-dixontest | 1.0.0   | For outlier detection in small and normally distributed samples the ratio test of Dixon (Q-test) can be used. Density, distribution function, quantile function and random generation for Dixon’s ratio statistics are provided as wrapper functions. The core applies McBane’s Fortran functions <doi:10.18637/jss.v016.i03> that use Gaussian quadrature for a numerical solution. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-dkdna     | 0.1.1   | Compute diffusion kernels on DNA polymorphisms, including SNP and bi-allelic genotypes. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-dlasso    | 2.0.2   | An implementation of the differentiable lasso (dlasso) and SCAD (dSCAD) using iterative ridge algorithm. This package allows selecting the tuning parameter by AIC, BIC, GIC and GIC. / GPL-2   | noarch                         |

| Name         | Version | Summary/License   | Platforms                      |
|--------------|---------|---|--------------------------------|
| r-dlib       | 1.0.3   | Interface for 'Rcpp' users to 'dlib' < <a href="http://dlib.net">http://dlib.net</a> > which is a 'C' toolkit containing machine learning algorithms and computer vision tools. It is used in a wide range of domains including robotics, embedded devices, mobile phones, and large high performance computing environments. This package allows R users to use 'dlib' through 'Rcpp'. / BSL-1.0   | linux-64,<br>osx-64,<br>win-64 |
| r-dlm        | 1.1_5   | Provides routines for Maximum likelihood, Kalman filtering and smoothing, and Bayesian analysis of Normal linear State Space models, also known as Dynamic Linear Models. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-dma        | 1.4_0   | Dynamic model averaging for binary and continuous outcomes. / GPL-2   | noarch                         |
| r-dmrnet     | 0.2.0   | Model selection algorithms for regression and classification, where the predictors can be numerical and categorical and the number of regressors exceeds the number of observations. The selected model consists of a subset of numerical regressors and partitions of levels of factors. Aleksandra Maj-Kańska, Piotr Pokarowski and Agnieszka Prochenka (2015) < <a href="https://doi.org/10.1214/15-EJS1050">doi:10.1214/15-EJS1050</a> >. Piotr Pokarowski and Jan Mielniczuk (2015) < <a href="http://www.jmlr.org/papers/volume16/pokarowski15a/pokarowski15a.pdf">http://www.jmlr.org/papers/volume16/pokarowski15a/pokarowski15a.pdf</a> >. / GPL-2 | noarch                         |
| r-dmt        | 0.8.20  | Probabilistic dependency modeling toolkit. / BSD_2_clause   | noarch                         |
| r-dmwr       | 0.4.1   | This package includes functions and data accompanying the book Data Mining with R, learning with case studies by Luis Torgo, CRC Press 2010. / GPL-2  | noarch                         |
| r-dnaseqtest | 1.0     | Generates DNA sequences based on Markov model techniques for matched sequences. This can be generalized to several sequences. The sequences (taxa) are then arranged in an evolutionary tree (phylogenetic tree) depicting how taxa diverge from their common ancestors. This gives the tests and estimation methods for the parameters of different models. Standard phylogenetic methods assume stationarity, homogeneity and reversibility for the Markov processes, and often impose further restrictions on the parameters. / GPL-2  | noarch                         |
| r-dne        | 2.1.0   | The DnE package involves functions to analyse the distribution of a set of given data. The basic idea of the analysis is chi-squared test. Functions which have the form as is.xxdistribution are used to analyse whether the data obeys the xxdistribution. If you do not know which distribution to judge, use function is.dt(). / GPL-2  | noarch                         |
| r-dng        | 0.2.1   | Provides density, distribution function, quantile function and random generation for the split normal and split-t distributions, and computes their mean, variance, skewness and kurtosis for the two distributions (Li, F, Villani, M. and Kohn, R. (2010) < <a href="https://doi.org/10.1016/j.jspi.2010.04.031">doi:10.1016/j.jspi.2010.04.031</a> >). / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

| Name          | Version | Summary/License   | Platforms                      |
|---------------|---------|---|--------------------------------|
| r-dnmf        | 1.3     | Discriminant Non-Negative Matrix Factorization aims to extend the Non-negative Matrix Factorization algorithm in order to extract features that enforce not only the spatial locality, but also the separability between classes in a discriminant manner. It refers to three article, Zafeiriou, Stefanos, et al. Exploiting discriminant information in nonnegative matrix factorization with application to frontal face verification. Neural Networks, IEEE Transactions on 17.3 (2006): 683-695. Kim, Bo-Kyeong, and Soo-Young Lee. Spectral Feature Extraction Using dNMF for Emotion Recognition in Vowel Sounds. Neural Information Processing. Springer Berlin Heidelberg, 2013. and Lee, Soo-Young, Hyun-Ah Song, and Shun-ichi Amari. A new discriminant NMF algorithm and its application to the extraction of subtle emotional differences in speech. Cognitive neurodynamics 6.6 (2012): 525-535. / GPL-2 | noarch                         |
| r-do          | 1.0.0   | Flexibly convert data between long and wide format using just two functions: reshape_toLong() and reshape_toWide(). / GPL-3   | noarch                         |
| r-dobad       | 1.0.6   | Provides Frequentist (EM) and Bayesian (MCMC) Methods for Inference of Birth-Death-Immigration Markov Chains. / GPL-2   | noarch                         |
| r-dobson      | 0.4     | Example datasets from the book An Introduction to Generalised Linear Models (Year: 2018, ISBN:9781138741515) by Dobson and Barnett. / GPL-2   | noarch                         |
| r-dockerfiler | 0.1.3   | Build a Dockerfile straight from your R session. ‘dockerfiler’ allows you to create step by step a Dockerfile, and provide convenient tools to wrap R code inside this Dockerfile. / MIT  | noarch                         |
| r-docopt      | 0.6.1   | Define a command-line interface by just giving it a description in the specific format. / MIT   | noarch                         |
| r-docopulae   | 0.4.0   | A direct approach to optimal designs for copula models based on the Fisher information. Provides flexible functions for building joint PDFs, evaluating the Fisher information and finding optimal designs. It includes an extensible solution to summation and integration called ‘nint’, functions for transforming, plotting and comparing designs, as well as a set of tools for common low-level tasks. / MIT  | linux-64,<br>osx-64,<br>win-64 |
| r-docstring   | 1.0.0   | Provides the ability to display something analogous to Python’s docstrings within R. By allowing the user to document their functions as comments at the beginning of their function without requiring putting the function into a package we allow more users to easily provide documentation for their functions. The documentation can be viewed just like any other help files for functions provided by packages as well. / GPL-2  | noarch                         |
| r-documair    | 0.6_0   | Production of R packages from tagged comments introduced within the code and a minimum of additional documentation files. / GPL (>= 2.15)   | linux-64,<br>osx-64,<br>win-64 |
| r-document    | 3.1.0   | Have you ever been tempted to create ‘roxygen2’-style documentation comments for one of your functions that was not part of one of your packages (yet)? This is exactly what this package is about: running ‘roxygen2’ on (chunks of) a single code file. / BSD_2_clause  | noarch                         |
| r-docusignr   | 0.0.3   | Connect to the ‘DocuSign’ Rest API < <a href="https://www.docusign.com/p/RESTAPIGuide/RESTAPIGuide.htm">https://www.docusign.com/p/RESTAPIGuide/RESTAPIGuide.htm</a> >, which supports embedded signing, and sending of documents. / GPL-3  | noarch                         |
| r-dodge       | 0.9_2   | A variety of sampling plans are able to be compared using evaluations of their operating characteristics (OC), average outgoing quality (OQ), average total inspection (ATI) etc. / GPL-3   | noarch                         |

|-------------------------------------|---------|--|---|
| <a href="#">r-dominanceanalysis</a> | 1.0.0   | Dominance analysis is a method that allows to compare the relative importance of predictors in multiple regression models: ordinary least squares, generalized linear models and hierarchical linear models. The main principles and methods of dominance analysis are described in Budescu, D. V. (1993) <doi:10.1037/0033-2909.114.3.542> and Azen, R., & Budescu, D. V. (2003) <doi:10.1037/1082-989X.8.2.129> for ordinary least squares regression. Subsequently, the extensions for multivariate regression, logistic regression and hierarchical linear models were described in Azen, R., & Budescu, D. V. (2006) <doi:10.3102/10769986031002157>, Azen, R., & Traxel, N. (2009) <doi:10.3102/1076998609332754> and Luo, W., & Azen, R. (2013) <doi:10.3102/1076998612458319>, respectively. / GPL-2 | noarch  |
| <a href="#">r-domino</a>            | 0.3.1   | A wrapper on top of the ‘Domino Command-Line Client’. It lets you run ‘Domino’ commands (e.g., run, upload, download) directly from your R environment. Under the hood, it uses R’s system function to run the ‘Domino’ executable, which must be installed as a prerequisite. ‘Domino’ is a service that makes it easy to run your code on scalable hardware, with integrated version control and collaboration features designed for analytical workflows (see < <a href="http://www.dominodatalab.com">http://www.dominodatalab.com</a> > for more information). / MIT  | noarch  |
| <a href="#">r-doparallel</a>        | 1.0.14  | Provides a parallel backend for the %dopar% function using the parallel package. / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-dorng</a>             | 1.7.1   | Provides functions to perform reproducible parallel foreach loops, using independent random streams as generated by L’Ecuyer’s combined multiple-recursive generator [L’Ecuyer (1999), <DOI:10.1287/opre.47.1.159>]. It enables to easily convert standard %dopar% loops into fully reproducible loops, independently of the number of workers, the task scheduling strategy, or the chosen parallel environment and associated foreach backend. / GPL-2   | noarch  |
| <a href="#">r-dos</a>               | 1.0.0   | Contains data sets, examples and software from the book Design of Observational Studies by Paul R. Rosenbaum, New York: Springer, <doi:10.1007/978-1-4419-1213-8>, ISBN 978-1-4419-1212-1. / GPL-2   | noarch  |
| <a href="#">r-dosearch</a>          | 1.0.2   | Identification of causal effects from arbitrary observational and experimental probability distributions via do-calculus and standard probability manipulations using a search-based algorithm. Allows for the presence of mechanisms related to selection bias (Bareinboim, E. and Tian, J. (2015) < <a href="http://ftp.cs.ucla.edu/pub/stat_ser/r445.pdf">http://ftp.cs.ucla.edu/pub/stat_ser/r445.pdf</a> >), transportability (Bareinboim, E. and Pearl, J. (2014) < <a href="http://ftp.cs.ucla.edu/pub/stat_ser/r443.pdf">http://ftp.cs.ucla.edu/pub/stat_ser/r443.pdf</a> >), missing data (Mohan, K. and Pearl, J. and Tian, J. (2013) < <a href="http://ftp.cs.ucla.edu/pub/stat_ser/r410.pdf">http://ftp.cs.ucla.edu/pub/stat_ser/r410.pdf</a> >) and arbitrary combinations of these. / GPL-2    | linux-64,<br>osx-64,<br>win-64                                    |

Continued on next page

Table 51 – continued from previous page

| Name                | Version | Summary/License  | Platforms                      |
|---------------------|---------|--|--------------------------------|
| r-dosefinding       | 0.9.1   | The DoseFinding package provides functions for the design and analysis of dose-finding experiments (with focus on pharmaceutical Phase II clinical trials). It provides functions for: multiple contrast tests, fitting non-linear dose-response models (using Bayesian and non-Bayesian estimation), calculating optimal designs and an implementation of the MCPMod methodology. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-dostats           | 1.3.2   | A small package containing helper utilities for creating function for computing statistics. / GPL-3  | noarch                         |
| r-dotcall64         | 1.0.0   | Provides .C64(), which is an enhanced version of .C() and .Fortran() from the foreign function interface. .C64() supports long vectors, arguments of type 64-bit integer, and provides a mechanism to avoid unnecessary copies of read-only and write-only arguments. This makes it a convenient and fast interface to C/C and Fortran code. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-dotdot            | 0.1.0   | Use ‘..’ on the right hand side of the ‘:=’ operator as a shorthand for the left hand side, so that ‘var := f(..) ..’ is equivalent to ‘var <- f(var) var’. This permits the user to be explicit about growing an object or overwriting it using its previous value, avoids repeating a variable name, and saves keystrokes, time, visual space and cognitive load. / GPL-3  | noarch                         |
| r-dotenv            | 1.0.2   | Load configuration from a ‘.env’ file, that is in the current working directory, into environment variables. / MIT   | noarch                         |
| r-doubcens          | 1.1     | Contains the discrete nonparametric survivor function estimation algorithm of De Gruttola and Lagakos for doubly interval-censored failure time data and the discrete nonparametric survivor function estimation algorithm of Sun for doubly interval-censored left-truncated failure time data [Victor De Gruttola & Stephen W. Lagakos (1989) <doi:10.2307/2532030>] [Jianguo Sun (1995) <doi:10.2307/2533008>]. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-double.truncation | 1.4     | Likelihood-based inference methods with doubly-truncated data are developed under various models. Nonparametric models are based on Efron and Petrosian (1999) <doi:10.1080/01621459.1999.10474187> and Emura, Konno, and Michimae (2015) <doi:10.1007/s10985-014-9297-5>. Parametric models from the special exponential family (SEF) are based on Hu and Emura (2015) <doi:10.1007/s00180-015-0564-z> and Emura, Hu and Konno (2017) <doi:10.1007/s00362-015-0730-y>. / GPL-2  | noarch                         |
| r-doublecone        | 1.1     | Performs hypothesis tests concerning a regression function in a least-squares model, where the null is a parametric function, and the alternative is the union of large-dimensional convex polyhedral cones. See Bodhisattva Sen and Mary C Meyer (2016) <doi:10.1111/rssb.12178> for more details. / GPL-2   GPL-3  | noarch                         |
| r-doubleexpseq      | 1.1     | Differential exon usage test for RNA-Seq data via an empirical Bayes shrinkage method for the dispersion parameter the utilizes inclusion-exclusion data to analyze the propensity to skip an exon across groups. The input data consists of two matrices where each row represents an exon and the columns represent the biological samples. The first matrix is the count of the number of reads expressing the exon for each sample. The second matrix is the count of the number of reads that either express the exon or explicitly skip the exon across the samples, a.k.a. the total count matrix. Dividing the two matrices yields proportions representing the propensity to express the exon versus skipping the exon for each sample. / GPL-3 | noarch                         |
| r-dovalidation      | 1.1.0   | Local linear hazard estimator and its multiplicatively bias correction, including three bandwidth selection methods: best one-sided cross-validation, double one-sided cross-validation, and standard cross-validation. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name                         | Version | Summary/License  | Platforms   |
|------------------------------|---------|--|---|
| <a href="#">r-downloader</a> | 0.4     | Provides a wrapper for the <code>download.file</code> function, making it possible to download files over HTTPS on Windows, Mac OS X, and other Unix-like platforms. The ‘RCurl’ package provides this functionality (and much more) but can be difficult to install because it must be compiled with external dependencies. This package has no external dependencies, so it is much easier to install. / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-downsize</a>   | 0.2.2   | Toggles the test and production versions of a large workflow. / GPL-3  | noarch  |
| <a href="#">r-dparser</a>    | 0.1.8   | A Scannerless GLR parser/parser generator. Note that GLR standing for generalized LR, where L stands for left-to-right and R stands for rightmost (derivation). For more information see < <a href="https://en.wikipedia.org/wiki/GLR_parser">https://en.wikipedia.org/wiki/GLR_parser</a> >. This parser is based on the Tomita (1987) algorithm. (Paper can be found at < <a href="http://acl-arc.comp.nus.edu.sg/archives/acl-arc-090501d3/data/pdf/anthology-PDF/J/J87/J87-1004.pdf">http://acl-arc.comp.nus.edu.sg/archives/acl-arc-090501d3/data/pdf/anthology-PDF/J/J87/J87-1004.pdf</a> >). The original ‘dparser’ package documentation can be found at < <a href="http://dparser.sourceforge.net/">http://dparser.sourceforge.net/</a> >. This allows you to add mini-languages to R (like RxODE’s ODE mini-language Wang, Hallow, and James 2015 <DOI:10.1002/psp4.12052>) or to parse other languages like ‘NONMEM’ to automatically translate them to R code. To use this in your code, add a <code>LinkingTo dparser</code> in your DESCRIPTION file and instead of using <code>#include &lt;dparse.h&gt;</code> use <code>#include &lt;dparser.h&gt;</code> . This also provides a R-based port of the <code>make_dparser</code> < <a href="http://dparser.sourceforge.net/d/make_dparser.cat">http://dparser.sourceforge.net/d/make_dparser.cat</a> > command called <code>mkdparser()</code> . Additionally you can parse an arbitrary grammar within R using the <code>dparse()</code> function, which works on most OSes and is mainly for grammar testing. The fastest parsing, of course, occurs at the C level, and is suggested. / BSD_3_clause | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-dpcid</a>      | 1.0     | Differential partial correlation identification with the ridge and the fusion penalties. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-dpglasso</a>   | 1.0     | fits the primal graphical lasso, via one-at-a-time block-coordinate descent. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |

|---------------------------|---------|--|--|
| <a href="#">r-dplrcon</a> | 1.0     | The concordance method is a non-parametric method based on bootstrapping that is used to test the hypothesis that two subsets of time series are similar in terms of mean, variance or both. This method was developed to address a concern within dendroclimatology that young trees may produce a differing climate response to older more established trees. Details of this method are available in Pirie, M. (2013). The Climate of New Zealand reconstructed from kauri tree rings: Enhancement through the use of novel statistical methodology. PhD. Dissertation, School of Environment and Department of Statistics, University of Auckland, New Zealand. This package also produces a figure with 3 panels, each panel is for a different climate variable. An example of this figure is included in On the influence of tree size on the climate - growth relationship of New Zealand kauri ( <i>Agathis australis</i> ): insights from annual, monthly and daily growth patterns. J Wunder, AM Fowler, ER Cook, M Pirie, SPJ McCloskey. <i>Trees</i> 27 (4), 937-948. For further R functions for loading your own dendroclimatology datasets and performing dendrochronology analysis refer to the R package dplr: Dendrochronology Program Library in R. The concordance procedure is intended to add to the standard dendrochronology techniques provided in dplr. / GPL-3 | noarch   |
| <a href="#">r-dplyr</a>   | 0.8.0   | A fast, consistent tool for working with data frame like objects, both in memory and out of memory. / MIT file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-dpp</a>     | 0.1.2   | This MCMC method takes a data numeric vector (Y) and assigns the elements of Y to a (potentially infinite) number of normal distributions. The individual normal distributions from a mixture of normals can be inferred. Following the method described in Escobar (1994) <doi:10.2307/2291223> we use a Dirichlet Process Prior (DPP) to describe stochastically our prior assumptions about the dimensionality of the data. / MIT   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-dprint</a>  | 0.0.4   | Provides a generalized method for printing tabular data within the R environment in order to make the process of presenting high quality tabular output seamless for the user. Output is directed to the R graphics device so that tables can be exported to any file format supported by the graphics device. Utilizes a formula interface to specify the contents of tables often found in manuscripts or business reports. In addition, formula interface provides inline formatting of the numeric cells of a table and renaming column labels. / GPL-2  | noarch   |
| <a href="#">r-dqshiny</a> | 0.0.3   | Provides highly customizable modules to enhance your shiny apps. Includes layout independent collapsible boxes and value boxes, a very fast autocomplete input, rhandsontable extensions for filtering and paging and much more. / GPL-3   | noarch   |

| Name                   | Version | Summary/License  | Platforms                      |
|------------------------|---------|--|--------------------------------|
| r-dr                   | 3.0.10  | Functions, methods, and datasets for fitting dimension reduction regression, using slicing (methods SAVE and SIR), Principal Hessian Directions (phd, using residuals and the response), and an iterative IRE. Partial methods, that condition on categorical predictors are also available. A variety of tests, and stepwise deletion of predictors, is also included. Also included is code for computing permutation tests of dimension. Adding additional methods of estimating dimension is straightforward. For documentation, see the vignette in the package. With version 3.0.4, the arguments for dr.step have been modified. / GPL-2  | noarch                         |
| r-dragonking           | 0.1.0   | Statistical tests and test statistics to identify events in a dataset that are dragon kings (DKs). The statistical methods in this package were reviewed in Wheatley & Sornette (2015) <doi:10.2139/ssrn.2645709>. / GPL-3   | noarch                         |
| r-dragular             | 0.3.1   | Move elements between containers in ‘Shiny’ without explicitly using ‘JavaScript’. It can be used to build custom inputs or to change the positions of user interface elements like plots or tables. / GPL-2   | noarch                         |
| r-drat                 | 0.1.5   | Creation and use of R Repositories via helper functions to insert packages into a repository, and to add repository information to the current R session. Two primary types of repositories are support: gh-pages at GitHub, as well as local repositories on either the same machine or a local network. Drat is a recursive acronym: Drat R Archive Template. / GPL-2  | noarch                         |
| r-draw                 | 1.0.0   | A set of user-friendly wrapper functions for creating consistent graphics and diagrams with lines, common shapes, text, and page settings. Compatible with and based on the R ‘grid’ package. / MIT  | noarch                         |
| r-drawr                | 1.0.1   | We present DRaWR, a network-based method for ranking genes or properties related to a given gene set. Such related genes or properties are identified from among the nodes of a large, heterogeneous network of biological information. Our method involves a random walk with restarts, performed on an initial network with multiple node and edge types, preserving more of the original, specific property information than current methods that operate on homogeneous networks. In this first stage of our algorithm, we find the properties that are the most relevant to the given gene set and extract a subnetwork of the original network, comprising only the relevant properties. We then rerank genes by their similarity to the given gene set, based on a second random walk with restarts, performed on the above subnetwork. / GPL-2 | noarch                         |
| r-driftbursthypothesis | 0.1.3   | Calculates the T-Statistic for the drift burst hypothesis from the working paper Christensen, Oomen and Reno (2018) <DOI:10.2139/ssrn.2842535>. The authors’ MATLAB code is available upon request, see: <https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2842535>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-drillr               | 0.1     | Provides a R driver for Apache Drill< <a href="https://drill.apache.org">https://drill.apache.org</a> >, which could connect to the Apache Drill cluster< <a href="https://drill.apache.org/docs/installing-drill-on-the-cluster">https://drill.apache.org/docs/installing-drill-on-the-cluster</a> > or drillbit< <a href="https://drill.apache.org/docs/embedded-mode-prerequisites">https://drill.apache.org/docs/embedded-mode-prerequisites</a> > and get result(in data frame) from the SQL query and check the current configuration status. This link < <a href="https://drill.apache.org/docs">https://drill.apache.org/docs</a> > contains more information about Apache Drill. / GPL-3  | noarch                         |

| Name        | Version | Summary/License   | Platforms   |
|-------------|---------|---|---|
| r-drimpute  | 1.0     | R codes for imputing dropout events. Many statistical methods in cell type identification, visualization and lineage reconstruction do not account for dropout events ('PCAreduce', 'SC3', 'PCA', 't-SNE', 'Monocle', 'TSCAN', etc). 'DrImpute' can improve the performance of such software by imputing dropout events. / GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| r-drmde1    | 1.3.1   | Dual empirical likelihood (DEL) inference under semiparametric density ratio models (DRM) in the presence of multiple samples, including population cumulative distribution function estimation, quantile estimation and comparison, density estimation, composite hypothesis testing for DRM parameters which encompasses testing for changes in population distribution functions as a special case, etc. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| r-dropr     | 0.1     | Drop out analysis for psychologists in a R based web application. Shiny is used to visualize and analyze drop outs tailored to the methods of online survey methodology. Concept and app presented at the SCIP Conference in Long Beach, California. / GPL-2  | noarch  |
| r-dropstest | 0.1.3   | Generates simulated data representing the LOX drop testing process (also known as impact testing). A simulated process allows for accelerated study of test behavior. Functions are provided to simulate trials, test series, and groups of test series. Functions for creating plots specific to this process are also included. Test attributes and criteria can be set arbitrarily. This work is not endorsed by or affiliated with NASA. See ASTM G86-17, Standard Test Method for Determining Ignition Sensitivity of Materials to Mechanical Impact in Ambient Liquid Oxygen and Pressurized Liquid and Gaseous Oxygen Environments <doi:10.1520/G0086-17>. / MIT | noarch  |
| r-drr       | 0.0.3   | An Implementation of Dimensionality Reduction via Regression using Kernel Ridge Regression. / GPL-3   file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-ds        | 4.0     | Performs various analyzes of descriptive statistics, including correlations, graphics and tables. / GPL-2   | noarch  |
| r-dsample   | 0.91.2  | Two discretization-based Monte Carlo algorithms, namely the Fu-Wang algorithm and the Wang-Lee algorithm, are provided for random sample generation from a high dimensional distribution of complex structure. The normalizing constant of the target distribution needs not to be known. / GPL-2   | noarch  |
| r-dsbayes   | 1.1     | Calculate posterior modes and credible intervals of parameters of the Dixon-Simon model for subgroup analysis (with binary covariates) in clinical trials. / GPL-2  | noarch  |
| r-dsl       | 0.1_6   | An abstract DList class helps storing large list-type objects in a distributed manner. Corresponding high-level functions and methods for handling distributed storage (DStorage) and lists allows for processing such DLists on distributed systems efficiently. In doing so it uses a well defined storage backend implemented based on the DStorage class. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |

| Name       | Version | Summary/License   | Platforms   |
|------------|---------|---|---|
| r-dst      | 1.4.0   | Using the Theory of Belief Functions for evidence calculus. Basic probability assignments, or mass functions, can be defined on the subsets of a set of possible values and combined. A mass function can be extended to a larger frame. Marginalization, i.e. reduction to a smaller frame can also be done. These features can be combined to analyze small belief networks and take into account situations where information cannot be satisfactorily described by probability distributions. / GPL-2   | noarch  |
| r-dstat    | 1.0.4   | A d-statistic tests the null hypothesis of no treatment effect in a matched, nonrandomized study of the effects caused by treatments. A d-statistic focuses on subsets of matched pairs that demonstrate insensitivity to unmeasured bias in such an observational study, correcting for double-use of the data by conditional inference. This conditional inference can, in favorable circumstances, substantially increase the power of a sensitivity analysis (Rosenbaum (2010) <doi:10.1007/978-1-4419-1213-8_14>). There are two examples, one concerning unemployment from Lalive et al. (2006) <doi:10.1111/j.1467-937X.2006.00406.x>, the other concerning smoking and periodontal disease from Rosenbaum (2017) <doi:10.1214/17-STS621>. / GPL-2 | noarch  |
| r-dt       | 0.5     | Data objects in R can be rendered as HTML tables using the JavaScript library 'DataTables' (typically via R Markdown or Shiny). The 'DataTables' library has been included in this R package. The package name 'DT' is an abbreviation of 'DataTables'. / GPL-3   file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-dtables  | 0.2.0   | Towards automation of descriptive frequencies and statistics tables. / GPL-3  | noarch  |
| r-dtangle  | 0.3.1   | Deconvolving cell types from high-throughput gene profiling data. / GPL-3   | noarch  |
| r-dtaxg    | 0.1.0   | To calculate the sensitivity and specificity in the absence of gold standard using the Bayesian method. The Bayesian method can be referenced at Haiyan Gu and Qiguang Chen (1999) <doi:10.3969/j.issn.1002-3674.1999.04.004>. / GPL-3  | noarch  |
| r-dtd      | 0.2.1   | Provides fast methods to work with Merton's distance to default model introduced in Merton (1974) <doi:10.1111/j.1540-6261.1974.tb03058.x>. The methods includes simulation and estimation of the parameters. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-dtda     | 2.1.1   | This package implements different algorithms for analyzing randomly truncated data, one-sided and two-sided (i.e. doubly) truncated data. Two real data sets are included. / GPL-2  | noarch  |
| r-dtda.cif | 1.0     | Nonparametric estimator of the cumulative incidences of competing risks under double truncation. The estimator generalizes the Efron-Petrosian NPMLE (Non-Parametric Maximum Likelihood Estimator) to the competing risks setting. Efron, B. and Petrosian, V. (1999) <doi:10.2307/2669997>. / GPL-2  | linux-64,<br>osx-64,<br>win-64                                    |

| Name                        | Version | Summary/License   | Platforms |
|-----------------------------|---------|---|-----------|
| <a href="#">r-dtda</a>      | 1.0     | Non-iterative estimator for the cumulative distribution of a doubly truncated variable. de Uña-Álvarez J. (2018) <doi:10.1007/978-3-319-73848-2_37>. / GPL-2  | noarch    |
| <a href="#">r-dtk</a>       | 3.5     | This package was created to analyze multi-level one-way experimental designs. It is designed to handle vectorized observation and factor data where there are unequal sample sizes and population variance homogeneity can not be assumed. To conduct the Dunnett modified Tukey-Kramer test (a.k.a. the T3 Procedure), create two vectors: one for your observations and one for the factor level of each observation. The function, <code>gl.unequal</code> , provides a means to more conveniently produce a factor vector with unequal sample sizes. Next, use the <code>DTK.test</code> function to conduct the test and save the output as an object to input into the <code>DTK.plot</code> function, which produces a confidence interval plot for each of the pairwise comparisons. Lastly, the function <code>TK.test</code> conducts the original Tukey-Kramer test. / GPL-2 | noarch    |
| <a href="#">r-dtmcpack</a>  | 0.1_2   | A series of functions which aid in both simulating and determining the properties of finite, discrete-time, discrete state markov chains. Two functions (DTMC, MultDTMC) produce n iterations of a Markov Chain(s) based on transition probabilities and an initial distribution. The function <code>FPTIME</code> determines the first passage time into each state. The function <code>statdistr</code> determines the stationary distribution of a Markov Chain. / GPL-2   | noarch    |
| <a href="#">r-dtp</a>       | 0.1.0   | Compute the dynamic threshold panel model suggested by (Stephanie Kremer, Alexander Bick and Dieter Nautz (2013) <doi:10.1007/s00181-012-0553-9>) in which they extended the (Hansen (1999) <doi: 10.1016/S0304-4076(99)00025-1>) original static panel threshold estimation and the Caner and (Hansen (2004) <doi:10.1017/S0266466604205011>) cross-sectional instrumental variable threshold model, where generalized methods of moments type estimators are used. / GPL-3  | noarch    |
| <a href="#">r-dtrlearn2</a> | 1.0     | We provide a comprehensive software to estimate general K-stage DTRs from SMARTs with Q-learning and a variety of outcome-weighted learning methods. Penalizations are allowed for variable selection and model regularization. With the outcome-weighted learning scheme, different loss functions - SVM hinge loss, SVM ramp loss, binomial deviance loss, and L2 loss - are adopted to solve the weighted classification problem at each stage; augmentation in the outcomes is allowed to improve efficiency. The estimated DTR can be easily applied to a new sample for individualized treatment recommendations or DTR evaluation. / GPL-2   | noarch    |
| <a href="#">r-dtrreg</a>    | 1.4     | Dynamic treatment regime estimation and inference via G-estimation, dynamic weighted ordinary least squares (dWOLS) and Q-learning. Inference via bootstrap and (for G-estimation) recursive sandwich estimation. Estimation and inference for survival outcomes via Dynamic Weighted Survival Modeling (DWSurv). / GPL-2   | noarch    |
| <a href="#">r-dtsg</a>      | 0.1.3   | Basic time series functionalities such as listing of missing values, application of arbitrary aggregation as well as rolling window functions and automatic detection of periodicity. As it is mainly based on 'data.table', it is fast and - in combination with the 'R6' package - offers reference semantics. In addition to its native R6 interface, it provides an S3 interface inclusive an S3 wrapper method generator for those who prefer the latter. / MIT  | noarch    |
| <a href="#">r-dtt</a>       | 0.1_2   | This package provides functions for 1D and 2D Discrete Cosine Transform (DCT), Discrete Sine Transform (DST) and Discrete Hartley Transform (DHT). / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name                           | Version | Summary/License  | Platforms                      |
|--------------------------------|---------|--|--------------------------------|
| <a href="#">r-dub</a>          | 0.2.0   | Provides an operator for assigning nested components of a list to names via a concise pattern matching syntax. This is especially convenient for assigning individual names to the multiple values that a function may return in the form of a list, and for extracting deeply nested list components. / MIT   | noarch                         |
| <a href="#">r-dummies</a>      | 1.5.6   | Expands factors, characters and other eligible classes into dummy/indicator variables. / GPL-2   | noarch                         |
| <a href="#">r-dummy</a>        | 0.1.3   | Efficiently create dummies of all factors and character vectors in a data frame. Support is included for learning the categories on one data set (e.g., a training set) and deploying them on another (e.g., a test set). / GPL-2  | noarch                         |
| <a href="#">r-dunn.test</a>    | 1.3.5   | Computes Dunn's test (1964) for stochastic dominance and reports the results among multiple pairwise comparisons after a Kruskal-Wallis test for stochastic dominance among k groups (Kruskal and Wallis, 1952). The interpretation of stochastic dominance requires an assumption that the CDF of one group does not cross the CDF of the other. 'dunn.test' makes $k(k-1)/2$ multiple pairwise comparisons based on Dunn's z-test-statistic approximations to the actual rank statistics. The null hypothesis for each pairwise comparison is that the probability of observing a randomly selected value from the first group that is larger than a randomly selected value from the second group equals one half; this null hypothesis corresponds to that of the Wilcoxon-Mann-Whitney rank-sum test. Like the rank-sum test, if the data can be assumed to be continuous, and the distributions are assumed identical except for a difference in location, Dunn's test may be understood as a test for median difference. 'dunn.test' accounts for tied ranks. / GPL-2 | noarch                         |
| <a href="#">r-dunnetttests</a> | 2.0     | For the implementation of the step-down or step-up Dunnett testing procedures, the package includes R functions to calculate critical constants and R functions to calculate adjusted P-values of the test statistics. In addition, the package also contains functions to evaluate testing powers and hence the necessary sample sizes specially for the classical problem of comparisons of several treatments with a control. / GPL-2   | noarch                         |
| <a href="#">r-durmod</a>       | 1.1_2   | Estimation of piecewise constant mixed proportional hazard competing risk model with NPMLE. The model is described in S. Gaure et al. (2007) <doi:10.1016/j.jeconom.2007.01.015>, J. Heckman and B. Singer (1984) <doi:10.2307/1911491>, and B.G. Lindsay (1983) <doi:10.1214/aos/1176346059>. / Artistic-2.0  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-dwdlarger</a>    | 0.1_0   | Solving large scale distance weighted discrimination. The main algorithm is a symmetric Gauss-Seidel based alternating direction method of multipliers (ADMM) method. See Lam, X.Y., Marron, J.S., Sun, D.F., and Toh, K.C. (2018) <arXiv:1604.05473> for more details. / GPL-2  | noarch                         |
| <a href="#">r-dwlm</a>         | 0.1.0   | This linear model solution is useful when both predictor and response have associated uncertainty. The doubly weights linear model solution is invariant on which quantity is used as predictor or response. Based on the results by Reed(1989) <doi:10.1119/1.15963> and Ripley & Thompson(1987) <doi:10.1039/AN9871200377>. / GPL-2  | noarch                         |
| <a href="#">r-dyads</a>        | 1.1.2   | Contains functions for the MCMC simulation of dyadic network models j2 (Zijlstra, 2017, <doi:10.1080/0022250X.2017.1387858>) and p2 (Van Duijn, Snijders & Zijlstra, 2004, <doi: 10.1046/j.0039-0402.2003.00258.x>) as described in Zijlstra, Van Duijn & Snijders (2009) <doi: 10.1348/000711007X255336>. / GPL-2   | noarch                         |

Table 51 – continued from previous page

| Name                  | Version | Summary/License   | Platforms   |
|-----------------------|---------|---|---|
| r-dydea               | 0.1.0   | Finds regular and chaotic intervals in the data using the 0-1 test for chaos proposed by Gottwald and Melbourne (2004) <DOI:10.1137/080718851>. / GPL-3   | noarch  |
| r-dygraphs            | 1.1.1.6 | An R interface to the ‘dygraphs’ JavaScript charting library (a copy of which is included in the package). Provides rich facilities for charting time-series data in R, including highly configurable series- and axis-display and interactive features like zoom/pan and series/point highlighting. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-dykstra             | 1.0_0   | Solves quadratic programming problems using Richard L. Dykstra’s cyclic projection algorithm. Routine allows for a combination of equality and inequality constraints. See Dykstra (1983) <doi:10.1080/01621459.1983.10477029> for details. / GPL-2   | noarch  |
| r-dym                 | 0.2     | Add a Did You Mean feature to the R interactive. With this package, error messages for misspelled input of variable names or package names suggest what you really want to do in addition to notification of the mistake. / BSD_3_clause  | noarch  |
| r-dyn                 | 0.2_9   | Time series regression. The dyn class interfaces ts, irts(), zoo() and zooreg() time series classes to lm(), glm(), loess(), quantreg::rq(), MASS::rlm(), MCMCpack::MCMCregress(), quantreg::rq(), randomForest::randomForest() and other regression functions allowing those functions to be used with time series including specifications that may contain lags, diffs and missing values. / GPL-3   | noarch  |
| r-dynamac             | 0.1.8   | While autoregressive distributed lag (ARDL) models allow for extremely flexible dynamics, interpreting substantive significance of complex lag structures remains difficult. This package is designed to assist users in dynamically simulating and plotting the results of various ARDL models. It also contains post-estimation diagnostics, including a test for cointegration when estimating the error-correction variant of the autoregressive distributed lag model (Pesaran, Shin, and Smith 2001 <doi:10.1002/jae.616>). / GPL-2 | noarch  |
| r-dynamicdistribution | 1.1     | The package is aimed at dynamically visualizing probability distributions and their moments and all the commonly used distributions are included. / GPL-2   | noarch  |
| r-dynamicchazard      | 0.6.5   | Contains functions that lets you fit dynamic hazard models using state space models. The first implemented model is described in Fahrmeir (1992) <doi:10.1080/01621459.1992.10475232> and Fahrmeir (1994) <doi:10.1093/biomet/81.2.317>. Extensions hereof are available where the Extended Kalman filter is replaced by an unscented Kalman filter and other options including particle filters. The implemented particle filters support more general state space models. / GPL-2   | linux-64,<br>win-64   |
| r-dynamictreecut      | 1.63    | Contains methods for detection of clusters in hierarchical clustering dendrograms. / GPL-2  | noarch  |
| r-dynatree            | 1.2_10  | Inference by sequential Monte Carlo for dynamic tree regression and classification models with hooks provided for sequential design and optimization, fully online learning with drift, variable selection, and sensitivity analysis of inputs. Illustrative examples from the original dynamic trees paper are facilitated by demos in the package; see demo(package=dynaTree). / LGPL-3   | linux-64,<br>osx-64,<br>win-64                                    |

Table 51 – continued from previous page

| Name                 | Version | Summary/License   | Platforms  |
|----------------------|---------|---|--|
| r-dynclust           | 3.13    | DynClust is a two-stage procedure for the denoising and clustering of stack of noisy images acquired over time. Clustering only assumes that the data contain an unknown but small number of dynamic features. The method first denoises the signals using local spatial and full temporal information. The clustering step uses the previous output to aggregate voxels based on the knowledge of their spatial neighborhood. Both steps use a single keytool based on the statistical comparison of the difference of two signals with the null signal. No assumption is therefore required on the shape of the signals. The data are assumed to be normally distributed (or at least follow a symmetric distribution) with a known constant variance. Working pixelwise, the method can be time-consuming depending on the size of the data-array but harnesses the power of multicore cpus. / MIT | noarch   |
| r-dyncomp            | 0.0.2   | While there are many well-established measures for identifying critical fluctuations and phase transitions, these measures only work with many points of measurement and thus are unreliable when studying short and coarse-grained time series. This package provides a measure for complexity in a time series that does not rely on long time series (Kaiser (2017), <doi:10.17605/OSF.IO/GWTKX>). / MIT   | noarch   |
| r-dynetnlaresistance | 0.1.0   | An anonymization algorithm to resist neighbor label attack in a dynamic network. / MIT  | noarch   |
| r-dynia              | 0.2     | Fit dynamic intervention model using the arima() function. / GPL-2  | noarch   |
| r-dynpanel           | 0.1.0   | Computes the first stage GMM estimate of a dynamic linear model with p lags of the dependent variables. / GPL-3   | noarch   |
| r-dynpred            | 0.1.2   | The dynpred package contains functions for dynamic prediction in survival analysis. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| r-dynprog            | 0.1.0   | A domain-specific language for specifying translating recursions into dynamic-programming algorithms. See < <a href="https://en.wikipedia.org/wiki/Dynamic_programming">https://en.wikipedia.org/wiki/Dynamic_programming</a> > for a description of dynamic programming. / GPL-3   | noarch   |
| r-dzexpm             | 2.0     | MCMC method to estimate and predict skewed spatial processes. A real data set is included. Reference: Wang, Yang and Majumdar (2018) <doi.org/10.1007/s00180-017-0741-3>. / GPL-2   | noarch   |
| r-e1071              | 1.7.1   | Functions for latent class analysis, short time Fourier transform, fuzzy clustering, support vector machines, shortest path computation, bagged clustering, naive Bayes classifier, ... / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-eaf                | 1.8     | Plots of the empirical attainment function for two objectives. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |

| Name                           | Version | Summary/License  | Platforms                      |
|--------------------------------|---------|--|--------------------------------|
| <a href="#">r-easyahp</a>      | 0.1.1   | Given the scores from decision makers, the analytic hierarchy process can be conducted easily. / GPL-3   | noarch                         |
| <a href="#">r-easyanova</a>    | 7.0     | Perform analysis of variance and other important complementary analyses. The functions are easy to use. Performs analysis in various designs, with balanced and unbalanced data. / GPL-2   | noarch                         |
| <a href="#">r-easycsv</a>      | 1.0.8   | Allows users to easily read multiple comma separated tables and create a data frame under the same name. Is able to read multiple comma separated tables from a local directory, a zip file or a zip file on a remote directory. / GPL-2   | noarch                         |
| <a href="#">r-easynls</a>      | 5.0     | Fit and plot some nonlinear models. / GPL-2  | noarch                         |
| <a href="#">r-easypubmed</a>   | 2.13    | Query NCBI Entrez and retrieve PubMed records in XML or text format. Process PubMed records by extracting and aggregating data from selected fields. A large number of records can be easily downloaded via this simple-to-use interface to the NCBI PubMed API. / GPL-2   | noarch                         |
| <a href="#">r-easyreg</a>      | 3.0     | Performs analysis of regression in simple designs with quantitative treatments, including mixed models and non linear models. / GPL-2  | noarch                         |
| <a href="#">r-easysvg</a>      | 0.1.0   | This SVG elements generator can easily generate SVG elements such as rect, line, circle, ellipse, polygon, polyline, text and group. Also, it can combine and output SVG elements into a SVG file. / MIT   | noarch                         |
| <a href="#">r-ebal</a>         | 0.1_6   | Package implements entropy balancing, a data preprocessing procedure that allows users to reweight a dataset such that the covariate distributions in the reweighted data satisfy a set of user specified moment conditions. This can be useful to create balanced samples in observational studies with a binary treatment where the control group data can be reweighted to match the covariate moments in the treatment group. Entropy balancing can also be used to reweight a survey sample to known characteristics from a target population. / GPL-2  | noarch                         |
| <a href="#">r-ebass</a>        | 0.1     | We propose a new sample size calculation method for trial-based cost-effectiveness analyses. Our strategy is based on the value of perfect information that would remain after the completion of the study. / GPL-3  | noarch                         |
| <a href="#">r-ebdbnet</a>      | 1.2.5   | Infer the adjacency matrix of a network from time course data using an empirical Bayes estimation procedure based on Dynamic Bayesian Networks. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-eben</a>         | 4.6     | Provides the Empirical Bayesian Elastic Net for handling multicollinearity in generalized linear regression models. As a special case of the 'EBglmnet' package (also available on CRAN), this package encourages a grouping effects to select relevant variables and estimate the corresponding non-zero effects. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ebgenotyping</a> | 2.0.1   | Genotyping the population using next generation sequencing data is essentially important for the rare variant detection. In order to distinguish the genomic structural variation from sequencing error, we propose a statistical model which involves the genotype effect through a latent variable to depict the distribution of non-reference allele frequency data among different samples and different genome loci, while decomposing the sequencing error into sample effect and positional effect. An ECM algorithm is implemented to estimate the model parameters, and then the genotypes and SNPs are inferred based on the empirical Bayes method. / GPL-2 | noarch                         |

Table 51 – continued from previous page

| Name                            | Version | Summary/License   | Platforms                      |
|---------------------------------|---------|---|--------------------------------|
| <a href="#">r-ebglmnet</a>      | 4.1     | Provides empirical Bayesian lasso and elastic net algorithms for variable selection and effect estimation. Key features include sparse variable selection and effect estimation via generalized linear regression models, high dimensionality with $p \gg n$ , and significance test for nonzero effects. This package outperforms other popular methods such as lasso and elastic net methods in terms of power of detection, false discovery rate, and power of detecting grouping effects. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ebprs</a>         | 1.1.5   | EB-PRS is a novel method that leverages information for effect sizes across all the markers to improve the prediction accuracy. No parameter tuning is needed in the method, and no external information is needed. This R-package provides the calculation of polygenic risk scores from the given training summary statistics and testing data. We can use EB-PRS to extract main information, estimate Empirical Bayes parameters, derive polygenic risk scores for each individual in testing data, and evaluate the PRS according to AUC and predictive $r^2$ . / GPL-3                                  | noarch                         |
| <a href="#">r-ebrank</a>        | 1.0.0   | Empirical Bayes ranking applicable to parallel-estimation settings where the estimated parameters are asymptotically unbiased and normal, with known standard errors. A mixture normal prior for each parameter is estimated using Empirical Bayes methods, subsequently ranks for each parameter are simulated from the resulting joint posterior over all parameters (The marginal posterior densities for each parameter are assumed independent). Finally, experiments are ordered by expected posterior rank, although computations minimizing other plausible rank-loss functions are also given. / CC0 | noarch                         |
| <a href="#">r-eb SNP</a>        | 1.0     | Genotyping and SNP calling tool for single-sample next generation sequencing data analysis using an empirical Bayes method. / GPL-2   | noarch                         |
| <a href="#">r-ecctmc</a>        | 0.2.5   | Draw sample paths for endpoint-conditioned continuous time Markov chains via modified rejection sampling or uniformization. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ecfsup</a>        | 0.1_2   | Testing the equality of several covariance functions of functional data. Four different methods are implemented: L2-norm with W-S naive, L2-norm with W-S bias-reduced, L2-norm (Zhang 2013) <ISBN:9781439862735>, and sup-norm with resampling (Guo et al. 2017) <arXiv:1609.04232>. / LGPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-echarts2shiny</a> | 0.2.13  | Embed interactive charts to their Shiny applications. These charts will be generated by ECharts library developed by Baidu (< <a href="http://echarts.baidu.com/">http://echarts.baidu.com/</a> >). Current version supports line chart, bar chart, pie chart, scatter plot, gauge, word cloud, radar chart, tree map, and heat map. / GPL-2  | noarch                         |
| <a href="#">r-ecipex</a>        | 1.0     | Provides a function that quickly computes the fine structure isotope patterns of a set of chemical formulas to a given degree of accuracy (up to the limit set by errors in floating point arithmetic). A data-set comprising the masses and isotopic abundances of individual elements is also provided. / GPL-2   | noarch                         |

Table 51 – continued from previous page

| Name                         | Version | Summary/License  | Platforms                      |
|------------------------------|---------|--|--------------------------------|
| <a href="#">r-eco</a>        | 4.0.1   | Implements the Bayesian and likelihood methods proposed in Imai, Lu, and Strauss (2008 <DOI: 10.1093/pan/mpm017>) and (2011 <DOI:10.18637/jss.v042.i05>) for ecological inference in 2 by 2 tables as well as the method of bounds introduced by Duncan and Davis (1953). The package fits both parametric and nonparametric models using either the Expectation-Maximization algorithms (for likelihood models) or the Markov chain Monte Carlo algorithms (for Bayesian models). For all models, the individual-level data can be directly incorporated into the estimation whenever such data are available. Along with in-sample and out-of-sample predictions, the package also provides a functionality which allows one to quantify the effect of data aggregation on parameter estimation and hypothesis testing under the parametric likelihood models. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ecodist</a>    | 2.0.1   | Dissimilarity-based analysis functions including ordination and Mantel test functions, intended for use with spatial and community data. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ecohydmod</a>  | 1.0.0   | Simulates the soil water balance (soil moisture, evapotranspiration, leakage and runoff), rainfall series by using the marked Poisson process and the vegetation growth through the normalized difference vegetation index (NDVI). Please see Souza et al. (2016) <doi:10.1002/hyp.10953>. / GPL-2   | noarch                         |
| <a href="#">r-econdemand</a> | 1.0     | Tools for general properties including price, quantity, elasticity, convexity, marginal revenue and manifold of various economics demand systems including Linear, Translog, CES, LES and CREMR. / GNU General Public License version 2  | noarch                         |
| <a href="#">r-ecoreg</a>     | 0.2.2   | Estimating individual-level covariate-outcome associations using aggregate data (ecological inference) or a combination of aggregate and individual-level data (hierarchical related regression). / GPL-2  | noarch                         |
| <a href="#">r-ecosimr</a>    | 0.1.0   | Given a site by species interaction matrix, users can make inferences about species interactions by performance hypothesis comparing test statistics against a null distribution. The current package provides algorithms and metrics for niche-overlap, body size ratios and species co-occurrence. Users can also integrate their own algorithms and metrics within these frameworks or completely novel null models. Detailed explanations about the underlying assumptions of null model analysis in ecology can be found at <a href="http://ecosimr.org">http://ecosimr.org</a> . / MIT   | noarch                         |
| <a href="#">r-ecosolver</a>  | 0.5.2   | R interface to the Embedded Conic Solver (ECOS), an efficient and robust C library for convex problems. Conic and equality constraints can be specified in addition to integer and boolean variable constraints for mixed-integer problems. This R interface is inspired by the python interface and has similar calling conventions. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |

| Name            | Version | Summary/License   | Platforms                      |
|-----------------|---------|---|--------------------------------|
| r-ecotoxicology | 1.0.1   | Implementation of the EPA's Ecological Exposure Research Division (EERD) tools (discontinued in 1999) for Probit and Trimmed Spearman-Kärber Analysis. Probit and Spearman-Kärber methods from Finney's book Probit analysis a statistical treatment of the sigmoid response curve with options for most accurate results or identical results to the book. Probit and all the tables from Finney's book (code-generated, not copied) with the generating functions included. Control correction: Abbott, Schneider-Orelli, Henderson-Tilton, Sun-Shepard. Toxicity scales: Horsfall-Barratt, Archer, Gauhl-Stover, Fullerton-Olsen, etc. / GPL-3   | noarch                         |
| r-ecotroph      | 1.6     | EcoTroph is an approach and software for modelling marine and freshwater ecosystems. It is articulated entirely around trophic levels. EcoTroph's key displays are bivariate plots, with trophic levels as the abscissa, and biomass flows or related quantities as ordinates. Thus, trophic ecosystem functioning can be modelled as a continuous flow of biomass surging up the food web, from lower to higher trophic levels, due to predation and ontogenic processes. Such an approach, wherein species as such disappear, may be viewed as the ultimate stage in the use of the trophic level metric for ecosystem modelling, providing a simplified but potentially useful caricature of ecosystem functioning and impacts of fishing. This version contains catch trophic spectrum analysis (CTSA) function and corrected versions of the mf.diagnosis and create.ETmain functions. / GPL-3 | noarch                         |
| r-ecovirtual    | 1.1     | Computer simulations of classical ecological models as a learning resource. / GPL-2   | noarch                         |
| r-ecp           | 3.1.1   | Implements various procedures for finding multiple change-points. Two methods make use of dynamic programming and pruning, with no distributional assumptions other than the existence of certain absolute moments in one method. Hierarchical and exact search methods are included. All methods return the set of estimated change-points as well as other summary information. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-ed50          | 0.1.1   | Functions of five estimation method for ED50 (50 percent effective dose) are provided, and they are respectively Dixon-Mood method (1948) <doi:10.2307/2280071>, Choi's original turning point method (1990) <doi:10.2307/2531453> and it's modified version given by us, as well as logistic regression and isotonic regression. Besides, the package also supports comparison between two estimation results. / GPL-3   | noarch                         |
| r-edci          | 1.1_3   | Detection of edge points in images based on the difference of two asymmetric M-kernel estimators. Linear and circular regression clustering based on redescending M-estimators. Detection of linear edges in images. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-esign         | 1.0_13  | An implementation of maximum entropy sampling for spatial data is provided. An exact branch-and-bound algorithm as well as greedy and dual greedy heuristics are included. / GPL (>= 2.0)   | linux-64,<br>osx-64,<br>win-64 |
| r-edf           | 1.0.0   | Import physiologic data stored in the European Data Format (EDF and EDF) into R. Both EDF and EDF files are supported. Discontinuous EDF files are not yet supported. / MIT   | noarch                         |

Table 51 – continued from previous page

| Name                 | Version | Summary/License   | Platforms                      |
|----------------------|---------|---|--------------------------------|
| r-edfreader          | 1.2.1   | Reads European Data Format files EDF and EDF, see < <a href="http://www.edfplus.info/">http://www.edfplus.info/</a> >, BioSemi Data Format files BDF, see < <a href="http://www.biosemi.com/faq/file_format.htm">http://www.biosemi.com/faq/file_format.htm</a> >, and BDF files, see < <a href="http://www.teuniz.net/edfbrowser/bdfplus%20format%20description.html">http://www.teuniz.net/edfbrowser/bdfplus%20format%20description.html</a> >. The files are read in two steps: first the header is read and then the signals (using the header object as a parameter). / GPL-3 | noarch                         |
| r-edfun              | 0.2.0   | Easily creating empirical distribution functions from data: 'dfun', 'pfun', 'qfun' and 'rfun'. / GPL-2   GPL-3  | noarch                         |
| r-edgarwebr          | 1.0.0   | A set of methods to access and parse live filing information from the U.S. Securities and Exchange Commission (SEC - < <a href="https://sec.gov">https://sec.gov</a> >) including company and fund filings along with all associated metadata. / MIT  | noarch                         |
| r-edgebundler        | 0.1.4   | Generates interactive circle plots with the nodes around the circumference and linkages between the connected nodes using hierarchical edge bundling via the D3 JavaScript library. See < <a href="http://d3js.org/">http://d3js.org/</a> > for more information on D3. / GPL-3   | noarch                         |
| r-edgecorr           | 1.0     | Facilitates basic spatial edge correction to point pattern data. / GPL-2  | noarch                         |
| r-edison             | 1.1.1   | Package EDISON (Estimation of Directed Interactions from Sequences Of Non-homogeneous gene expression) runs an MCMC simulation to reconstruct networks from time series data, using a non-homogeneous, time-varying dynamic Bayesian network. Networks segments and changepoints are inferred concurrently, and information sharing priors provide a reduction of the inference uncertainty. / GPL-2  | noarch                         |
| r-edma               | 1.5_3   | Perform dynamic model averaging with grid search as in Dangl and Halling (2012) <doi:10.1016/j.jfineco.2012.04.003> using parallel computing. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-eegkitdata         | 1.0     | Contains the example EEG data used in the package eegkit. Also contains code for easily creating larger EEG datasets from the EEG Database on the UCI Machine Learning Repository. / GPL-2  | noarch                         |
| r-effectsrelbaseline | 0.5     | Functions to test for changes of a response to a stimulus grouping relative to a background or baseline response. / GPL-3   | noarch                         |
| r-effectstars        | 1.9     | Notice: The package EffectStars2 provides a more up-to-date implementation of effect stars! EffectStars provides functions to visualize regression models with categorical response as proposed by Tutz and Schauburger (2013) <doi:10.1080/10618600.2012.701379>. The effects of the variables are plotted with star plots in order to allow for an optical impression of the fitted model. / GPL-2  | noarch                         |
| r-effectstars2       | 0.1_2   | Provides functions for the method of effect stars as proposed by Tutz and Schauburger (2013) <doi:10.1080/10618600.2012.701379>. Effect stars can be used to visualize estimates of parameters corresponding to different groups, for example in multinomial logit models. Beside the main function 'effect-stars' there exist methods for special objects, for example for 'vglm' objects from the 'VGAM' package. / GPL-2   | noarch                         |

| Name                                 | Version | Summary/License  | Platforms         |
|--------------------------------------|---------|--|-------------------|
| <code>r-effecttreat</code>           | 0.4     | In personalized medicine, one wants to know, for a given patient and his or her outcome for a predictor (pre-treatment variable), how likely it is that a treatment will be more beneficial than an alternative treatment. This package allows for the quantification of the predictive causal association (i.e., the association between the predictor variable and the individual causal effect of the treatment) and related metrics. Part of this software has been developed using funding provided from the European Union's 7th Framework Programme for research, technological development and demonstration under Grant Agreement no 602552. / GPL-2  | noarch            |
| <code>r-efficientmaxeigenpair</code> | 0.1.4   | An implementation for using efficient initials to compute the maximal eigenpair in R. It provides three algorithms to find the efficient initials under two cases: the tridiagonal matrix case and the general matrix case. Besides, it also provides two algorithms for the next to the maximal eigenpair under these two cases. / MIT  | noarch            |
| <code>r-efflog</code>                | 1.0     | Fitting a causal loglinear model and calculating the causal effects for a causal loglinear model with the multiplicative interaction or without the multiplicative interaction, obtaining the natural direct, indirect and the total effect. It calculates also the cell effect, which is a new interaction effect. / GPL-2  | noarch            |
| <code>r-effsize</code>               | 0.7.6   | A collection of functions to compute the standardized effect sizes for experiments (Cohen d, Hedges g, Cliff delta, Vargha-Delaney A). The computation algorithms have been optimized to allow efficient computation even with very large data sets. / GPL-2   | noarch            |
| <code>r-egst</code>                  | 1.0.0   | Genetic predisposition for complex traits is often manifested through multiple tissues of interest at different time points in the development. As an example, the genetic predisposition for obesity could be manifested through inherited variants that control metabolism through regulation of genes expressed in the brain and/or through the control of fat storage in the adipose tissue by dysregulation of genes expressed in adipose tissue. We present a method eGST (eQTL-based genetic subtyper) that integrates tissue-specific eQTLs with GWAS data for a complex trait to probabilistically assign a tissue of interest to the phenotype of each individual in the study. eGST estimates the posterior probability that an individual's phenotype can be assigned to a tissue based on individual-level genotype data of tissue-specific eQTLs and marginal phenotype data in a genome-wide association study (GWAS) cohort. Under a Bayesian framework of mixture model, eGST employs a maximum a posteriori (MAP) expectation-maximization (EM) algorithm to estimate the tissue-specific posterior probability across individuals. Methodology is available from: A Majumdar, C Giambartolomei, N Cai, MK Freund, T Halder, T Schwarz, J Flint, B Pasaniuc (2019) <doi:10.1101/674226>. / GPL-3 | noarch            |
| <code>r-eha</code>                   | 2.6.0   | Sampling of risk sets in Cox regression, selections in the Lexis diagram, bootstrapping. Parametric proportional hazards fitting with left truncation and right censoring for common families of distributions, piecewise constant hazards, and discrete models. Parametric accelerated failure time models for left truncated and right censored data. / GPL-2  | osx-64,<br>win-64 |
| <code>r-ehof</code>                  | 1.8     | Extended and enhanced hierarchical logistic regression models (called Huisman-Olff-Fresco in biology, see Huisman et al. 1993 JVS <doi:10.1111/jvs.12050>) models. Response curves along one-dimensional gradients including no response, monotone, plateau, unimodal and bimodal models. / GPL-2  | noarch            |
| <code>r-eiadata</code>               | 0.0.5   | An R wrapper to allow the user to query categories and Series IDs, and import data, from the EIA's API < <a href="https://www.eia.gov/opendata/">https://www.eia.gov/opendata/</a> >. / GPL-2  | noarch            |

|-------------------------------|---------|--|-----------|
| <a href="#">r-eigeninv</a>    | 2011.8  | Solves the “inverse eigenvalue problem” which is to generate a real-valued matrix that has the specified real eigenvalue spectrum. It can generate infinitely many dense matrices, symmetric or asymmetric, with the given set of eigenvalues. Algorithm can also generate stochastic and doubly stochastic matrices. / GPL-2  | noarch    |
| <a href="#">r-eigenmodel</a>  | 1.11    | Estimation of the parameters in a model for symmetric relational data (e.g., the above-diagonal part of a square matrix), using a model-based eigenvalue decomposition and regression. Missing data is accommodated, and a posterior mean for missing data is calculated under the assumption that the data are missing at random. The marginal distribution of the relational data can be arbitrary, and is fit with an ordered probit specification. See Hoff (2007) <arXiv:0711.1146> for details on the model. / GPL-2 | noarch    |
| <a href="#">r-eigenprcomp</a> | 1.0     | Computes confidence intervals for the proportion explained by the first 1,2,k principal components, and computes confidence intervals for each eigenvalue. Both computations are done via nonparametric bootstrap. / GPL-2   | noarch    |

| Name                       | Version | Summary/License  | Platforms |
|----------------------------|---------|--|-----------|
| <code>r-eikosograms</code> | 0.1.1   | An eikosogram (ancient Greek for probability picture) divides the unit square into rectangular regions whose areas, sides, and widths, represent various probabilities associated with the values of one or more categorical variates. Rectangle areas are joint probabilities, widths are always marginal (though possibly joint margins, i.e. marginal joint distributions of two or more variates), and heights of rectangles are always conditional probabilities. Eikosograms embed the rules of probability and are useful for introducing elementary probability theory, including axioms, marginal, conditional, and joint probabilities, and their relationships (including Bayes theorem as a completely trivial consequence). They are markedly superior to Venn diagrams for this purpose, especially in distinguishing probabilistic independence, mutually exclusive events, coincident events, and associations. They also are useful for identifying and understanding conditional independence structure. As data analysis tools, eikosograms display categorical data in a manner similar to Mosaic plots, especially when only two variates are involved (the only case in which they are essentially identical, though eikosograms purposely disallow spacing between rectangles). Unlike Mosaic plots, eikosograms do not alternate axes as each new categorical variate (beyond two) is introduced. Instead, only one categorical variate, designated the response, presents on the vertical axis and all others, designated the conditioning variates, appear on the horizontal. In this way, conditional probability appears only as height and marginal probabilities as widths. The eikosogram is therefore much better suited to a response model analysis (e.g. logistic model) than is a Mosaic plot. Mosaic plots are better suited to log-linear style modelling as in discrete multivariate analysis. Of course, eikosograms are also suited to discrete multivariate analysis with each variate in turn appearing as the response. This makes it better suited than Mosaic plots to discrete graphical models based on conditional independence graphs (i.e. Bayesian Networks or BayesNets). The eikosogram and its superiority to Venn diagrams in teaching probability is described in W.H. Cherry and R.W. Oldford (2003) < <a href="https://math.uwaterloo.ca/~rwoldfor/papers/eikosograms/paper.pdf">https://math.uwaterloo.ca/~rwoldfor/papers/eikosograms/paper.pdf</a> >, its value in exploring conditional independence structure and relation to graphical and log-linear models is described in R.W. Oldford (2003) < <a href="https://math.uwaterloo.ca/~rwoldfor/papers/eikosograms/independence/paper.pdf">https://math.uwaterloo.ca/~rwoldfor/papers/eikosograms/independence/paper.pdf</a> >, and a number of problems, puzzles, and paradoxes that are easily explained with eikosograms are given in R.W. Oldford (2003) < <a href="https://math.uwaterloo.ca/~rwoldfor/papers/eikosograms/examples/paper.pdf">https://math.uwaterloo.ca/~rwoldfor/papers/eikosograms/examples/paper.pdf</a> >. / GPL-3 | noarch    |
| <code>r-eila</code>        | 0.1_2   | Implementation of Efficient Inference of Local Ancestry using fused quantile regression and k-means classifier / GPL-2   | noarch    |
| <code>r-eipartialid</code> | 0.1.2   | Estimate district-level bounds for 2x2 ecological inference based on the approach described in the forthcoming article Jiang et al. (2019), Ecological Regression with Partial Identification, Political Analysis. Interval data regression is used to bound the nonidentified regression parameter in a linear contextual effects model, from which district-level bounds are derived. The approach here can be useful as a baseline of comparison for future work on ecological inference. / MIT   | noarch    |

Table 51 – continued from previous page

| Name            | Version     | Summary/License   | Platforms                      |
|-----------------|-------------|---|--------------------------------|
| r-eive          | 2.3         | Performs a compact genetic algorithm search to reduce errors-in-variables bias in linear regression. The algorithm estimates the regression parameters with lower biases and higher variances but mean-square errors (MSEs) are reduced. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-eiwild        | 0.6.7       | This package allows to use the hybrid Multinomial-Dirichlet-Model of Ecological Inference for estimating inner Cells of RxC-Tables. This was already implemented in the eiPack-package. eiwild-package now has the possibility to use individual level data to support the aggregate level data and using different Hyperprior-Distributions. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-ekmcmc        | 0.1.0       | Functions for estimating catalytic constant and Michaelis-Menten constant for enzyme kinetics model using Metropolis-Hasting algorithm within Gibbs sampler based on the Bayesian framework. Additionally, a function to create plot to identify the goodness-of-fit is included. / GPL-3   | noarch                         |
| r-el            | 1.0         | Empirical likelihood (EL) inference for two-sample problems. The following statistics are included: the difference of two-sample means, smooth Huber estimators, quantile (qdiff) and cumulative distribution functions (ddiff), probability-probability (P-P) and quantile-quantile (Q-Q) plots as well as receiver operating characteristic (ROC) curves. / GPL-2   | linux-64,<br>osx-64            |
| r-el2surv       | 1.1         | Functions for computing critical values and implementing the one-sided/two-sided EL tests. / GPL-2  | noarch                         |
| r-elasth        | 0.3.1       | O pacote disponibiliza funções para estimar modelos de componentes não observados e determinar intervenções automaticamente. Com especial atenção para a replicação dos modelos utilizados na metodologia de calculo do resultado estrutural da SPE/MF. The package provides simple ways to estimates general unobserved components models and automatically detects interventions. It is specially useful to replicate Brazilian Ministry of Finance methodology to estimate income-output gap elasticities. / GPL-3 | noarch                         |
| r-elasticnet    | 1.1.1       | Provides functions for fitting the entire solution path of the Elastic-Net and also provides functions for estimating sparse Principal Components. The Lasso solution paths can be computed by the same function. First version: 2005-10. / GPL-2   | noarch                         |
| r-elec          | 0.1.2       | This is a bizarre collection of functions written to do various sorts of statistical election audits. There are also functions to generate simulated voting data, and simulated truth so as to do simulations to check characteristics of these methods. / GPL-2  | noarch                         |
| r-elections     | 1.0         | This includes a dataset on the outcomes of the USA presidential elections since 1920, and various predictors, as used in < <a href="http://vanderwalresearch.com/blog/15-elections">http://vanderwalresearch.com/blog/15-elections</a> >. / GPL-2   | noarch                         |
| r-electivity    | 1.0.2       | Provides all electivity algorithms (including Vanderploeg and Scavia electivity) that were examined in Lechowicz (1982) <doi:10.1007/BF00349007>, plus the example data that were provided for moth resource utilisation. / MIT   | noarch                         |
| r-elemstatlearn | 2015.0.26.1 | When reading the book above mentioned, in the documentation referred to as 'the book'. / GPL-2  | noarch                         |
| r-elexr         | 1.0         | Provides R access to election results data. Wraps elex ( <a href="https://github.com/newsdev/elex/">https://github.com/newsdev/elex/</a> ), a Python package and command line tool for fetching and parsing Associated Press election results. / MIT  | noarch                         |

| Name                       | Version | Summary/License  | Platforms                                 |
|----------------------------|---------|--|---|
| <a href="#">r-elhmc</a>    | 1.1.0   | A tool to draw samples from a Empirical Likelihood Bayesian posterior of parameters using Hamiltonian Monte Carlo. / GPL-2   | noarch                                    |
| <a href="#">r-elitism</a>  | 1.0.4   | Recently many new p-value based multiple test procedures have been proposed, and these new methods are more powerful than the widely used Hochberg procedure. These procedures strongly control the familywise error rate (FWER). This is a comprehensive collection of p-value based FWER-control stepwise multiple test procedures, including six procedure families and thirty multiple test procedures. In this collection, the conservative Hochberg procedure, linear time Hommel procedures, asymptotic Rom procedure, Gou-Tamhane-Xi-Rom procedures, and Quick procedures are all developed in recent five years since 2014. The package name elitism is an acronym of equipment for logarithmic and linear time stepwise multiple hypothesis testing. Version 1.0.0 was released on June 26, 2019. See Gou, J., and Zhang, F. (2020). Quick multiple test procedures and p-value adjustments. Technical report. / GPL-3 | noarch                                    |
| <a href="#">r-ellipt</a>   | 1.2.0   | Correlation chart of two set (x and y) of data. Using Quantiles. Visualize the effect of factor. / MIT (FOSS)  | noarch                                    |
| <a href="#">r-ellipse</a>  | 0.4.1   | Contains various routines for drawing ellipses and ellipse-like confidence regions, implementing the plots described in Murdoch and Chow (1996), A graphical display of large correlation matrices, The American Statistician 50, 178-180. There are also routines implementing the profile plots described in Bates and Watts (1988), Nonlinear Regression Analysis and its Applications. / GPL-2   | noarch                                    |
| <a href="#">r-ellipsis</a> | 0.1.0   | In S3 generics, it's useful to take ... so that methods can have additional argument. But this flexibility comes at a cost: misspelled arguments will be silently ignored. The ellipsis packages is an experiment that allows a generic to warn if any arguments passed in ... are not used. / GPL-3   | linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-elliptic</a> | 1.4_0   | A suite of elliptic and related functions including Weierstrass and Jacobi forms. Also includes various tools for manipulating and visualizing complex functions. / GPL-2  | noarch                                    |
| <a href="#">r-elmr</a>     | 1.0     | Training and prediction functions are provided for the Extreme Learning Machine algorithm (ELM). The ELM use a Single Hidden Layer Feedforward Neural Network (SLFN) with random generated weights and no gradient-based backpropagation. The training time is very short and the online version allows to update the model using small chunk of the training set at each iteration. The only parameter to tune is the hidden layer size and the learning function. / GPL-2   GPL-3  | noarch                                    |

| Name                    | Version | Summary/License  | Platforms                      |
|-------------------------|---------|--|--------------------------------|
| <code>r-elms</code>     | 1.0.0   | An implementation of the algorithm described in Efficient Large- Scale Internet Media Selection Optimization for Online Display Advertising by Paulson, Luo, and James (Journal of Marketing Research 2018; see URL below for journal text/citation and < <a href="http://www-bcf.usc.edu/~gareth/research/ELMSO.pdf">http://www-bcf.usc.edu/~gareth/research/ELMSO.pdf</a> > for a full-text version of the paper). The algorithm here is designed to allocate budget across a set of online advertising opportunities using a coordinate-descent approach, but it can be used in any resource-allocation problem with a matrix of visitation (in the case of the paper, website page- views) and channels (in the paper, websites). The package contains allocation functions both in the presence of bidding, when allocation is dependent on channel-specific cost curves, and when advertising costs are fixed at each channel. / GPL-3 | noarch                         |
| <code>r-elo</code>      | 2.0.0   | A flexible framework for calculating Elo ratings and resulting rankings of any two-team-per-matchup system (chess, sports leagues, ‘Go’, etc.). This implementation is capable of evaluating a variety of matchups, Elo rating updates, and win probabilities, all based on the basic Elo rating system. It also includes methods to benchmark performance, including logistic regression and Markov chain models. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-elrm</code>     | 1.2.4   | Implements a Markov Chain Monte Carlo algorithm to approximate exact conditional inference for logistic regression models. Exact conditional inference is based on the distribution of the sufficient statistics for the parameters of interest given the sufficient statistics for the remaining nuisance parameters. Using model formula notation, users specify a logistic model and model terms of interest for exact inference. See Zamar et al. (2007) <doi:10.18637/jss.v021.i03> for more details. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-elyp</code>     | 0.7.5   | Empirical likelihood ratio tests for the Yang and Prentice (short/long term hazards ratio) models. Empirical likelihood tests within a Cox model, for parameters defined via both baseline hazard function and regression parameters. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-embc</code>     | 2.0.2   | Unsupervised, multivariate, binary clustering for meaningful annotation of data, taking into account the uncertainty in the data. A specific constructor for trajectory analysis in movement ecology yields behavioural annotation of trajectories based on estimated local measures of velocity and turning angle, eventually with solar position covariate as a daytime indicator, (Expectation-Maximization Binary Clustering for Behavioural Annotation). / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-embedsom</code> | 1.9.1   | Provides a smooth mapping of multidimensional points into low-dimensional space defined by a self-organizing map. Designed to work with ‘Flow-SOM’ and flow-cytometry use-cases. See Kratochvil et al. (2019) <doi:10.1101/496869>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-emc</code>      | 1.3     | random walk Metropolis, Metropolis Hasting, parallel tempering, evolutionary Monte Carlo, temperature ladder construction and placement / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name        | Version | Summary/License  | Platforms   |
|-------------|---------|--|---|
| r-emcdf     | 0.1.2   | Computes and visualizes empirical joint distribution of multivariate data with optimized algorithms and multi-thread computation. There is a faster algorithm using dynamic programming to compute the whole empirical joint distribution of a bivariate data. There are optimized algorithms for computing empirical joint CDF function values for other multivariate data. Visualization is focused on bivariate data. Levelplots and wireframes are included. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| r-emcluster | 0.2.1   | EM algorithms and several efficient initialization methods for model-based clustering of finite mixture Gaussian distribution with unstructured dispersion in both of unsupervised and semi-supervised learning. / Mozilla Public License 2.0  | linux-64,<br>osx-64,<br>win-64                                    |
| r-emdbook   | 1.3.1   | Auxiliary functions and data sets for Ecological Models and Data, a book presenting maximum likelihood estimation and related topics for ecologists (ISBN 978-0-691-12522-0). / GPL-3  | noarch  |
| r-emdist    | 0.3.1   | Package providing calculation of Earth Mover's Distance (EMD). / MIT   | linux-64,<br>osx-64,<br>win-64                                    |
| r-emg       | 1.0.7   | Provides basic distribution functions for a mixture model of a Gaussian and exponential distribution. / GPL-2  | noarch  |
| r-emhawkes  | 0.9.0   | Simulate and fitting exponential multivariate Hawkes model. This package simulates a multivariate Hawkes model, introduced by Hawkes (1971) <doi:10.1093/biomet/58.1.83>, with an exponential kernel and fits the parameters from the data. Models with the constant parameters, as well as complex dependent structures, can also be simulated and estimated. The estimation is based on the maximum likelihood method, introduced by introduced by Ozaki (1979) <doi:10.1007/BF02480272>, with 'maxLik' package. / GPL-2           | noarch  |
| r-emistatr  | 1.2.2.0 | Provides a fast and parallelised calculator to estimate combined wastewater emissions. It supports the planning and design of urban drainage systems, without the requirement of extensive simulation tools. The 'EmiStatR' package implements modular R methods. This enables to add new functionalities through the R framework. / GPL-3   | noarch  |
| r-emme2     | 0.9     | This package includes functions to read and write to an EMME/2 databank / GPL-3  | noarch  |
| r-emmeans   | 1.3.4   | Obtain estimated marginal means (EMMs) for many linear, generalized linear, and mixed models. Compute contrasts or linear functions of EMMs, trends, and comparisons of slopes. Plots and compact letter displays. Least-squares means are discussed, and the term estimated marginal means is suggested, in Searle, Speed, and Milliken (1980) Population marginal means in the linear model: An alternative to least squares means, The American Statistician 34(4), 216-221 <doi:10.1080/00031305.1980.10483031>. / GPL-2   GPL-3 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name                         | Version | Summary/License   | Platforms                      |
|------------------------------|---------|---|--------------------------------|
| <a href="#">r-emmixmapfa</a> | 2.0.7   | We provide functions to fit finite mixtures of multivariate normal or t-distributions to data with various factor analytic structures adopted for the covariance/scale matrices. The factor analytic structures available include mixtures of factor analyzers and mixtures of common factor analyzers. The latter approach is so termed because the matrix of factor loadings is common to components before the component-specific rotation of the component factors to make them white noise. Note that the component-factor loadings are not common after this rotation. Maximum likelihood estimators of model parameters are obtained via the Expectation-Maximization algorithm. See descriptions of the algorithms used in McLachlan GJ, Peel D (2000) <doi:10.1002/0471721182.ch8> McLachlan GJ, Peel D (2000) <ISBN:1-55860-707-2> McLachlan GJ, Peel D, Bean RW (2003) <doi:10.1016/S0167-9473(02)00183-4> McLachlan GJ, Bean RW, Ben-Tovim Jones L (2007) <doi:10.1016/j.csda.2006.09.015> Baek J, McLachlan GJ, Flack LK (2010) <doi:10.1109/TPAMI.2009.149> Baek J, McLachlan GJ (2011) <doi:10.1093/bioinformatics/btr112> McLachlan GJ, Baek J, Rathnayake SI (2011) <doi:10.1002/9781119995678.ch9>. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-emmixskew</a>  | 1.0.3   | EM algorithm for Fitting Mixture of Multivariate Skew Normal and Skew t Distributions. An implementation of the algorithm described in Wang, Ng, and McLachlan (2009) <doi:10.1109/DICTA.2009.88>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-emmli</a>      | 0.0.3   | Fit models of modularity to morphological landmarks. Perform model selection on results. Fit models with a single within-module correlation or with separate within-module correlations fitted to each module. / MIT  | noarch                         |
| <a href="#">r-emmreml</a>    | 3.1     | The main functions are ‘emmreml’, and ‘emmremlMultiKernel’. ‘emmreml’ solves a mixed model with known covariance structure using the ‘EMMA’ algorithm. ‘emmremlMultiKernel’ is a wrapper for ‘emmreml’ to handle multiple random components with known covariance structures. The function ‘emmremlMultivariate’ solves a multivariate gaussian mixed model with known covariance structure using the ‘ECM’ algorithm. / GPL-2  | noarch                         |
| <a href="#">r-emoa</a>       | 0.5.0   | Collection of building blocks for the design and analysis of evolutionary multiobjective optimization algorithms. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-emon</a>       | 1.3.2   | Statistical tools for environmental and ecological surveys. Simulation-based power and precision analysis; detection probabilities from different survey designs; visual fast count estimation. / GPL-3   | noarch                         |
| <a href="#">r-emov</a>       | 0.1.1   | Fixation and saccade detection in eye movement recordings. This package implements a dispersion-based algorithm (I-DT) proposed by Salvucci & Goldberg (2000) which detects fixation duration and position. / GPL-3   | noarch                         |
| <a href="#">r-emp</a>        | 2.0.5   | Functions for estimating EMP (Expected Maximum Profit Measure) in Credit Risk Scoring and Customer Churn Prediction, according to Verbraken et al (2013, 2014) <DOI:10.1109/TKDE.2012.50>, <DOI:10.1016/j.ejor.2014.04.001>. / GPL-3  | noarch                         |

| Name                       | Version | Summary/License  | Platforms                      |
|----------------------------|---------|--|--------------------------------|
| <a href="#">r-empichar</a> | 1.0.0   | Evaluates the empirical characteristic function of univariate and multivariate samples. This package uses 'RcppArmadillo' for fast evaluation. It is also possible to export the code to be used in other packages at 'C' level. / MIT   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-emplik</a>   | 1.0_4   | Empirical likelihood ratio tests for means/quantiles/hazards from possibly censored and/or truncated data. Now does regression too. This version contains some C code. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-emplik2</a>  | 1.21    | Calculates the p-value for a mean-type hypothesis (or multiple mean-type hypotheses) based on two samples with censored data. / GPL-2  | noarch                         |
| <a href="#">r-ems</a>      | 1.2.7   | Collection of functions for data analysis and editing of clinical and epidemiological data. Most of them are related to benchmark with prediction models. / GPL-2  | noarch                         |
| <a href="#">r-emsaov</a>   | 2.3     | Provides the analysis of variance table including the expected mean squares (EMS) for various types of experimental design. When some variables are random effects or we use special experimental design such as nested design, repeated-measures design, or split-plot design, it is not easy to find the appropriate test, especially denominator for F-statistic which depends on EMS. / GPL-2  | noarch                         |
| <a href="#">r-emsnm</a>    | 1.0     | It provides a method based on EM algorithm to estimate the parameter of a mixture model, Sigmoid-Normal Model, where the samples come from several normal distributions (also call them subgroups) whose mean is determined by co-variable Z and coefficient alpha while the variance are homogeneous. Meanwhile, the subgroup each item belongs to is determined by co-variables X and coefficient eta through Sigmoid link function which is the extension of Logistic Link function. It uses bootstrap to estimate the standard error of parameters. When sample is indeed separable, removing estimation with abnormal sigma, the estimation of alpha is quite well. I used this method to explore the subgroup structure of HIV patients and it can be used in other domains where exists subgroup structure. / GPL-2 | noarch                         |
| <a href="#">r-emt</a>      | 1.1     | The package provides functions to carry out a Goodness-of-fit test for discrete multivariate data. It is tested if a given observation is likely to have occurred under the assumption of an ab-initio model. A p-value can be calculated using different distance measures between observed and expected frequencies. A Monte Carlo method is provided to make the package capable of solving high-dimensional problems. / GPL-3  | noarch                         |

| Name                         | Version | Summary/License  | Platforms                      |
|------------------------------|---------|--|--------------------------------|
| <a href="#">r-emulator</a>   | 1.2_20  | Allows one to estimate the output of a computer program, as a function of the input parameters, without actually running it. The computer program is assumed to be a Gaussian process, whose parameters are estimated using Bayesian techniques that give a PDF of expected program output. This PDF is conditional on a training set of runs, each consisting of a point in parameter space and the model output at that point. The emphasis is on complex codes that take weeks or months to run, and that have a large number of undetermined input parameters; many climate prediction models fall into this class. The emulator essentially determines Bayesian posterior estimates of the PDF of the output of a model, conditioned on results from previous runs and a user-specified prior linear model. A vignette is provided and the help pages include examples. / GPL-3 | noarch                         |
| <a href="#">r-emvs</a>       | 1.0     | An efficient expectation-maximization algorithm for fitting Bayesian spike-and-slab regularization paths for linear regression. Rockova and George (2014) <doi:10.1080/01621459.2013.869223>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-enc</a>        | 0.2.1   | Implements an S3 class for storing ‘UTF-8’ strings, based on regular character vectors. Also contains routines to portably read and write ‘UTF-8’ encoded text files, to convert all strings in an object to ‘UTF-8’, and to create character vectors with various encodings. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-encode</a>     | 0.3.6   | Interconverts between ordered lists and compact string notation. Useful for capturing code lists, and pair-wise codes and decodes, for text storage. Analogous to factor levels and labels. Generics encode() and decode() perform interconversion, while codes() and decodes() extract components of an encoding. The function encoded() checks whether something is interpretable as an encoding. If a vector has an encoded ‘guide’ attribute, as_factor() uses it to coerce to factor. / GPL-3   | noarch                         |
| <a href="#">r-endogenous</a> | 1.0     | Likelihood-based approaches to estimate linear regression parameters and treatment effects in the presence of endogeneity. Specifically, this package includes James Heckman’s classical simultaneous equation models-the sample selection model for outcome selection bias and hybrid model with structural shift for endogenous treatment. For more information, see the seminal paper of Heckman (1978) <DOI:10.3386/w0177> in which the details of these models are provided. This package accommodates repeated measures on subjects with a working independence approach. The hybrid model further accommodates treatment effect modification. / GPL-2   | noarch                         |
| <a href="#">r-endogmnp</a>   | 0.2_1   | endogMNP is an R package that fits a Bayesian multinomial probit model with endogenous selection, which is sometimes called an endogenous switching model. This can be used to model discrete choice data when respondents select themselves into one of several groups. This package is based on the MNP package by Kosuke Imai and David A. van Dyk. This package modifies their code. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

| Name                              | Version | Summary/License  | Platforms                      |
|-----------------------------------|---------|--|--------------------------------|
| <a href="#">r-endorse</a>         | 1.6.1   | Fit the hierarchical and non-hierarchical Bayesian measurement models proposed by Bullock, Imai, and Shapiro (2011) <DOI:10.1093/pan/mpr031> to analyze endorsement experiments. Endorsement experiments are a survey methodology for eliciting truthful responses to sensitive questions. This methodology is helpful when measuring support for socially sensitive political actors such as militant groups. The model is fitted with a Markov chain Monte Carlo algorithm and produces the output containing draws from the posterior distribution. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-energy</a>          | 1.7_6   | E-statistics (energy) tests and statistics for multivariate and univariate inference, including distance correlation, one-sample, two-sample, and multi-sample tests for comparing multivariate distributions, are implemented. Measuring and testing multivariate independence based on distance correlation, partial distance correlation, multivariate goodness-of-fit tests, k-groups and hierarchical clustering based on energy distance, testing for multivariate normality, distance components (disco) for non-parametric analysis of structured data, and other energy statistics/methods are implemented. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-energyonlinecpm</a> | 1.0     | Provides a function for distribution free control chart based on the change point model, for multivariate statistical process control. The main constituent of the chart is the energy test that focuses on the discrepancy between empirical characteristic functions of two random vectors. This new control chart highlights in three aspects. Firstly, it is distribution free, requiring no knowledge of the random processes. Secondly, this control chart can monitor mean and variance simultaneously. Thirdly it is devised for multivariate time series which is more practical in real data application. Fourthly, it is designed for online detection (Phase II), which is central for real time surveillance of stream data. For more information please refer to O. Okhrin and Y.F. Xu (2017) < <a href="https://github.com/YafeiXu/working_paper/raw/master/CPM102.pdf">https://github.com/YafeiXu/working_paper/raw/master/CPM102.pdf</a> >. / GPL-3 | noarch                         |
| <a href="#">r-english</a>         | 1.2_3   | Allow numbers to be presented in an English language version, one, two, three, ... Ordinals are also available, first, second, third, ... / GPL-2  | noarch                         |
| <a href="#">r-engrext</a>         | 0.1_8   | Datasets from Nelson, Coffin and Copeland Introductory Statistics for Engineering Experimentation (Elsevier, 2003) with sample code. / GPL-2   | noarch                         |
| <a href="#">r-enrichr</a>         | 2.1     | Provides an R interface to all ‘Enrichr’ databases. ‘Enrichr’ is a web-based tool for analysing gene sets and returns any enrichment of common annotated biological features. Quoting from their website ‘Enrichment analysis is a computational method for inferring knowledge about an input gene set by comparing it to annotated gene sets representing prior biological knowledge.’ See (< <a href="http://amp.pharm.mssm.edu/Enrichr/">http://amp.pharm.mssm.edu/Enrichr/</a> >) for further details. / GPL-2  | noarch                         |
| <a href="#">r-enrichvs</a>        | 0.0.5   | These programs are used for calculating enrichment factors, drawing enrichment curves to evaluate virtual screening approaches. / BSD  | noarch                         |

| Name                                | Version | Summary/License  | Platforms                      |
|-------------------------------------|---------|--|--------------------------------|
| <a href="#">r-enrichwith</a>        | 0.2     | Provides the <code>enrich</code> method to enrich list-like R objects with new, relevant components. The current version has methods for enriching objects of class ‘family’, ‘link-glm’, ‘lm’, ‘glm’ and ‘betareg’. The resulting objects preserve their class, so all methods associated with them still apply. The package also provides the ‘ <code>enriched_glm</code> ’ function that has the same interface as ‘ <code>glm</code> ’ but results in objects of class ‘ <code>enriched_glm</code> ’. In addition to the usual components in a <i>glm</i> object, ‘ <code>enriched_glm</code> ’ objects carry an object-specific <code>simulate</code> method and functions to compute the scores, the observed and expected information matrix, the first-order bias, as well as model densities, probabilities, and quantiles at arbitrary parameter values. The package can also be used to produce customizable source code templates for the structured implementation of methods to compute new components and enrich arbitrary objects. / GPL-2   GPL-3 | noarch                         |
| <a href="#">r-ensemblebma</a>       | 5.1.5   | Bayesian Model Averaging to create probabilistic forecasts from ensemble forecasts and weather observations. / GPL-2   | noarch                         |
| <a href="#">r-ensemblepp</a>        | 1.0_0   | Data sets for the chapter Ensemble Postprocessing with R of the book Stephane Vannitsem, Daniel S. Wilks, and Jakob W. Messner (2018) Statistical Post-processing of Ensemble Forecasts, Elsevier, 362pp. These data sets contain temperature and precipitation ensemble weather forecasts and corresponding observations at Innsbruck/Austria. Additionally, a demo with the full code of the book chapter is provided. / GPL-2   GPL-3   | noarch                         |
| <a href="#">r-ensurer</a>           | 1.1     | Add simple runtime contracts to R values. These ensure that values fulfil certain conditions and will raise appropriate errors if they do not. / MIT   | noarch                         |
| <a href="#">r-entropy</a>           | 1.2.1   | This package implements various estimators of entropy, such as the shrinkage estimator by Hausser and Strimmer, the maximum likelihood and the Millow-Madow estimator, various Bayesian estimators, and the Chao-Shen estimator. It also offers an R interface to the NSB estimator. Furthermore, it provides functions for estimating Kullback-Leibler divergence, chi-squared, mutual information, and chi-squared statistic of independence. In addition there are functions for discretizing continuous random variables. / GPL-3  | noarch                         |
| <a href="#">r-entropyestimation</a> | 1.2     | Contains methods for the estimation of Shannon’s entropy, variants of Renyi’s entropy, mutual information, Kullback-Leibler divergence, and generalized Simpson’s indices. The estimators used have a bias that decays exponentially fast. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-entropyexplorer</a>   | 1.1     | Rows of two matrices are compared for Shannon entropy, coefficient of variation, and expression. P-values can be requested for all metrics. / GPL-3  | noarch                         |
| <a href="#">r-envcpt</a>            | 1.1.1   | Tools for automatic model selection and diagnostics for Climate and Environmental data. In particular the <code>envcpt()</code> function does automatic model selection between a variety of trend, changepoint and autocorrelation models. The <code>envcpt()</code> function should be your first port of call. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-envdocument</a>       | 2.4.1   | Prints out information about the R working environment (system, R version, loaded and attached packages and versions) from a single function <code>env_doc()</code> . Optionally adds information on git repository, tags, commits and remotes (if available). / GPL (>= 3.0)  | noarch                         |

| Name                             | Version | Summary/License   | Platforms                      |
|----------------------------------|---------|---|--------------------------------|
| <a href="#">r-envipat</a>        | 2.4     | Fast and very memory-efficient calculation of isotope patterns, subsequent convolution to theoretical envelopes (profiles) plus valley detection and centroidization or intensoid calculation. Batch processing, resolution interpolation, wrapper, adduct calculations and molecular formula parsing. Loos, M., Gerber, C., Corona, F., Hollender, J., Singer, H. (2015) <doi:10.1021/acs.analchem.5b00941>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-envirostat</a>     | 0.4.2   | Functions and datasets to support the book by Nhu D Le and James V Zidek, Springer (2006). / AGPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-envnames</a>       | 0.4.0   | Set of functions to keep track of user-defined environment names (which cannot be retrieved with the built-in function <code>environmentName()</code> ). The package also provides functionality to search for objects in environments, deal with function calling chains, and retrieve an object's memory address. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-epandist</a>       | 1.1.1   | Analyzing censored variables usually requires the use of optimization algorithms. This package provides an alternative algebraic approach to the task of determining the expected value of a random censored variable with a known censoring point. Likewise this approach allows for the determination of the censoring point if the expected value is known. These results are derived under the assumption that the variable follows an Epanechnikov kernel distribution with known mean and range prior to censoring. Statistical functions related to the uncensored Epanechnikov distribution are also provided by this package. / LGPL-3 | noarch                         |
| <a href="#">r-epanet2toolkit</a> | 0.3.2   | Enables simulation of water piping networks using 'EPANET'. The package provides functions from the 'EPANET' programmer's toolkit as R functions so that basic or customized simulations can be carried out from R. The package uses 'EPANET' version 2.1 from Open Water Analytics < <a href="https://github.com/OpenWaterAnalytics/EPANET/releases/tag/v2.1">https://github.com/OpenWaterAnalytics/EPANET/releases/tag/v2.1</a> >. / MIT  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-epanetreader</a>   | 0.7.3   | Reads water network simulation data in 'Epanet' text-based '.inp' and '.rpt' formats into R. Also reads results from 'Epanet-msx'. Provides basic summary information and plots. The README file has a quick introduction. See < <a href="http://www2.epa.gov/water-research/epanet">http://www2.epa.gov/water-research/epanet</a> > for more information on the Epanet software for modeling hydraulic and water quality behavior of water piping systems. / MIT   | noarch                         |
| <a href="#">r-epibasix</a>       | 1.5     | Contains elementary tools for analysis of common epidemiological problems, ranging from sample size estimation, through 2x2 contingency table analysis and basic measures of agreement (kappa, sensitivity/specificity). Appropriate print and summary statements are also written to facilitate interpretation wherever possible. Source code is commented throughout to facilitate modification. The target audience includes advanced undergraduate and graduate students in epidemiology or biostatistics courses, and clinical researchers. / GPL-2  | noarch                         |
| <a href="#">r-epidisplay</a>     | 3.5.0   | Package for data exploration and result presentation. Full 'epicalc' package with data management functions is available at '< <a href="http://medipe.psu.ac.th/epicalc">http://medipe.psu.ac.th/epicalc</a> >'. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name                  | Version | Summary/License   | Platforms |
|-----------------------|---------|---|-----------|
| r-epimdr              | 0.6_4   | Functions, data sets and shiny apps for Epidemics: Models and Data in R by Ottar N. Bjornstad (ISBN 978-3-319-97487-3) < <a href="https://www.springer.com/gp/book/9783319974866">https://www.springer.com/gp/book/9783319974866</a> >. The package contains functions to study the S(E)IR model, spatial and age-structured SIR models; time-series SIR and chain-binomial stochastic models; catalytic disease models; coupled map lattice models of spatial transmission and network models for social spread of infection. The package is also an advanced quantitative companion to the coursera Epidemics Massive Online Open Course < <a href="https://www.coursera.org/learn/epidemics">https://www.coursera.org/learn/epidemics</a> >. / GPL-3 | noarch    |
| r-epir                | 1.0_4   | Tools for the analysis of epidemiological data. Contains functions for directly and indirectly adjusting measures of disease frequency, quantifying measures of association on the basis of single or multiple strata of count data presented in a contingency table, and computing confidence intervals around incidence risk and incidence rate estimates. Miscellaneous functions for use in meta-analysis, diagnostic test interpretation, and sample size calculations. / GPL-2  | noarch    |
| r-episcan             | 0.0.1   | Searching genomic interactions with linear/logistic regression in a high-dimensional dataset is a time-consuming task. This package provides some efficient ways to scan epistasis in genome-wide interaction studies (GWIS). Both case-control status (binary outcome) and quantitative phenotype (continuous outcome) are supported (the main references: 1. Kam-Thong, T., D. Czamara, K. Tsuda, K. Borgwardt, C. M. Lewis, A. Erhardt-Lehmann, B. Hemmer, et al. (2011). <doi:10.1038/ejhg.2010.196>. 2. Kam-Thong, T., B. Pütz, N. Karbalai, B. Müller-Myhsok, and K. Borgwardt. (2011). <doi:10.1093/bioinformatics/btr218>.) / GPL-2   | noarch    |
| r-epistemicgametheory | 0.1.2   | Constructing an epistemic model such that, for every player i and for every choice c(i) which is optimal, there is one type that expresses common belief in rationality. / GPL-3  | noarch    |
| r-epitools            | 0.5_1   | Tools for training and practicing epidemiologists including methods for two-way and multi-way contingency tables. / GPL-2   | noarch    |
| r-eplot               | 1.0     | Aim: Adjust the graphical parameters to create nicer longitudinal series plots. The default set of graphical parameters is very general, and can be improved upon when we are interested in plotting data points observed over time. Functions facilitate plotting those kind of series, univariate plots, bivariate plots (with vertical axis on both left and right hand sides), multivariate plots and plots which allow to examine whether a new observation is 'unusual' via construction and visualization of prediction intervals around it. / GPL-2   | noarch    |
| r-eplot               | 0.1.2   | Evaluate a function over a data frame of expressions. / GPL-3   | noarch    |
| r-epsival             | 0.1.0   | Implements the conditional estimation procedure of Lee, Sun, Sun and Taylor (2016) <doi:10.1214/15-AOS1371>. This procedure allows hypothesis testing on the mean of a normal random vector subject to linear constraints. / LGPL-3   | noarch    |
| r-epxtor              | 0.3_0   | Import data from 'Epidata' XML files '.epx' and convert it to R data structures. / GPL-3  | noarch    |

Table 51 – continued from previous page

| Name                          | Version | Summary/License   | Platforms |
|-------------------------------|---------|---|-----------|
| <a href="#">r-eq5d</a>        | 0.2.0   | EQ-5D is a popular health related quality of life instrument used in the clinical and economic evaluation of health care. Developed by the EuroQol group < <a href="https://www.euroqol.org">https://www.euroqol.org</a> >, the instrument consists of two components: health state description and evaluation. For the description component a subject self-rates their health in terms of five dimensions; mobility, self-care, usual activities, pain/discomfort, and anxiety/depression using either a three-level (EQ-5D-3L, < <a href="https://www.euroqol.org/eq-5d-instruments/eq-5d-3l-about">https://www.euroqol.org/eq-5d-instruments/eq-5d-3l-about</a> >) or a five-level (EQ-5D-5L, < <a href="https://www.euroqol.org/eq-5d-instruments/eq-5d-5l-about">https://www.euroqol.org/eq-5d-instruments/eq-5d-5l-about</a> >) scale. Frequently the scores on these five dimensions are converted to a single utility index using country specific value sets, which can be used in the clinical and economic evaluation of health care as well as in population health surveys. The eq5d package provides methods to calculate index scores from a subject's dimension scores. 19 TTO and 9 VAS EQ-5D-3L value sets including those for countries in Szende et al (2007) <doi:10.1007/1-4020-5511-0> and Szende et al (2014) <doi:10.1007/978-94-007-7596-1>, 15 EQ-5D-5L EQ-VT value sets from the EuroQol website, and the EQ-5D-5L crosswalk value sets developed by van Hout et al. (2012) <doi:10.1016/j.jval.2012.02.008> are included. Additionally, a shiny web tool is included to enable the calculation and visualisation of EQ-5D index values via a web browser using EQ-5D dimension scores stored in CSV or Excel files. / MIT | noarch    |
| <a href="#">r-eqs2lavaan</a>  | 3.0     | Transitioning from EQS to R for structural equation modeling (SEM) is made easier with a set of functions to convert .out files into R code. The EQS output can be converted into lavaan syntax and run in the R environment. Other functions parse descriptive statistics and the covariance matrix from an EQS .out file. A heat map plot of a covariance matrix is also included. / GPL-2  | noarch    |
| <a href="#">r-equaltestmi</a> | 0.1.0   | Functions for examining measurement invariance via equivalence testing along with adjusted RMSEA (root mean square error of approximation; Steiger & Lind, 1980) cutoff values. In particular, a projection-based method is implemented to test the equality of latent factor means across groups without assuming the equality of intercepts. / GPL-3  | noarch    |
| <a href="#">r-equate</a>      | 2.0.7   | Contains methods for observed-score linking and equating under the single-group, equivalent-groups, and nonequivalent-groups with anchor test(s) designs. Equating types include identity, mean, linear, general linear, equipercentile, circle-arc, and composites of these. Equating methods include synthetic, nominal weights, Tucker, Levine observed score, Levine true score, Braun/Holland, frequency estimation, and chained equating. Plotting and summary methods, and methods for multivariate presmoothing and bootstrap error estimation are also provided. / GPL-3   | noarch    |
| <a href="#">r-equivnoninf</a> | 1.0     | Making available in R the complete set of programs accompanying S. Wellek's (2010) monograph "Testing Statistical Hypotheses of Equivalence and Non-inferiority. Second Edition" (Chapman&Hall/CRC). / CC0  | noarch    |
| <a href="#">r-equivump</a>    | 0.1.1   | Implementation of uniformly most powerful invariant equivalence tests for one- and two-sample problems (paired and unpaired) as described in Wellek (2010, ISBN:978-1-4398-0818-4). Also one-sided alternatives (non-inferiority and non-superiority tests) are supported. Basically a variant of a t-test with (relaxed) null and alternative hypotheses exchanged. / GPL-2  | noarch    |
| <a href="#">r-ercv</a>        | 1.0.0   | Provides a methodology simple and trustworthy for the analysis of extreme values and multiple threshold tests for a generalized Pareto distribution, together with an automatic threshold selection algorithm. See del Castillo, J, Daoudi, J and Lockhart, R (2014) <doi:10.1111/sjos.12037>. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms |
|------------------------------|---------|---|-----------|
| <a href="#">r-ergmharris</a> | 1.0     | Data for use with the Sage Introduction to Exponential Random Graph Modeling text by Jenine K. Harris. Network data set consists of 1283 local health departments and the communication links among them along with several attributes. / GPL-3   | noarch    |
| <a href="#">r-erpr</a>       | 0.2.0   | This package is dedicated to the analysis of event-related potentials (ERPs). Event-related potentials are the measured brain responses associated with a specific sensory, cognitive, or motor event and are obtained from electroencephalographic (EEG) signal. The erpR package contains a series of functions for importing ERP data, computing traditional ERP measures, exploratory ERP analyses and plotting. / GPL-3  | noarch    |
| <a href="#">r-err</a>        | 0.2.0   | Messages should provide users with readable information about R objects without flooding their console. ‘cc()’ concatenates vector and data frame values into a grammatically correct string using commas, an ellipsis and conjunction. ‘cn()’ allows the user to define a string which varies based on a count. ‘co()’ combines the two to produce a customizable object aware string. The package further facilitates this process by providing five ‘sprintf’-like types such as ‘%n’ for the length of an object and ‘%o’ for its name as well as wrappers for pasting objects and issuing errors, warnings and messages. / MIT | noarch    |
| <a href="#">r-errorizer</a>  | 0.2.1   | Provides a function to convert existing R functions into errorized versions with added logging and handling functionality when encountering errors or warnings. The errorize function accepts an existing R function as its first argument and returns a R function with the exact same arguments and functionality. However, if an error or warning occurs when running that errorized R function, it will save a .Rds file to the current working directory with the relevant objects and information required to immediately recreate the error. / BSD_2_clause  | noarch    |
| <a href="#">r-errors</a>     | 0.3.2   | Support for measurement errors in R vectors, matrices and arrays: automatic uncertainty propagation and reporting. Documentation about ‘errors’ is provided in the paper by Ucar, Pebesma & Azcorra (2018, <doi:10.32614/RJ-2018-075>), included in this package as a vignette; see ‘citation(errors)’ for details. / MIT   | noarch    |
| <a href="#">r-es</a>         | 1.0     | Implementation of the Edge Selection Algorithm / GPL-2  | noarch    |
| <a href="#">r-es.dif</a>     | 1.0.1   | Computes various effect sizes of the difference, their variance, and confidence interval. This package treats Cohen’s d, Hedges’ d, biased/unbiased c (an effect size between a mean and a constant) and e (an effect size between means without assuming the variance equality). / MIT   | noarch    |
| <a href="#">r-esc</a>        | 0.5.0   | Implementation of the web-based ‘Practical Meta-Analysis Effect Size Calculator’ from David B. Wilson (< <a href="http://www.campbellcollaboration.org/escalc/html/EffectSizeCalculator-Home.php">http://www.campbellcollaboration.org/escalc/html/EffectSizeCalculator-Home.php</a> >) in R. Based on the input, the effect size can be returned as standardized mean difference, Cohen’s f, Hedges’ g, Pearson’s r or Fisher’s transformation z, odds ratio or log odds, or eta squared effect size. / GPL-3  | noarch    |

|---------------------------------------|---------|--|---|
| <a href="#">r-esdesign</a>            | 1.0.2   | Software of ‘esDesign’ is developed to implement the adaptive enrichment designs with sample size re-estimation. In details, three-proposed trial designs are provided, including the AED1-SSR (or ES1-SSR), AED2-SSR (or ES2-SSR) and AED3-SSR (or ES3-SSR). In addition, this package also contains several widely used adaptive designs, such as the Marker Sequential Test (MaST) design proposed Freidlin et al. (2014) <doi:10.1177/1740774513503739>, the adaptive enrichment designs without early stopping (AED or ES), the sample size re-estimation procedure (SSR) based on the conditional power proposed by Proschan and Hunsberger (1995), and some useful functions. In details, we can calculate the futility and/or efficacy stopping boundaries, the sample size required, calibrate the value of the threshold of the difference between subgroup-specific test statistics, conduct the simulation studies in AED, SSR, AED1-SSR, AED2-SSR and AED3-SSR. / GPL-2 | noarch  |
| <a href="#">r-esg</a>                 | 0.1     | The package presents a Scenarios class containing general parameters, risk parameters and projection results. Risk parameters are gathered together into a ParamsScenarios sub-object. The general process for using this package is to set all needed parameters in a Scenarios object, use the customPathsGeneration method to proceed to the projection, then use xxx_PriceDistribution() methods to get asset prices. / GPL-2  | noarch  |
| <a href="#">r-eshrink</a>             | 0.1.0   | Computes shrinkage estimators for regression problems. Selects penalty parameter by minimizing bias and variance in the effect estimate, where bias and variance are estimated from the posterior predictive distribution. / GPL-2   | noarch  |
| <a href="#">r-essentials</a>          | 3.6.0   | Some essential packages for working with R / Various   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-essentials-mrclient</a> | 3.4.3   | Essential R packages including MS R Client and MS Machine Learning / Various   | linux-64,<br>win-64   |
| <a href="#">r-estimability</a>        | 1.3     | Provides tools for determining estimability of linear functions of regression coefficients, and ‘epredict’ methods that handle non-estimable cases correctly. Estimability theory is discussed in many linear-models textbooks including Chapter 3 of Monahan, JF (2008), A Primer on Linear Models, Chapman and Hall (ISBN 978-1-4200-6201-4). / GPL (>= 3)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                      | Version | Summary/License  | Platforms |
|---------------------------|---------|--|-----------|
| <code>r-estout</code>     | 1.2     | This package is intended to speedup the process of creating model-comparing tables common in Macroeconomics. The function collection stores the estimates of several models and formats it to a table of the form estimate starred and std.err. below. The default output is LaTeX but output to CSV for later editing in a spreadsheet tool is possible as well. It works for linear models (lm) and panel models from the plm-package (plm). Two further implemented functions descsto and descstab enable you to export descriptive statistics of data-frames and single variables to LaTeX and CSV. / GPL-2  | noarch    |
| <code>r-estsimpdmp</code> | 1.2     | This package deals with the estimation of the jump rate for piecewise-deterministic Markov processes (PDMPs), from only one observation of the process within a long time. The main functions provide an estimate of this function. The state space may be discrete or continuous. The associated paper has been published in Scandinavian Journal of Statistics and is given in references. Other functions provide a method to simulate random variables from their (conditional) hazard rate, and then to simulate PDMPs. / GPL-2   | noarch    |
| <code>r-esvis</code>      | 0.2.0   | A variety of methods are provided to estimate and visualize distributional differences in terms of effect sizes. Particular emphasis is upon evaluating differences between two or more distributions across the entire scale, rather than at a single point (e.g., differences in means). For example, Probability-Probability (PP) plots display the difference between two or more distributions, matched by their empirical CDFs (see Ho and Reardon, 2012; <doi:10.3102/1076998611411918>), allowing for examinations of where on the scale distributional differences are largest or smallest. The area under the PP curve (AUC) is an effect-size metric, corresponding to the probability that a randomly selected observation from the x-axis distribution will have a higher value than a randomly selected observation from the y-axis distribution. Binned effect size plots are also available, in which the distributions are split into bins (set by the user) and separate effect sizes (Cohen's d) are produced for each bin - again providing a means to evaluate the consistency (or lack thereof) of the difference between two or more distributions at different points on the scale. Evaluation of empirical CDFs is also provided, with built-in arguments for providing annotations to help evaluate distributional differences at specific points (e.g., semi-transparent shading). All function take a consistent argument structure. Calculation of specific effect sizes is also possible. The following effect sizes are estimable: (a) Cohen's d, (b) Hedges' g, (c) percentage above a cut, (d) transformed (normalized) percentage above a cut, (e) area under the PP curve, and (f) the V statistic (see Ho, 2009; <doi:10.3102/1076998609332755>), which essentially transforms the area under the curve to standard deviation units. By default, effect sizes are calculated for all possible pairwise comparisons, but a reference group (distribution) can be specified. / MIT | noarch    |
| <code>r-etc</code>        | 1.3     | The package allows selecting those treatments of a one-way layout being equivalent to a control. Bonferroni adjusted two one-sided t-tests (TOST) and related simultaneous confidence intervals are given for both differences or ratios of means of normally distributed data. For the case of equal variances and balanced sample sizes for the treatment groups, the single-step procedure of Bofinger and Bofinger (1995) can be chosen. For non-normal data, the Wilcoxon test is applied. / GPL-3  | noarch    |

Table 51 – continued from previous page

| Name                 | Version | Summary/License   | Platforms   |
|----------------------|---------|---|---|
| r-etma               | 1.1_1   | Traditional meta-regression based method has been developed for using meta-analysis data, but it faced the challenge of inconsistent estimates. This package purpose a new statistical method to detect epistasis using incomplete information summary, and have proven it not only successfully let consistency of evidence, but also increase the power compared with traditional method (Detailed tutorial is shown in website). / GPL-3 | noarch  |
| r-etrunc             | 0.1     | Computes moments of univariate truncated t distribution. There is only one exported function, e_trunc(), which should be seen for details. / MIT  | noarch  |
| r-etseed             | 0.1.0   | Client to interact with the 'etcd' 'key-value' data store < <a href="https://github.com/coreos/etcd">https://github.com/coreos/etcd</a> >. Functions included for managing directories, keys, nodes, and getting statistics. / MIT  | noarch  |
| r-europop            | 0.3.1   | This dataset contains population estimates of all European cities with at least 10,000 inhabitants during the period 1500-1800. These data are adapted from Jan De Vries, European Urbanization, 1500-1800 (1984). / CC0  | noarch  |
| r-eurosarcbayes      | 1.1     | Bayesian sample size calculation software and examples for EuroSARC clinical trials which utilise Bayesian methodology. These trials rely on binomial based endpoints so the majority of programs found here relate to this sort of endpoint. Developed as part of the EuroSARC FP7 grant. / GPL-2  | noarch  |
| r-evaluate           | 0.13    | Parsing and evaluation tools that make it easy to recreate the command line behaviour of R. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-evaluationmeasures | 1.1.0   | Provides Some of the most important evaluation measures for evaluating a model. Just by giving the real and predicted class, measures such as accuracy, sensitivity, specificity, ppv, npv, fmeasure, mcc and ... will be returned. / GPL-3   | noarch  |
| r-evapotranspiration | 1.14    | Uses data and constants to calculate potential evapotranspiration (PET) and actual evapotranspiration (AET) from 21 different formulations including Penman, Penman-Monteith FAO 56, Priestley-Taylor and Morton formulations. / GPL-2  | noarch  |
| r-evcombr            | 0.1_2   | Package for combining pieces of evidence / MIT  | noarch  |
| r-eventdatar         | 0.2.0   | Event dataset repository including both real-life and artificial event logs. They can be used in combination with functionalities provided by the 'bupaR' packages 'edeaR', 'processmapR', etc. / MIT   | noarch  |
| r-eventinterval      | 1.3     | Functions for analysis of rate changes in sequential events. / GPL-2  | noarch  |
| r-events             | 0.5     | Stores, manipulates, aggregates and otherwise messes with event data from KEDS/TABARI or any other extraction tool with similar output / GPL-3  | noarch  |
| r-evir               | 1.7_4   | Functions for extreme value theory, which may be divided into the following groups; exploratory data analysis, block maxima, peaks over thresholds (univariate and bivariate), point processes, gev/gpd distributions. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name           | Version | Summary/License   | Platforms |
|----------------|---------|---|-----------|
| r-evmix        | 2.12    | The usual distribution functions, maximum likelihood inference and model diagnostics for univariate stationary extreme value mixture models are provided. Kernel density estimation including various boundary corrected kernel density estimation methods and a wide choice of kernels, with cross-validation likelihood based bandwidth estimator. Reasonable consistency with the base functions in the ‘evd’ package is provided, so that users can safely interchange most code. / GPL-3   | noarch    |
| r-evolvability | 1.1.0   | An implementation of the evolvability parameters defined in Hansen and Houle (2008). / GPL-2  | noarch    |
| r-evorag       | 2.0     | Uses maximum likelihood to estimate rates of trait evolution across environmental gradients. / GPL-2  | noarch    |
| r-ew           | 1.1     | Edgeworth Expansion calculation. / GPL-3  | noarch    |
| r-exact        | 1.7     | Performs unconditional exact tests and power calculations for 2x2 contingency tables. Unconditional exact tests are often more powerful than conditional exact tests and asymptotic tests. / GPL-2  | noarch    |
| r-exactcidiff  | 1.3     | This is a package for exact Confidence Intervals for the difference between two independent or dependent proportions. / GPL-2   | noarch    |
| r-exactmeta    | 1.0_2   | Perform exact fixed effect meta analysis for rare events data without the need of artificial continuity correction. / GPL-2   | noarch    |
| r-excelr       | 0.3.0   | An R interface to ‘jExcel’ library to create web-based interactive tables and spreadsheets compatible with ‘Excel’ or any other spreadsheet software. / MIT   | noarch    |
| r-excerpttr    | 2.0.0   | This is an R interface to the python package ‘excerpts’ (< <a href="https://pypi.python.org/pypi/excerpts">https://pypi.python.org/pypi/excerpts</a> >). / BSD_2_clause   | noarch    |
| r-excessmass   | 1.0     | Implementation of a function which calculates the empirical excess mass for given eqn{lambda} and given maximal number of modes (excessm()). Offering powerful plot features to visualize empirical excess mass (exmplot()). This includes the possibility of drawing several plots (with different maximal number of modes / cut off values) in a single graph. / LGPL-3   | noarch    |
| r-excon        | 0.2.5   | Interactive tools to explore topographic-like data sets. Such data sets take the form of a matrix in which the rows and columns provide location/frequency information, and the matrix elements contain altitude/response information. Such data is found in cartography, 2D spectroscopy and chemometrics. The functions in this package create interactive web pages showing the contoured data, possibly with slices from the original matrix parallel to each dimension. The interactive behavior is created using the ‘D3.js’ ‘JavaScript’ library by Mike Bostock. / GPL-3  | noarch    |
| r-exiftoolr    | 0.1.2   | Reads, writes, and edits EXIF and other file metadata using ExifTool < <a href="http://www.sno.phy.queensu.ca/~phil/exiftool/">http://www.sno.phy.queensu.ca/~phil/exiftool/</a> >, returning read results as a data frame. ExifTool supports many different metadata formats including EXIF, GPS, IPTC, XMP, JFIF, GeoTIFF, ICC Profile, Photoshop IRB, FlashPix, ACP and ID3, as well as the maker notes of many digital cameras by Canon, Casio, DJI, FLIR, FujiFilm, GE, GoPro, HP, JVC/Victor, Kodak, Leaf, Minolta/Konica-Minolta, Motorola, Nikon, Nintendo, Olympus/Epson, Panasonic/Leica, Pentax/Asahi, Phase One, Reconyx, Ricoh, Samsung, Sanyo, Sigma/Foveon and Sony. / GPL-2 | noarch    |
| r-expde        | 0.1.4   | Modular implementation of the Differential Evolution algorithm for experimenting with different types of operators. / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name            | Version | Summary/License   | Platforms                      |
|-----------------|---------|---|--------------------------------|
| r-expert        | 1.0_0   | Expert opinion (or judgment) is a body of techniques to estimate the distribution of a random variable when data is scarce or unavailable. Opinions on the quantiles of the distribution are sought from experts in the field and aggregated into a final estimate. The package supports aggregation by means of the Cooke, Mendel-Sheridan and predefined weights models. / GPL-2  | noarch                         |
| r-expperm       | 1.6     | A set of functions for computing expected permutation matrices given a matrix of likelihoods for each individual assignment. It has been written to accompany the forthcoming paper ‘Computing expectations and marginal likelihoods for permutations’. Publication details will be updated as soon as they are finalized. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-exprep        | 1.0     | Allows to calculate the probabilities of occurrences of an event in a great number of repetitions of Bernoulli experiment, through the application of the local and the integral theorem of De Moivre Laplace, and the theorem of Poisson. Gives the possibility to show the results graphically and analytically, and to compare the results obtained by the application of the above theorems with those calculated by the direct application of the Binomial formula. Is basically useful for educational purposes. / Unlimited  | noarch                         |
| r-expss         | 0.9.1   | Package computes and displays tables with support for ‘SPSS’-style labels, multiple and nested banners, weights, multiple-response variables and significance testing. There are facilities for nice output of tables in ‘knitr’, ‘Shiny’, ‘*.xlsx’ files, R and ‘Jupyter’ notebooks. Methods for labelled variables add value labels support to base R functions and to some functions from other packages. Additionally, the package brings popular data transformation functions from ‘SPSS’ Statistics and ‘Excel’: ‘RECODE’, ‘COUNT’, ‘COMPUTE’, ‘DO IF’, ‘COUNTIF’, ‘VLOOKUP’ and etc. These functions are very useful for data processing in marketing research surveys. Package intended to help people to move data processing from ‘Excel’ and ‘SPSS’ to R. / GPL-2 | noarch                         |
| r-exptest       | 1.2     | Tests for the composite hypothesis of exponentiality / GPL-3  | noarch                         |
| r-exrq          | 1.0     | Estimation for high conditional quantiles based on quantile regression. / GPL-3   | noarch                         |
| r-exsic         | 1.1.1   | The package provides tools for botanists, plant taxonomists, curators of plant genebanks and perhaps other biological collections. / MIT  | noarch                         |
| r-exteriormatch | 1.0.0   | If one treated group is matched to one control reservoir in two different ways to produce two sets of treated-control matched pairs, then the two control groups may be entwined, in the sense that some control individuals are in both control groups. The exterior match is used to compare the two control groups. / GPL-2  | noarch                         |
| r-extlasso      | 0.2     | The package estimates coefficients of extended LASSO penalized linear regression and generalized linear models. Currently lasso and elastic net penalized linear regression and generalized linear models are considered. The package currently utilizes an accurate approximation of L1 penalty and then a modified Jacobi algorithm to estimate the coefficients. There is provision for plotting of the solutions and predictions of coefficients at given values of lambda. The package also contains functions for cross validation to select a suitable lambda value given the data. The package also provides a function for estimation in fused lasso penalized linear regression. / GPL-2  | noarch                         |
| r-extmallows    | 0.1.0   | For multiple full/partial ranking lists, R package ‘ExtMallows’ can (1) detect whether the input ranking lists are over-correlated, and (2) use the Mallows model or extended Mallows model to integrate the ranking lists, and (3) use hierarchical extended Mallows model for rank integration if there are groups of over-correlated ranking lists. / GPL-2  | noarch                         |

| Name            | Version | Summary/License  | Platforms                      |
|-----------------|---------|--|--------------------------------|
| r-extrabinomial | 2.1     | This package tests for differences in minor allele frequency between groups and is based on an extra-binomial variation model for pooled sequencing data. / GPL-3  | noarch                         |
| r-extradistr    | 1.8.1   | Density, distribution function, quantile function and random generation for a number of univariate and multivariate distributions. This package implements the following distributions: Bernoulli, beta-binomial, beta-negative binomial, beta prime, Bhattacharjee, Birnbaum-Saunders, bivariate normal, bivariate Poisson, categorical, Dirichlet, Dirichlet-multinomial, discrete gamma, discrete Laplace, discrete normal, discrete uniform, discrete Weibull, Frechet, gamma-Poisson, generalized extreme value, Gompertz, generalized Pareto, Gumbel, half-Cauchy, half-normal, half-t, Huber density, inverse chi-squared, inverse-gamma, Kumaraswamy, Laplace, location-scale t, logarithmic, Lomax, multivariate hypergeometric, multinomial, negative hypergeometric, non-standard beta, normal mixture, Poisson mixture, Pareto, power, reparametrized beta, Rayleigh, shifted Gompertz, Skellam, slash, triangular, truncated binomial, truncated normal, truncated Poisson, Tukey lambda, Wald, zero-inflated binomial, zero-inflated negative binomial, zero-inflated Poisson. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-extrafontdb   | 1.0     | Package for holding the database for the extrafont package / GPL-2   | noarch                         |
| r-extratrees    | 1.0.5   | Classification and regression based on an ensemble of decision trees. The package also provides extensions of ExtraTrees to multi-task learning and quantile regression. Uses Java implementation of the method. / Apache License 2.0  | noarch                         |
| r-extremebounds | 0.1.6   | An implementation of Extreme Bounds Analysis (EBA), a global sensitivity analysis that examines the robustness of determinants in regression models. The package supports both Leamer's and Sala-i-Martin's versions of EBA, and allows users to customize all aspects of the analysis. / GPL-2  | noarch                         |
| r-extremefit    | 1.0.2   | Extreme value theory, nonparametric kernel estimation, tail conditional probabilities, extreme conditional quantile, adaptive estimation, quantile regression, survival probabilities. / GPL-2   | noarch                         |
| r-extremis      | 0.90    | Conducts inference in statistical models for extreme values (de Carvalho et al (2012), <doi:10.1080/03610926.2012.709905>; de Carvalho and Davison (2014), <10.1080/01621459.2013.872651>; Einmahl et al (2016), <doi:10.1111/rssb.12099>). / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-extremogram   | 1.0.2   | Estimation of the sample univariate, cross and return time extremograms. The package can also adds empirical confidence bands to each of the extremogram plots via a permutation procedure under the assumption that the data are independent. Finally, the stationary bootstrap allows us to construct credible confidence bands for the extremograms. / GPL-3  | noarch                         |
| r-extweibquant  | 1.1     | It implements the subjectively censored Weibull MLE and censored Weibull mixture methods for the lower quantile estimation. Quantile estimates from these two methods are robust to model misspecification in the lower tail. It also includes functions to evaluation the standard error of the resulting quantile estimates. Also, the methods here can be used to fit the Weibull or Weibull mixture for the Type-I or Type-II right censored data. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-eyetracking   | 1.1     | Misc function for working with eyetracking data / GPL-3  | noarch                         |

| Name                               | Version | Summary/License   | Platforms                      |
|------------------------------------|---------|---|--------------------------------|
| <a href="#">r-ezglm</a>            | 1.0     | This package implements a simplified version of least squares, and logistic regression for efficiently selecting the significant non-additive interactions between two variables. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ezknitr</a>          | 0.6     | An extension of ‘knitr’ that adds flexibility in several ways. One common source of frustration with ‘knitr’ is that it assumes the directory where the source file lives should be the working directory, which is often not true. ‘ezknitr’ addresses this problem by giving you complete control over where all the inputs and outputs are, and adds several other convenient features to make rendering markdown/HTML documents easier. / MIT   | noarch                         |
| <a href="#">r-fabci</a>            | 0.1     | Frequentist assisted by Bayes (FAB) confidence interval construction. See ‘Adaptive multigroup confidence intervals with constant coverage’ by Yu and Hoff < <a href="https://arxiv.org/abs/1612.08287">https://arxiv.org/abs/1612.08287</a> >. / GPL-3   | noarch                         |
| <a href="#">r-fabricatr</a>        | 0.10.0  | Helps you imagine your data before you collect it. Hierarchical data structures and correlated data can be easily simulated, either from random number generators or by resampling from existing data sources. This package is faster with ‘data.table’ and ‘mvnfast’ installed. / MIT  | noarch                         |
| <a href="#">r-facebook.s4</a>      | 1.1.0   | Provides an interface to the Facebook API and builds collections of elements that reflects the graph architecture of Facebook. See < <a href="https://developers.facebook.com/docs/graph-api">https://developers.facebook.com/docs/graph-api</a> > for more information. / MIT  | noarch                         |
| <a href="#">r-factmixtanalysis</a> | 1.0     | The package estimates Factor Mixture Analysis via the EM algorithm / GPL-2  | noarch                         |
| <a href="#">r-factorial2x2</a>     | 0.1.0   | Used for the design and analysis of a 2x2 factorial trial for a time-to-event endpoint. Performs power calculations and significance testing. Important reference papers include Slud EV. (1994) < <a href="https://www.ncbi.nlm.nih.gov/pubmed/8086609">https://www.ncbi.nlm.nih.gov/pubmed/8086609</a> > Lin DY, Gong J, Gallo P, Bunn PH, Couper D. (2016) <DOI:10.1111/biom.12507> Leifer ES, Troendle JF, Kolecki A, Follmann DA. (2019) < <a href="https://github.com/EricSLeifer/factorial2x2/blob/master/Leifer%20et%20al%20Factorial.pdf">https://github.com/EricSLeifer/factorial2x2/blob/master/Leifer%20et%20al%20Factorial.pdf</a> >. / GPL-2  | noarch                         |
| <a href="#">r-factorplot</a>       | 1.1_2   | Methods to calculate, print, summarize and plot pairwise differences from GLMs, GLHT or Multinomial Logit models. / GPL-2   | noarch                         |
| <a href="#">r-factorqr</a>         | 0.1_4   | Package to fit Bayesian quantile regression models that assume a factor structure for at least part of the design matrix. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-factorsr</a>         | 1.4     | It identifies the factors significantly related to species richness, and their relative contribution, using multiple regressions and support vector machine models. It uses an output file of ‘ModestR’ (< <a href="http://www.ipez.es/ModestR">http://www.ipez.es/ModestR</a> >) with data of richness of the species and environmental variables in a cell size defined by the user. The residuals of the support vector machine model are shown on a map. Negative residuals may be potential areas with undiscovered and/or unregistered species, or areas with decreased species richness due to the negative effect of anthropogenic factors. / GPL-2 | noarch                         |

Table 51 – continued from previous page

| Name             | Version | Summary/License   | Platforms                      |
|------------------|---------|---|--------------------------------|
| r-factualr       | 0.5     | Per the Factual.com website, Factual is a platform where anyone can share and mash open, living data on any subject. The data is in the form of tables and is accessible via REST API. The factualR package is a thin wrapper around the Factual.com API, to make it even easier for people working with R to explore Factual.com data sets. / Apache License 2.0   | noarch                         |
| r-fadist         | 2.2     | Probability distributions that are sometimes useful in hydrology. / GPL-2   | noarch                         |
| r-fahrmeir       | 2016.5  | Data and functions for the book Multivariate Statistical Modelling Based on Generalized Linear Models, first edition, by Ludwig Fahrmeir and Gerhard Tutz. Useful when using the book. / GPL-2  | noarch                         |
| r-fail           | 1.3     | More comfortable interface to work with R data or source files in a key-value fashion. / BSD_3_clause   | noarch                         |
| r-faisalconjoint | 1.15    | It is used for systematic analysis of decisions based on attributes and its levels. / GPL-3   | noarch                         |
| r-falcon         | 0.2     | This is a method for Allele-specific DNA Copy Number Profiling using Next-Generation Sequencing. Given the allele-specific coverage at the variant loci, this program segments the genome into regions of homogeneous allele-specific copy number. It requires, as input, the read counts for each variant allele in a pair of case and control samples. For detection of somatic mutations, the case and control samples can be the tumor and normal sample from the same individual. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-falconx        | 0.2     | This is a method for Allele-specific DNA Copy Number profiling for whole-Exome sequencing data. Given the allele-specific coverage and site biases at the variant loci, this program segments the genome into regions of homogeneous allele-specific copy number. It requires, as input, the read counts for each variant allele in a pair of case and control samples, as well as the site biases. For detection of somatic mutations, the case and control samples can be the tumor and normal sample from the same individual. The implemented method is based on the paper: Chen, H., Jiang, Y., Maxwell, K., Nathanson, K. and Zhang, N. (under review). Allele-specific copy number estimation by whole Exome sequencing. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-fam.recrisk    | 0.1     | Given vectors of family sizes and number of affecteds per family, calculates the risk of disease recurrence in an unaffected person, conditional on a family having at least k affected members. Methods also model heterogeneity of disease risk across families by fitting a mixture model, allowing for high and low risk families. / GPL-2  | noarch                         |
| r-famle          | 1.3.5   | Estimate parameters of univariate probability distributions with maximum likelihood and Bayesian methods. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-fanc           | 2.2     | Computes the penalized maximum likelihood estimates of factor loadings and unique variances for various tuning parameters. The pathwise coordinate descent along with EM algorithm is used. This package also includes a new graphical tool which outputs path diagram, goodness-of-fit indices and model selection criteria for each regularization parameter. The user can change the regularization parameter by manipulating scrollbars, which is helpful to find a suitable value of regularization parameter. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name       | Version | Summary/License   | Platforms                                 |
|------------|---------|---|---|
| r-fancova  | 0.5_1   | This package contains a collection of R functions to perform nonparametric analysis of covariance for regression curves or surfaces. Testing the equality or parallelism of nonparametric curves or surfaces is equivalent to analysis of variance (ANOVA) or analysis of covariance (ANCOVA) for one-sample functional data. Three different testing methods are available in the package, including one based on L-2 distance, one based on an ANOVA statistic, and one based on variance estimators. / GPL-3   | noarch                                    |
| r-fancycut | 0.1.2   | Provides the function fancycut() which is like cut() except you can mix left open and right open intervals with point values, intervals that are closed on both ends and intervals that are open on both ends. / CC0  | noarch                                    |
| r-fanplot  | 3.4.1   | Visualise sequential distributions using a range of plotting styles. Sequential distribution data can be input as either simulations or values corresponding to percentiles over time. Plots are added to existing graphic devices using the fan function. Users can choose from four different styles, including fan chart type plots, where a set of coloured polygon, with shadings corresponding to the percentile values are layered to represent different uncertainty levels. / GPL-2  | noarch                                    |
| r-fansi    | 0.4.0   | Counterparts to R string manipulation functions that account for the effects of ANSI text formatting control sequences. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-far      | 0.6_5   | Modelizations and previsions functions for Functional AutoRegressive processes using nonparametric methods: functional kernel, estimation of the covariance operator in a subspace, ... / LGPL-2.1  | linux-64,<br>osx-64,<br>win-64            |
| r-faraway  | 1.0.7   | Books are Practical Regression and ANOVA in R on CRAN, Linear Models with R published 1st Ed. August 2004, 2nd Ed. July 2014 by CRC press, ISBN 9781439887332, and Extending the Linear Model with R published by CRC press in 1st Ed. December 2005 and 2nd Ed. March 2016, ISBN 9781584884248. / GPL-3  | noarch                                    |
| r-farmtest | 1.0.3   | Performs robust multiple testing for means in the presence of known and unknown latent factors. It implements a robust procedure to estimate distribution parameters using the Huber's loss function and accounts for strong dependence among coordinates via an approximate factor model. This method is particularly suitable for high dimensional data when there are many variables but only a small number of observations available. Moreover, the method is tailored to cases when the underlying distribution deviates from Gaussian, which is commonly assumed in the literature. Besides the results of hypotheses testing, the estimated underlying factors and diagnostic plots are also output. Multiple comparison correction is done after estimating the proportion of true null hypotheses using the method in Storey (2015) < <a href="https://github.com/jdstorey/qvalue">https://github.com/jdstorey/qvalue</a> >. For detailed description of methods and further references, see the papers on the 'FarmTest' method: Fan et al. (2017) <arXiv:1711.05386> and Zhou et al. (2017) <arXiv:1711.05381>. / GPL-2 | linux-64,<br>osx-64,<br>win-64            |

Table 51 – continued from previous page

| Name           | Version | Summary/License   | Platforms                      |
|----------------|---------|---|--------------------------------|
| r-farver       | 1.1.0   | The encoding of colour can be handled in many different ways, using different colour spaces. As different colour spaces have different uses, efficient conversion between these representations are important. The 'farver' package provides a set of functions that gives access to very fast colour space conversion and comparisons implemented in C, and offers 100-fold speed improvements over the 'convertColor' function in the 'grDevices' package. / MIT  | linux-64,<br>osx-64,<br>win-64 |
| r-faseg        | 0.1.9   | It contains a function designed to the joint segmentation in the mean of several correlated series. The method is described in the paper X. Collilieux, E. Lebarbier and S. Robin. A factor model approach for the joint segmentation with between-series correlation (2015) <arXiv:1505.05660>. / GPL-2  | noarch                         |
| r-fasjem       | 1.1.2   | This is an R implementation of A Fast and Scalable Joint Estimator for Learning Multiple Related Sparse Gaussian Graphical Models (FASJEM). The FASJEM algorithm can be used to estimate multiple related precision matrices. For instance, it can identify context-specific gene networks from multi-context gene expression datasets. By performing data-driven network inference from high-dimensional and heterogonous data sets, this tool can help users effectively translate aggregated data into knowledge that take the form of graphs among entities. Please run demo(fasjem) to learn the basic functions provided by this package. For more details, please see < <a href="http://proceedings.mlr.press/v54/wang17e/wang17e.pdf">http://proceedings.mlr.press/v54/wang17e/wang17e.pdf</a> >. / GPL-2 | noarch                         |
| r-fast         | 0.64    | The Fourier Amplitude Sensitivity Test (FAST) is a method to determine global sensitivities of a model on parameter changes with relatively few model runs. This package implements this sensitivity analysis method. / GPL-2   | noarch                         |
| r-fasta        | 0.1.0   | A collection of acceleration schemes for proximal gradient methods for estimating penalized regression parameters described in Goldstein, Studer, and Baraniuk (2016) <arXiv:1411.3406>. Schemes such as Fast Iterative Shrinkage and Thresholding Algorithm (FISTA) by Beck and Teboulle (2009) <doi:10.1137/080716542> and the adaptive stepsize rule introduced in Wright, Nowak, and Figueiredo (2009) <doi:10.1109/TSP.2009.2016892> are included. You provide the objective function and proximal mappings, and it takes care of the issues like stepsize selection, acceleration, and stopping conditions for you. / MIT   | noarch                         |
| r-fastadaboost | 1.0.0   | Implements Adaboost based on C backend code. This is blazingly fast and especially useful for large, in memory data sets. The package uses decision trees as weak classifiers. Once the classifiers have been trained, they can be used to predict new data. Currently, we support only binary classification tasks. The package implements the Adaboost.M1 algorithm and the real Adaboost(SAMME.R) algorithm. / MIT   | linux-64,<br>osx-64,<br>win-64 |
| r-fastbandchol | 0.1.1   | Fast and numerically stable estimation of a covariance matrix by banding the Cholesky factor using a modified Gram-Schmidt algorithm implemented in RcppArmadillo. See < <a href="http://stat.umn.edu/~molst029">http://stat.umn.edu/~molst029</a> > for details on the algorithm. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-fastclime    | 1.4.1   | Provides a method of recovering the precision matrix efficiently and solving for the dantzig selector by applying the parametric simplex method. The computation is based on a linear optimization solver. It also contains a generic LP solver and a parameterized LP solver using parametric simplex method. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

| Name                               | Version | Summary/License  | Platforms                      |
|------------------------------------|---------|--|--------------------------------|
| <a href="#">r-fastcluster</a>      | 1.1.25  | This is a two-in-one package which provides interfaces to both R and ‘Python’. It implements fast hierarchical, agglomerative clustering routines. Part of the functionality is designed as drop-in replacement for existing routines: <code>linkage()</code> in the ‘SciPy’ package ‘ <code>scipy.cluster.hierarchy</code> ’, <code>hclust()</code> in R’s ‘stats’ package, and the ‘flashClust’ package. It provides the same functionality with the benefit of a much faster implementation. Moreover, there are memory-saving routines for clustering of vector data, which go beyond what the existing packages provide. For information on how to install the ‘Python’ files, see the file <code>INSTALL</code> in the source distribution. Based on the present package, Christoph Dalitz also wrote a pure ‘C’ interface to ‘fastcluster’: <a href="http://informatik.hsnr.de/~dalitz/data/hclust">http://informatik.hsnr.de/~dalitz/data/hclust</a> . / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fastcmh</a>          | 0.2.7   | A method which uses the Cochran-Mantel-Haenszel test with significant pattern mining to detect intervals in binary genotype data which are significantly associated with a particular phenotype, while accounting for categorical covariates. / GPL-2   GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fastcmprsk</a>       | 1.1.1   | In competing risks regression, the proportional subdistribution hazards (PSH) model is popular for its direct assessment of covariate effects on the cumulative incidence function. This package allows for both penalized and unpenalized PSH regression in linear time using a novel forward-backward scan. Penalties include Ridge, Least Absolute Shrinkage and Selection Operator (LASSO), Smoothly Clipped Absolute Deviation (SCAD), Minimax Concave Plus (MCP), and elastic net. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fastcox</a>          | 1.1.3   | We implement a cocktail algorithm, a good mixture of coordinate decent, the majorization-minimization principle and the strong rule, for computing the solution paths of the elastic net penalized Cox’s proportional hazards model. The package is an implementation of Yang, Y. and Zou, H. (2013) DOI: <doi:10.4310/SII.2013.v6.n2.a1>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fastdigest</a>       | 0.6.3   | Provides an R interface to Bob Jenkin’s streaming, non-cryptographic ‘SpookyHash’ hash algorithm for use in digest-based comparisons of R objects. ‘fastdigest’ plugs directly into R’s internal serialization machinery, allowing digests of all R objects the <code>serialize()</code> function supports, including reference-style objects via custom hooks. Speed is high and scales linearly by object size; memory usage is constant and negligible. / Artistic-2.0  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fasteraster</a>      | 1.1.1   | If there is a need to recognise edges on a raster image or a bitmap or any kind of a matrix, one can find packages that does only 90 degrees vectorization. Typically the nature of artefact images is linear and can be vectorized in much more efficient way than draw a series of 90 degrees lines. The fasteraster package does recognition of lines using only one pass. It also allows to calculate mass and the mass centers for the recognized zones or polygons. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fasterelasticnet</a> | 1.1.2   | Fit Elastic Net, Lasso, and Ridge regression and do cross-validation in a fast way. We build the algorithm based on Least Angle Regression by Bradley Efron, Trevor Hastie, Iain Johnstone, etc. (2004)(<doi:10.1214/009053604000000067 >) and some algorithms like Givens rotation and Forward/Back Substitution. In this way, many matrices to be computed are retained as triangular matrices which can eventually speed up the computation. The fitting algorithm for Elastic Net is written in C using Armadillo linear algebra library. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

| Name                         | Version | Summary/License  | Platforms  |
|------------------------------|---------|--|--|
| <a href="#">r-fasterize</a>  | 1.0.0   | Provides a drop-in replacement for rasterize() from the ‘raster’ package that takes ‘sf’-type objects, and is much faster. There is support for the main options provided by the rasterize() function, including setting the field used and background value, and options for aggregating multi-layer rasters. Uses the scan line algorithm attributed to Wylie et al. (1967) <doi:10.1145/1465611.1465619>. / MIT | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-fastghquad</a> | 1.0     | Fast, numerically-stable Gauss-Hermite quadrature rules and utility functions for adaptive GH quadrature. See Liu, Q. and Pierce, D. A. (1994) <doi:10.2307/2337136> for a reference on these methods. / MIT   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-fastglm</a>    | 0.0.1   | Fits generalized linear models efficiently using ‘RcppEigen’. The iteratively reweighted least squares implementation utilizes the step-halving approach of Marschner (2011) <doi:10.32614/RJ-2011-012> to help safeguard against convergence issues. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-fastgraph</a>  | 2.1     | Provides functionality to produce graphs of probability density functions and cumulative distribution functions with few keystrokes, allows shading under the curve of the probability density function to illustrate concepts such as p-values and critical values, and fits a simple linear regression line on a scatter plot with the equation as the main title. / GPL-3                                       | noarch   |
| <a href="#">r-fasthcs</a>    | 0.0.6   | The FastHCS algorithm of Schmitt and Vakili (2014) <doi:10.1007/s11222-015-9602-5> for high-dimensional, robust PCA modelling and associated outlier detection and diagnostic tools. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-fasthica</a>   | 1.0.2   | It implements HICA (Hierarchical Independent Component Analysis) algorithm. This approach, obtained through the integration between treelets and Independent Component Analysis, is able to provide a multi-scale non-orthogonal data-driven basis, whose elements have a phenomenological interpretation according to the problem under study. / GPL-2  | noarch   |
| <a href="#">r-fastica</a>    | 1.2.1   | Implementation of FastICA algorithm to perform Independent Component Analysis (ICA) and Projection Pursuit. / GPL-2   GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                                      | Version  | Summary/License  | Platforms                      |
|---|----------|--|--------------------------------|
| <a href="#">r-fastimputation</a>          | 2.0      | TrainFastImputation() uses training data to describe a multivariate normal distribution that the data approximates or can be transformed into approximating and stores this information as an object of class 'FastImputationPatterns'. FastImputation() function uses this 'FastImputationPatterns' object to impute (make a good guess at) missing data in a single line or a whole data frame of data. This approximates the process used by 'Amelia' < <a href="http://gking.harvard.edu/amelia/">http://gking.harvard.edu/amelia/</a> > but is much faster when filling in values for a single line of data. / GPL-2  | noarch                         |
| <a href="#">r-fastjt</a>                  | 1.0.5    | This 'Rcpp'-based package implements highly efficient functions for the calculation of the Jonckheere-Terpstra statistic. It can be used for a variety of applications, including feature selection in machine learning problems, or to conduct genome-wide association studies (GWAS) with multiple quantitative phenotypes. The code leverages 'OpenMP' directives for multi-core computing to reduce overall processing time. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fastlzerospikeinference</a> | 2018.2.1 | Estimate spike times from calcium imaging data using an L0 penalty. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fastm</a>                   | 0.0.4    | Implements the new algorithm for fast computation of M-scatter matrices using a partial Newton-Raphson procedure for several estimators. The algorithm is described in Duembgen, Nordhausen and Schuhmacher (2016) < <a href="https://doi.org/10.1016/j.jmva.2015.11.009">doi:10.1016/j.jmva.2015.11.009</a> >. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fastmap</a>                 | 1.0.0    | Fast implementation of a key-value store. Environments are commonly used as key-value stores, but every time a new key is used, it is added to R's global symbol table, causing a small amount of memory leakage. This can be problematic in cases where many different keys are used. Fastmap avoids this memory leak issue by implementing the map using data structures in C. / MIT   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fastmatch</a>               | 1.1.0    | Package providing a fast match() replacement for cases that require repeated look-ups. It is slightly faster than R's built-in match() function on first match against a table, but extremely fast on any subsequent lookup as it keeps the hash table in memory. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fastnaivebayes</a>          | 2.1.0    | This is an extremely fast implementation of a Naive Bayes classifier. This package is currently the only package that supports a Bernoulli distribution, a Multinomial distribution, and a Gaussian distribution, making it suitable for both binary features, frequency counts, and numerical features. Another feature is the support of a mix of different event models. Only numerical variables are allowed, however, categorical variables can be transformed into dummies and used with the Bernoulli distribution. The implementation is largely based on the paper A comparison of event models for Naive Bayes anti-spam e-mail filtering written by K.M. Schneider (2003) < <a href="https://doi.org/10.3115/1067807">doi:10.3115/1067807</a> >. Any issues can be submitted to: < <a href="https://github.com/mskogholt/fastNaiveBayes/issues">https://github.com/mskogholt/fastNaiveBayes/issues</a> >. / GPL-3 | noarch                         |

| Name         | Version | Summary/License   | Platforms  |
|--------------|---------|---|--|
| r-fastpcs    | 0.1.3   | The FastPCS algorithm of Vakili and Schmitt (2014) <doi:10.1016/j.csda.2013.07.021> for robust estimation of multivariate location and scatter and multivariate outliers detection. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| r-fastpseudo | 0.1     | Computes pseudo-observations for survival analysis on right-censored data based on restricted mean survival time. / GPL-2   | noarch   |
| r-fastres    | 0.0.8   | The FastRCS algorithm of Vakili and Schmitt (2014) for robust fit of the multivariable linear regression model and outliers detection. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |
| r-fastrweb   | 1.1_1   | Infrastructure for creating rich, dynamic web content using R scripts while maintaining very fast response time. / GPL-2  | linux-64,<br>osx-64                                    |
| r-fastsom    | 1.0.0   | Functions for computing spillover measures, especially spillover tables and spillover indices, as well as their average, minimal, and maximal values. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| r-fasttexttr | 1.0     | An interface to the ‘fastText’ library < <a href="https://github.com/facebookresearch/fastText">https://github.com/facebookresearch/fastText</a> >. The package can be used for text classification and to learn word vectors. The install folder contains the ‘PATENTS’ file. An example how to use ‘fastTextR’ can be found in the ‘README’ file. / BSD_3_clause  | linux-64,<br>osx-64,<br>win-64                         |
| r-fasttime   | 1.0_2   | Fast functions for timestamp manipulation that avoid system calls and take shortcuts to facilitate operations on very large data. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| r-favnums    | 1.0.0   | A dataset of favourite numbers, selected from an online poll of over 30,000 people by Alex Bellos ( <a href="http://pages.bloomsbury.com/favouritenumber">http://pages.bloomsbury.com/favouritenumber</a> ). / CC0  | noarch   |
| r-fbasics    | 3042.89 | Provides a collection of functions to explore and to investigate basic properties of financial returns and related quantities. The covered fields include techniques of explorative data analysis and the investigation of distributional properties, including parameter estimation and hypothesis testing. Even more there are several utility functions for data handling and management. / GPL (>= 2) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms                      |
|-----------------------------|---------|---|--------------------------------|
| <a href="#">r-fbfsearch</a> | 1.1     | We propose an objective Bayesian algorithm for searching the space of Gaussian directed acyclic graph (DAG) models. The algorithm proposed makes use of moment fractional Bayes factors (MFBF) and thus it is suitable for learning sparse graph. The algorithm is implemented by using Armadillo: an open-source C linear algebra library. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fbn</a>       | 1.5.1   | Normalizes the data from a file containing the raw values of the SNP probes of microarray data by using the FISH probes and their corresponding CNs. / GPL-2  | noarch                         |
| <a href="#">r-fbonds</a>    | 3042.18 | implements the Nelson-Siegel and the Nelson-Siegel-Svensson term structures. / GPL-2  | noarch                         |
| <a href="#">r-fbranks</a>   | 2.0     | This package uses time dependent Poisson regression and a record of goals scored in matches to rank teams via estimated attack and defense strengths. The statistical model is based on Dixon and Coles (1997) Modeling Association Football Scores and Inefficiencies in the Football Betting Market, Applied Statistics, Volume 46, Issue 2, 265-280. The package has a some webscrapers to assist in the development and updating of a match database. If the match database contains unconnected clusters (i.e. sets of teams that have only played each other and not played teams from other sets), each cluster is ranked separately relative to the median team strength in the cluster. The package contains functions for predicting and simulating tournaments and leagues from estimated models. The package allows fitting via the glm(), speedglm(), and glmnet() functions. The latter allows fast and efficient fitting of very large numbers of teams. The fitting algorithm will analyze the match data and determine which teams form a cluster (a set of teams where there is a path of matches connecting every team) and fit each cluster separately. / GPL-2 | noarch                         |
| <a href="#">r-fc</a>        | 0.1.0   | Provides a streamlined, standard evaluation-based approach to multivariate function composition. Allows for chaining commands via a forward-pipe operator, %>%. / GPL-2   | noarch                         |
| <a href="#">r-fcd</a>       | 0.1     | Efficient procedures for community detection in network studies, especially for sparse networks with not very obvious community structure. The algorithms impose penalties on the differences of the coordinates which represent the community labels of the nodes. / GPL (>= 2.0)  | noarch                         |
| <a href="#">r-fclust</a>    | 2.1     | Algorithms for fuzzy clustering, cluster validity indices and plots for cluster validity and visualizing fuzzy clustering results. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fcmapper</a>  | 1.1     | Provides several functions to create and manipulate fuzzy cognitive maps. It is based on 'FCMapper' for Excel, distributed at < <a href="http://www.fcappers.net/joomla/">http://www.fcappers.net/joomla/</a> >, developed by Michael Bachhofer and Martin Wildenberg. Maps are inputted as adjacency matrices. Attributes of the maps and the equilibrium values of the concepts (including with user-defined constrained values) can be calculated. The maps can be graphed with a function that calls 'igraph'. Multiple maps with shared concepts can be aggregated. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name         | Version | Summary/License  | Platforms                      |
|--------------|---------|--|--------------------------------|
| r-fcros      | 1.6.1   | A fold change rank based method is presented to search for genes with changing expression and to detect recurrent chromosomal copy number aberrations. This method may be useful for high-throughput biological data (micro-array, sequencing, ...). Probabilities are associated with genes or probes in the data set and there is no problem of multiple tests when using this method. For array-based comparative genomic hybridization data, segmentation results are obtained by merging the significant probes detected. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-fda        | 2.4.8   | These functions were developed to support functional data analysis as described in Ramsay, J. O. and Silverman, B. W. (2005) Functional Data Analysis. New York: Springer. They were ported from earlier versions in Matlab and S-PLUS. An introduction appears in Ramsay, J. O., Hooker, Giles, and Graves, Spencer (2009) Functional Data Analysis with R and Matlab (Springer). The package includes data sets and script files working many examples including all but one of the 76 figures in this latter book. Matlab versions of the code and sample analyses are no longer distributed through CRAN, as they were when the book was published. For those, ftp from < <a href="http://www.psych.mcgill.ca/misc/fda/downloads/FDAfuns/">http://www.psych.mcgill.ca/misc/fda/downloads/FDAfuns/</a> > There you find a set of .zip files containing the functions and sample analyses, as well as two .txt files giving instructions for installation and some additional information. The changes from Version 2.4.1 are fixes of bugs in density.fd and removal of functions create.polynomial.basis, polynompen, and polynomial. These were deleted because the monomial basis does the same thing and because there were errors in the code. / GPL-2 | noarch                         |
| r-fdakma     | 1.2.1   | It performs simultaneously clustering and alignment of a multidimensional or unidimensional functional dataset by means of k-mean alignment. / GPL-3   | noarch                         |
| r-fdamixed   | 0.6     | Likelihood based analysis of 1-dimension functional data in a mixed-effects model framework. Matrix computation are approximated by semi-explicit operator equivalents with linear computational complexity. Markussen (2013) <doi:10.3150/11-BEJ389>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-fdrcti     | 2.1     | FDR functions for permutation-based estimators, including pi0 as well as FDR confidence intervals. The confidence intervals account for dependencies between tests by the incorporation of an overdispersion parameter, which is estimated from the permuted data. / Artistic-2.0  | noarch                         |
| r-fdrsampsiz | 1.0     | Defines a collection of functions to compute average power and sample size for studies that use the false discovery rate as the final measure of statistical significance. / GPL-2   | noarch                         |
| r-fdrtool    | 1.2.1   | Estimates both tail area-based false discovery rates (Fdr) as well as local false discovery rates (fdr) for a variety of null models (p-values, z-scores, correlation coefficients, t-scores). The proportion of null values and the parameters of the null distribution are adaptively estimated from the data. In addition, the package contains functions for non-parametric density estimation (Grenander estimator), for monotone regression (isotonic regression and antitonic regression with weights), for computing the greatest convex minorant (GCM) and the least concave majorant (LCM), for the half-normal and correlation distributions, and for computing empirical higher criticism (HC) scores and the corresponding decision threshold. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-fdth       | 1.2.1   | Perform frequency distribution tables, associated histograms and polygons from vector, data.frame and matrix objects for numerical and categorical variables. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name                              | Version | Summary/License   | Platforms  |
|-----------------------------------|---------|---|--|
| <a href="#">r-feather</a>         | 0.3.3   | Read and write feather files, a lightweight binary columnar data store designed for maximum speed. / Apache License 2.0   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-featurehashing</a>  | 0.9.1   | Feature hashing, also called as the hashing trick, is a method to transform features of a instance to a vector. Thus, it is a method to transform a real dataset to a matrix. Without looking up the indices in an associative array, it applies a hash function to the features and uses their hash values as indices directly. The method of feature hashing in this package was proposed in Weinberger et al. (2009) <arXiv:0902.2206>. The hashing algorithm is the murmurhash3 from the 'digest' package. Please see the README in < <a href="https://github.com/wush978/FeatureHashing">https://github.com/wush978/FeatureHashing</a> > for more information. / GPL-3 | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-featurizer</a>      | 0.2     | A collection of functions that would help one to build features based on external data. Very useful for Data Scientists in data to day work. Many functions create features using parallel computation. Since the nitty gritty of parallel computation is hidden under the hood, the user need not worry about creating clusters and shutting them down. / GPL-2  | noarch   |
| <a href="#">r-fechner</a>         | 1.0.3   | Functions and example datasets for Fechnerian scaling of discrete object sets. User can compute Fechnerian distances among objects representing subjective dissimilarities, and other related information. See package?fechner for an overview. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-federalregister</a> | 0.2.0   | Access data from the Federal Register API < <a href="https://www.federalregister.gov/developers/api/v1">https://www.federalregister.gov/developers/api/v1</a> >. / GPL-2  | noarch   |
| <a href="#">r-fedreporter</a>     | 0.2.1   | Downloads data from Federal 'RePORTER' < <a href="https://api.federalreporter.nih.gov/">https://api.federalreporter.nih.gov/</a> > using the Federal 'RePORTER' API. Allows the user to search job projects from different government agencies. / GPL-3   | noarch   |
| <a href="#">r-fenmlm</a>          | 2.4.2   | Efficient estimation of maximum likelihood models with multiple fixed-effects. Standard-errors can easily and flexibly be clustered and estimations exported. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-fermicatsr</a>      | 1.4     | Data from various catalogs of astrophysical gamma-ray sources detected by NASA's Large Area Telescope (The Astrophysical Journal, 697, 1071, 2009 June 1), on board the Fermi gamma-ray satellite. More information on Fermi and its data products is available from the Fermi Science Support Center ( <a href="http://fermi.gsfc.nasa.gov/ssc/">http://fermi.gsfc.nasa.gov/ssc/</a> ). / CC0  | noarch   |
| <a href="#">r-fextremes</a>       | 3042.82 | Provides functions for analysing and modelling extreme events in financial time Series. The topics include: (i) data pre-processing, (ii) explorative data analysis, (iii) peak over threshold modelling, (iv) block maxima modelling, (v) estimation of VaR and CVaR, and (vi) the computation of the extreme index. / GPL-2   | noarch   |

Table 51 – continued from previous page

| Name    | Version | Summary/License  | Platforms                      |
|---------|---------|--|--------------------------------|
| r-ff    | 2.2.14  | The ff package provides data structures that are stored on disk but behave (almost) as if they were in RAM by transparently mapping only a section (page-size) in main memory - the effective virtual memory consumption per ff object. ff supports R's standard atomic data types 'double', 'logical', 'raw' and 'integer' and non-standard atomic types boolean (1 bit), quad (2 bit unsigned), nibble (4 bit unsigned), byte (1 byte signed with NAs), ubyte (1 byte unsigned), short (2 byte signed with NAs), ushort (2 byte unsigned), single (4 byte float with NAs). For example 'quad' allows efficient storage of genomic data as an 'A','T','G','C' factor. The unsigned types support 'circular' arithmetic. There is also support for close-to-atomic types 'factor', 'ordered', 'POSIXct', 'Date' and custom close-to-atomic types. ff not only has native C-support for vectors, matrices and arrays with flexible dimorder (major column-order, major row-order and generalizations for arrays). There is also a ffd class not unlike data.frames and import/export filters for csv files. ff objects store raw data in binary flat files in native encoding, and complement this with metadata stored in R as physical and virtual attributes. ff objects have well-defined hybrid copying semantics, which gives rise to certain performance improvements through virtualization. ff objects can be stored and reopened across R sessions. ff files can be shared by multiple ff R objects (using different data en/de-coding schemes) in the same process or from multiple R processes to exploit parallelism. A wide choice of finalizer options allows to work with 'permanent' files as well as creating/removing 'temporary' ff files completely transparent to the user. On certain OS/Filesystem combinations, creating the ff files works without notable delay thanks to using sparse file allocation. Several access optimization techniques such as Hybrid Index Preprocessing and Virtualization are implemented to achieve good performance even with large datasets, for example virtual matrix transpose without touching a single byte on disk. Further, to reduce disk I/O, 'logicals' and non-standard data types get stored native and compact on binary flat files i.e. logicals take up exactly 2 bits to represent TRUE, FALSE and NA. Beyond basic access functions, the ff package also provides compatibility functions that facilitate writing code for ff and ram objects and support for batch processing on ff objects (e.g. as.ram, as.ff, ffapply). ff interfaces closely with functionality from package 'bit': chunked looping, fast bit operations and coercions between different objects that can store subscript information ('bit', 'bitwhich', ff 'boolean', ri range index, hi hybrid index). This allows to work interactively with selections of large datasets and quickly modify selection criteria. Further high-performance enhancements can be made available upon request. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-field | 0.1.0   | Force field simulation of interaction of set of points. Very useful for placing text labels on graphs, such as scatterplots. / GPL-3   | noarch                         |

Table 51 – continued from previous page

| Name                          | Version | Summary/License   | Platforms  |
|-------------------------------|---------|---|--|
| <a href="#">r-ffmanova</a>    | 1.1.0   | General linear modeling with multiple responses (MANCOVA). An overall p-value for each model term is calculated by the 50-50 MANOVA method by Langsrud (2002) <doi:10.1111/1467-9884.00320>, which handles collinear responses. Rotation testing, described by Langsrud (2005) <doi:10.1007/s11222-005-4789-5>, is used to compute adjusted single response p-values according to familywise error rates and false discovery rates (FDR). The approach to FDR is described in the appendix of Moen et al. (2005) <doi:10.1128/AEM.71.4.2086-2094.2005>. Unbalanced designs are handled by Type II sums of squares as argued in Langsrud (2003) <doi:10.1023/A:1023260610025>. Furthermore, the Type II philosophy is extended to continuous design variables as described in Langsrud et al. (2007) <doi:10.1080/02664760701594246>. This means that the method is invariant to scale changes and that common pitfalls are avoided. / GPL-2 | noarch   |
| <a href="#">r-ffmetadata</a>  | 1.0.0   | A collection of functions that allows users to retrieve metadata for the Fragile Families challenge via a Web API (< <a href="http://api.metadata.fragilefamilies.princeton.edu">http://api.metadata.fragilefamilies.princeton.edu</a> >). Users can select and search metadata for relevant variables by filtering on different attribute names. / MIT   | noarch   |
| <a href="#">r-ffstream</a>    | 0.1.6   | An implementation of the adaptive forgetting factor scheme described in Bodenham and Adams (2016) <doi:10.1007/s11222-016-9684-8> which adaptively estimates the mean and variance of a stream in order to detect multiple changepoints in streaming data. The implementation is in C and uses Rcpp. Additionally, implementations of the fixed forgetting factor scheme from the same paper, as well as the classic CUSUM and EWMA methods, are included. / GPL-2   GPL-3  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-fftw</a>        | 1.0_5   | Provides a simple and efficient wrapper around the fastest Fourier transform in the west (FFTW) < <a href="http://www.fftw.org/">http://www.fftw.org/</a> > library. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-fftwtools</a>   | 0.9_8   | Provides a wrapper for several ‘FFTW’ functions. This package provides access to the two-dimensional ‘FFT’, the multivariate ‘FFT’, and the one-dimensional real to complex ‘FFT’ using the ‘FFTW3’ library. The package includes the functions fftw() and mvfftw() which are designed to mimic the functionality of the R functions fft() and mvfft(). The ‘FFT’ functions have a parameter that allows them to not return the redundant complex conjugate when the input is real data. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-fgac</a>        | 0.6_1   | Bi-variate data fitting is done by two stochastic components: the marginal distributions and the dependency structure. The dependency structure is modeled through a copula. An algorithm was implemented considering seven families of copulas (Generalized Archimedean Copulas), the best fitting can be obtained looking all copula’s options (totally positive of order 2 and stochastically increasing models). / GPL-3  | noarch   |
| <a href="#">r-fgalgorithm</a> | 1.0     | This is a package for implementation of Flury-Gautschi algorithms. / GPL-2  | noarch   |

Table 51 – continued from previous page

| Name      | Version   | Summary/License   | Platforms  |
|-----------|-----------|---|--|
| r-fgarch  | 3042.8    | Provides a collection of functions to analyze and model heteroskedastic behavior in financial time series models. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-fgeo.x  | 1.1.4     | Access small example datasets from Luquillo, a ForestGEO site in Puerto Rico (< <a href="https://forestgeo.si.edu/sites/north-america/luquillo">https://forestgeo.si.edu/sites/north-america/luquillo</a> >). / GPL-3   | noarch   |
| r-fgof    | 0.2_1     | Goodness-of-fit test with multiplier or parametric bootstrap. / GPL-3   | noarch   |
| r-fgpt    | 2.3       | A permutation technique to explore and control for spatial autocorrelation. This package contains low level functions for performing permutations and calculating statistics as well as higher level functions. Higher level functions are an easy to use function for performing spatially restricted permutation tests and summarize and plot results. / GPL-3  | noarch   |
| r-fgsg    | 1.0.2     | Implement algorithms for feature grouping and selection over an undirected graph, solves problems like graph fused lasso, graph OSCAR and so on. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |
| r-fgui    | 1.0_8     | Rapidly create a GUI interface for a function you created by automatically creating widgets for arguments of the function. Automatically parses help routines for context-sensitive help to these arguments. The interface essentially a wrapper to some Tcl/Tk routines to both simplify and facilitate GUI creation. More advanced Tcl/Tk routines/GUI objects can be incorporated into the interface for greater customization for the more experienced. / GPL-3 | noarch   |
| r-fhdi    | 1.3.2     | Impute general multivariate missing data with the fractional hot deck imputation based on Jaekwang Kim (2011) <doi:10.1093/biomet/asq073>. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |
| r-fhidata | 2019.8.27 | Provides structural data for Norway. Datasets relating to maps, population in municipalities, vaccination coverage for childhood vaccines, municipality/county matching, and how different municipalities have merged/redistricted over time from 2006 to 2019. / GPL-3   | noarch   |
| r-fi      | 1.0       | Provide functions for forest inventory calculations. Common volumetric equations (Smalian, Newton and Huber) as well stacking factor and form / GPL-3   | noarch   |

Table 51 – continued from previous page

| Name                         | Version | Summary/License  | Platforms                      |
|------------------------------|---------|--|--------------------------------|
| <a href="#">r-fiberld</a>    | 0.1.6   | Routines for estimating tree fiber (tracheid) length distributions in the standing tree based on increment core samples. Two types of data can be used with the package, increment core data measured by means of an optical fiber analyzer (OFA), e.g. such as the Kajaani Fiber Lab, or measured by microscopy. Increment core data analyzed by OFAs consist of the cell lengths of both cut and uncut fibres (tracheids) and fines (such as ray parenchyma cells) without being able to identify which cells are cut or if they are fines or fibres. The microscopy measured data consist of the observed lengths of the uncut fibres in the increment core. A censored version of a mixture of the fine and fiber length distributions is proposed to fit the OFA data, under distributional assumptions (Svensson et al., 2006) <doi:10.1111/j.1467-9469.2006.00501.x>. The package offers two choices for the assumptions of the underlying density functions of the true fiber (fine) lengths of those fibers (fines) that at least partially appear in the increment core, being the generalized gamma and the log normal densities. / GPL-2 | noarch                         |
| <a href="#">r-filehash</a>   | 2.4.2   | Implements a simple key-value style database where character string keys are associated with data values that are stored on the disk. A simple interface is provided for inserting, retrieving, and deleting data from the database. Utilities are provided that allow ‘filehash’ databases to be treated much like environments and lists are already used in R. These utilities are provided to encourage interactive and exploratory analysis on large datasets. Three different file formats for representing the database are currently available and new formats can easily be incorporated by third parties for use in the ‘filehash’ framework. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-filelock</a>   | 1.0.2   | Place an exclusive or shared lock on a file. It uses ‘LockFile’ on Windows and ‘fcntl’ locks on Unix-like systems. / MIT   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-filematrix</a> | 1.3     | Interface for working with large matrices stored in files, not in computer memory. Supports multiple non-character data types (double, integer, logical and raw) of various sizes (e.g. 8 and 4 byte real values). Access to parts of the matrix is done by indexing, exactly as with usual R matrices. Supports very large matrices. Tested on multi-terabyte matrices. Allows for more than $2^{32}$ rows or columns. Allows for quick addition of extra columns to a filematrix. Cross-platform as the package has R code only. / LGPL-3  | noarch                         |
| <a href="#">r-filenamer</a>  | 0.2.3   | Create descriptive file names with ease. New file names are automatically (but optionally) time stamped and placed in date stamped directories. Streamline your analysis pipeline with input and output file names that have informative tags and proper file extensions. / GPL-3  | noarch                         |
| <a href="#">r-files</a>      | 0.0.1   | Functions for printing the contents of a folder as columns in a ragged-bottom data.frame and for viewing the details (size, time created, time modified, etc.) of a folder’s top level contents. / GPL-3   | noarch                         |
| <a href="#">r-fillr</a>      | 0.1.1   | Edit vectors to fill missing values, based on the vector itself. / MIT   | noarch                         |
| <a href="#">r-fimport</a>    | 3042.85 | Provides a collection of utility functions to download and manage data sets from the Internet or from other sources. / GPL-2   | noarch                         |
| <a href="#">r-finana</a>     | 0.1.2   | Functions for financial analysis and financial modeling, including batch graphs generation, beta calculation, descriptive statistics, annuity calculation, bond pricing and financial data download. / GPL-2   | noarch                         |

Continued on next page

Table 51 – continued from previous page

| Name                                   | Version | Summary/License  | Platforms   |
|--|---------|--|---|
| <a href="#">r-financialinstrument</a>  | 1.3.1   | Infrastructure for defining meta-data and relationships for financial instruments. / GPL-3   | noarch  |
| <a href="#">r-financialmath</a>        | 0.1.1   | Contains financial math functions and introductory derivative functions included in the Society of Actuaries and Casualty Actuarial Society ‘Financial Mathematics’ exam, and some topics in the ‘Models for Financial Economics’ exam. / GPL-2  | noarch  |
| <a href="#">r-finasymp</a>             | 1.0     | This package accomplishes two tasks: a) it classifies implicit trading activity from quotes in OTC markets using the algorithm of Lee and Ready (1991); b) based on information for trade initiation, the package computes the probability of informed trading of Easley and O’Hara (1987). / GPL-3  | noarch  |
| <a href="#">r-fincovregularization</a> | 1.1.0   | Estimation and regularization for covariance matrix of asset returns. For covariance matrix estimation, three major types of factor models are included: macroeconomic factor model, fundamental factor model and statistical factor model. For covariance matrix regularization, four regularized estimators are included: banding, tapering, hard-thresholding and soft- thresholding. The tuning parameters of these regularized estimators are selected via cross-validation. / GPL-2  | noarch  |
| <a href="#">r-findallroots</a>         | 1.0     | Find all root(s) of the equation,including complex roots;Find root(s) of the equation by dichotomy.Besides,in dichotomy, more than one interval can be given at a time. / GPL-2  | noarch  |
| <a href="#">r-findpython</a>           | 1.0.5   | Package designed to find an acceptable python binary. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-findr</a>                | 0.2.1   | Scans all directories and subdirectories of a path for code snippets, R scripts, R Markdown, PDF or text files containing a specific pattern. Files found can be copied to a new folder. / GPL-3   | noarch  |
| <a href="#">r-finepop</a>              | 1.5.1   | Statistical tool set for population genetics. The package provides following functions: 1) empirical Bayes estimator of Fst and other measures of genetic differentiation, 2) regression analysis of environmental effects on genetic differentiation using bootstrap method, 3) interfaces to read and manipulate ‘GENEPOP’ format data files and allele/haplotype frequency format files. / GPL (>= 2.0)   | noarch  |
| <a href="#">r-fingerprint</a>          | 3.5.7   | Functions to manipulate binary fingerprints of arbitrary length. A fingerprint is represented by an object of S4 class ‘fingerprint’ which is internally represented a vector of integers, such that each element represents the position in the fingerprint that is set to 1. The bitwise logical functions in R are overridden so that they can be used directly with ‘fingerprint’ objects. A number of distance metrics are also available (many contributed by Michael Fadock). Fingerprints can be converted to Euclidean vectors (i.e., points on the unit hypersphere) and can also be folded using OR. Arbitrary fingerprint formats can be handled via line handlers. Currently handlers are provided for CDK, MOE and BCI fingerprint data. / GPL-3 | linux-64,<br>osx-64,<br>win-64                                    |

Table 51 – continued from previous page

| Name             | Version | Summary/License  | Platforms                      |
|------------------|---------|--|--------------------------------|
| r-fints          | 0.4.6   | R companion to Tsay (2005) Analysis of Financial Time Series, second edition (Wiley). Includes data sets, functions and script files required to work some of the examples. Version 0.3-x includes R objects for all data files used in the text and script files to recreate most of the analyses in chapters 1-3 and 9 plus parts of chapters 4 and 11. / GPL-2  | noarch                         |
| r-fire           | 1.0     | The algorithm assigns rareness/ outlieriness score to every sample in voluminous datasets. The algorithm makes multiple estimations of the proximity between a pair of samples, in low-dimensional spaces. To compute proximity, FiRE uses Sketching, a variant of locality sensitive hashing. For more details: Jindal, A., Gupta, P., Jayadeva and Sengupta, D., 2018. Discovery of rare cells from voluminous single cell expression data. Nature Communications, 9(1), p.4719. <doi:10.1038/s41467-018-07234-6>. / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| r-fishdata       | 0.1.3   | A collection of four datasets based around the population dynamics of migratory fish. Datasets contain both basic size information on a per fish basis, as well as otolith data that contains a per day record of fish growth history. All data in this package was collected by the author, from 2015-2016, in the Wellington region of New Zealand. / GPL-3  | noarch                         |
| r-fisherem       | 1.5.1   | The FisherEM algorithm, proposed by Bouveyron & Brunet (201) <doi:10.1007/s11222-011-9249-9>, is an efficient method for the clustering of high-dimensional data. FisherEM models and clusters the data in a discriminative and low-dimensional latent subspace. It also provides a low-dimensional representation of the clustered data. A sparse version of Fisher-EM algorithm is also provided. / GPL-2  | noarch                         |
| r-fisheyer       | 0.9     | fisheyer provides tools for creating Interactive Data Visualizations by implementing ideas from Furnas, Munzner, Costa and Venturini. / GPL-2  | noarch                         |
| r-fishical       | 1.1     | FisHiCal integrates Hi-C and FISH data, offering a modular and easy-to-use tool for chromosomal spatial analysis. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-fishkirkko2015 | 1.0.0   | Dataset of 302 measurements of 11 fish species to accompany the manuscript Length-weight relationships of six freshwater fish species from lake Kirkkojarvi, Finland. / GPL-3  | noarch                         |
| r-fishmethods    | 1.11    | Functions for applying a wide range of fisheries stock assessment methods. / GPL-2   | noarch                         |
| r-fishmod        | 0.29    | Fits models to catch and effort data. Single-species models are 1) delta log-normal, 2) Tweedie, or 3) Poisson-gamma (G)LMs. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-fishtree       | 0.3.1   | An interface to the Fish Tree of Life API to download taxonomies, phylogenies, fossil calibrations, and diversification rate information for ray-finned fishes. / BSD_2_clause   | noarch                         |
| r-fit.models     | 0.5.14  | The fit.models function and its associated methods (coefficients, print, summary, plot, etc.) were originally provided in the robust package to compare robustly and classically fitted model objects. The aim of the fit.models package is to separate this fitted model object comparison functionality from the robust package and to extend it to support fitting methods (e.g., classical, robust, Bayesian, regularized, etc.) more generally. / GPL-3   | noarch                         |

Table 51 – continued from previous page

| Name                              | Version | Summary/License  | Platforms |
|-----------------------------------|---------|--|-----------|
| <a href="#">r-fitbitscraper</a>   | 0.1.8   | Scrapes data from Fitbit < <a href="http://www.fitbit.com">http://www.fitbit.com</a> >. This does not use the official API, but instead uses the API that the web dashboard uses to generate the graphs displayed on the dashboard after login at < <a href="http://www.fitbit.com">http://www.fitbit.com</a> >. / MIT   | noarch    |
| <a href="#">r-fitdc</a>           | 0.0.1   | A pure R package for decoding activity files written in the FIT (Flexible and Interoperable Data Transfer) format. A format that is fast becoming the standard for recording running and cycling data. Details of the FIT protocol can be found at < <a href="https://www.thisisant.com/resources/fits">https://www.thisisant.com/resources/fits</a> >. / MIT  | noarch    |
| <a href="#">r-fitdrc</a>          | 1.1.1   | Fits Density Ratio Classes to elicited probability-quantile points or intervals. / GPL-2   | noarch    |
| <a href="#">r-fitpoly</a>         | 3.0.0   | Genotyping assays for bi-allelic markers (e.g. SNPs) produce signal intensities for the two alleles. ‘fitPoly’ assigns genotypes (allele dosages) to a collection of polyploid samples based on these signal intensities. ‘fitPoly’ replaces the older package ‘fitTetra’ that was limited (a.o.) to only tetraploid populations whereas ‘fitPoly’ accepts any ploidy level. Reference: Voorrips RE, Gort G, Vosman B (2011) <doi:10.1186/1471-2105-12-172>. / GPL-2   | noarch    |
| <a href="#">r-fitsio</a>          | 2.1_0   | Utilities to read and write files in the FITS (Flexible Image Transport System) format, a standard format in astronomy (see e.g. < <a href="https://en.wikipedia.org/wiki/FITS">https://en.wikipedia.org/wiki/FITS</a> > for more information). Present low-level routines allow: reading, parsing, and modifying FITS headers; reading FITS images (multi-dimensional arrays); reading FITS binary and ASCII tables; and writing FITS images (multi-dimensional arrays). Higher-level functions allow: reading files composed of one or more headers and a single (perhaps multidimensional) image or single table; reading tables into data frames; generating vectors for image array axes; scaling and writing images as 16-bit integers. Known incompletenesses are reading random group extensions, as well as bit, complex, and array descriptor data types in binary tables. / GPL-2 | noarch    |
| <a href="#">r-fittetra</a>        | 1.0     | Package fitTetra contains three functions that can be used to assign genotypes to a collection of tetraploid samples based on biallelic marker assays. Functions fitTetra (to fit several models for one marker from the data and select the best fitting) or saveMarkerModels (calls fitTetra for multiple markers and saves the results to files) will probably be the most convenient to use. Function CodomMarker offers more control and fits one specified model for a given marker. / GPL (>= 2.2)  | noarch    |
| <a href="#">r-fivethirtyeight</a> | 0.5.0   | Datasets and code published by the data journalism website ‘FiveThirtyEight’ available at < <a href="https://github.com/fivethirtyeight/data">https://github.com/fivethirtyeight/data</a> >. Note that while we received guidance from editors at ‘FiveThirtyEight’, this package is not officially published by ‘FiveThirtyEight’. / MIT  | noarch    |
| <a href="#">r-fixedpoint</a>      | 0.6.1   | For functions that take and return vectors (or scalars), this package provides 8 algorithms for finding fixed point vectors (vectors for which the inputs and outputs to the function are the same vector). These algorithms include Anderson (1965) acceleration <doi:10.1145/321296.321305>, epsilon extrapolation methods (Wynn 1962 <doi:10.2307/2004051>) and minimal polynomial methods (Cabay and Jackson 1976 <doi:10.1137/0713060>). / MIT  | noarch    |
| <a href="#">r-fixedtimeevents</a> | 1.0     | Distribution functions and test for over-representation of short distances in the Liland distribution. Simulation functions are included for comparison. / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms                      |
|-----------------------------|---------|---|--------------------------------|
| <a href="#">r-fixest</a>    | 0.1.0   | Fast and user-friendly estimation of econometric models with multiple fixed-effects. Includes ordinary least squares (OLS), generalized linear models (GLM) and the negative binomial. The core of the package is based on optimized parallel C code, scaling especially well for large data sets. The method to obtain the fixed-effects coefficients is based on Berge (2018) < <a href="https://www.wen.uni.lu/content/download/110162/1299525/file/2018_13">https://www.wen.uni.lu/content/download/110162/1299525/file/2018_13</a> >. Further provides tools to export and view the results of several estimations with intuitive design to cluster the standard-errors. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-fixseqmtp</a> | 0.1.2   | Several generalized / directional Fixed Sequence Multiple Testing Procedures (FSMTPs) are developed for testing a sequence of pre-ordered hypotheses while controlling the FWER, FDR and Directional Error (mdFWER). All three FWER controlling generalized FSMTPs are designed under arbitrary dependence, which allow any number of acceptances. Two FDR controlling generalized FSMTPs are respectively designed under arbitrary dependence and independence, which allow more but a given number of acceptances. Two mdFWER controlling directional FSMTPs are respectively designed under arbitrary dependence and independence, which can also make directional decisions based on the signs of the test statistics. The main functions for each proposed generalized / directional FSMTPs are designed to calculate adjusted p-values and critical values, respectively. For users' convenience, the functions also provide the output option for printing decision rules. / GPL-2   | noarch                         |
| <a href="#">r-fizzbuzzr</a> | 0.1.1   | An implementation of the Fizz Buzz algorithm, as defined e.g. in < <a href="https://en.wikipedia.org/wiki/Fizz_buzz">https://en.wikipedia.org/wiki/Fizz_buzz</a> >. It provides the standard algorithm with 3 replaced by Fizz and 5 replaced by Buzz, with the option of specifying start and end numbers, step size and the numbers being replaced by fizz and buzz, respectively. This package gives interviewers the optional answer of I use fizzbuzzR::fizzbuzz() when interviewing rather than having to write an algorithm themselves. / GPL-3  | noarch                         |
| <a href="#">r-flagr</a>     | 0.3.2   | Three methods are implemented in R to facilitate the aggregations of flags in official statistics. From the underlying flags the highest in the hierarchy, the most frequent, or with the highest total weight is propagated to the flag(s) for EU or other aggregates. Below there are some reference documents for the topic: < <a href="https://sdmx.org/wp-content/uploads/CL_OBS_STATUS_v2_1.docx">https://sdmx.org/wp-content/uploads/CL_OBS_STATUS_v2_1.docx</a> >, < <a href="https://sdmx.org/wp-content/uploads/CL_CONF_STATUS_1_2_2018.docx">https://sdmx.org/wp-content/uploads/CL_CONF_STATUS_1_2_2018.docx</a> >, < <a href="http://ec.europa.eu/eurostat/data/database/information">http://ec.europa.eu/eurostat/data/database/information</a> >, < <a href="http://www.oecd.org/sdd/33869551.pdf">http://www.oecd.org/sdd/33869551.pdf</a> >, < <a href="https://sdmx.org/wp-content/uploads/CL_OBS_STATUS_implementation_20-10-2014.pdf">https://sdmx.org/wp-content/uploads/CL_OBS_STATUS_implementation_20-10-2014.pdf</a> >. / EUPL-1.1 | noarch                         |
| <a href="#">r-flam</a>      | 3.2     | Implements the fused lasso additive model as proposed in Petersen, A., Witten, D., and Simon, N. (2016). Fused Lasso Additive Model. Journal of Computational and Graphical Statistics, 25(4): 1005-1025. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

|------------------|---------|--|--------------------------------|
| r-flamingos      | 0.1.0   | Provides a variety of original and flexible user-friendly statistical latent variable models for the simultaneous clustering and segmentation of heterogeneous functional data (i.e time series, or more generally longitudinal data, fitted by unsupervised algorithms, including EM algorithms. Functional Latent Data Models for Clustering heterogeneous curves ('FLaMingos') are originally introduced and written in 'Matlab' by Faicel Chamroukhi < <a href="https://github.com/fchamroukhi?utf8=?&amp;tab=repositories&amp;q=mix&amp;type=public&amp;language=matlab">https://github.com/fchamroukhi?utf8=?&amp;tab=repositories&amp;q=mix&amp;type=public&amp;language=matlab</a> >. The references are mainly the following ones. Chamroukhi F. (2010) < <a href="https://chamroukhi.com/FChamroukhi-PhD.pdf">https://chamroukhi.com/FChamroukhi-PhD.pdf</a> >. Chamroukhi F., Same A., Govaert, G. and Aknin P. (2010) <doi:10.1016/j.neucom.2009.12.023>. Chamroukhi F., Same A., Aknin P. and Govaert G. (2011). <doi:10.1109/IJCNN.2011.6033590>. (2019) <doi:10.1002/widm.1298>. / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| r-flatxml        | 0.0.2   | On import, the XML information is converted to a dataframe that reflects the hierarchical XML structure. Intuitive functions allow to navigate within this transparent XML data structure (without any knowledge of 'XPath'). 'flatXML' also provides tools to extract data from the XML into a flat dataframe that can be used to perform statistical operations. / GPL-3   | noarch                         |
| r-flexdashboard  | 0.5.1   | Format for converting an R Markdown document to a grid oriented dashboard. The dashboard flexibly adapts the size of it's components to the containing web page. / MIT   | noarch                         |
| r-flexdir        | 1.0     | Provides tools to work with the Flexible Dirichlet distribution. The main features are an E-M algorithm for computing the maximum likelihood estimate of the parameter vector and a function based on conditional bootstrap to estimate its asymptotic variance-covariance matrix. It contains also functions to plot graphs, to generate random observations and to handle compositional data. / GPL-2  | noarch                         |
| r-flexmet        | 1.0.0   | Application of the filtered monotonic polynomial (FMP) item response model to flexibly fit item response models. The package includes tools that allow the item response model to be build on any monotonic transformation of the latent trait metric, as described by Feuerstahler (2016) < <a href="http://hdl.handle.net/11299/182267">http://hdl.handle.net/11299/182267</a> >. / GPL-3  | noarch                         |
| r-flexmix        | 2.3_1   | A general framework for finite mixtures of regression models using the EM algorithm is implemented. The E-step and all data handling are provided, while the M-step can be supplied by the user to easily define new models. Existing drivers implement mixtures of standard linear models, generalized linear models and model-based clustering. / GPL-2  | noarch                         |
| r-flexparamcurve | 1.5_5   | Model selection tools and 'selfStart' functions to fit parametric curves in 'nls', 'nlsList' and 'nlme' frameworks. / GPL-2  | noarch                         |
| r-flexpm         | 2.0     | Estimation of flexible parametric models for survival data. / GPL-2  | noarch                         |
| r-flickrapi      | 0.1.0   | Provides an interface to the Flickr API < <a href="https://www.flickr.com/services/api/">https://www.flickr.com/services/api/</a> > and allows R users to download data on Flickr. / GPL-2   | noarch                         |
| r-flipscores     | 0.2     | Provides robust tests for testing in GLMs, by sign-flipping score contributions. The tests are often robust against overdispersion, heteroscedasticity and, in some cases, ignored nuisance variables. See Hemerik and Goeman (2017) <doi:10.1007/s11749-017-0571-1>. / GPL-3  | noarch                         |

Table 51 – continued from previous page

| Name             | Version | Summary/License  | Platforms |
|------------------|---------|--|-----------|
| r-flower         | 1.0     | Flowering is an important life history trait of flowering plants. It has been mainly analyzed with respect to flowering onset and duration of flowering. This tools provide some functions to compute the temporal distribution of an flowering individual related to other population members. fCV() measures the temporal variation in flowering. Rlind() measures the rank order of flowering for individual plants within a population. SI(), SI2(), SI3(), and SI4() calculate flowering synchrony with different methods. / GPL ( $\geq 1.0$ ) | noarch    |
| r-flowfield      | 1.0     | Flow field forecasting draws information from an interpolated flow field of the observed time series to incrementally build a forecast. / GPL-3  | noarch    |
| r-flowregenvcost | 0.1.1   | An application to calculate the daily environmental costs of river flow regulation by dams based on Garc a de Jalon et al. 2017 <doi:10.1007/s11269-017-1663-0>. / MIT   | noarch    |
| r-flows          | 1.1.1   | Selections on flow matrices, statistics on selected flows, map and graph visualisations. / GPL-3   | noarch    |
| r-flr            | 1.0     | FLR algorithm for classification / GPL-2   | noarch    |
| r-fluosurv       | 1.0.0   | Use spectrophotometry measurements performed on insects as a way to infer pathogens virulence. Insect movements cause fluctuations in fluorescence signal, and functions are provided to estimate when the insect has died as the moment when variance in autofluorescence signal drops to zero. The package provides functions to obtain this estimate together with functions to import spectrophotometry data from a Biotek microplate reader. Details of the method are given in Parthuisot et al. (2018) <doi:10.1101/297929>. / GPL-3          | noarch    |
| r-flury          | 0.1_3   | Contains data sets from Bernard Flury (1997) A First Course in Multivariate Statistics, Springer NY / GPL-2  | noarch    |
| r-flux           | 0.3_0   | Functions for the calculation of greenhouse gas flux rates from closed chamber concentration measurements. The package follows a modular concept: Fluxes can be calculated in just two simple steps or in several steps if more control in details is wanted. Additionally plot and preparation functions as well as functions for modelling gpp and reco are provided. / GPL-2  | noarch    |
| r-fluxweb        | 0.2.0   | Compute energy fluxes in trophic networks, from resources to their consumers, and can be applied to systems ranging from simple two-species interactions to highly complex food webs. It implements the approach described in Gauzens et al. (2017) <doi:10.1101/229450> to calculate energy fluxes, which are also used to calculate equilibrium stability. / GPL ( $\geq 2.0$ )  | noarch    |
| r-fmcmc          | 0.2_0   | Provides a friendly (flexible) Markov Chain Monte Carlo (MCMC) framework for implementing Metropolis-Hastings algorithm in a modular way allowing users to specify automatic convergence checker, personalized transition kernels, and out-of-the-box multiple MCMC chains using parallel computing. Most of the methods implemented in this package can be found in Brooks et al. (2011, ISBN 9781420079425). / MIT   | noarch    |
| r-fmdates        | 0.1.4   | Implements common date calculations relevant for specifying the economic nature of financial market contracts that are typically defined by International Swap Dealer Association (ISDA, < <a href="http://www2.isda.org">http://www2.isda.org</a> >) legal documentation. This includes methods to check whether dates are business days in certain locales, functions to adjust and shift dates and time length (or day counter) calculations. / GPL-2   | noarch    |
| r-fmp            | 1.4     | Estimates Filtered Monotonic Polynomial IRT Models as described by Liang and Browne (2015) <DOI:10.3102/1076998614556816>. / GPL-2   | noarch    |

| Name                             | Version | Summary/License  | Platforms   |
|----------------------------------|---------|--|---|
| <code>r-fmsb</code>              | 0.6.3   | Several utility functions for the book entitled Practices of Medical and Health Data Analysis using R (Pearson Education Japan, 2007) with Japanese demographic data and some demographic analysis related functions. / GPL-2  | noarch  |
| <code>r-fmsmsnreg</code>         | 1.0     | Fit linear regression models where the random errors follow a finite mixture of of Skew Heavy-Tailed Errors. / GPL-2   | noarch  |
| <code>r-foba</code>              | 0.1     | foba is a package that implements forward, backward, and foba sparse learning algorithms for ridge regression, described in the paper Adaptive Forward-Backward Greedy Algorithm for Learning Sparse Representations. / GPL-2  | noarch  |
| <code>r-focusedmds</code>        | 1.3.3   | Takes a distance matrix and plots it as an interactive graph. One point is focused at the center of the graph, around which all other points are plotted in their exact distances as given in the distance matrix. All other non-focus points are plotted as best as possible in relation to one another. Double click on any point to choose a new focus point, and hover over points to see their ID labels. If color label categories are given, hover over colors in the legend to highlight only those points and click on colors to highlight multiple groups. For more information on the rationale and mathematical background, as well as an interactive introduction, see < <a href="https://lea-urpa.github.io/focusedMDS.html">https://lea-urpa.github.io/focusedMDS.html</a> >. / GPL-3 | noarch  |
| <code>r-folderfun</code>         | 0.1.2   | If you find yourself working on multiple different projects in R, you'll want a series of folders pointing to raw data, processed data, plot results, intermediate table outputs, etc. This package makes it easier to do that by providing a quick and easy way to create and use functions for project-level directories. / BSD_2_clause   | noarch  |
| <code>r-fontbitstreamvera</code> | 0.1.1   | Provides fonts licensed under the 'Bitstream Vera Fonts' license for the 'fontquiver' package. / file LICENCE (FOSS)   | noarch  |
| <code>r-fontcm</code>            | 1.1     | Computer Modern font for use with extrafont package / GPL-2  | noarch  |
| <code>r-fontliberation</code>    | 0.1.0   | A placeholder for the Liberation fontset intended for the <i>fontquiver</i> package. This fontset covers the 12 combinations of families (sans, serif, mono) and faces (plain, bold, italic, bold italic) supported in R graphics devices. / file LICENSE (FOSS)   | noarch  |
| <code>r-foolbox</code>           | 0.1.1   | Provides functionality for manipulating functions and translating them in metaprogramming. / GPL-3   | noarch  |
| <code>r-forcats</code>           | 0.4.0   | Helpers for reordering factor levels (including moving specified levels to front, ordering by first appearance, reversing, and randomly shuffling), and tools for modifying factor levels (including collapsing rare levels into other, 'anonymising', and manually 'recoding'). / GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

|--|---------|--|---|
| <a href="#">r-foreach</a>              | 1.4.4   | Support for the foreach looping construct. Foreach is an idiom that allows for iterating over elements in a collection, without the use of an explicit loop counter. This package in particular is intended to be used for its return value, rather than for its side effects. In that sense, it is similar to the standard lapply function, but doesn't require the evaluation of a function. Using foreach without side effects also facilitates executing the loop in parallel. / Apache License (== 2.0) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-forecast</a>             | 8.6     | Methods and tools for displaying and analysing univariate time series forecasts including exponential smoothing via state space models and automatic ARIMA modelling. / GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-forecastcombinations</a> | 1.1     | Aim: Supports the most frequently used methods to combine forecasts. Among others: Simple average, Ordinary Least Squares, Least Absolute Deviation, Constrained Least Squares, Variance-based, Best Individual model, Complete subset regressions and Information-theoretic (information criteria based). / GPL-2   | noarch  |
| <a href="#">r-foreign</a>              | 0.8_7   | Reading and writing data stored by some versions of 'Epi Info', 'Minitab', 'S', 'SAS', 'SPSS', 'Stata', 'Systat', 'Weka', and for reading and writing some 'dBase' files. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

Table 51 – continued from previous page

| Name                           | Version | Summary/License   | Platforms |
|--------------------------------|---------|---|-----------|
| <a href="#">r-forestfit</a>    | 0.4     | Developed for the following tasks. I) Computing the probability density function, cumulative distribution function, random generation, and estimating the parameters of the eleven mixture models including mixture of Birnbaum-Saunders, BurrXII, Chen, F, Frechet, gamma, Gompertz, log-logistic, log-normal, Lomax, and Weibull. II) Point estimation of the parameters of two- and three-parameter Weibull distributions. In the case of two-parameter, twelve methods consist of generalized least square type 1, generalized least square type 2, L-moment, maximum likelihood, logarithmic moment, moment, percentile, rank correlation, least square, weighted maximum likelihood, U-statistic, weighted least square are used and investigated methods for the three-parameter case are: maximum likelihood, modified moment type 1, modified moment type 2, modified moment type 3, modified maximum likelihood type 1, modified maximum likelihood type 2, modified maximum likelihood type 3, modified maximum likelihood type 4, moment, maximum product spacing, T-L moment, and weighted maximum likelihood. III) The Bayesian estimators of the three-parameter Weibull distribution. IV) Estimating parameters of the three-parameter Weibull distribution fitted to grouped data using three methods including approximated maximum likelihood, expectation maximization, and maximum likelihood. V) Estimating the parameters of the gamma, log-normal, and Weibull mixture models fitted to the grouped data through the EM algorithm. VI) Estimating parameters of the non-linear growth curve fitted to the height-diameter observations. / GPL-2 | noarch    |
| <a href="#">r-foresthes</a>    | 1.0_1   | Assessing forest ecosystem health is an effective way for forest resource management. The national forest health evaluation system at the forest stand level using analytic hierarchy process, has a high application value and practical significance. The package can effectively and easily realize the total assessment process, and help foresters to further assess and management forest resources. / GPL-2  | noarch    |
| <a href="#">r-forestplot</a>   | 1.9     | A forest plot that allows for multiple confidence intervals per row, custom fonts for each text element, custom confidence intervals, text mixed with expressions, and more. The aim is to extend the use of forest plots beyond meta-analyses. This is a more general version of the original 'rmeta' package's forestplot() function and relies heavily on the 'grid' package. / GPL-2  | noarch    |
| <a href="#">r-foretell</a>     | 0.2.0   | Project Customer Retention based on Beta Geometric, Beta Discrete Weibull and Latent Class Discrete Weibull Models. This package is based on Fader and Hardie (2007) <doi:10.1002/dir.20074> and Fader and Hardie et al. (2018) <doi:10.1016/j.intmar.2018.01.002>. / GPL-3   | noarch    |
| <a href="#">r-forge</a>        | 0.2.0   | Helper functions with a consistent interface to coerce and verify the types and shapes of values for input checking. / Apache License (>= 2.0)  | noarch    |
| <a href="#">r-forit</a>        | 1.0     | This package provides estimates of tree volume and biomass from Italian NFI models / GPL-3  | noarch    |
| <a href="#">r-formalseries</a> | 1.0     | Implemented, addition, subtracking, multiplication, division in formal series rings of any number of variables (except division is only to 3 variables). Also are available [ <- operators. / GPL-2   | noarch    |

|---------------------------------|---------|--|---|
| <a href="#">r-formatr</a>       | 1.6     | Provides a function <code>tidy_source()</code> to format R source code. Spaces and indent will be added to the code automatically, and comments will be preserved under certain conditions, so that R code will be more human-readable and tidy. There is also a Shiny app as a user interface in this package (see <code>tidy_app()</code> ). / GPL   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-formattable</a>   | 0.2.0   | Provides functions to create formattable vectors and data frames. ‘Formattable’ vectors are printed with text formatting, and formattable data frames are printed with multiple types of formatting in HTML to improve the readability of data presented in tabular form rendered in web pages. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-formula</a>       | 1.2_3   | Infrastructure for extended formulas with multiple parts on the right-hand side and/or multiple responses on the left-hand side (see <DOI:10.18637/jss.v034.i01>). / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-fortunes</a>      | 1.5_4   | A collection of fortunes from the R community. / GPL-2   GPL-3   | noarch  |
| <a href="#">r-forward</a>       | 1.0.4   | Robust analysis using forward search in linear and generalized linear regression models, as described in Atkinson, A.C. and Riani, M. (2000), Robust Diagnostic Regression Analysis, First Edition. New York: Springer. / GPL-2  | noarch  |
| <a href="#">r-forwards</a>      | 0.1.3   | Anonymized data from surveys conducted by Forwards < <a href="https://forwards.github.io/">https://forwards.github.io/</a> >, the R Foundation task force on women and other under-represented groups. Currently, a single data set of responses to a survey of attendees at useR! 2016 < <a href="https://www.r-project.org/useR-2016/">https://www.r-project.org/useR-2016/</a> >, the R user conference held at Stanford University, Stanford, California, USA, June 27 - June 30 2016. / CC0 | noarch  |
| <a href="#">r-forwardsearch</a> | 1.0     | Forward Search analysis of time series regressions. Implements the asymptotic theory developed in Johansen and Nielsen (2013, 2014). / GPL-3   | noarch  |
| <a href="#">r-foto</a>          | 1.0.0   | The Fourier Transform Textural Ordination method uses a principal component analysis on radially averaged two dimensional Fourier spectra to characterize image texture. / AGPL-3  | noarch  |

| Name                         | Version | Summary/License  | Platforms  |
|------------------------------|---------|--|--|
| r-fourgametep                | 0.1.0   | The four-gamete test is based on the infinite-sites model which assumes that the probability of the same mutation occurring twice (recurrent or parallel mutations) and the probability of a mutation back to the original state (reverse mutations) are close to zero. Without these types of mutations, the only explanation for observing the four dilocus genotypes (example below) is recombination (Hudson and Kaplan 1985, Genetics 111:147-164). Thus, the presence of all four gametes is also called phylogenetic incompatibility. / GPL-2   | noarch   |
| r-fourscores                 | 1.5.1   | A game for two players: Who gets first four in a row (horizontal, vertical or diagonal) wins. As board game published by Milton Bradley, designed by Howard Wexler and Ned Strongin. / GPL-3   | noarch   |
| r-fpca2d                     | 1.0     | Compute the two dimension functional principal component scores for a series of two dimension images. / GPL-3  | noarch   |
| r-fpca3d                     | 1.0     | Run three dimensional functional principal component analysis and return the three dimensional functional principal component scores. The details of the method are explained in Lin et al.(2015) <doi:10.1371/journal.pone.0132945>. / GPL-2   GPL-3  | noarch   |
| r-fpcompare                  | 0.2.3   | Comparisons of floating point numbers are problematic due to errors associated with the binary representation of decimal numbers. Despite being aware of these problems, people still use numerical methods that fail to account for these and other rounding errors (this pitfall is the first to be highlighted in Circle 1 of Burns (2012) ‘The R Inferno’ < <a href="http://www.burns-stat.com/pages/Tutor/R_inferno.pdf">http://www.burns-stat.com/pages/Tutor/R_inferno.pdf</a> >). This package provides new relational operators useful for performing floating point number comparisons with a set tolerance. / GPL-3 | noarch   |
| r-fpest                      | 0.1.1   | Given the values of sampled units and selection probabilities the desraj function in the package computes the estimated value of the total as well as estimated variance. / GPL-3  | noarch   |
| r-fptdapprox                 | 2.1     | Efficient approximation of first-passage-time densities for diffusion processes based on the First-Passage-Time Location (FPTL) function. / GPL-2  | noarch   |
| r-fracdiff                   | 1.4_2   | Maximum likelihood estimation of the parameters of a fractionally differenced ARIMA(p,d,q) model (Haslett and Raftery, Appl.Statistics, 1989). / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-fracprolif                 | 1.0.7   | Functions for fitting data to a quiescent growth model, i.e. a growth process that involves members of the population who stop dividing or propagating. / GPL-2  | noarch   |
| r-fractaldim                 | 0.8_4   | Implements various methods for estimating fractal dimension of time series and 2-dimensional data. / GPL-2   | noarch   |
| r-fractalparameterestimation | 1.1.2   | The parameters p and q are estimated with the aid of a randomized Sierpinski Carpet which is built on a [p-p-p-q]-model. Thereby, for three times a simulation with a p-value and once with a q-value is assumed. Hence, these parameters are estimated and displayed. Moreover, functions for simulating random Sierpinski-Carpets with constant and variable probabilities are included. For more details on the method please see Hermann et al. (2015) <doi:10.1002/sim.6497>. / GPL-2   | noarch   |

Table 51 – continued from previous page

| Name          | Version | Summary/License  | Platforms |
|---------------|---------|--|-----------|
| r-fraction    | 1.0     | This is the package which can help you turn numeric,dataframe,matrix into fraction form. / GPL-2   | noarch    |
| r-fragman     | 1.0.9   | Performs fragment analysis using genetic data coming from capillary electrophoresis machines. These are files with FSA extension which stands for FASTA-type file, and .txt files from Beckman CEQ 8000 system, both contain DNA fragment intensities read by machinery. In addition to visualization, it performs automatic scoring of SSRs (Sample Sequence Repeats; a type of genetic marker very common across the genome) and other type of PCR markers (standing for Polymerase Chain Reaction) in biparental populations such as F1, F2, BC (backcross), and diversity panels (collection of genetic diversity). / GPL-3  | noarch    |
| r-frailtyhl   | 2.2     | Implements the h-likelihood estimation procedures for general frailty models including competing-risk models and joint models. / Unlimited   | noarch    |
| r-frambgrowth | 0.1.0   | Generation of theoretical size distributions of framboidal or sunflower pyrite. The growth mechanisms used are surface and supply controlled and dependent or independent of size. The algorithms are fully described in the published work in Mineralogy and Petrology journal: Theoretical growth of framboidal and sunflower pyrite using the R-package frambgrowth The authors Merinero, R., and Cardenes, V. (2018). <DOI:10.1007/s00710-017-0535-x>. / GPL-2   | noarch    |
| r-franc       | 1.1.2   | With no external dependencies and support for 335 languages; all languages spoken by more than one million speakers. 'Franc' is a port of the 'JavaScript' project of the same name, see < <a href="https://github.com/woorm/franc">https://github.com/woorm/franc</a> >. / MIT  | noarch    |
| r-frapplot    | 0.1.3   | Automatically process Fluorescence Recovery After Photobleaching (FRAP) data and generate consistent, publishable figures. Note: this package does not replace 'ImageJ' (or its equivalence) in raw image quantification. Some references about the methods: Sprague, Brian L. (2004) <doi:10.1529/biophysj.103.026765>; Day, Charles A. (2012) <doi:10.1002/0471142956.cy0219s62>. / MIT  | noarch    |
| r-frbs        | 3.1.0   | An implementation of various learning algorithms based on fuzzy rule-based systems (FRBSs) for dealing with classification and regression tasks. Moreover, it allows to construct an FRBS model defined by human experts. FRBSs are based on the concept of fuzzy sets, proposed by Zadeh in 1965, which aims at representing the reasoning of human experts in a set of IF-THEN rules, to handle real-life problems in, e.g., control, prediction and inference, data mining, bioinformatics data processing, and robotics. FRBSs are also known as fuzzy inference systems and fuzzy models. During the modeling of an FRBS, there are two important steps that need to be conducted: structure identification and parameter estimation. Nowadays, there exists a wide variety of algorithms to generate fuzzy IF-THEN rules automatically from numerical data, covering both steps. Approaches that have been used in the past are, e.g., heuristic procedures, neuro-fuzzy techniques, clustering methods, genetic algorithms, squares methods, etc. Furthermore, in this version we provide a universal framework named 'frbsPMML', which is adopted from the Predictive Model Markup Language (PMML), for representing FRBS models. PMML is an XML-based language to provide a standard for describing models produced by data mining and machine learning algorithms. Therefore, we are allowed to export and import an FRBS model to/from 'frbsPMML'. Finally, this package aims to implement the most widely used standard procedures, thus offering a standard package for FRBS modeling to the R community. / GPL-2 | noarch    |
| r-frecc       | 1.0     | This package implements the functions associated with Fast Regularized Canonical Correlation Analysis. / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name                | Version | Summary/License  | Platforms                                 |
|---------------------|---------|--|---|
| r-freegroup         | 1.1.0   | Provides functionality for manipulating elements of the free group (juxtaposition is represented by a plus) including inversion, multiplication by a scalar, group-theoretic power operation, and Tietze forms. The package is fully vectorized. / GPL-2   | noarch                                    |
| r-freestats         | 0.0.3   | A collections of useful statistical functions used in Columbia course W4240/W4400. / BSD_3_clause  | noarch                                    |
| r-freesurferformats | 0.1.0   | Provides functions to read data from neuroimaging files in 'FreeSurfer' < <a href="http://freesurfer.net/">http://freesurfer.net/</a> > binary formats. This includes the following file formats: 1) MGH/MGZ format files, which can contain multi-dimensional images or other data. Typically they contain time-series of three-dimensional brain scans acquired by magnetic resonance imaging (MRI). They can also contain vertex-wise measures of surface morphometry data. The MGH format is named after the Massachusetts General Hospital, and the MGZ format is a compressed version of the same format. 2) 'FreeSurfer' morphometry data files in binary 'curv' format. These contain vertex-wise surface measures, i.e., one scalar value for each vertex of a brain surface mesh. These are typically values like the cortical thickness or brain surface area at each vertex. / MIT | noarch                                    |
| r-fregression       | 3042.82 | A collection of functions for linear and non-linear regression modelling. It implements a wrapper for several regression models available in the base and contributed packages of R. / GPL-2   | noarch                                    |
| r-freq              | 1.0     | Real capture frequencies will be fitted to various distributions which provide the basis of estimating population sizes, their standard error, and symmetric as well as asymmetric confidence intervals. / GPL-2   | noarch                                    |
| r-freqdist          | 0.1     | Generates a frequency distribution. The frequency distribution includes raw frequencies, percentages in each category, and cumulative frequencies. The frequency distribution can be stored as a data frame. / GPL-2   | noarch                                    |
| r-frm               | 1.2.2   | Estimation and specification analysis of one- and two-part fractional regression models and calculation of partial effects. / GPL-2  | noarch                                    |
| r-frmhet            | 1.1.3   | Estimation and specification analysis of fractional regression models with neglected heterogeneity and/or endogenous covariates. / GPL-2   | noarch                                    |
| r-frmpd             | 1.1.0   | Estimation of panel data regression models for fractional responses. / GPL-2   | noarch                                    |
| r-frost             | 0.0.4   | A compilation of empirical methods used by farmers and agronomic engineers to predict the minimum temperature to detect a frost night. These functions use variables such as environmental temperature, relative humidity, and dew point. See < <a href="http://sedici.unlp.edu.ar/handle/10915/72102">http://sedici.unlp.edu.ar/handle/10915/72102</a> > < <a href="http://www.fao.org/docrep/008/y7223e/y7223e0b.htm#bm11.8">http://www.fao.org/docrep/008/y7223e/y7223e0b.htm#bm11.8</a> > for details. / MIT   | noarch                                    |
| r-frt               | 0.1     | Perform full randomization tests. / GPL-2  | noarch                                    |
| r-fs                | 1.2.7   | A cross-platform interface to file system operations, built on top of the 'libuv' C library. / GPL-3   | linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-fsadata           | 0.3.8   | The datasets to support the Fish Stock Assessment ('FSA') package. / GPL-2   | noarch                                    |

Table 51 – continued from previous page

| Name          | Version | Summary/License   | Platforms |
|---------------|---------|---|-----------|
| r-fsia        | 1.1.1   | Import data of tests and questionnaires from FormScanner. FormScanner is an open source software that converts scanned images to data using optical mark recognition (OMR) and it can be downloaded from <a href="http://sourceforge.net/projects/formscanner/">http://sourceforge.net/projects/formscanner/</a> . The spreadsheet file created by FormScanner is imported in a convenient format to perform the analyses provided by the package. These analyses include the conversion of multiple responses to binary (correct/incorrect) data, the computation of the number of corrected responses for each subject or item, scoring using weights, the computation and the graphical representation of the frequencies of the responses to each item and the report of the responses of a few subjects. / GPL-3 | noarch    |
| r-fstability  | 0.1.2   | Has two functions to help with calculating feature selection stability. ‘Lump’ is a function that groups subset vectors into a dataframe, and adds NA to shorter vectors so they all have the same length. ‘ASM’ is a function that takes a dataframe of subset vectors and the original vector of features as inputs, and calculates the Stability of the feature selection. The calculation for ‘asm’ uses the Adjusted Stability Measure proposed in: ‘Lustgarten’, ‘Gopalakrishnan’, & ‘Visweswaran’ (2009) <a href="https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2815476/">https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2815476/</a> . / GPL-3   | noarch    |
| r-fsthet      | 1.0.1   | A program to generate smoothed quantiles for the Fst-heterozygosity distribution. Designed for use with large numbers of loci (e.g., genome-wide SNPs). The best case for analyzing the Fst-heterozygosity distribution is when many populations (>10) have been sampled. See Flanagan & Jones (2017) <a href="https://doi.org/10.1093/jhered/esx048">doi:10.1093/jhered/esx048</a> . / GPL-2   | noarch    |
| r-fticrms     | 0.8     | This package was developed partially with funding from the NIH Training Program in Biomolecular Technology (2-T32-GM08799). / GPL-2   | noarch    |
| r-ftrading    | 3042.79 | A collection of functions for trading and rebalancing financial instruments. It implements various technical indicators to analyse time series such as moving averages or stochastic oscillators. / GPL-2   | noarch    |
| r-fueleconomy | 0.1     | Fuel economy data from the EPA, 1985-2015, conveniently packaged for consumption by R users. / CC0  | noarch    |
| r-fugue       | 0.1.7   | As in music, a fugue statistic repeats a theme in small variations. Here, the psi-function that defines an m-statistic is slightly altered to maintain the same design sensitivity in matched sets of different sizes. The main functions in the package are sen() and senCI(). For sensitivity analyses for m-statistics, see Rosenbaum (2007) Biometrics 63 456-464 <a href="https://doi.org/10.1111/j.1541-0420.2006.00717.x">doi:10.1111/j.1541-0420.2006.00717.x</a> . / GPL-2   | noarch    |
| r-fun         | 0.2     | This is a collection of R games and other funny stuff, such as the classic Mine sweeper and sliding puzzles. / GPL-3  | noarch    |
| r-funchir     | 0.1.4   | A set of functions, some subset of which I use in every .R file I write. Examples are table2(), which adds useful functionalities to base table (sorting, built-in proportion argument, etc.); lyx.xtable(), which converts xtable() output to a format more easily copy-pasted into LyX; pdf2(), which writes a plot to file while also displaying it in the RStudio plot window; and abbr_to_colClass(), which is a much more concise way of feeding many types to a colClass argument in a data reader. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name          | Version | Summary/License   | Platforms   |
|---------------|---------|---|---|
| r-functional  | 0.6     | Curry, Compose, and other higher-order functions / GPL ( $\geq 2$ )   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-funtools    | 0.2.0   | Extends functional programming in R by providing support to the usual higher order functional suspects (Map, Reduce, Filter, etc.). / MIT   | noarch  |
| r-funique     | 0.0.1   | Similar to base's unique function, only optimized for working with data frames, especially those that contain date-time columns. / MIT  | noarch  |
| r-funr        | 0.3.2   | A small utility which wraps Rscript and provides access to all R functions from the shell. / MIT  | noarch  |
| r-funreg      | 1.2     | Performs functional regression, and some related approaches, for intensive longitudinal data (see the book by Walls & Schafer, 2006, Models for Intensive Longitudinal Data, Oxford) when such data is not necessarily observed on an equally spaced grid of times. The approach generally follows the ideas of Goldsmith, Bobb, Crainiceanu, Caffo, and Reich (2011)<DOI:10.1198/jcgs.2010.10007> and the approach taken in their sample code, but with some modifications to make it more feasible to use with long rather than wide, non-rectangular longitudinal datasets with unequal and potentially random measurement times. It also allows easy plotting of the correlation between the smoothed covariate and the outcome as a function of time, which can add additional insights on how to interpret a functional regression. Additionally, it also provides several permutation tests for the significance of the functional predictor. The heuristic interpretation of “time” is used to describe the index of the functional predictor, but the same methods can equally be used for another unidimensional continuous index, such as space along a north-south axis. The development of this package was part of a research project supported by Award R03 CA171809-01 from the National Cancer Institute and Award P50 DA010075 from the National Institute on Drug Abuse. The content is solely the responsibility of the authors and does not necessarily represent the official views of the National Institute on Drug Abuse, the National Cancer Institute, or the National Institutes of Health. / GPL-2 | noarch  |
| r-funta       | 0.1.0   | Computes the functional tangential angle pseudo-depth and its robustified version from the paper by Kuhnt and Rehage (2016). See Kuhnt, S.; Rehage, A. (2016): An angle-based multivariate functional pseudo-depth for shape outlier detection, JMVA 146, 325-340, <doi:10.1016/j.jmva.2015.10.016> for details. / GPL-3  | noarch  |
| r-fusionclust | 1.0.0   | Provides the Big Merge Tracker and COSCI algorithms for convex clustering and feature screening using L1 fusion penalty. See Radchenko, P. and Mukherjee, G. (2017) <doi:10.1111/rssb.12226> and T.Banerjee et al. (2017) <doi:10.1016/j.jmva.2017.08.001> for more details. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name                             | Version | Summary/License   | Platforms |
|----------------------------------|---------|---|-----------|
| <a href="#">r-fusionlearn</a>    | 0.1.1   | The fusion learning method uses a model selection algorithm to learn from multiple data sets across different experimental platforms through group penalization. The responses of interest may include a mix of discrete and continuous variables. The responses may share the same set of predictors, however, the models and parameters differ across different platforms. Integrating information from different data sets can enhance the power of model selection. Package is based on Xin Gao, Raymond J. Carroll (2017) <arXiv:1610.00667v1>. / GPL-2  | noarch    |
| <a href="#">r-futile.options</a> | 1.0.1   | A scoped options management framework. Used in other packages. / LGPL-3   | noarch    |
| <a href="#">r-futility</a>       | 0.4     | Randomized clinical trials commonly follow participants for a time-to-event efficacy endpoint for a fixed period of time. Consequently, at the time when the last enrolled participant completes their follow-up, the number of observed endpoints is a random variable. Assuming data collected through an interim timepoint, simulation-based estimation and inferential procedures in the standard right-censored failure time analysis framework are conducted for the distribution of the number of endpoints—in total as well as by treatment arm—at the end of the follow-up period. The future (i.e., yet unobserved) enrollment, endpoint, and dropout times are generated according to mechanisms specified in the <code>simTrial()</code> function in the ‘seqDesign’ package. A Bayesian model for the endpoint rate, offering the option to specify a robust mixture prior distribution, is used for generating future data (see the vignette for details). Inference can be restricted to participants who received treatment according to the protocol and are observed to be at risk for the endpoint at a specified timepoint. Plotting functions are provided for graphical display of results. / GPL-2 | noarch    |
| <a href="#">r-fuzzyahp</a>       | 0.9.1   | Calculation of AHP (Analytic Hierarchy Process - < <a href="http://en.wikipedia.org/wiki/Analytic_hierarchy_process">http://en.wikipedia.org/wiki/Analytic_hierarchy_process</a> >) with classic and fuzzy weights based on Saaty’s pairwise comparison method for determination of weights. / LGPL-3   | noarch    |
| <a href="#">r-fuzzyfdr</a>       | 1.0     | Exact calculation of fuzzy decision rules for multiple testing. Choose to control FDR (false discovery rate) using the Benjamini and Hochberg method, or FWER (family wise error rate) using the Bonferroni method. Kulinskaya and Lewin (2007). / GPL-3  | noarch    |
| <a href="#">r-fuzzynumbers</a>   | 0.4_6   | S4 classes and methods to deal with fuzzy numbers. They allow for computing any arithmetic operations (e.g., by using the Zadeh extension principle), performing approximation of arbitrary fuzzy numbers by trapezoidal and piecewise linear ones, preparing plots for publications, computing possibility and necessity values for comparisons, etc. / LGPL-3   | noarch    |
| <a href="#">r-fuzzyr</a>         | 2.1     | Design and simulate fuzzy logic systems using Type 1 Fuzzy Logic. This toolkit includes with graphical user interface (GUI) and an adaptive neuro-fuzzy inference system (ANFIS). This toolkit is a continuation from the previous package (‘FuzzyToolkitUoN’). Produced by the Intelligent Modelling & Analysis Group, University of Nottingham. / GPL-2   | noarch    |

| Name                              | Version | Summary/License   | Platforms   |
|-----------------------------------|---------|---|---|
| <a href="#">r-fuzzysim</a>        | 2.0     | Functions to calculate fuzzy versions of species' occurrence patterns based on presence-absence data (including inverse distance interpolation, trend surface analysis and prevalence-independent favourability GLM), and pair-wise fuzzy similarity (based on fuzzy versions of commonly used similarity indices) among those occurrence patterns. Includes also functions for model comparison (overlap and fuzzy similarity, loss or gain), and for data preparation, such as obtaining unique abbreviations of species names, converting species lists (long format) to presence-absence tables (wide format), transposing part of a data frame, assessing the false discovery rate, or analysing and dealing with multicollinearity among variables. Includes also sample datasets for providing practical examples. / GPL-3 | noarch  |
| <a href="#">r-fuzzystattra</a>    | 1.0     | The aim of the package is to provide some basic functions for doing statistics with trapezoidal fuzzy numbers. In particular, the package contains several functions for simulating trapezoidal fuzzy numbers, as well as for calculating some central tendency measures (mean and two types of median), some scale measures (variance, ADD, MDD, Sn, Qn, Tn and some M-estimators) and one diversity index and one inequality index. Moreover, functions for calculating the 1-norm distance, the mid/spr distance and the (phi,theta)-wabl/ldev/rdev distance between fuzzy numbers are included, and a function to calculate the value phi-wabl given a sample of trapezoidal fuzzy numbers. / GPL-2   | noarch  |
| <a href="#">r-fuzzytoolkituon</a> | 1.0     | A custom framework for working with Type 1 Fuzzy Logic, produced by the University of Nottingham IMA Group. / GPL-2   | noarch  |
| <a href="#">r-fuzzywuzzyr</a>     | 1.0.3   | Fuzzy string matching implementation of the 'fuzzywuzzy' < <a href="https://github.com/seatgeek/fuzzywuzzy">https://github.com/seatgeek/fuzzywuzzy</a> > 'python' package. It uses the Levenshtein Distance < <a href="https://en.wikipedia.org/wiki/Levenshtein_distance">https://en.wikipedia.org/wiki/Levenshtein_distance</a> > to calculate the differences between sequences. / GPL-2   | noarch  |
| <a href="#">r-fwdselect</a>       | 2.1.0   | A simple method to select the best model or best subset of variables using different types of data (binary, Gaussian or Poisson) and applying it in different contexts (parametric or non-parametric). / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-fwi.fbp</a>         | 1.7     | Provides three functions to calculate the outputs of the two main components of the Canadian Forest Fire Danger Rating System (CFFDRS): the Fire Weather Index (FWI) System and the Fire Behaviour Prediction (FBP) System. / GPL-2   | noarch  |
| <a href="#">r-g.data</a>          | 2.4     | Create and maintain delayed-data packages (ddp's). Data stored in a ddp are available on demand, but do not take up memory until requested. You attach a ddp with g.data.attach(), then read from it and assign to it in a manner similar to S-PLUS, except that you must run g.data.save() to actually commit to disk. / GPL-3   | noarch  |
| <a href="#">r-g1dbn</a>           | 3.1.1   | G1DBN performs DBN inference using 1st order conditional dependencies. / GPL-2  | noarch  |
| <a href="#">r-g3viz</a>           | 1.1.2   | R interface for 'g3-lollipop' JavaScript library. Visualize genetic mutation data using an interactive lollipop diagram in RStudio or your browser. / MIT   | noarch  |

Table 51 – continued from previous page

| Name           | Version | Summary/License   | Platforms |
|----------------|---------|---|-----------|
| r-gad          | 1.1.1   | This package analyses complex ANOVA models with any combination of orthogonal/nested and fixed/random factors, as described by Underwood (1997). There are two restrictions: (i) data must be balanced; (ii) fixed nested factors are not allowed. Homogeneity of variances is checked using Cochran's C test and 'a posteriori' comparisons of means are done using Student-Newman-Keuls (SNK) procedure. / GPL ( $\geq 2.0$ )   | noarch    |
| r-gadifpt      | 1.0     | In this package we consider Gaussian Diffusion processes and smooth thresholds. After evaluating the mean of the process to check the subthreshold regimen hypothesis, the FPT density function is reconstructed via the numerical quadrature of the integral equation in (Buonocore 1987); first passage times are also generated by the method in (Buonocore 2014) and results are compared. The timestep of the simulations can iteratively be refined. User should provide the functional form for the drift and the infinitesimal variance in the script 'userfunc.R' and for the threshold in the script 'userthresh.R'. All the parameters required by the implementation are to be set in the script 'userparam.R'. Example scripts for common drifts and thresholds are given. / GPL-2 | noarch    |
| r-gains        | 1.2     | Constructs gains tables and lift charts for prediction algorithms. Gains tables and lift charts are commonly used in direct marketing applications. The method is described in Drozdenko and Drake (2002), Optimal Database Marketing, Chapter 11. / GPL-3  | noarch    |
| r-gaipe        | 1.0     | GAYPE implements graphical representation of accuracy in parameter estimation (AIPE) on RMSEA for sample size planning in structural equation modeling. Sample sizes suggested by RMSEA with AIPE method and power analysis approach can also be obtained separately using the provided functions. / GPL-2  | noarch    |
| r-gamair       | 1.0_2   | Data sets and scripts used in the book 'Generalized Additive Models: An Introduction with R', Wood (2006,2017) CRC. / GPL-2   | noarch    |
| r-gambin       | 2.4.1   | Fits unimodal and multimodal gambin distributions to species-abundance distributions from ecological data, as in in Matthews et al. (2014) <DOI:10.1111/ecog.00861>. 'gambin' is short for 'gamma-binomial'. The main function is fit_abundances(), which estimates the 'alpha' parameter(s) of the gambin distribution using maximum likelihood. Functions are also provided to generate the gambin distribution and for calculating likelihood statistics. / GPL-3  | noarch    |
| r-games        | 1.1.2   | Provides estimation and analysis functions for strategic statistical models. / GPL-2  | noarch    |
| r-gamlss.data  | 5.1_4   | Data used as examples to demonstrate GAMLSS models. / GPL-2   GPL-3   | noarch    |
| r-gamm4        | 0.2_5   | Estimate generalized additive mixed models via a version of function gamm() from 'mgcv', using 'lme4' for estimation. / GPL-2   | noarch    |
| r-gamrr        | 0.6.0   | To calculate the relative risk (RR) for the generalized additive model. / GPL-3   | noarch    |
| r-ganpadata    | 1.0     | This is a dataset package for GANPA, which implements a network-based gene weighting approach to pathway analysis. This package includes data useful for GANPA, such as a functional association network, pathways, an expression dataset and multi-subunit proteins. / GPL-2   | noarch    |
| r-gap.datasets | 0.0.4   | Datasets associated with the 'gap' package. Currently, it includes an example data for regional association plot (CDKN), an example data for a genomewide association meta-analysis (OPG), Manhattan plots with (hr1420, mhtdata) and without (w4) gene annotations. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name            | Version | Summary/License   | Platforms |
|-----------------|---------|---|-----------|
| r-gaparsimony   | 0.9.2   | Methodology that combines feature selection, model tuning, and parsimonious model selection with Genetic Algorithms (GA) proposed in {Martinez-de-Pison} (2015) <DOI:10.1016/j.asoc.2015.06.012>. To this objective, a novel GA selection procedure is introduced based on separate cost and complexity evaluations. / GPL-2  | noarch    |
| r-gar           | 1.1     | The functions included are used to obtain initial authentication with Google Analytics as well as simple and organized data retrieval from the API. Allows for retrieval from multiple profiles at once. / GPL-2  | noarch    |
| r-garray        | 1.1.2   | Organize a so-called ragged array as generalized arrays, which is simply an array with sub-dimensions denoting the subdivision of dimensions (grouping of members within dimensions). By the margins (names of dimensions and sub-dimensions) in generalized arrays, operators and utility functions provided in this package automatically match the margins, doing map-reduce style parallel computation along margins. Generalized arrays are also cooperative to R's native functions that work on simple arrays. / GPL-3 | noarch    |
| r-gatepoints    | 0.1.3   | Allows user to choose/gate a region on the plot and returns points within it. / GPL-2   | noarch    |
| r-gaussdiff     | 1.1     | A collection difference measures for multivariate Gaussian probability density functions, such as the Euclidean mean, the Mahalanobis distance, the Kullback-Leibler divergence, the J-Coefficient, the Minkowski L2-distance, the Chi-square divergence and the Hellinger Coefficient. / GPL-2   | noarch    |
| r-gaussfacts    | 0.0.2   | Display a random fact about Carl Friedrich Gauss based the on collection curated by Mike Cavers via the < <a href="http://gaussfacts.com">http://gaussfacts.com</a> > site. / GPL-2   | noarch    |
| r-gaussianhmm1d | 1.0.1   | Inference, goodness-of-fit test, and prediction densities and intervals for univariate Gaussian Hidden Markov Models (HMM). The goodness-of-fit is based on a Cramer-von Mises statistic and uses parametric bootstrap to estimate the p-value. The description of the methodology is taken from Chapter 10.2 of Remillard (2013) <doi:10.1201/b14285>. / GPL-2   | noarch    |
| r-gbrd          | 0.4_1   | Provides utilities for processing Rd objects and files. Extract argument descriptions and other parts of the help pages of functions. / GPL-2   | noarch    |
| r-gcai.bias     | 1.0     | Many inherited biases and effects exists in RNA-seq due to both biological and technical effects. We observed the biological variance of testing target transcripts can influence the yield of sequencing reads, which might indicate a resource competition existing in RNA-seq. We developed this package to capture the bias depending on local sequence and perform the correction of this type of bias by borrowing information from spike-in measurement. / GPL-2   | noarch    |
| r-gcd           | 4.0.4   | Contains the Global Charcoal database data. Data include charcoal series (age, depth, charcoal quantity, associated units and methods) and information on sedimentary sites (localisation, depositional environment, biome, etc.) as well as publications informations. Since 4.0.0 the GCD mirrors the online SQL database at < <a href="http://paleofire.org">http://paleofire.org</a> >. / GPL-2   | noarch    |
| r-gclus         | 1.3.2   | Orders panels in scatterplot matrices and parallel coordinate displays by some merit index. Package contains various indices of merit, ordering functions, and enhanced versions of pairs and parcoord which color panels according to their merit level. / GPL-2   | noarch    |
| r-gcookbook     | 2.0     | Data sets used in the book R Graphics Cookbook by Winston Chang, published by O'Reilly Media. / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name        | Version | Summary/License  | Platforms   |
|-------------|---------|--|---|
| r-gd        | 1.7     | Geographical detectors for measuring spatial stratified heterogeneity, as described in Jinfeng Wang (2010) <doi:10.1080/13658810802443457> and Jinfeng Wang (2016) <doi:10.1016/j.ecolind.2016.02.052>. Includes the optimal discretization of continuous data, four primary functions of geographical detectors, comparison of size effects of spatial unit and the visualizations of results. The descriptions of the package, methods and case datasets refer to the citation information below. / GPL-2  | noarch  |
| r-gdadata   | 0.93    | Datasets used in the book ‘Graphical Data Analysis with R’ (Antony Unwin, CRC Press 2015). / GPL-2   | noarch  |
| r-gdata     | 2.18.0  | Various R programming tools for data manipulation, including: - medical unit conversions (‘ConvertMedUnits’, ‘MedUnits’), - combining objects (‘bindData’, ‘cbindX’, ‘combine’, ‘interleave’), - character vector operations (‘centerText’, ‘startsWith’, ‘trim’), - factor manipulation (‘levels’, ‘reorder.factor’, ‘mapLevels’), - obtaining information about R objects (‘object.size’, ‘elem’, ‘env’, ‘humanReadable’, ‘is.what’, ‘ll’, ‘keep’, ‘ls.funs’, ‘Args’, ‘nPairs’, ‘nobs’), - manipulating MS-Excel formatted files (‘read.xls’, ‘installXLSX-support’, ‘sheetCount’, ‘xlsFormats’), - generating fixed-width format files (‘write.fwf’), - extricating components of date & time objects (‘getYear’, ‘getMonth’, ‘getDay’, ‘getHour’, ‘getMin’, ‘getSec’), - operations on columns of data frames (‘matchcols’, ‘rename.vars’), - matrix operations (‘unmatrix’, ‘upperTriangle’, ‘lowerTriangle’), - operations on vectors (‘case’, ‘unknown-ToNA’, ‘duplicated2’, ‘trimSum’), - operations on data frames (‘frameApply’, ‘wideByFactor’), - value of last evaluated expression (‘ans’), and - wrapper for ‘sample’ that ensures consistent behavior for both scalar and vector arguments (‘resample’). / GPL-2 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-gdistance | 1.2_2   | Calculate distances and routes on geographic grids. / GPL-2  | noarch  |
| r-gdns      | 0.3.1   | To address the problem of insecurity of ‘UDP’-based ‘DNS’ requests, ‘Google Public DNS’ offers ‘DNS’ resolution over an encrypted ‘HTTPS’ connection. ‘DNS-over-HTTPS’ greatly enhances privacy and security between a client and a recursive resolver, and complements ‘DNSSEC’ to provide end-to-end authenticated ‘DNS’ lookups. Functions that enable querying individual requests that bulk requests that return detailed responses and bulk requests are both provided. Support for reverse lookups is also provided. See < <a href="https://developers.google.com/speed/public-dns/docs/dns-over-https">https://developers.google.com/speed/public-dns/docs/dns-over-https</a> > for more information. / AGPL-3   | noarch  |
| r-gds       | 0.1.0   | Contains a function called gds() which accepts three input parameters like lower limits, upper limits and the frequencies of the corresponding classes. The gds() function calculate and return the values of mean (‘gmean’), median (‘gmedian’), mode (‘gmode’), variance (‘gvar’), standard deviation (‘gstdev’), coefficient of variance (‘gcv’), quartiles (‘gq1’, ‘gq2’, ‘gq3’), inter-quartile range (‘gIQR’), skewness (‘g1’), and kurtosis (‘g2’) which facilitate effective data analysis. For skewness and kurtosis calculations we use moments. / GPL-2   | noarch  |
| r-geem      | 0.10.1  | IGEE estimation of the parameters in mean structures with possible correlation between the outcomes. User-specified mean link and variance functions are allowed, along with observation weighting. The ‘M’ in the name ‘geeM’ is meant to emphasize the use of the Matrix package, which allows for an implementation based fully in R. / GPL-3   | noarch  |
| r-gen2stage | 1.0     | One can find single-stage and two-stage designs for a phase II single-arm study with either efficacy or safety/toxicity endpoints as described in Kim and Wong (2019) <doi:10.29220/CSAM.2019.26.2.163>. / GPL-2   | noarch  |

Table 51 – continued from previous page

| Name                    | Version | Summary/License  | Platforms |
|-------------------------|---------|--|-----------|
| r-genalg                | 0.2.0   | R based genetic algorithm for binary and floating point chromosomes. / GPL-2   | noarch    |
| r-genbinomapps          | 1.0_2   | Density, distribution function, quantile function and random generation for the Generalized Binomial Distribution. Functions to compute the Clopper-Pearson Confidence Interval and the required sample size. Enhanced model for burn-in studies, where failures are tackled by countermeasures. / GPL-3   | noarch    |
| r-gendata               | 1.1     | Set of functions to create datasets using a correlation matrix. / GPL-3  | noarch    |
| r-genderizer            | 2.1.1   | Utilizes the 'genderize.io' Application Programming Interface to predict gender from first names extracted from a text vector. The accuracy of prediction could be controlled by two parameters: counts of a first name in the database and probability of prediction. / MIT   | noarch    |
| r-gendist               | 2.0     | Computes the probability density function (pdf), cumulative distribution function (cdf), quantile function (qf) and generates random values (rg) for the following general models : mixture models, composite models, folded models, skewed symmetric models and arc tan models. / GPL-2   | noarch    |
| r-genef                 | 1.0     | This package implements several generalized F-statistics. The current version includes a generalized F-statistic based on the flexible isotonic/monotonic regression or order restricted hypothesis testing. / GPL-2   | noarch    |
| r-genelistpie           | 1.0     | geneListPie package is for mapping a gene list to function categories defined in GOSlim or Kegg. The results can be plotted as a pie chart to provide a quick view of the genes distribution of the gene list among the function categories. The gene list must contain a list of gene symbols. The package contains a set of pre-processed gene sets obtained from Gene Ontology and MSigDB including human, mouse, rat and yeast. To provide a high level concise view, only GO slim and kegg are provided. The gene sets are regularly updated. User can also use customized gene sets. User can use the R Pie() or Pie3D() function for plotting the pie chart. Users can also choose to output the gene function mapping results and use external software such as Excel(R) for plotting. / GPL-3 | noarch    |
| r-genemodel             | 1.1.0   | Using simple input, this package creates plots of gene models. Users can create plots of alternatively spliced gene variants and the positions of mutations and other gene features. / GPL-2   | noarch    |
| r-generalhoslem         | 1.3.4   | Functions to assess the goodness of fit of binary, multinomial and ordinal logistic models. Included are the Hosmer-Lemeshow tests (binary, multinomial and ordinal) and the Lipsitz and Pulkstenis-Robinson tests (ordinal). / GPL-2  | noarch    |
| r-generalizedhyperbolic | 0.8_4   | Functions for the hyperbolic and related distributions. Density, distribution and quantile functions and random number generation are provided for the hyperbolic distribution, the generalized hyperbolic distribution, the generalized inverse Gaussian distribution and the skew-Laplace distribution. Additional functionality is provided for the hyperbolic distribution, normal inverse Gaussian distribution and generalized inverse Gaussian distribution, including fitting of these distributions to data. Linear models with hyperbolic errors may be fitted using hyperblmFit. / GPL-2  | noarch    |
| r-generalaoxaca         | 1.0     | Perform the Blinder-Oaxaca decomposition for generalized linear model with bootstrapped standard errors. The twofold and threefold decomposition are given, even the generalized linear model output in each group. / GPL-2  | noarch    |
| r-generator             | 0.1.0   | Allows users to quickly and easily generate fake data containing Personally Identifiable Information (PII) through convenience functions. / MIT  | noarch    |

Table 51 – continued from previous page

| Name                               | Version      | Summary/License   | Platforms  |
|------------------------------------|--------------|---|--|
| <code>r-generics</code>            | 0.0.2        | In order to reduce potential package dependencies and conflicts, generics provides a number of commonly used S3 generics. / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-64 |
| <code>r-genesignaturefinder</code> | 2014.02.15.1 | Tool for finding an ensemble gene-signature by a steepest ascending algorithm partially supervised by survival time data. / GPL-2   | noarch   |
| <code>r-genesysr</code>            | 0.9.2        | Access data on plant genetic resources from genebanks around the world published on Genesys (< <a href="https://www.genesys-pgr.org">https://www.genesys-pgr.org</a> >). Your use of data is subject to terms and conditions available at < <a href="https://www.genesys-pgr.org/content/legal/terms">https://www.genesys-pgr.org/content/legal/terms</a> >. / Apache License 2.0   | noarch   |
| <code>r-genetics</code>            | 1.3.8        | Classes and methods for handling genetic data. Includes classes to represent genotypes and haplotypes at single markers up to multiple markers on multiple chromosomes. Function include allele frequencies, flagging homo/heterozygotes, flagging carriers of certain alleles, estimating and testing for Hardy-Weinberg disequilibrium, estimating and testing for linkage disequilibrium, ... / GPL-3  | noarch   |
| <code>r-geneticssubsetter</code>   | 0.8          | Finds subsets of sets of genotypes with a high Heterozygosity, and Mean of Transformed Kinships (MTK), measures that can indicate a subset would be beneficial for rare-trait discovery and genome-wide association scanning, respectively. / GPL-2   | noarch   |
| <code>r-genmeta</code>             | 0.1          | Generalized meta-analysis is a technique for estimating parameters associated with a multiple regression model through meta-analysis of studies which may have information only on partial sets of the regressors. It estimates the effects of each variable while fully adjusting for all other variables that are measured in at least one of the studies. Using algebraic relationships between regression parameters in different dimensions, a set of moment equations is specified for estimating the parameters of a maximal model through information available on sets of parameter estimates from a series of reduced models available from the different studies. The specification of the equations requires a reference dataset to estimate the joint distribution of the covariates. These equations are solved using the generalized method of moments approach, with the optimal weighting of the equations taking into account uncertainty associated with estimates of the parameters of the reduced models. The proposed framework is implemented using iterated reweighted least squares algorithm for fitting generalized linear regression models. For more details about the method, please see pre-print version of the manuscript on generalized meta-analysis by Prosenjit Kundu, Runlong Tang and Nilanjan Chatterjee (2018) <arXiv:1708.03818>. / GPL-3 | noarch   |
| <code>r-genomic.autocorr</code>    | 1.0_1        | Local structure in genomic data often induces dependence between observations taken at different genomic locations. Ignoring this dependence leads to underestimation of the standard error of parameter estimates. This package uses block bootstrapping to estimate asymptotically correct standard errors of parameters from any standard generalised linear model that may be fit by the <code>glm()</code> function. / GPL-2   | noarch   |

Table 51 – continued from previous page

| Name         | Version | Summary/License   | Platforms |
|--------------|---------|---|-----------|
| r-genomicper | 1.6     | Circular genomic permutation approach uses GWAS results to establish the significance of pathway/gene-set associations whilst accounting for genomic structure. All SNPs in the GWAS are placed in a ‘circular genome’ according to their location. Then the complete set of SNP association p-values are permuted by rotation with respect to the SNPs’ genomic locations. Two testing frameworks are available: permutations at the gene level, and permutations at the SNP level. The permutation at the gene level uses fisher’s combination test to calculate a single gene p-value, followed by the hypergeometric test. The SNP count methodology maps each SNP to pathways/gene-sets and calculates the proportion of SNPs for the real and the permuted datasets above a pre-defined threshold. Genomicper requires a matrix of GWAS association p-values. The SNPs annotation and pathways annotations can be performed within the package or provided by the user. / GPL-2 | noarch    |
| r-genopltr   | 0.8.9   | Draws gene or genome maps and comparisons between these, in a publication-grade manner. Starting from simple, common files, it will draw postscript or PDF files that can be sent as such to journals. / GPL-2  | noarch    |
| r-genord     | 1.4.0   | A gaussian copula based procedure for generating samples from discrete random variables with prescribed correlation matrix and marginal distributions. / GPL-3  | noarch    |
| r-gensemble  | 1.0.1   | Generalized ensemble methods allowing arbitrary underlying models to be used. Currently only bagging is supported. / GPL-2  | noarch    |
| r-gentag     | 1.0     | Implement a coherent and flexible protocol for animal color tagging. ‘GenTag’ provides a simple computational routine with low CPU usage to create color sequences for animal tag. First, a single-color tag sequence is created from an algorithm selected by the user, followed by verification of the combination uniqueness. Three methods to produce color tag sequences are provided. Users can modify the main function core to allow a wide range of applications. / GPL-2  | noarch    |
| r-genwin     | 0.1     | Defines window or bin boundaries for the analysis of genomic data. Boundaries are based on the inflection points of a cubic smoothing spline fitted to the raw data. Along with defining boundaries, a technique to evaluate results obtained from unequally-sized windows is provided. Applications are particularly pertinent for, though not limited to, genome scans for selection based on variability between populations (e.g. using Wright’s fixations index, Fst, which measures variability in subpopulations relative to the total population). / MIT  | noarch    |
| r-geoboxplot | 1.0     | Make geographic box plot as detailed in Willmott et al. (2007). / GPL-2   | noarch    |
| r-geode      | 1.0     | Given expression data this package calculate a multivariate geometrical characterization of the differential expression and can also perform gene-set enrichment. / GPL-2   | noarch    |
| r-geomapdata | 1.0_4   | Set of data for use in package GEOMap. Includes world map, USA map, Coso map, Japan Map, ETOPO5 / GPL-3   | noarch    |
| r-geomedb    | 2.0.0   | The Genomic Observatory Metadatabase (GeOMe Database) is an open access repository for geographic and ecological metadata associated with sequenced samples. This package is used to retrieve GeOMe data for analysis. See < <a href="http://www.geome-db.org">http://www.geome-db.org</a> > for more information regarding GeOMe. / GPL-3  | noarch    |
| r-geometa    | 0.5_0   | Provides facilities to handle reading and writing of geographic metadata defined with OGC/ISO 19115, 11119 and 19110 geographic information metadata standards, and encoded using the ISO 19139 (XML) standard. It includes also a facility to check the validity of ISO 19139 XML encoded metadata. / MIT  | noarch    |

| Name       | Version | Summary/License  | Platforms  |
|------------|---------|--|--|
| r-geometry | 0.4.1   | Makes the qhull library ( <a href="http://www.qhull.org">www.qhull.org</a> ) available in R, in a similar manner as in Octave and MATLAB. Qhull computes convex hulls, Delaunay triangulations, halfspace intersections about a point, Voronoi diagrams, furthest-site Delaunay triangulations, and furthest-site Voronoi diagrams. It runs in 2-d, 3-d, 4-d, and higher dimensions. It implements the Quickhull algorithm for computing the convex hull. Qhull does not support constrained Delaunay triangulations, or mesh generation of non-convex objects, but the package does include some R functions that allow for this. Currently the package only gives access to Delaunay triangulation and convex hull computation. / GPL (>= 3) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-geonames | 0.999   | The web service at < <a href="https://www.geonames.org/">https://www.geonames.org/</a> > provides a number of spatial data queries, including administrative area hierarchies, city locations and some country postal code queries. A (free) username is required and rate limits exist. / GPL-3   | noarch   |
| r-geosapi  | 0.4.0   | Provides an R interface to the GeoServer REST API, allowing to upload and publish data in a GeoServer web-application and expose data to OGC Web-Services. The package currently supports all CRUD (Create,Read,Update,Delete) operations on GeoServer workspaces, namespaces, datastores (stores of vector data), featuretypes, layers, styles, as well as vector data upload operations. For more information about the GeoServer REST API, see < <a href="http://docs.geoserver.org/stable/en/user/rest/">http://docs.geoserver.org/stable/en/user/rest/</a> >. / MIT   | noarch   |
| r-geoscale | 2.0     | Function for adding the geological timescale to bivariate plots. / GPL-2   | noarch   |
| r-geosed   | 0.1.1   | Find the smallest circle that contains all longitude and latitude input points. From the generated center and radius, variable side polygons can be created, navigation based on bearing and distance can be applied, and more. Based on a modified version of Welzl's algorithm for smallest circle. Distance calculations are based on the haversine formula. Calculations for distance, midpoint, bearing and more are derived from < <a href="https://www.movable-type.co.uk">https://www.movable-type.co.uk</a> >. / MIT  | noarch   |
| r-geotech  | 1.0     | A compilation of functions for performing calculations and creating plots that commonly arise in geotechnical engineering and soil mechanics. The types of calculations that are currently included are: (1) phase diagrams and index parameters, (2) grain-size distributions, (3) plasticity, (4) soil classification, (5) compaction, (6) groundwater, (7) subsurface stresses (geostatic and induced), (8) Mohr circle analyses, (9) consolidation settlement and rate, (10) shear strength, (11) bearing capacity, (12) lateral earth pressures, (13) slope stability, and (14) subsurface explorations. Geotechnical engineering students, educators, researchers, and practitioners will find this package useful. / GPL-3              | noarch   |
| r-geotools | 0.1     | Tools / GPL-3  | noarch   |
| r-geozoo   | 0.5.1   | Geometric objects defined in 'geozoo' can be simulated or displayed in the R package 'tourr'. / GPL-2  | noarch   |
| r-gepaf    | 0.1.1   | Encode and decode the Google Encoded Polyline Algorithm Format (< <a href="https://developers.google.com/maps/documentation/utilities/polylinealgorithm">https://developers.google.com/maps/documentation/utilities/polylinealgorithm</a> >). / GPL-3  | noarch   |
| r-gesca    | 1.0.4   | Fit a variety of component-based structural equation models. / GPL-2   | noarch   |
| r-gestalt  | 0.1.8   | Provides a suite of function-building tools centered around a (forward) composition operator, %>>>%, which extends the semantics of the 'magrittr' %>% operator and supports 'tidyverse' quasiquotation. It enables you to construct composite functions that can be inspected and transformed as list-like objects. In conjunction with %>>>%, a compact function constructor, fn(), and a function that performs partial application, partial(), are also provided. Both support quasiquotation. / MIT   | noarch   |

| Name       | Version | Summary/License  | Platforms   |
|------------|---------|--|---|
| r-gethr    | 0.1.0   | Full access to the Geth command line interface for running full Ethereum nodes. With gethr it is possible to carry out different tasks such as mine ether, transfer funds, create contracts, explore block history, etc. The package also provides access to all the available APIs. The officially exposed by Ethereum blockchains (eth, shh, web3, net) and some provided directly by Geth (admin, debug, miner, personal, txpool). For more details on Ethereum, access the project website < <a href="https://www.ethereum.org/">https://www.ethereum.org/</a> >. For more details on the Geth client, access the project website < <a href="https://github.com/ethereum/go-ethereum/wiki/geth/">https://github.com/ethereum/go-ethereum/wiki/geth/</a> >. / MIT | noarch  |
| r-getopt   | 1.20.3  | Package designed to be used with Rscript to write “#!” shebang scripts that accept short and long flags/options. Many users will prefer using instead the packages optparse or argparse which add extra features like automatically generated help option and usage, support for default values, positional argument support, etc. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-gets     | 0.19    | Automated General-to-Specific (GETS) modelling of the mean and variance of a regression, and indicator saturation methods for detecting and testing for structural breaks in the mean. / GPL-2   | noarch  |
| r-gevcdn   | 1.1.6   | Implements a flexible nonlinear modelling framework for nonstationary generalized extreme value analysis in hydroclimatology following Cannon (2010) <doi:10.1002/hyp.7506>. / GPL-2   | noarch  |
| r-gexp     | 1.0_0   | Generates experiments - simulating structured or experimental data as: completely randomized design, randomized block design, latin square design, factorial and split-plot experiments (Ferreira, 2008, ISBN:8587692526; Naes et al., 2007 <doi:10.1002/qre.841>; Rencher et al., 2007, ISBN:9780471754985; Montgomery, 2001, ISBN:0471316490). / GPL-2   | noarch  |
| r-gfa      | 1.0.3   | Factor analysis implementation for multiple data sources, i.e., for groups of variables. The whole data analysis pipeline is provided, including functions and recommendations for data normalization and model definition, as well as missing value prediction and model visualization. The model group factor analysis (GFA) is inferred with Gibbs sampling, and it has been presented originally by Virtanen et al. (2012), and extended in Klami et al. (2015) <DOI:10.1109/TNNLS.2014.2376974> and Bunte et al. (2016) <DOI:10.1093/bioinformatics/btw207>; for details, see the citation info. / MIT  | noarch  |
| r-ggm      | 2.3     | Functions and datasets for maximum likelihood fitting of some classes of graphical Markov models. / GPL-2  | noarch  |
| r-ggmridge | 1.1     | Estimation of partial correlation matrix using ridge penalty followed by thresholding and reestimation. Under multivariate Gaussian assumption, the matrix constitutes an Gaussian graphical model (GGM). / GPL-2  | noarch  |

| Name                            | Version | Summary/License  | Platforms   |
|---------------------------------|---------|--|---|
| <a href="#">r-ggplot2</a>       | 3.1.1   | A system for ‘declaratively’ creating graphics, based on The Grammar of Graphics. You provide the data, tell ‘ggplot2’ how to map variables to aesthetics, what graphical primitives to use, and it takes care of the details. / GPL-2   file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-ggplot2movies</a> | 0.0.1   | A dataset about movies. This was previously contained in ggplot2, but has been moved its own package to reduce the download size of ggplot2. / GPL-3   | noarch  |
| <a href="#">r-gggroups</a>      | 1.2.1   | Calculates additive and dominance genetic relationship matrices and their inverses, in matrix and tabular-sparse formats. It includes functions for checking and processing pedigree, as well as functions to calculate the matrix of genetic group contributions (Q), and adding those contributions to the genetic merit of animals (Quaas (1988) <doi:10.3168/jds.S0022-0302(88)79691-5>). Calculation of Q is computationally extensive. There are computationally optimized functions to calculate Q. / GPL-3   | noarch  |
| <a href="#">r-ggversa</a>       | 0.0.1   | A collection of datasets for the upcoming book Graficas versatiles con ggplot: Analisis visuales de datos, by Raymond L. Tremblay and Julian Hernandez-Serano. / GPL-2   | noarch  |
| <a href="#">r-ggvis</a>         | 0.4.4   | An implementation of an interactive grammar of graphics, taking the best parts of ‘ggplot2’, combining them with the reactive framework of ‘shiny’ and drawing web graphics using ‘vega’. / GPL-2   file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-gh</a>            | 1.0.1   | Minimal client to access the ‘GitHub’ ‘API’. / MIT file LICENSE  | noarch  |
| <a href="#">r-ghibli</a>        | 0.3.0   | Colour palettes inspired by Studio Ghibli < <a href="https://en.wikipedia.org/wiki/Studio_Ghibli">https://en.wikipedia.org/wiki/Studio_Ghibli</a> > films, ported to R for your enjoyment. / MIT   | noarch  |
| <a href="#">r-ghs</a>           | 0.1     | Draw posterior samples to estimate the precision matrix for multivariate Gaussian data. Posterior means of the samples is the graphical horseshoe estimate by Li, Bhadra and Craig(2017) <arXiv:1707.06661>. The function uses matrix decomposition and variable change from the Bayesian graphical lasso by Wang(2012) <doi:10.1214/12-BA729>, and the variable augmentation for sampling under the horseshoe prior by Makalic and Schmidt(2016) <arXiv:1508.03884>. Structure of the graphical horseshoe function was inspired by the Bayesian graphical lasso function using blocked sampling, authored by Wang(2012) <doi:10.1214/12-BA729>. / GPL-2 | noarch  |

| Name           | Version | Summary/License  | Platforms   |
|----------------|---------|--|---|
| r-gibbs.met    | 1.1_3   | This package provides two generic functions for performing Markov chain sampling in a naive way for a user-defined target distribution, which involves only continuous variables. The function <code>gibbs_met</code> performs Gibbs sampling with each 1-dimensional distribution sampled with Metropolis update using Gaussian proposal distribution centered at the previous state. The function <code>met_gaussian</code> updates the whole state with Metropolis method using independent Gaussian proposal distribution centered at the previous state. The sampling is carried out without considering any special tricks for improving efficiency. This package is aimed at only routine applications of MCMC in moderate-dimensional problems. / GPL-2  | noarch  |
| r-gibbsacov    | 1.1     | Gibbs sampler for one-way linear mixed-effects models (ANOVA, ANCOVA) with homoscedasticity of errors and uniform priors. / GPL-2  | noarch  |
| r-gifti        | 0.7.5   | Functions to read in the geometry format under the ‘Neuroimaging’ ‘Informat-ics’ Technology Initiative (‘NIFTI’), called ‘GIFTI’ < <a href="https://www.nitrc.org/projects/gifti/">https://www.nitrc.org/projects/gifti/</a> >. These files contain surfaces of brain imaging data. / GPL-2  | noarch  |
| r-gillespiessa | 0.6.1   | Provides a simple to use, intuitive, and extensible interface to several stochastic simulation algorithms for generating simulated trajectories of finite population continuous-time model. Currently it implements Gillespie’s exact stochastic simulation algorithm (Direct method) and several approximate methods (Explicit tau-leap, Binomial tau-leap, and Optimized tau-leap). The package also contains a library of template models that can be run as demo models and can easily be customized and extended. Currently the following models are included, ‘Decaying-Dimerization’ reaction set, linear chain system, logistic growth model, ‘Lotka’ predator-prey model, Rosenzweig-MacArthur predator-prey model, ‘Kermack-McKendrick’ SIR model, and a ‘metapopulation’ SIRS model. Pineda-Krch et al. (2008) <doi:10.18637/jss.v025.i12>. / GPL-3 | noarch  |
| r-gim          | 0.11.0  | Implements the generalized integration model, which integrates individual-level data and summary statistics under a generalized linear model framework. It supports continuous and binary outcomes to be modeled by the linear and logistic regression models. / MIT   | noarch  |
| r-giniwegneg   | 1.0.1   | Gini-based coefficients and plot of the ordinary and generalized curve of maximum inequality in the presence of weighted and negative attributes. / GPL-3  | noarch  |
| r-gipfrm       | 3.1     | Maximum likelihood estimation under relational models, with or without the overall effect. / GPL-2   | noarch  |
| r-gistr        | 0.4.2   | Work with ‘GitHub’ ‘gists’ from ‘R’ (e.g., < <a href="http://en.wikipedia.org/wiki/GitHub#Gist">http://en.wikipedia.org/wiki/GitHub#Gist</a> >, < <a href="https://help.github.com/articles/about-gists/">https://help.github.com/articles/about-gists/</a> >). A ‘gist’ is simply one or more files with code/text/images/etc. This package allows the user to create new ‘gists’, update ‘gists’ with new files, rename files, delete files, get and delete ‘gists’, star and ‘un-star’ ‘gists’, fork ‘gists’, open a ‘gist’ in your default browser, get embed code for a ‘gist’, list ‘gist’ ‘commits’, and get rate limit information when ‘authenticated’. Some requests require authentication and some do not. ‘Gists’ website: < <a href="https://gist.github.com/">https://gist.github.com/</a> >. / MIT file LICENSE                                | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name          | Version | Summary/License  | Platforms  |
|---------------|---------|--|--|
| r-git2r       | 0.25.2  | Interface to the 'libgit2' library, which is a pure C implementation of the 'Git' core methods. Provides access to 'Git' repositories to extract data and running some basic 'Git' commands. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-git2rdata   | 0.1     | Make versioning of data.frame easy and efficient using git repositories. / GPL-3   | noarch   |
| r-gitlink     | 0.1.3   | Provides helpers to add 'Git' links to 'shiny' applications, 'rmarkdown' documents, and other 'HTML' based resources. This is most commonly used for 'GitHub' ribbons. / MIT   | noarch   |
| r-gk2011      | 0.1.3   | Implementations of the treatment effect estimators for hybrid (self-selection) experiments, as developed by Brian J. Gaines and James H. Kuklinski, (2011), Experimental Estimation of Heterogeneous Treatment Effects Related to Self-Selection, American Journal of Political Science 55(3): 724-736. / GPL-2  | noarch   |
| r-glaciersmbm | 0.1     | A fully distributed glacier surface mass balance model developed for the simulation of accumulation and ablation processes on debris-free as well as debris-covered glaciers. / GPL-3  | noarch   |
| r-glarma      | 1.6_0   | Functions are provided for estimation, testing, diagnostic checking and forecasting of generalized linear autoregressive moving average (GLARMA) models for discrete valued time series with regression variables. These are a class of observation driven non-linear non-Gaussian state space models. The state vector consists of a linear regression component plus an observation driven component consisting of an autoregressive-moving average (ARMA) filter of past predictive residuals. Currently three distributions (Poisson, negative binomial and binomial) can be used for the response series. Three options (Pearson, score-type and unscaled) for the residuals in the observation driven component are available. Estimation is via maximum likelihood (conditional on initializing values for the ARMA process) optimized using Fisher scoring or Newton Raphson iterative methods. Likelihood ratio and Wald tests for the observation driven component allow testing for serial dependence in generalized linear model settings. Graphical diagnostics including model fits, autocorrelation functions and probability integral transform residuals are included in the package. Several standard data sets are included in the package. / GPL-2 | noarch   |
| r-glassdoor   | 0.8.1   | Interacts with the 'Glassdoor' API < <a href="https://www.glassdoor.com/developer/index.htm">https://www.glassdoor.com/developer/index.htm</a> >. Allows the user to search job statistics, employer statistics, and job progression, where 'Glassdoor' provides a breakdown of other jobs a person did after their current one. / GPL-2   | noarch   |
| r-glba        | 0.2     | Analyses response times and accuracies from psychological experiments with the linear ballistic accumulator (LBA) model from Brown and Heathcote (2008). The LBA model is optionally fitted with explanatory variables on the parameters such as the drift rate, the boundary and the starting point parameters. A log-link function on the linear predictors can be used to ensure that parameters remain positive when needed. / GPL-3   | noarch   |

| Name                           | Version | Summary/License  | Platforms |
|--------------------------------|---------|--|-----------|
| <a href="#">r-gldrm</a>        | 1.5     | Fits a generalized linear density ratio model (GLDRM). A GLDRM is a semiparametric generalized linear model. In contrast to a GLM, which assumes a particular exponential family distribution, the GLDRM uses a semiparametric likelihood to estimate the reference distribution. The reference distribution may be any discrete, continuous, or mixed exponential family distribution. The model parameters, which include both the regression coefficients and the cdf of the unspecified reference distribution, are estimated by maximizing a semiparametric likelihood. Regression coefficients are estimated with no loss of efficiency, i.e. the asymptotic variance is the same as if the true exponential family distribution were known. Huang (2014) <doi:10.1080/01621459.2013.824892>. Huang and Rathouz (2012) <doi:10.1093/biomet/asr075>. Rathouz and Gao (2008) <doi:10.1093/biostatistics/kxn030>. / MIT | noarch    |
| <a href="#">r-glm.predict</a>  | 3.1.0   | Functions to calculate predicted values and the difference between the two cases with confidence interval for lm() [linear model], glm() [general linear model], glm.nb() [negative binomial model], polr() [ordinal logistic model] and multinom() [multinomial model] using Monte Carlo simulations. Reference: Bennet A. Zelner (2009) <doi:10.1002/smj.783>. / GPL-2   | noarch    |
| <a href="#">r-glm2</a>         | 1.2.1   | Fits generalized linear models using the same model specification as glm in the stats package, but with a modified default fitting method that provides greater stability for models that may fail to converge using glm. / GPL-2  | noarch    |
| <a href="#">r-glmbb</a>        | 0.3     | Find all hierarchical models of specified generalized linear model with information criterion (AIC, BIC, or AICc) within specified cutoff of minimum value. Alternatively, find all such graphical models. Use branch and bound algorithm so we do not have to fit all models. / MIT   | noarch    |
| <a href="#">r-glmc</a>         | 0.3.1   | Fits generalized linear models where the parameters are subject to linear constraints. The model is specified by giving a symbolic description of the linear predictor, a description of the error distribution, and a matrix of constraints on the parameters. / GPL-2  | noarch    |
| <a href="#">r-glmdm</a>        | 2.60    | This package contains functions to perform generalized linear mixed Dirichlet models using posterior simulation. / GPL-3   | noarch    |
| <a href="#">r-glmmadaptive</a> | 0.6.0   | Fits generalized linear mixed models for a single grouping factor under maximum likelihood approximating the integrals over the random effects with an adaptive Gaussian quadrature rule; Jose C. Pinheiro and Douglas M. Bates (1995) <doi:10.1080/10618600.1995.10474663>. / GPL-3   | noarch    |
| <a href="#">r-glmmboot</a>     | 0.4.0   | Performs bootstrap resampling for most models that update() works for. There are two primary functions: bootstrap_model() performs block resampling if random effects are present, and case resampling if not; bootstrap_ci() converts output from bootstrap model runs into confidence intervals and p-values. By default, bootstrap_model() calls bootstrap_ci(). Package motivated by Humphrey and Swingley (2018) <arXiv:1805.08670>. / AGPL-3   | noarch    |
| <a href="#">r-glmmlasso</a>    | 1.5.1   | A variable selection approach for generalized linear mixed models by L1-penalized estimation is provided. / GPL-2  | noarch    |
| <a href="#">r-glmmrr</a>       | 0.2.0   | Generalized Linear Mixed Model (GLMM) for Binary Randomized Response Data. Includes Cauchit, Compl. Log-Log, Logistic, and Probit link functions for Bernoulli Distributed RR data. RR Designs: Warner, Forced Response, Unrelated Question, Kuk, Crosswise, and Triangular. / GPL-2   GPL-3   | noarch    |

Table 51 – continued from previous page

| Name            | Version | Summary/License  | Platforms  |
|-----------------|---------|--|--|
| r-glmnet        | 2.0_16  | Extremely efficient procedures for fitting the entire lasso or elastic-net regularization path for linear regression, logistic and multinomial regression models, Poisson regression and the Cox model. Two recent additions are the multiple-response Gaussian, and the grouped multinomial regression. The algorithm uses cyclical coordinate descent in a path-wise fashion, as described in the paper linked to via the URL below. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-glmnetcr      | 1.0.4   | Penalized methods are useful for fitting over-parameterized models. This package includes functions for restructuring an ordinal response dataset for fitting continuation ratio models for datasets where the number of covariates exceeds the sample size or when there is collinearity among the covariates. The glmnet fitting algorithm is used to fit the continuation ratio model after data restructuring. / GPL-2   | noarch   |
| r-glmnetutils   | 1.1.2   | Provides a formula interface for the 'glmnet' package for elasticnet regression, a method for cross-validating the alpha parameter, and other quality-of-life tools. / GPL-2   | noarch   |
| r-glmsdata      | 1.0.0   | Data sets from the book Generalized Linear Models with Examples in R by Dunn and Smyth. / GPL-2  | noarch   |
| r-glmtlp        | 1.1     | It provides an extremely efficient procedure for fitting the entire truncated lasso regularization path for linear regression, logistic and multinomial regression models, Poisson regression and the Cox model. The algorithm uses the difference of convex technique. The detail of the algorithm is described in Shen, Pan and Zhu (2012) <doi:10.1080/01621459.2011.645783>. The package is inherited from a popular R package 'glmnet' and many functions in 'glmnet' can be directly used in 'glmtlp'. You can learn more details by the online manual (<http://wuchong.org/glmtlp.html>). / GPL-2 | noarch   |
| r-glmulti       | 1.0.7   | Automated model selection and model-averaging. Provides a wrapper for glm and other functions, automatically generating all possible models (under constraints set by the user) with the specified response and explanatory variables, and finding the best models in terms of some Information Criterion (AIC, AICc or BIC). Can handle very large numbers of candidate models. Features a Genetic Algorithm to find the best models when an exhaustive screening of the candidates is not feasible. / GPL-2  | noarch   |
| r-glmx          | 0.1_1   | Extended techniques for generalized linear models (GLMs), especially for binary responses, including parametric links and heteroskedastic latent variables. / GPL-2   GPL-3  | noarch   |
| r-globalgsa     | 1.0     | Implementation of three different Gene set analysis (GSA) algorithms for combining the individual pvalues of a set of genetic variats (SNPs) in a gene level pvalue. The implementation includes the selection of the best inheritance model for each SNP. / GPL-2   | noarch   |
| r-globaloptions | 0.1.0   | It provides more configurations on the option values such as validation and filtering on the values, making options invisible or private. / MIT  | noarch   |
| r-globals       | 0.12.4  | Identifies global (unknown or free) objects in R expressions by code inspection using various strategies, e.g. conservative or liberal. The objective of this package is to make it as simple as possible to identify global objects for the purpose of exporting them in distributed compute environments. / LGPL-2.1   | noarch   |
| r-globe         | 1.2_0   | Basic functions for plotting 2D and 3D views of a sphere, by default the Earth with its major coastline, and additional lines and points. / GPL (>= 2.0)   | noarch   |

| Name            | Version | Summary/License  | Platforms  |
|-----------------|---------|--|--|
| r-glogis        | 1.0.1   | Tools for the generalized logistic distribution (Type I, also known as skew-logistic distribution), encompassing basic distribution functions (p, q, d, r, score), maximum likelihood estimation, and structural change methods. / GPL-2   GPL-3   | noarch   |
| r-glrt          | 2.0     | Functions to conduct four generalized logrank tests and a score test under a proportional hazards model / GPL-2  | noarch   |
| r-glrrth        | 0.2.0   | Likelihood ratio tests for genome-wide association and genome-wide linkage analysis under heterogeneity. / GPL-3   | noarch   |
| r-glsme         | 1.0.4   | Performs linear regression with correlated predictors, responses and correlated measurement errors in predictors and responses, correcting for biased caused by these. / GPL-2   | noarch   |
| r-glue          | 1.3.1   | An implementation of interpreted string literals, inspired by Python's Literal String Interpolation < <a href="https://www.python.org/dev/peps/pep-0498/">https://www.python.org/dev/peps/pep-0498/</a> > and Docstrings < <a href="https://www.python.org/dev/peps/pep-0257/">https://www.python.org/dev/peps/pep-0257/</a> > and Julia's Triple-Quoted String Literals < <a href="https://docs.julialang.org/en/stable/manual/strings/#triple-quoted-string-literals">https://docs.julialang.org/en/stable/manual/strings/#triple-quoted-string-literals</a> >. / MIT file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-gmac          | 3.0     | Performs genomic mediation analysis with adaptive confounding adjustment (GMAC) proposed by Yang et al. (2017) <doi:10.1101/078683>. It implements large scale mediation analysis and adaptively selects potential confounding variables to adjust for each mediation test from a pool of candidate confounders. The package is tailored for but not limited to genomic mediation analysis (e.g., cis-gene mediating trans-gene regulation pattern where an eQTL, its cis-linking gene transcript, and its trans-gene transcript play the roles as treatment, mediator and the outcome, respectively), restricting to scenarios with the presence of cis-association (i.e., treatment-mediator association) and random eQTL (i.e., treatment). / GPL-3 | noarch   |
| r-gmapsdistance | 3.4     | Get distance and travel time between two points from Google Maps. Four possible modes of transportation (bicycling, walking, driving and public transportation). / GPL-2   | noarch   |
| r-gmdatabase    | 0.5.0   | A template for a geometallurgical database and a fast and easy interface for accessing it is provided in this package. / GPL-2   LGPL-2  | noarch   |
| r-gmdh          | 1.6     | Group method of data handling (GMDH) - type neural network algorithm is the heuristic self-organization method for modelling the complex systems. In this package, GMDH-type neural network algorithms are applied to make short term forecasting for a univariate time series. / GPL-2  | noarch   |

| r-gmdhreg    | 0.2.0   | Regression using GMDH algorithms from Prof. Alexey G. Ivakhnenko. Group Method of Data Handling (GMDH), or polynomial neural networks, is a family of inductive algorithms that performs gradually complicated polynomial models and selecting the best solution by an external criterion. In other words, inductive GMDH algorithms give possibility finding automatically interrelations in data, and selecting an optimal structure of model or network. The package includes GMDH Combinatorial, GMDH MIA (Multilayered Iterative Algorithm), GMDH GIA (Generalized Iterative Algorithm) and GMDH Combinatorial with Active Neurons. An introduction of GMDH algorithms: Farlow, S.J. (1981): The GMDH algorithm of Ivakhnenko, The American Statistician, 35(4), pp. 210-215. <doi:10.2307/2683292> Ivakhnenko A.G. (1968): The Group Method of Data Handling - A Rival of the Method of Stochastic Approximation, Soviet Automatic Control, 13(3), pp. 43-55. / GPL-3 | noarch   |
| r-gmediation | 0.1.1   | Current version of this R package conducts mediation path analysis for multiple mediators in two stages. / GPL-2   GPL-3  | noarch   |
| r-gmfd       | 1.0.1   | Some methods for the inference and clustering of univariate and multivariate functional data, using a generalization of Mahalanobis distance, along with some functions useful for the analysis of functional data. For further details, see Martino A., Ghigletti, A., Ieva, F. and Paganoni A. M. (2017) <arXiv:1708.00386>. / GPL-3  | noarch   |
| r-gmm        | 1.6_2   | It is a complete suite to estimate models based on moment conditions. It includes the two step Generalized method of moments (Hansen 1982; <doi:10.2307/1912775>), the iterated GMM and continuous updated estimator (Hansen, Eaton and Yaron 1996; <doi:10.2307/1392442>) and several methods that belong to the Generalized Empirical Likelihood family of estimators (Smith 1997; <doi:10.1111/j.0013-0133.1997.174.x>, Kitamura 1997; <doi:10.1214/aos/1069362388>, Newey and Smith 2004; <doi:10.1111/j.1468-0262.2004.00482.x>, and Anatolyev 2005 <doi:10.1111/j.1468-0262.2005.00601.x>). / GPL-2   | noarch   |
| r-gmmboost   | 1.1.2   | Likelihood-based Boosting for Generalized mixed models / GPL-2  | noarch   |
| r-gmodels    | 2.18.1  | Various R programming tools for model fitting. / GPL-2  | noarch   |
| r-gmp        | 0.5_1   | Multiple Precision Arithmetic (big integers and rationals, prime number tests, matrix computation), arithmetic without limitations using the C library GMP (GNU Multiple Precision Arithmetic). / GPL   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-gmt        | 2.0_1   | Interface between the GMT map-making software and R, enabling the user to manipulate geographic data within R and call GMT commands to draw and annotate maps in postscript format. The gmt package is about interactive data analysis, rapidly visualizing subsets and summaries of geographic data, while performing statistical analysis in the R console. / GPL-2   | noarch   |
| r-gnorm      | 1.0.0   | Functions for obtaining generalized normal/exponential power distribution probabilities, quantiles, densities and random deviates. The generalized normal/exponential power distribution was introduced by Subbotin (1923) and rediscovered by Nadarajah (2005). The parametrization given by Nadarajah (2005) <doi:10.1080/02664760500079464> is used. / GPL-2   | noarch   |

Table 51 – continued from previous page

| Name                    | Version   | Summary/License  | Platforms  |
|-------------------------|-----------|--|--|
| r-gnumeric              | 0.7_8     | Read data files readable by 'gnumeric' into 'R'. Can read whole sheet or a range, from several file formats, including the native format of 'gnumeric'. Reading is done by using 'ssconvert' (a file converter utility included in the 'gnumeric' distribution < <a href="http://projects.gnome.org/gnumeric/">http://projects.gnome.org/gnumeric/</a> >) to convert the requested part to CSV. From 'gnumeric' files (but not other formats) can list sheet names and sheet sizes or read all sheets. / GPL-2 | noarch   |
| r-gofkernel             | 2.1_1     | Tests of goodness-of-fit based on a kernel smoothing of the data. / GPL-3  | noarch   |
| r-gogarch               | 0.7_2     | Implementation of the GO-GARCH model class / GPL-2   | noarch   |
| r-gomms                 | 1.0       | A zero-inflated quasi-Poisson factor model to display similarity between samples visually in a low (2 or 3) dimensional space. / GPL-2   | noarch   |
| r-goodmankruskal        | 0.0.2     | Association analysis between categorical variables using the Goodman and Kruskal tau measure. This asymmetric association measure allows the detection of asymmetric relations between categorical variables (e.g., one variable obtained by re-grouping another). / MIT   | noarch   |
| r-googleformr           | 0.0.3     | GET and POST data to Google Forms; an API to Google Forms, allowing users to POST data securely to Google Forms without needing authentication or permissioning. / GPL-2   | noarch   |
| r-googleknowledgegraphr | 0.1.0     | Allows you to retrieve information from the 'Google Knowledge Graph' API < <a href="https://www.google.com/intl/bn/insidesearch/features/search/knowledge.html">https://www.google.com/intl/bn/insidesearch/features/search/knowledge.html</a> > and process it in R in various forms. The 'Knowledge Graph Search' API lets you find entities in the 'Google Knowledge Graph'. The API uses standard 'schema.org' types and is compliant with the 'JSON-LD' specification. / MIT                              | noarch   |
| r-googlevis             | 0.6.4     | R interface to Google's chart tools, allowing users to create interactive charts based on data frames. Charts are displayed locally via the R HTTP help server. A modern browser with an Internet connection is required and for some charts a Flash player. The data remains local and is not uploaded to Google. / GPL-2   | noarch   |
| r-goric                 | 1.1_0     | Generalized Order-Restricted Information Criterion (GORIC) value for a set of hypotheses in multivariate linear models and generalised linear models. / GPL-2  | noarch   |
| r-govstatjpn            | 0.1       | This package purposes to deal with public survey data of Japanese government via their Application Programming Interface ( <a href="http://statdb.nstac.go.jp/">http://statdb.nstac.go.jp/</a> ) / GPL-3   | noarch   |
| r-gower                 | 0.2.0     | Compute Gower's distance (or similarity) coefficient between records. Compute the top-n matches between records. Core algorithms are executed in parallel on systems supporting OpenMP. / GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-gparotation           | 2014.11.1 | Gradient Projection Algorithm Rotation for Factor Analysis. See ?GPArotation.Intro for more details. / GPL-2   | noarch   |
| r-gpca                  | 1.0       | This package implements guided principal components analysis for the detection of batch effects in high-throughput data. / GPL-2   | noarch   |

Table 51 – continued from previous page

| Name        | Version | Summary/License   | Platforms   |
|-------------|---------|---|---|
| r-gpctest   | 0.4     | This package computes the bootstrap goodness-of-fit test for the generalized Pareto distribution by Villasenor-Alva and Gonzalez-Estrada (2009). The null hypothesis includes heavy and non-heavy tailed gPd's. A function for fitting the gPd to data using the parameter estimation methods proposed in the same article is also provided. / GPL-2  | noarch  |
| r-gpk       | 1.0     | Collection of datasets as prepared by Profs. A.P. Gore, S.A. Paranjape, and M.B. Kulkarni of Department of Statistics, Poona University, India. With their permission, first letter of their names forms the name of this package, the package has been built by me and made available for the benefit of R users. This collection requires a rich class of models and can be a very useful building block for a beginner. / GPL-2  | noarch  |
| r-gplots    | 3.0.1   | Various R programming tools for plotting data, including: - calculating and plotting locally smoothed summary function as ('bandplot', 'wapply'), - enhanced versions of standard plots ('barplot2', 'boxplot2', 'heatmap.2', 'smartlegend'), - manipulating colors ('col2hex', 'colorpanel', 'redgreen', 'greenred', 'bluered', 'redblue', 'rich.colors'), - calculating and plotting two-dimensional data summaries ('ci2d', 'hist2d'), - enhanced regression diagnostic plots ('lplot2', 'residplot'), - formula-enabled interface to 'stats::lowess' function ('lowess'), - displaying textual data in plots ('textplot', 'sinkplot'), - plotting a matrix where each cell contains a dot whose size reflects the relative magnitude of the elements ('balloonplot'), - plotting Venn diagrams ('venn'), - displaying Open-Office style plots ('ooplot'), - plotting multiple data on same region, with separate axes ('overplot'), - plotting means and confidence intervals ('plotCI', 'plotmeans'), - spacing points in an x-y plot so they don't overlap ('space'). / GPL-2 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-gpltr     | 1.2     | Combining a generalized linear model with an additional tree part on the same scale. A four-step procedure is proposed to fit the model and test the joint effect of the selected tree part while adjusting on confounding factors. We also proposed an ensemble procedure based on the bagging to improve prediction accuracy and computed several scores of importance for variable selection. / GPL (>= 2.0)   | noarch  |
| r-gpr       | 1.1     | This package provides a minimalistic functionality necessary to apply Gaussian Process in R. They provide a selection of functionalities of GPML Matlab library. / GPL-3  | noarch  |
| r-gprofiler | 0.6.8   | This package has been deprecated and will not be updated. New users should use the package 'gprofiler2' (< <a href="https://CRAN.R-project.org/package=gprofiler2">https://CRAN.R-project.org/package=gprofiler2</a> >) for up-to-date data and improved functionality. Functional enrichment analysis, gene identifier conversion and mapping homologous genes across related organisms via the 'g:Profiler' toolkit (< <a href="https://biit.cs.ut.ee/gprofiler/">https://biit.cs.ut.ee/gprofiler/</a> >). / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name               | Version | Summary/License   | Platforms |
|--------------------|---------|---|-----------|
| r-graddescent      | 3.0     | An implementation of various learning algorithms based on Gradient Descent for dealing with regression tasks. The variants of gradient descent algorithm are : Mini-Batch Gradient Descent (MBGD), which is an optimization to use training data partially to reduce the computation load. Stochastic Gradient Descent (SGD), which is an optimization to use a random data in learning to reduce the computation load drastically. Stochastic Average Gradient (SAG), which is a SGD-based algorithm to minimize stochastic step to average. Momentum Gradient Descent (MGD), which is an optimization to speed-up gradient descent learning. Accelerated Gradient Descent (AGD), which is an optimization to accelerate gradient descent learning. Adagrad, which is a gradient-descent-based algorithm that accumulate previous cost to do adaptive learning. Adadelata, which is a gradient-descent-based algorithm that use hessian approximation to do adaptive learning. RMSprop, which is a gradient-descent-based algorithm that combine Adagrad and Adadelata adaptive learning ability. Adam, which is a gradient-descent-based algorithm that mean and variance moment to do adaptive learning. Stochastic Variance Reduce Gradient (SVRG), which is an optimization SGD-based algorithm to accelerates the process toward converging by reducing the gradient. Semi Stochastic Gradient Descent (SSGD), which is a SGD-based algorithm that combine GD and SGD to accelerates the process toward converging by choosing one of the gradients at a time. Stochastic Recursive Gradient Algorithm (SARAH), which is an optimization algorithm similarly SVRG to accelerates the process toward converging by accumulated stochastic information. Stochastic Recursive Gradient Algorithm (SARAHPlus), which is a SARAH practical variant algorithm to accelerates the process toward converging provides a possibility of earlier termination. / GPL-2 | noarch    |
| r-grade            | 0.2.1   | Provides functions for matching student-answers to teacher answers for a variety of data types. / GPL-2   | noarch    |
| r-grader           | 1.0.1   | After being given the location of your students' submissions and a test file, the function runs each .R file, and evaluates the results from all the given tests. Results are neatly returned in a data frame that has a row for each student, and a column for each test. / MIT  | noarch    |
| r-gradientpickerd3 | 0.1.0.0 | Widget for an interactive selection and modification of a color gradient. 'gradientPickerD3' allows addition, removal and replacement of color ticks. List of numeric values will automatically translate in their corresponding tick position within the numeric range. App returns a data.frame containing tick values, colors and the positions in percent (0.0 to 1.0) for each color tick in the gradient. The original JS 'jquery-gradient-picker' was implemented by Matt Crinklaw-Vogt (nick: tantaman) < <a href="https://github.com/tantaman/">https://github.com/tantaman/</a> >. Widget and JS modifications were done by CD. Peikert. / GPL-3  | noarch    |
| r-gramevol         | 2.1.3   | A native R implementation of grammatical evolution (GE). GE facilitates the discovery of programs that can achieve a desired goal. This is done by performing an evolutionary optimisation over a population of R expressions generated via a user-defined context-free grammar (CFG) and cost function. / GPL-2  | noarch    |
| r-grangers         | 0.1.0   | Contains five functions performing the calculation of unconditional and conditional Granger-causality spectra, bootstrap inference on both, and inference on the difference between them via the bootstrap approach of Farne' and Montanari, 2018 <arXiv:1803.00374>. / GPL-2   | noarch    |

| Name                           | Version | Summary/License   | Platforms |
|--------------------------------|---------|---|-----------|
| r-grape                        | 0.1.1   | Gene-Ranking Analysis of Pathway Expression (GRAPE) is a tool for summarizing the consensus behavior of biological pathways in the form of a template, and for quantifying the extent to which individual samples deviate from the template. GRAPE templates are based only on the relative rankings of the genes within the pathway and can be used for classification of tissue types or disease subtypes. GRAPE can be used to represent gene-expression samples as vectors of pathway scores, where each pathway score indicates the departure from a given collection of reference samples. The resulting pathway- space representation can be used as the feature set for various applications, including survival analysis and drug-response prediction. Users of GRAPE should use the following citation: Klein MI, Stern DF, and Zhao H. GRAPE: A pathway template method to characterize tissue-specific functionality from gene expression profiles. BMC Bioinformatics, 18:317 (June 2017). / GPL-2 | noarch    |
| r-grapes                       | 1.0.0   | Turn arbitrary functions into binary operators. / GPL-3   | noarch    |
| r-grapfa                       | 1.0     | gRapfa is for modelling discrete longitudinal data using acyclic probabilistic finite automata (APFA). The package contains functions for constructing APFA models from a given data using penalized likelihood methods. For graphical display of APFA models, gRapfa depends on 'igraph package'. gRapfa also contains an interface function to Beagle software that implements an efficient model selection algorithm. / GPL-2  | noarch    |
| r-grapher                      | 1.9_86  | A multi-platform user interface for drawing highly customizable graphs in R. It aims to be a valuable help to quickly draw publishable graphs without any knowledge of R commands. Six kinds of graph are available: histogram, box-and-whisker plot, bar plot, pie chart, curve and scatter plot. / GPL-2  | noarch    |
| r-graphfactor                  | 1.1     | A Network Implementation of Fuzzy Sets: Build Network Objects from Multivariate Flat Files. For more information on fuzzy sets, refer to: Zadeh, L.A. (1964) <DOI:10.1016/S0019-9958(65)90241-X>. / GPL-2   | noarch    |
| r-graphicsqc                   | 1.0_8   | Functions to generate graphics files, compare them with model files, and report the results, including visual and textual diffs of any differences. / GPL-2   | noarch    |
| r-grassmannoptim               | 2.0     | Optimizing a function F(U), where U is a semi-orthogonal matrix and F is invariant under an orthogonal transformation of U / GPL-2  | noarch    |
| r-graticule                    | 0.1.2   | Create graticule lines and labels for maps. Control the creation of lines by setting their placement (at particular meridians and parallels) and extent (along parallels and meridians). Labels are created independently of lines. / GPL-3   | noarch    |
| r-grcdata                      | 1.0     | We implement two main functions. The first function uses a given grouped and/or right-censored grouping scheme and empirical data to infer parameters, and implements chi-square goodness-of-fit tests. The second function searches for the global optimal grouping scheme of grouped and/or right-censored count responses in surveys. / GPL-3  | noarch    |
| r-greedyexperimental<br>design | 1.0     | These are GreedyExperimentalDesign Java dependency libraries. Note: this package has no functionality of its own and should not be installed as a standalone package without GreedyExperimentalDesign. / GPL-3  | noarch    |
| r-greenclust                   | 1.0.0   | Implements a method of iteratively collapsing the rows of a contingency table, two at a time, by selecting the pair of categories whose combination yields a new table with the smallest loss of chi-squared, as described by Greenacre, M.J. (1988) <doi:10.1007/BF01901670>. The result is compatible with the class of object returned by the 'stats' package's hclust() function and can be used similarly (plotted as a dendrogram, cut, etc.). Additional functions are provided for automatic cutting and diagnostic plotting. / MIT   | noarch    |

Table 51 – continued from previous page

| Name                           | Version | Summary/License  | Platforms   |
|--------------------------------|---------|--|---|
| <a href="#">r-gremlin</a>      | 0.1.0   | Fit linear mixed-effects models using restricted (or residual) maximum likelihood (REML) and with generalized inverse matrices to specify covariance structures for random effects. In particular, the package is suited to fit quantitative genetic mixed models, often referred to as ‘animal models’ (Kruuk. 2004 <DOI: 10.1098/rstb.2003.1437>). Implements the average information algorithm as the main tool to maximize the restricted likelihood, but with other algorithms available (Meyer. 1997. Genet Sel Evol 29:97; Meyer and Smith. 1998. Genet Sel Evol 28:23.). / GPL-3 | noarch  |
| <a href="#">r-grex</a>         | 1.9     | Convert ‘Ensembl’ gene identifiers from Genotype-Tissue Expression (GTEx) data to identifiers in other annotation systems, including ‘Entrez’, ‘HGNC’, and ‘UniProt’. / GPL-3  | noarch  |
| <a href="#">r-gridbase</a>     | 0.4_7   | Integration of base and grid graphics / GPL  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-gridbezier</a>   | 1.1_1   | Functions for rendering Bezier curves (Pomax, 2018) < <a href="https://pomax.github.io/bezierinfo/">https://pomax.github.io/bezierinfo/</a> > in ‘grid’. There is support for both quadratic and cubic Bezier curves. There are also functions for calculating points on curves, tangents to curves, and normals to curves. / GPL-2  | noarch  |
| <a href="#">r-gridextra</a>    | 2.3     | Provides a number of user-level functions to work with grid graphics, notably to arrange multiple grid-based plots on a page, and draw tables. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-gridgraphics</a> | 0.4_1   | Functions to convert a page of plots drawn with the ‘graphics’ package into identical output drawn with the ‘grid’ package. The result looks like the original ‘graphics’-based plot, but consists of ‘grid’ grobs and viewports that can then be manipulated with ‘grid’ functions (e.g., edit grobs and revisit viewports). / GPL-2  | noarch  |
| <a href="#">r-gridsvg</a>      | 1.7_0   | Functions to export graphics drawn with package grid to SVG format. Additional functions provide access to SVG features that are not available in standard R graphics, such as hyperlinks, animation, filters, masks, clipping paths, and gradient and pattern fills. / GPL-3  | noarch  |
| <a href="#">r-grimport</a>     | 0.9_2   | Functions for converting, importing, and drawing PostScript pictures in R plots. / GPL-2   | noarch  |

Continued on next page

Table 51 – continued from previous page

| Name            | Version | Summary/License  | Platforms  |
|-----------------|---------|--|--|
| r-grimport2     | 0.1_5   | Functions for importing external vector images and drawing them as part of ‘R’ plots. This package is different from the ‘grImport’ package because, where that package imports ‘PostScript’ format images, this package imports ‘SVG’ format images. Furthermore, this package imports a specific subset of ‘SVG’, so external images must be preprocessed using a package like ‘rsvg’ to produce ‘SVG’ that this package can import. ‘SVG’ features that are not supported by ‘R’ graphics, e.g., gradient fills, can be imported and then exported via the ‘gridSVG’ package. / GPL-2 | noarch   |
| r-grnn          | 0.1.0   | The program GRNN implements the algorithm proposed by Specht (1991). / AGPL-3  | noarch   |
| r-grouped       | 0.6_0   | Regression models for grouped and coarse data, under the Coarsened At Random assumption. / GPL-2   | noarch   |
| r-groupica      | 0.1.1   | Contains an implementation of an independent component analysis (ICA) for grouped data. The main function groupICA() performs a blind source separation, by maximizing an independence across sources and allows to adjust for varying confounding for user-specified groups. Additionally, the package contains the function uwedge() which can be used to approximately jointly diagonalize a list of matrices. For more details see the project website < <a href="https://sweichwald.de/groupICA/">https://sweichwald.de/groupICA/</a> >. / AGPL-3                                   | noarch   |
| r-grouptest     | 1.0.1   | Contains functions for a two-stage multiple testing procedure for grouped hypothesis, aiming at controlling both the total posterior false discovery rate and within-group false discovery rate. / GPL-3   | noarch   |
| r-growthmodels  | 1.2.0   | A compilation of nonlinear growth models used in many areas / GPL-3  | noarch   |
| r-growthrate    | 1.3     | A nonparametric empirical Bayes method for recovering gradients (or growth velocities) from observations of smooth functions (e.g., growth curves) at isolated time points. / GPL-3  | noarch   |
| r-grplasso      | 0.4_6   | Fits user-specified (GLM-) models with group lasso penalty. / GPL-3  | noarch   |
| r-grpreg        | 3.2_1   | Efficient algorithms for fitting the regularization path of linear or logistic regression models with grouped penalties. This includes group selection methods such as group lasso, group MCP, and group SCAD as well as bi-level selection methods such as the group exponential lasso, the composite MCP, and the group bridge. / GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-grpregoverlap | 2.2_0   | Fit the regularization path of linear, logistic or Cox models with overlapping grouped covariates based on the latent group lasso approach. Latent group MCP/SCAD as well as bi-level selection methods, namely the group exponential lasso and the composite MCP are also available. This package serves as an extension of R package ‘grpreg’ (by Dr. Patrick Breheny < <a href="mailto:patrick-breheny@uiowa.edu">patrick-breheny@uiowa.edu</a> >) for grouped variable selection involving overlaps between groups. / GPL-3  | noarch   |
| r-grpss         | 3.0.1   | Contains the tools to screen grouped variables, and select screened grouped variables afterwards. The main function grpss() can perform the grouped variables screening as well as selection for ultra-high dimensional data with group structure. The screening step is primarily used to reduce the dimensions of data so that the selection procedure can easily handle the moderate or low dimensions instead of ultra-high dimensions. / GPL-2   GPL-3  | noarch   |

Table 51 – continued from previous page

| Name                | Version | Summary/License   | Platforms |
|---------------------|---------|---|-----------|
| r-grpstring         | 0.3.2   | Methods include converting series of event names to strings, finding common patterns in a group of strings, discovering featured patterns when comparing two groups of strings as well as the number and starting position of each pattern in each string, obtaining transition matrix, computing transition entropy, statistically comparing the difference between two groups of strings, and clustering string groups. Event names can be any action names or labels such as events in log files or areas of interest (AOIs) in eye tracking research. / GPL-2 | noarch    |
| r-grs.test          | 1.1     | Computational resources for test proposed by Gibbons, Ross, Shanken (1989)<DOI:10.2307/1913625>. It also has the functions for the power analysis and the choice of the optimal level of significance. The optimal level is determined by minimizing the expected loss from hypothesis testing. / GPL-2   | noarch    |
| r-grt               | 0.2.1   | Functions to generate and analyze data for psychology experiments based on the General Recognition Theory. / GPL-2  | noarch    |
| r-grto              | 1.3     | Offers functions for the comparison of Gutenberg-Richter b-values. Several functions in GRTo are helpful for the assessment of the quality of seismicity catalogs. / GPL-3  | noarch    |
| r-gsa               | 1.03.1  | Gene Set Analysis. / LGPL-3   | noarch    |
| r-gsafishercombined | 1.0     | Provides the p-value for a joint test of association between a phenotype and a set of genetic variants (SNPs) by combining marginal p-values using the Fisher method. See Fisher, R.A. (1925,ISBN:0-05-002170-2) Statistical Methods for Research Workers. / GPL-2  | noarch    |
| r-gsalib            | 2.1     | This package contains utility functions used by the Genome Analysis Toolkit (GATK) to load tables and plot data. The GATK is a toolkit for variant discovery in high-throughput sequencing data. / MIT  | noarch    |
| r-gsaq              | 1.0     | Computation of Quantitative Trait Loci hits in the selected gene set. Performing gene set validation with Quantitative Trait Loci information. Performing gene set enrichment analysis with available Quantitative Trait Loci data and computation of statistical significance value from gene set analysis. Obtaining the list of Quantitative Trait Loci hit genes along with their overlapped Quantitative Trait Loci names. / GPL-2   | noarch    |
| r-gsarima           | 0.1_4   | Write SARIMA models in (finite) AR representation and simulate generalized multiplicative seasonal autoregressive moving average (time) series with Normal / Gaussian, Poisson or negative binomial distribution. / GPL-2   | noarch    |
| r-gseg              | 0.6     | Using an approach based on similarity graph to estimate change-point(s) and the corresponding p-values. Can be applied to any type of data (high-dimensional, non-Euclidean, etc.) as long as a reasonable similarity measure is available. / GPL-2   | noarch    |
| r-gsg               | 2.0     | gsg (gam selection gradients) provides a unified approach to the regression analysis of selection from longitudinal data collected from natural populations. / GPL-2  | noarch    |
| r-gsheet            | 0.4.2   | Simple package to download Google Sheets using just the sharing link. Spreadsheets can be downloaded as a data frame, or as plain text to parse manually. Google Sheets is the new name for Google Docs Spreadsheets. / GPL-3   | noarch    |

| Name                      | Version | Summary/License  | Platforms  |
|---------------------------|---------|--|--|
| <a href="#">r-gsl</a>     | 2.1_6   | An R wrapper for the special functions and quasi random number generators of the Gnu Scientific Library ( <a href="http://www.gnu.org/software/gsl/">http://www.gnu.org/software/gsl/</a> ). See <code>gsl-package.Rd</code> for details of overall package organization, and <code>Misc.Rd</code> for some functions that are widely used in the package, and some tips on installation. / GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-gsloid</a>  | 0.1.0   | Contains published data sets for global benthic d18O data for 0-5.3 Myr <doi:10.1029/2004PA001071> and global sea levels based on marine sediment core data for 0-800 ka <doi:10.5194/cp-12-1-2016>. / MIT   | noarch   |
| <a href="#">r-gsm</a>     | 1.3.2   | Implementation of a Bayesian approach for estimating a mixture of gamma distributions in which the mixing occurs over the shape parameter. This family provides a flexible and novel approach for modeling heavy-tailed distributions, it is computationally efficient, and it only requires to specify a prior distribution for a single parameter. / GPL-2   | noarch   |
| <a href="#">r-gsmx</a>    | 1.3     | Estimating trait heritability and handling overfitting. This package includes a collection of functions for (1) estimating genetic variance-covariances and calculate trait heritability; and (2) handling overfitting by calculating the variance components and the heritability through cross validation. / GPL-2   | noarch   |
| <a href="#">r-gss</a>     | 2.1_9   | A comprehensive package for structural multivariate function estimation using smoothing splines. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-gstream</a> | 0.2.0   | Uses an approach based on k-nearest neighbor information to sequentially detect change-points. Offers analytic approximations for false discovery control given user-specified average run length. Can be applied to any type of data (high-dimensional, non-Euclidean, etc.) as long as a reasonable similarity measure is available. See references (1) Chen, H. (2019) Sequential change-point detection based on nearest neighbors. The Annals of Statistics, 47(3):1381-1407. (2) Chu, L. and Chen, H. (2018) Sequential change-point detection for high-dimensional and non-Euclidean data <arXiv:1810.05973>. / GPL-2 | noarch   |

| Name        | Version | Summary/License  | Platforms   |
|-------------|---------|--|---|
| r-gsubfn    | 0.7     | The gsubfn function is like gsub but can take a replacement function or certain other objects instead of the replacement string. Matches and back references are input to the replacement function and replaced by the function output. gsubfn can be used to split strings based on content rather than delimiters and for quasi-perl-style string interpolation. The package also has facilities for translating formulas to functions and allowing such formulas in function calls instead of functions. This can be used with R functions such as apply, sapply, lapply, optim, integrate, xyplot, Filter and any other function that expects another function as an input argument or functions like cat or sql calls that may involve strings where substitution is desirable. There is also a facility for returning multiple objects from functions and a version of transform that allows the RHS to refer to LHS used in the same transform. / GPL-2 | noarch  |
| r-gsw       | 1.0_5   | Provides an interface to the Gibbs ‘SeaWater’ (‘TEOS-10’) C library, version 3.05-4 (commit ‘5b4d959e54031f9e972f3e863f63e67fa4f5bfec’, dated 2017-08-07, available at < <a href="https://github.com/TEOS-10/GSW-C">https://github.com/TEOS-10/GSW-C</a> >, which stems from ‘Matlab’ and other code written by members of Working Group 127 of ‘SCOR’/‘IAPSO’ (Scientific Committee on Oceanic Research / International Association for the Physical Sciences of the Oceans). / GPL (>= 2)   file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| r-gt4ireval | 2.0     | Provides tools to measure the reliability of an Information Retrieval test collection. It allows users to estimate reliability using Generalizability Theory and map those estimates onto well-known indicators such as Kendall tau correlation or sensitivity. / MIT  | noarch  |
| r-gtable    | 0.3.0   | Tools to make it easier to work with tables of ‘grobs’. The ‘gtable’ package defines a ‘gtable’ grob class that specifies a grid along with a list of grobs and their placement in the grid. Further the package makes it easy to manipulate and combine ‘gtable’ objects so that complex compositions can be build up sequentially. / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-gtcorr    | 0.2_1   | This package provides functions to calculate the efficiencies (expected tests per unit) of hierarchical and matrix group testing procedures. Efficiencies can be calculated in the presense of correlated responses under multiple arrangements of clusters. Efficiencies can also be evaluated in the presense of test error. / GPL-3   | noarch  |
| r-gtests    | 0.2     | Four graph-based tests are provided for testing whether two samples are from the same distribution. It works for both continuous data and discrete data. / GPL-2   | noarch  |
| r-gtheory   | 0.1.2   | Estimates variance components, generalizability coefficients, universe scores, and standard errors when observed scores contain variation from one or more measurement facets (e.g., items and raters). / GPL-3  | noarch  |

| Name                        | Version | Summary/License  | Platforms  |
|-----------------------------|---------|--|--|
| <a href="#">r-gtools</a>    | 3.8.1   | Functions to assist in R programming, including: - assist in developing, updating, and maintaining R and R packages ('ask', 'checkRVersion', 'getDependencies', 'keywords', 'scat'), - calculate the logit and inverse logit transformations ('logit', 'inv.logit'), - test if a value is missing, empty or contains only NA and NULL values ('invalid'), - manipulate R's .Last function ('addLast'), - define macros ('defmacro'), - detect odd and even integers ('odd', 'even'), - convert strings containing non-ASCII characters (like single quotes) to plain ASCII ('ASCIIify'), - perform a binary search ('binsearch'), - sort strings containing both numeric and character components ('mixedsort'), - create a factor variable from the quantiles of a continuous variable ('quantcut'), - enumerate permutations and combinations ('combinations', 'permutation'), - calculate and convert between fold-change and log-ratio ('foldchange', 'logratio2foldchange', 'foldchange2logratio'), - calculate probabilities and generate random numbers from Dirichlet distributions ('rdirichlet', 'ddirichlet'), - apply a function over adjacent subsets of a vector ('running'), - modify the TCP_NODELAY ('de-Nagle') flag for socket objects, - efficient 'rbind' of data frames, even if the column names don't match ('smartbind'), - generate significance stars from p-values ('stars.pval'), - convert characters to/from ASCII codes. / GPL-2 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-gtwas</a>     | 1.1.0   | Quantitative trait loci mapping and genome wide association analysis are used to find candidate molecular marker or region associated with phenotype based on linkage analysis and linkage disequilibrium. Gene expression quantitative trait loci mapping is used to find candidate molecular marker or region associated with gene expression. In this package, we applied the method in Liu W. (2011) <doi:10.1007/s00122-011-1631-7> and Gusev A. (2016) <doi:10.1038/ng.3506> to genome and transcriptome wide association study, which is aimed at revealing the association relationship between phenotype and molecular markers, expression levels, molecular markers nested within different related expression effect and expression effect nested within different related molecular marker effect. F test based on full and reduced model are performed to obtain p value or likelihood ratio statistic. The best linear model can be obtained by stepwise regression analysis. / GPL-2  | noarch   |
| <a href="#">r-gtx</a>       | 0.0.8   | Assorted tools for genetic association analyses. The current focus is on implementing (either exactly or approximately) regression analyses using summary statistics instead of using subject-specific data. So far, functions exist to support multi-SNP risk score analyses, multi-SNP conditional regression analyses, and multi-phenotype analyses, using summary statistics. There are helper functions for reading and manipulating subject-specific genotype data, which provide a platform for calculating the summary statistics, or for using R to conduct other analyses not supported by specific GWAS analysis tools. / GPL-2   | noarch   |
| <a href="#">r-guardianr</a> | 0.9     | Provides an interface to the Open Platform's Content API of the Guardian Media Group. It retrieves content from news outlets The Observer, The Guardian, and guardian.co.uk from 1999 to current day. / GPL-2  | noarch   |
| <a href="#">r-guerry</a>    | 1.6_1   | This package comprises maps of France in 1830, multivariate data from A.-M. Guerry and others, and statistical and graphic methods related to Guerry's Moral Statistics of France. The goal is to facilitate the exploration and development of statistical and graphic methods for multivariate data in a geo-spatial context of historical interest. / GPL-3   | noarch   |

Table 51 – continued from previous page

| Name        | Version | Summary/License  | Platforms   |
|-------------|---------|--|---|
| r-guide     | 1.2.7   | A nice GUI for financial DERivatives in R. / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-gumbel    | 1.10    | Provides probability functions (cumulative distribution and density functions), simulation function (Gumbel copula multivariate simulation) and estimation functions (Maximum Likelihood Estimation, Inference For Margins, Moment Based Estimation and Canonical Maximum Likelihood). / GPL-2   | noarch  |
| r-gustave   | 0.4.0   | Provides a toolkit for analytical variance estimation in survey sampling. Apart from the implementation of standard variance estimators, its main feature is to help the sampling expert produce easy-to-use variance estimation wrappers, where systematic operations (linearization, domain estimation) are handled in a consistent and transparent way. / GPL-3 | noarch  |
| r-gvarx     | 1.1     | Perform the estimation and inference of stationary Global Vector Autoregression model (GVAR) of Pesaran, Schuermann and Weiner (2004) <DOI:10.1198/073500104000000019> and Dees, di Mauro, Pesaran and Smith (2007) <DOI:10.1002/jae.932>. / GPL-2   | noarch  |
| r-gvc       | 0.5.2   | Several tools for Global Value Chain ('GVC') analysis are implemented. / GPL-3   | noarch  |
| r-gvcm.cat  | 1.9     | Generalized structured regression models with regularized categorical effects, categorical effect modifiers, continuous effects and smooth effects. / GPL-2  | noarch  |
| r-gvlma     | 1.0.0   | Methods from the paper: Pena, EA and Slate, EH, Global Validation of Linear Model Assumptions, J. American Statistical Association, 101(473):341-354, 2006. / GPL-3  | noarch  |
| r-gweram    | 1.0     | This package provides functions to calculate the significance threshold for controlling the type I error rate in mixed-model association mapping analyses. / GPL-2   | noarch  |
| r-gwg       | 1.0     | Based on calculations of 758 women this package calculates positive predictive values (PPV) and negative predictive values (NPV) for inadequate and excessive gestational weight gain (GWG) for different prevalences for different BMI categories. / GPL-2  | noarch  |
| r-gwidgets  | 0.0_54  | Provides a toolkit-independent API for building interactive GUIs. At least one of the 'gWidgetsXXX packages', such as gWidgetstcltk, needs to be installed. Some icons are on loan from the scigraphica project < <a href="http://scigraphica.sourceforge.net">http://scigraphica.sourceforge.net</a> >. / GPL-2   | noarch  |
| r-gwidgets2 | 1.0_8   | Re-implementation of the 'gWidgets' API. The API is defined in this package. A second, toolkit-specific package is required to use it. There are three in development: 'gWidgets2RGtk2', 'gWidgets2Qt', and 'gWidgets2tcltk'. / GPL-3  | noarch  |
| r-gworm     | 2.1.0   | Statistical functions to fit, validate and describe a Generalized Waring Regression Model (GWRM). / GPL-2   GPL-3  | noarch  |

| Name              | Version | Summary/License  | Platforms |
|-------------------|---------|--|-----------|
| r-gwrpvr          | 1.0     | Computes the sample probability value (p-value) for the estimated coefficient from a standard genome-wide univariate regression. It computes the exact finite-sample p-value under the assumption that the measured phenotype (the dependent variable in the regression) has a known Bernoulli-normal mixture distribution. Finite-sample genome-wide regression p-values (Gwrpv) with a non-normally distributed phenotype (Gregory Connor and Michael O'Neill, bioRxiv 204727 <doi:10.1101/204727>). / GPL-3   | noarch    |
| r-gwsignif        | 1.2     | The correlations and linkage disequilibrium between tests can vary as a function of minor allele frequency thresholds used to filter variants, and also varies with different choices of test statistic for region-based tests. Appropriate genome-wide significance thresholds can be estimated empirically through permutation on only a small proportion of the whole genome. / GPL-2   | noarch    |
| r-gxm             | 1.1     | Quantifying and testing gene-by-measured-environment interaction in behavior genetic designs. / GPL-2  | noarch    |
| r-gym             | 0.1.0   | OpenAI Gym is a open-source Python toolkit for developing and comparing reinforcement learning algorithms. This is a wrapper for the OpenAI Gym API, and enables access to an ever-growing variety of environments. For more details on OpenAI Gym, please see here: < <a href="https://github.com/openai/gym">https://github.com/openai/gym</a> >. For more details on the OpenAI Gym API specification, please see here: < <a href="https://github.com/openai/gym-http-api">https://github.com/openai/gym-http-api</a> >. / MIT  | noarch    |
| r-h2o             | 3.26.0  | Interface for 'H2O', the scalable open source machine learning platform that offers parallelized implementations of many supervised and unsupervised machine learning algorithms such as Generalized Linear Models, Gradient Boosting Machines (including XGBoost), Random Forests, Deep Neural Networks (Deep Learning), Stacked Ensembles, Naive Bayes, Cox Proportional Hazards, K-Means, PCA, Word2Vec, as well as a fully automatic machine learning algorithm (AutoML). / Apache License (== 2.0)  | noarch    |
| r-h2o4gpu         | 0.2.0   | Interface to 'H2O4GPU' < <a href="https://github.com/h2oai/h2o4gpu">https://github.com/h2oai/h2o4gpu</a> >, a collection of 'GPU' solvers for machine learning algorithms. / Apache License 2.0  | noarch    |
| r-hac             | 1.0_5   | Package provides the estimation of the structure and the parameters, sampling methods and structural plots of Hierarchical Archimedean Copulae (HAC). / GPL-3  | noarch    |
| r-hadoopstreaming | 0.2     | Provides a framework for writing map/reduce scripts for use in Hadoop Streaming. Also facilitates operating on data in a streaming fashion, without Hadoop. / GPL-3  | noarch    |
| r-hail            | 0.1.1   | Read data from the City of Portland's 'HYDRA' < <a href="http://or.water.usgs.gov/precip/">http://or.water.usgs.gov/precip/</a> > rainfall datasets within R. / MIT  | noarch    |
| r-halfcircle      | 0.1.0   | There are growing concerns on flow data in diverse fields including trade, migration, knowledge diffusion, disease spread, and transportation. The package is an effective visual support to learn the pattern of flow which is called halfcircle diagram. The flow between two nodes placed on the center line of a circle is represented using a half circle drawn from the origin to the destination in a clockwise direction. Through changing the order of nodes, the halfcircle diagram enables users to examine the complex relationship between bidirectional flow and each potential determinants. Furthermore, the halfmeancenter function, which calculates (un) weighted mean center of half circles, makes the comparison easier. / MIT | noarch    |

| Name                 | Version | Summary/License  | Platforms |
|----------------------|---------|--|-----------|
| r-hamlet             | 0.9.6   | Various functions and algorithms are provided here for solving optimal matching tasks in the context of preclinical cancer studies. Further, various helper and plotting functions are provided for unsupervised and supervised machine learning as well as longitudinal mixed-effects modeling of tumor growth response patterns. / GPL-2   | noarch    |
| r-handtill2001       | 0.2_1   | An S4 implementation of Eq. (3) and Eq. (7) by David J. Hand and Robert J. Till (2001) <DOI:10.1023/A:1010920819831>. / GPL-2  | noarch    |
| r-handypLOTS         | 1.1.3   | Several handy plots for quickly looking at the relationship between two numeric vectors of equal length. Quickly visualize scatter plots, residual plots, qq-plots, box plots, confidence intervals, and prediction intervals. / GPL-2   | noarch    |
| r-hapim              | 1.3     | The package provides a set of functions whose aim is to propose 4 methods of QTL detection. HAPimLD is an interval-mapping method designed for unrelated individuals with no family information that makes use of linkage disequilibrium. HAPimLDL is an interval-mapping method for design of half-sib families. It combines linkage analysis and linkage disequilibrium. HaploMax is based on an analysis of variance with a dose haplotype effect. HaploMaxHS is based on an analysis of variance with a sire effect and a dose haplotype effect in half-sib family design. Fundings for the package development were provided to the LDLmapQTL project by the ANR GENANIMAL program and APIS-GENE. / GPL-3 | noarch    |
| r-haploReconstruct   | 0.1.2   | Reconstruction of founder haplotype blocks from time series data. / GPL-3  | noarch    |
| r-haploSim           | 1.8.4   | Simulate haplotypes through meioses. Allows specification of population parameters. / GPL-2  | noarch    |
| r-haplotyper         | 0.1     | Function to identify haplotypes within QTL (Quantitative Trait Loci). One haplotype is a combination of SNP (Single Nucleotide Polymorphisms) within the QTL. This function groups together all individuals of a population with the same haplotype. Each group contains individual with the same allele in each SNP, whether or not missing data. Thus, haplotyper groups individuals, that to be imputed, have a non-zero probability of having the same alleles in the entire sequence of SNP's. Moreover, haplotyper calculates such probability from relative frequencies. / GPL-3  | noarch    |
| r-happytime          | 0.1.0   | There are two interesting games in this package, one is 2048 games(for windows), using up and down to control the direction until there is a 2048 figure. And the other is 'what to eat today',preparing for people who choose difficulties, including most of the delicious Cantonese cuisine. / GPL-2  | noarch    |
| r-harmonicRegression | 1.0     | Fits the first harmonics in a Fourier expansion to one or more time series. Trend elimination can be performed. Computed values include estimates of amplitudes and phases, as well as confidence intervals and p-values for the null hypothesis of Gaussian noise. / MIT  | noarch    |
| r-hartools           | 0.0.5   | The goal of 'HARtools' is to provide a simple set of functions to read/parse, write and visualise HTTP Archive ('HAR') files in R. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name                           | Version | Summary/License   | Platforms  |
|--------------------------------|---------|---|--|
| <a href="#">r-harvest.tree</a> | 1.1     | Aimed at applying the Harvest classification tree algorithm, modified algorithm of classic classification tree. The harvested tree has advantage of deleting redundant rules in trees, leading to a simplify and more efficient tree model. It was firstly used in drug discovery field, but it also performs well in other kinds of data, especially when the region of a class is disconnected. This package also improves the basic harvest classification tree algorithm by extending the field of data of algorithm to both continuous and categorical variables. To learn more about the harvest classification tree algorithm, you can go to <a href="http://www.stat.ubc.ca/Research/TechReports/techreports/220.pdf">http://www.stat.ubc.ca/Research/TechReports/techreports/220.pdf</a> for more information. / GPL-2 | noarch   |
| <a href="#">r-hash</a>         | 2.2.6   | Implements a data structure similar to hashes in Perl and dictionaries in Python but with a purposefully R flavor. For objects of appreciable size, access using hashes outperforms native named lists and vectors. / GPL-2   | noarch   |
| <a href="#">r-hashids</a>      | 0.9.0   | An R port of the hashids library. hashids generates YouTube-like hashes from integers or vector of integers. Hashes generated from integers are relatively short, unique and non-sequential. hashids can be used to generate unique ids for URLs and hide database row numbers from the user. By default hashids will avoid generating common English cursewords by preventing certain letters being next to each other. hashids are not one-way: it is easy to encode an integer to a hashid and decode a hashid back into an integer. / MIT   | noarch   |
| <a href="#">r-haven</a>        | 2.1.0   | Import foreign statistical formats into R via the embedded 'ReadStat' C library, < <a href="https://github.com/WizardMac/ReadStat">https://github.com/WizardMac/ReadStat</a> >. / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-hazer</a>        | 1.1.1   | Provides a set of functions to estimate haziness of an image based on RGB bands. It returns a haze factor, varying from 0 to 1, a metric for fogginess and cloudiness. The package also presents additional functions to estimate brightness, darkness and contrast rasters of the RGB image. This package can be used for several applications such as inference of weather quality data and performing environmental studies from interpreting digital images. / AGPL-3   | noarch   |
| <a href="#">r-hazus</a>        | 0.1     | Damage Functions (DFs), also known as Vulnerability Functions, associate the physical damage to a building or a structure (and also its contents and inventory) from natural disasters to financial damage. The Federal Emergency Management Agency (FEMA) in USA developed several thousand DFs and these serve as a benchmark in natural catastrophe modeling, both in academia and industry. However, these DFs and their documentation are buried within the HAZUS software are not easily accessible for analysis and visualization. This package provides more than 1300 raw DFs used by FEMA's HAZUS software and also functionality to extract and visualize DFs specific to the flood hazard. The vignette included with this package demonstrates its use. / GPL-2  | noarch   |
| <a href="#">r-hbim</a>         | 1.0.3   | Calculate expected relative risk and proportion protected assuming normally distributed log10 transformed antibody dose for several component vaccine. Uses Hill models for each component which are combined under Bliss independence. / GPL-2   | noarch   |

| Name                          | Version | Summary/License  | Platforms |
|-------------------------------|---------|--|-----------|
| <a href="#">r-hbm</a>         | 1.0     | A package for building hierarchical block matrices from association matrices and for performing multi-scale analysis. It specifically targets chromatin contact maps, generated from high-throughput chromosome conformation capture data, such as 5C and Hi-C, and provides methods for detecting movements and for computing chain hierarchy and region communicability across scales. / GPL-2   | noarch    |
| <a href="#">r-hbsae</a>       | 1.0     | Functions to compute small area estimates based on a basic area or unit-level model. The model is fit using restricted maximum likelihood, or in a hierarchical Bayesian way. In the latter case numerical integration is used to average over the posterior density for the between-area variance. The output includes the model fit, small area estimates and corresponding MSEs, as well as some model selection measures. Additional functions provide means to compute aggregate estimates and MSEs, to minimally adjust the small area estimates to benchmarks at a higher aggregation level, and to graphically compare different sets of small area estimates. / GPL-3 | noarch    |
| <a href="#">r-hbstm</a>       | 1.0.1   | This package fits Hierarchical Bayesian space-Time models for Gaussian data. Furthermore, its functions have been implemented for analysing the fitting qualities of those models. / GPL (>= 2.0)  | noarch    |
| <a href="#">r-hcandersenr</a> | 0.2.0   | Texts for H.C. Andersens fairy tales, ready for text analysis. Fairy tales in German, Danish, English, Spanish and French. / MIT   | noarch    |
| <a href="#">r-hcc</a>         | 0.54    | A new diagnostic check for model adequacy in regression and generalized linear models is implemented. / GPL-2  | noarch    |
| <a href="#">r-hccci</a>       | 1.0.0   | This package calculates the interval estimates for the parameters of linear models heteroscedastic regression using bootstrap - (Wild Bootstrap) and double bootstrap-t (Wild Bootstrap). It is also possible to calculate confidence intervals using the percentile bootstrap and percentile bootstrap double. It is possible to calculate consistent estimates of the covariance matrix of the parameters of linear regression models with heteroskedasticity of unknown form. The package also provides function to calculate consistently the covariance matrix of the parameters of linear models with heteroskedasticity of unknown form. / GPL-2                        | noarch    |
| <a href="#">r-hchinamap</a>   | 0.1.0   | By binding R functions and the ‘Highmaps’ < <a href="https://www.highcharts.com.cn/products/highmaps">https://www.highcharts.com.cn/products/highmaps</a> > chart library, ‘hchinamap’ package provides a simple way to map China and its provinces. The map of China drawn by this package contains complete Chinese territory, especially the Nine-dotted line, South Tibet, Hong Kong, Macao and Taiwan. / MIT  | noarch    |
| <a href="#">r-hcp</a>         | 0.1     | Estimation of parameters in 3-segment (i.e. 2 change-point) regression models with heteroscedastic variances is provided based on both likelihood and hybrid Bayesian approaches, with and without continuity constraints at the change points. / GPL-2   GPL-3  | noarch    |
| <a href="#">r-hcr</a>         | 0.1.1   | This code provides a method to fit the hidden compact representation model as well as to identify the causal direction on discrete data. We implement an effective solution to recover the above hidden compact representation under the likelihood framework. Please see the Causal Discovery from Discrete Data using Hidden Compact Representation from NIPS 2018 by Ruichu Cai, Jie Qiao, Kun Zhang, Zhenjie Zhang and Zhifeng Hao (2018) < <a href="https://nips.cc/Conferences/2018/Schedule?showEvent=11274">https://nips.cc/Conferences/2018/Schedule?showEvent=11274</a> > for a description of some of our methods. / GPL-2  | noarch    |
| <a href="#">r-hda</a>         | 0.2.1   | Functions to perform dimensionality reduction for classification if the covariance matrices of the classes are unequal. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms |
|------------------------------|---------|---|-----------|
| <a href="#">r-hdci</a>       | 1.0.2   | Fits regression models on high dimensional data to estimate coefficients and use bootstrap method to obtain confidence intervals. Choices for regression models are Lasso, LassoOLS, Lasso partial ridge, LassoOLS partial ridge. / GNU General Public License version 2  | noarch    |
| <a href="#">r-hdfqlr</a>     | 0.6.1   | Provides an interface to 'HDFql' < <a href="http://www.hdfql.com/">http://www.hdfql.com/</a> > and helper functions for reading data from and writing data to 'HDF5' files. 'HDFql' provides a high-level language for managing 'HDF5' data that is platform independent. For more information, see the reference manual < <a href="http://www.hdfql.com/resources/HDFqlReferenceManual.pdf">http://www.hdfql.com/resources/HDFqlReferenceManual.pdf</a> >. / GPL-3   | noarch    |
| <a href="#">r-hdinterval</a> | 0.2.0   | A generic function and a set of methods to calculate highest density intervals for a variety of classes of objects which can specify a probability density distribution, including MCMC output, fitted density objects, and functions. / GPL-3  | noarch    |
| <a href="#">r-hdmd</a>       | 1.2     | High Dimensional Molecular Data (HDMD) typically have many more variables or dimensions than observations or replicates ( $D \gg N$ ). This can cause many statistical procedures to fail, become intractable, or produce misleading results. This package provides several tools to reduce dimensionality and analyze biological data for meaningful interpretation of results. Factor Analysis (FA), Principal Components Analysis (PCA) and Discriminant Analysis (DA) are frequently used multivariate techniques. However, PCA methods <code>prcomp</code> and <code>princomp</code> do not reflect the proportion of total variation of each principal component. <code>Loadings.variation</code> displays the relative and cumulative contribution of variation for each component by accounting for all variability in data. When $D \gg N$ , the maximum likelihood method cannot be applied in FA and the the principal axes method must be used instead, as in <code>factor.pa</code> of the <code>psych</code> package. The <code>factor.pa.ginv</code> function in this package further allows for a singular covariance matrix by applying a general inverse method to estimate factor scores. Moreover, <code>factor.pa.ginv</code> removes and warns of any variables that are constant, which would otherwise create an invalid covariance matrix. <code>Promax.only</code> further allows users to define rotation parameters during factor estimation. Similar to the Euclidean distance, the Mahalanobis distance estimates the relationship among groups. <code>pairwise.mahalanobis</code> computes all such pairwise Mahalanobis distances among groups and is useful for quantifying the separation of groups in DA. Genetic sequences are composed of discrete alphabetic characters, which makes estimates of variability difficult. <code>MolecularEntropy</code> and <code>MolecularMI</code> calculate the entropy and mutual information to estimate variability and covariability, respectively, of DNA or Amino Acid sequences. Functional grouping of amino acids (Atchley et al 1999) is also available for entropy and mutual information estimation. Mutual information values can be normalized by NMI to account for the background distribution arising from the stochastic pairing of independent, random sites. Alternatively, discrete alphabetic sequences can be transformed into biologically informative metrics to be used in various multivariate procedures. <code>FactorTransform</code> converts amino acid sequences using the amino acid indices determined by Atchley et al 2005. / GPL-2 | noarch    |
| <a href="#">r-hdpca</a>      | 1.0.0   | In high-dimensional settings: Estimate the number of distant spikes based on the Generalized Spiked Population (GSP) model. Estimate the population eigenvalues, angles between the sample and population eigenvectors, correlations between the sample and population PC scores, and the asymptotic shrinkage factors. Adjust the shrinkage bias in the predicted PC scores. / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name                             | Version | Summary/License   | Platforms |
|----------------------------------|---------|---|-----------|
| <a href="#">r-heatex</a>         | 1.0     | The heatex package calculates heat storage in the body and the components of heat exchange (conductive, convective, radiative, and evaporative) between the body and the environment during physical activity based on the principles of partitional calorimetry. The program enables heat exchange calculations for a range of environmental conditions when wearing various clothing ensembles. / GPL-3   | noarch    |
| <a href="#">r-heatmap.plus</a>   | 1.3     | Allows heatmap matrix to have non-identical X- and Y-dimensions. Allows multiple tracks of annotation for RowSideColors and ColSideColors. / GPL-3  | noarch    |
| <a href="#">r-heatmapfit</a>     | 2.0.4   | Generates a fit plot for diagnosing misspecification in models of binary dependent variables, and calculates the related heatmap fit statistic described in Esarey and Pierce (2012) <DOI:10.1093/pan/mps026>. / GPL-2  | noarch    |
| <a href="#">r-hedgehog</a>       | 0.1     | Hedgehog will eat all your bugs. ‘Hedgehog’ is a property-based testing package in the spirit of ‘QuickCheck’. With ‘Hedgehog’, one can test properties of their programs against randomly generated input, providing far superior test coverage compared to unit testing. One of the key benefits of ‘Hedgehog’ is integrated shrinking of counterexamples, which allows one to quickly find the cause of bugs, given salient examples when incorrect behaviour occurs. / MIT  | noarch    |
| <a href="#">r-hellno</a>         | 0.0.1   | Base R’s default setting for ‘stringsAsFactors’ within ‘data.frame()’ and ‘as.data.frame()’ is supposedly the most often complained about piece of code in the R infrastructure. The ‘hellno’ package provides an explicit solution without changing R itself or having to mess around with options. It tries to solve this problem by providing alternative ‘data.frame()’ and ‘as.data.frame()’ functions that are in fact simple wrappers around base R’s ‘data.frame()’ and ‘as.data.frame()’ with ‘stringsAsFactors’ option set to ‘HELLNO’ ( which in turn equals FALSE ) by default. / MIT   | noarch    |
| <a href="#">r-hellojavaworld</a> | 0.0_9   | A dummy package to demonstrate how to interface to a jar file that resides inside an R package. / GPL-3   | noarch    |
| <a href="#">r-helminthr</a>      | 1.0.7   | Access to large host-parasite data is often hampered by the availability of data and difficulty in obtaining it in a programmatic way to encourage analyses. ‘helminthR’ provides a programmatic interface to the London Natural History Museum’s host-parasite database, one of the largest host-parasite databases existing currently < <a href="http://www.nhm.ac.uk/research-curation/scientific-resources/taxonomy-systematics/host-parasites/">http://www.nhm.ac.uk/research-curation/scientific-resources/taxonomy-systematics/host-parasites/</a> >. The package allows the user to query by host species, parasite species, and geographic location. / GPL-3 | noarch    |
| <a href="#">r-helpersmg</a>      | 3.7     | Contains many functions useful for managing ‘NetCDF’ files (see < <a href="http://en.wikipedia.org/wiki/NetCDF">http://en.wikipedia.org/wiki/NetCDF</a> >), get tide levels on any point of the globe, get moon phase and time for sun rise and fall, analyse and reconstruct periodic time series of temperature with irregular sinusoidal pattern, show scales and wind rose in plot with change of color of text, Metropolis-Hastings algorithm for Bayesian MCMC analysis, plot graphs or boxplot with error bars, search files in disk by there names or their content, read the contents of all files from a folder at one time. / GPL-2                        | noarch    |
| <a href="#">r-helsinki</a>       | 0.9.29  | Tools for accessing various open data sources in the Helsinki region in Finland. Current data sources include the Real Estate Department (< <a href="http://ptp.hel.fi/avoindata/">http://ptp.hel.fi/avoindata/</a> >), Service Map API (< <a href="http://api.hel.fi/servicemap/v1/">http://api.hel.fi/servicemap/v1/</a> >), Linked Events API (< <a href="http://api.hel.fi/linkedevents/v0.1/">http://api.hel.fi/linkedevents/v0.1/</a> >), Helsinki Region Infoshare statistics API (< <a href="https://dev.hel.fi/stats/">https://dev.hel.fi/stats/</a> >). / BSD_2_clause  | noarch    |

Table 51 – continued from previous page

| Name                           | Version | Summary/License   | Platforms  |
|--------------------------------|---------|---|--|
| <a href="#">r-here</a>         | 0.1     | Constructs paths to your project's files. The 'here()' function uses a reasonable heuristics to find your project's files, based on the current working directory at the time when the package is loaded. Use it as a drop-in replacement for 'file.path()', it will always locate the files relative to your project root. / GPL-3   | noarch   |
| <a href="#">r-heritability</a> | 1.2     | Implements marker-based estimation of heritability when observations on genetically identical replicates are available. These can be either observations on individual plants or plot-level data in a field trial. Heritability can then be estimated using a mixed model for the individual plant or plot data. For comparison, also mixed-model based estimation using genotypic means and estimation of repeatability with ANOVA are implemented. For illustration the package contains several datasets for the model species <i>Arabidopsis thaliana</i> . / GPL-3 | noarch   |
| <a href="#">r-hermite</a>      | 1.1.2   | Probability functions and other utilities for the generalized Hermite distribution. / GPL-2   | noarch   |
| <a href="#">r-hero</a>         | 0.0.3   | Data and data-generating functions related to the paper Fast Bivariate Penalized Splines by Xiao et al. (2012) <doi:10.1111/rssb.12007>. A hero is a specific type of sandwich. Dictionary.com (2018) <https://www.dictionary.com> describes a hero as: a large sandwich, usually consisting of a small loaf of bread or long roll cut in half lengthwise and containing a variety of ingredients, as meat, cheese, lettuce, and tomatoes. / GPL-2  | noarch   |
| <a href="#">r-het.test</a>     | 0.1     | An implementation of White's Test for Heteroskedasticity as outlined in Doornik (1996). / GPL-2   | noarch   |
| <a href="#">r-hett</a>         | 0.3_2   | Functions for the fitting and summarizing of heteroscedastic t-regression. / GPL-2  | noarch   |
| <a href="#">r-hexbin</a>       | 1.27    | Binning and plotting functions for hexagonal bins. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-hexview</a>      | 0.3_4   | Functions to view files in raw binary form like in a hex editor. Additional functions to specify and read arbitrary binary formats. / GPL-2   | noarch   |
| <a href="#">r-hflights</a>     | 0.1     | A data only package containing commercial domestic flights that departed Houston (IAH and HOU) in 2011. / CC0   | noarch   |
| <a href="#">r-hglm.data</a>    | 1.0_1   | This data-only package was created for distributing data used in the examples of the 'hglm' package. / GPL-2  | noarch   |
| <a href="#">r-hgnchelper</a>   | 0.7.1   | Contains functions for identifying and correcting HGNC human gene symbols and MGI mouse gene symbols which have been converted to date format by Excel, withdrawn, or aliased. Also contains functions for reversibly converting between HGNC symbols and valid R names. / GPL (>= 2.0)   | noarch   |
| <a href="#">r-hgsl</a>         | 1.0.0   | Estimation of high-dimensional multi-response regression with heterogeneous noises under Heterogeneous group square-root Lasso penalty. For details see: Ren, Z., Kang, Y., Fan, Y. and Lv, J. (2018)<arXiv:1606.03803>. / GPL-2  | noarch   |

Table 51 – continued from previous page

| Name                            | Version | Summary/License  | Platforms   |
|---------------------------------|---------|--|---|
| <a href="#">r-hiddenf</a>       | 2.0     | Computes the ACMIF test and Bonferroni-adjusted p-value of interaction in two-factor studies. Produces corresponding interaction plot and analysis of variance tables and p-values from several other tests of non-additivity. / GPL-2   | noarch  |
| <a href="#">r-hierdiversity</a> | 0.1     | Hierarchical group-wise partitioning of phenotypic diversity into within-group (alpha), among-group (beta), and pooled-total (gamma) components using Hill numbers. Turnover and overlap are also calculated as standardized alternatives to beta diversity. Hierarchical bootstrapping is used to approximate uncertainty around each diversity component. / GPL-2  | noarch  |
| <a href="#">r-hiertest</a>      | 1.1     | Implementation of the convex hierarchical testing (CHT) procedure introduced in Bien, Simon, and Tibshirani (2015) Convex Hierarchical Testing of Interactions. Annals of Applied Statistics. Vol. 9, No. 1, 27-42. / GPL-3  | noarch  |
| <a href="#">r-hiest</a>         | 2.0     | Uses likelihood to estimate ancestry and heterozygosity. Evaluates simple hybrid classifications (parentals, F1, F2, backcrosses). Estimates genomic clines. / GPL-3   | noarch  |
| <a href="#">r-highcharter</a>   | 0.7.0   | A wrapper for the ‘Highcharts’ library including shortcut functions to plot R objects. ‘Highcharts’ < <a href="http://www.highcharts.com/">http://www.highcharts.com/</a> > is a charting library offering numerous chart types with a simple configuration syntax. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-highlighthtml</a> | 0.2.1   | A tool to format R markdown with CSS ids for HTML output. The tool may be most helpful for those using markdown to create reproducible documents. The biggest limitations in formatting is the knowledge of CSS by the document authors. / MIT   | noarch  |
| <a href="#">r-highmean</a>      | 3.0     | Provides various tests for comparing high-dimensional mean vectors in two sample populations. / GPL-2  | noarch  |
| <a href="#">r-highr</a>         | 0.8     | Provides syntax highlighting for R source code. Currently it supports LaTeX and HTML output. Source code of other languages is supported via Andre Simon’s highlight package (< <a href="http://www.andre-simon.de">http://www.andre-simon.de</a> >). / GPL  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-highscreen</a>    | 0.3     | Can be used to carry out extraction, normalization, quality control (QC), candidate hits identification and visualization for plate based assays, in drug discovery. This project was funded by the Division of Allergy, Immunology, and Transplantation, National Institute of Allergy and Infectious Diseases, National Institutes of Health, Department of Health and Human Services, under contract No. HHSN272201400054C entitled Adjuvant Discovery For Vaccines Against West Nile Virus and Influenza, awarded to Duke University and lead by Drs. Herman Staats and Soman Abraham. / GPL-3 | noarch  |

Continued on next page

Table 51 – continued from previous page

| Name                            | Version | Summary/License   | Platforms |
|---------------------------------|---------|---|-----------|
| <code>r-hightttest</code>       | 1.1     | Implements the method developed by Cao and Kosorok (2011) for the significance analysis of thousands of features in high-dimensional biological studies. It is an asymptotically valid data-driven procedure to find critical values for rejection regions controlling the k-familywise error rate, false discovery rate, and the tail probability of false discovery proportion. / GPL-2   | noarch    |
| <code>r-higrad</code>           | 0.1.0   | Implements the Hierarchical Incremental GRAdient Descent (HiGrad) algorithm, a first-order algorithm for finding the minimizer of a function in online learning just like stochastic gradient descent (SGD). In addition, this method attaches a confidence interval to assess the uncertainty of its predictions. See Su and Zhu (2018) <arXiv:1802.04876> for details. / GPL-3  | noarch    |
| <code>r-hilmm</code>            | 1.1     | Estimation of heritability with confidence intervals in linear mixed models. / GPL-2  | noarch    |
| <code>r-hindexcalculator</code> | 1.0.0   | H(x) is the h-index for the past x years. Here, the h(x) of a scientist/department/etc. can be calculated using the exported excel file from a Web of Science citation report of a search. Also calculated is the year of first publication, total number of publications, and sum of times cited for the specified period. Therefore, for h-10: the date of first publication, total number of publications, and sum of times cited in the past 10 years are calculated. Note: the excel file has to first be saved in a .csv format. / AGPL-3 | noarch    |
| <code>r-histdata</code>         | 0.8_4   | The ‘HistData’ package provides a collection of small data sets that are interesting and important in the history of statistics and data visualization. The goal of the package is to make these available, both for instructional use and for historical research. Some of these present interesting challenges for graphics or analysis in R. / GPL-3   | noarch    |
| <code>r-histogram</code>        | 0.0_25  | Automatic construction of regular and irregular histograms as described in Rozenholc/Mildenberger/Gather (2010). / GPL-2  | noarch    |
| <code>r-historydata</code>      | 0.1     | These sample data sets are intended for historians learning R. They include population, institutional, religious, military, and prosopographical data suitable for mapping, quantitative analysis, and network analysis. / MIT  | noarch    |
| <code>r-hiv.lifetables</code>   | 0.1     | The functions in this package produce a complete set of mortality rates as a function of a combination of HIV prevalence and either life expectancy at birth (e0), child mortality (5q0), or child mortality with adult mortality (45q15) / Unlimited   | noarch    |
| <code>r-hive</code>             | 0.2_0   | Hadoop InteractiVE facilitates distributed computing via the MapReduce paradigm through R and Hadoop. An easy to use interface to Hadoop, the Hadoop Distributed File System (HDFS), and Hadoop Streaming is provided. / GPL-3  | noarch    |
| <code>r-hk80</code>             | 0.0.2   | This is a collection of functions for converting coordinates between WGS84UTM, WGS84GEO, HK80UTM, HK80GEO and HK1980GRID Coordinate Systems used in Hong Kong SAR, based on the algorithms described in Explanatory Notes on Geodetic Datums in Hong Kong by Survey and Mapping Office Lands Department, Hong Kong Government (1995). / GPL-2   | noarch    |
| <code>r-hkclustering</code>     | 1.0.1   | Implements an ensemble algorithm for clustering combining a k-means and a hierarchical clustering approach. / GPL-2   | noarch    |
| <code>r-hkex.api</code>         | 0.1     | A set of functions helps to retrieve data from HKEX (Hong Kong Stock Exchange), see < <a href="https://www.hkex.com.hk/">https://www.hkex.com.hk/</a> > for more information. In addition, a function generates insert SQL statements from a dataframe. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms  |
|------------------------------|---------|---|--|
| <a href="#">r-hmdhfdplus</a> | 1.9.1   | Utilities for reading data from the Human Mortality Database ( <a href="https://www.mortality.org">https://www.mortality.org</a> ), Human Fertility Database ( <a href="https://www.humanfertility.org">https://www.humanfertility.org</a> ), and similar databases from the web or locally into an R session as data.frame objects. These are the two most widely used sources of demographic data to study basic demographic change, trends, and develop new demographic methods. Other supported databases at this time include the Human Fertility Collection ( <a href="http://www.fertilitydata.org">http://www.fertilitydata.org</a> ), The Japanese Mortality Database ( <a href="http://www.ipss.go.jp/p-toukei/JMD">http://www.ipss.go.jp/p-toukei/JMD</a> ), and the Canadian Human Mortality Database ( <a href="http://www.bdlc.umontreal.ca/chmd/">http://www.bdlc.umontreal.ca/chmd/</a> ). Arguments and data are standardized. / GPL-2 | noarch   |
| <a href="#">r-hmeasure</a>   | 1.0.2   | Classification performance metrics that are derived from the ROC curve of a classifier. The package includes the H-measure performance metric as described in <a href="http://link.springer.com/article/10.1007/s10994-009-5119-5">http://link.springer.com/article/10.1007/s10994-009-5119-5</a> , which computes the minimum total misclassification cost, integrating over any uncertainty about the relative misclassification costs, as per a user-defined prior. It also offers a one-stop-shop for other scalar metrics of performance, including sensitivity, specificity and many others, and also offers plotting tools for ROC curves and related statistics. / MIT  | noarch   |
| <a href="#">r-hmisc</a>      | 4.2.0   | Contains many functions useful for data analysis, high-level graphics, utility operations, functions for computing sample size and power, importing and annotating datasets, imputing missing values, advanced table making, variable clustering, character string manipulation, conversion of R objects to LaTeX and html code, and recoding variables. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-hmm</a>        | 1.0     | Easy to use library to setup, apply and make inference with discrete time and discrete space Hidden Markov Models / GPL-2   | noarch   |
| <a href="#">r-hmmcont</a>    | 1.0     | The package includes the functions designed to analyse continuous observations processes with the Hidden Markov Model approach. They include Baum-Welch and Viterbi algorithms and additional visualisation functions. The observations are assumed to have Gaussian distribution and to be weakly stationary processes. The package was created for analyses of financial time series, but can also be applied to any continuous observations processes. / GPL-3   | noarch   |
| <a href="#">r-hmmpa</a>      | 1.0.1   | Analysing time-series accelerometer data to quantify length and intensity of physical activity using hidden Markov models. It also contains the traditional cut-off point method. Witowski V, Foraita R, Pitsiladis Y, Pigeot I, Wirsik N (2014)<doi:10.1371/journal.pone.0114089>. / GPL-3   | noarch   |
| <a href="#">r-hmr</a>        | 0.4.2   | Statistical analysis of static chamber concentration data for trace gas flux estimation. / GPL-2  | noarch   |

Continued on next page

Table 51 – continued from previous page

| Name       | Version | Summary/License  | Platforms   |
|------------|---------|--|---|
| r-hms      | 0.4.2   | Implements an S3 class for storing and formatting time-of-day values, based on the 'difftime' class. / GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-hmstimer | 0.0.2   | Tracks elapsed clock time using a 'hms()' scalar (inherits from 'difftime()') with seconds as the unit). / MIT   | noarch  |
| r-hmvd     | 1.0     | Perform association test between a group of variable and the outcome. / GPL-3  | noarch  |
| r-hnp      | 1.2_6   | Generates (half-)normal plots with simulation envelopes using different diagnostics from a range of different fitted models. A few example datasets are included. / GPL-2  | noarch  |
| r-hoardr   | 0.5.2   | Suite of tools for managing cached files, targeting use in other R packages. Uses 'rappdirs' for cross-platform paths. Provides utilities to manage cache directories, including targeting files by path or by key; cached directories can be compressed and uncompressed easily to save disk space. / MIT   | noarch  |
| r-holdem   | 1.2     | Simulates hands and tournaments of Texas Holdem, the most popular form of poker. For examples of probability problems involving Texas Holdem and a brief explanation of the game see Schoenberg, F. (2011). An Introduction to Probability with Texas Hold'em Examples. Taylor and Francis, New York, ISBN-13: 978-1439827680. / GPL-2   | noarch  |
| r-homer    | 0.3.0   | A collection of functions useful for the analysis of building physics experiments. / GPL-2   | noarch  |
| r-homeric  | 0.1_3   | A simple implementation of doughnut plots - pie charts with a blank center. The package is named after Homer Simpson - arguably the best-known lover of doughnuts. / GPL-2   | noarch  |
| r-homtest  | 1.0_5   | A collection of homogeneity tests described in: Viglione A., Laio F., Claps P. (2007) "A comparison of homogeneity tests for regional frequency analysis", Water Resources Research, 43, W03428, doi:10.1029/2006WR005095. More on Regional Frequency Analysis can be found in package nsRFA. / GPL-2  | noarch  |
| r-horizon  | 1.2     | Calculates horizon elevation angle and sky view factor from a digital terrain model (Dozier and Frew, 1990). / GPL-2   | noarch  |
| r-hornpa   | 1.0     | A stand-alone function that generates a user specified number of random datasets and computes eigenvalues using the random datasets (i.e., implements Horn's parallel analysis). Users then compare the resulting eigenvalues (the mean or the specified percentile) from the random datasets (i.e., eigenvalues resulting from noise) to the eigenvalues generated with the user's data. Can be used for both principal components analysis (PCA) and common/exploratory factor analysis (EFA). The output table shows how large eigenvalues can be as a result of merely using randomly generated datasets. If the user's own dataset has actual eigenvalues greater than the corresponding eigenvalues, that lends support to retain that factor/component. In other words, if the i(th) eigenvalue from the actual data was larger than the percentile of the (i)th eigenvalue generated using randomly generated data, empirical support is provided to retain that factor/component. Horn, J. (1965). A rationale and test for the number of factors in factor analysis. Psychometrika, 32, 179-185. / GPL-3 | noarch  |

Table 51 – continued from previous page

| Name            | Version | Summary/License   | Platforms |
|-----------------|---------|---|-----------|
| r-horseshoe     | 0.2.0   | Contains functions for applying the horseshoe prior to high- dimensional linear regression, yielding the posterior mean and credible intervals, amongst other things. The key parameter tau can be equipped with a prior or estimated via maximum marginal likelihood estimation (MMLE). The main function, horseshoe, is for linear regression. In addition, there are functions specifically for the sparse normal means problem, allowing for faster computation of for example the posterior mean and posterior variance. Finally, there is a function available to perform variable selection, using either a form of thresholding, or credible intervals. / GPL-3 | noarch    |
| r-hotelling     | 1.0_5   | A set of R functions which implements Hotelling's $T^2$ test and some variants of it. Functions are also included for Aitchison's additive log ratio and centred log ratio transformations. / GPL-2   | noarch    |
| r-hotspot       | 1.0     | Contains data for software hotspot analysis, along with a function performing the analysis itself. / GPL-2  | noarch    |
| r-housingdata   | 0.3.0   | Monthly median home listing, sale price per square foot, and number of units sold for 2984 counties in the contiguous United States From 2008 to January 2016. Additional data sets containing geographical information and links to Wikipedia are also included. / CC0   | noarch    |
| r-howmany       | 0.3_1   | When testing multiple hypotheses simultaneously, this package provides functionality to calculate a lower bound for the number of correct rejections (as a function of the number of rejected hypotheses), which holds simultaneously -with high probability- for all possible number of rejections. As a special case, a lower bound for the total number of false null hypotheses can be inferred. Dependent test statistics can be handled for multiple tests of associations. For independent test statistics, it is sufficient to provide a list of p-values. / GPL-3  | noarch    |
| r-hpackedbubble | 0.1.0   | By binding R functions and the 'Highcharts' < <a href="http://www.highcharts.com/">http://www.highcharts.com/</a> > charting library, 'hpackedbubble' package provides a simple way to draw split packed bubble charts. / MIT   | noarch    |
| r-hpbayes       | 0.1     | This package provides all the functions necessary to estimate the 8 parameters of the Heligman Pollard mortality model using a Bayesian Melding procedure with IMIS as well as to convert those parameters into age-specific probabilities of death and a corresponding life table / Unlimited  | noarch    |
| r-hqmisc        | 0.1_1   | This package contains some miscellaneous convenience functions, to create a matrix of dummy columns from a factor, to determine whether x lies in range [a,b], to add a rectangular bracket to an existing plot, and to convert frequencies between Hz, semitones, mel and Bark. This package also contains an example data set of a stratified sample of 80 talkers of Dutch. / GPL-2  | noarch    |
| r-hripw         | 0.1.2   | Estimates the log hazard ratio associated with a binary exposure using a Cox PH model weighted by the propensity score. Propensity model is estimated using a simple logistic regression. Variance estimation takes into account the propensity score estimation step with the method proposed by Hajage et al. (2018) < <a href="https://doi.org/10.1002/bimj.201700330">doi:10.1002/bimj.201700330</a> >. Both the average treatment effect on the overall (ATE) or the treated (ATT) population can be estimated. For the ATE estimation, both unstabilized and stabilized weights can be used. / GPL-2  | noarch    |
| r-hrw           | 1.0_3   | The book Semiparametric Regression with R by J. Harezlak, D. Ruppert & M.P. Wand (2018, Springer; ISBN: 978-1-4939-8851-8) makes use of datasets and scripts to explain semiparametric regression concepts. Each of the book's scripts are contained in this package as well as datasets that are not within other R packages. Functions that aid semiparametric regression analysis are also included. / GPL-2   | noarch    |

| Name                      | Version | Summary/License   | Platforms |
|---------------------------|---------|---|-----------|
| <a href="#">r-hsaur</a>   | 1.3_9   | Functions, data sets, analyses and examples from the book “A Handbook of Statistical Analyses Using R” (Brian S. Everitt and Torsten Hothorn, Chapman & Hall/CRC, 2006). The first chapter of the book, which is entitled “An Introduction to R”, is completely included in this package, for all other chapters, a vignette containing all data analyses is available. / GPL-3   | noarch    |
| <a href="#">r-hsaur2</a>  | 1.1_1   | Functions, data sets, analyses and examples from the second edition of the book “A Handbook of Statistical Analyses Using R” (Brian S. Everitt and Torsten Hothorn, Chapman & Hall/CRC, 2008). The first chapter of the book, which is entitled “An Introduction to R”, is completely included in this package, for all other chapters, a vignette containing all data analyses is available. In addition, the package contains Sweave code for producing slides for selected chapters (see HSAUR2/inst/slides). / GPL-2  | noarch    |
| <a href="#">r-hsaur3</a>  | 1.0_9   | Functions, data sets, analyses and examples from the third edition of the book “A Handbook of Statistical Analyses Using R” (Torsten Hothorn and Brian S. Everitt, Chapman & Hall/CRC, 2014). The first chapter of the book, which is entitled “An Introduction to R”, is completely included in this package, for all other chapters, a vignette containing all data analyses is available. In addition, Sweave source code for slides of selected chapters is included in this package (see HSAUR3/inst/slides). The publishers web page is ‘< <a href="http://www.crcpress.com/product/isbn/9781482204582">http://www.crcpress.com/product/isbn/9781482204582</a> >’. / GPL-2  | noarch    |
| <a href="#">r-hsiccca</a> | 1.0     | Canonical correlation analysis that extracts nonlinear correlation through the use of Hilbert Schmidt Independence Criterion and Centered Kernel Target Alignment. / GPL-2  | noarch    |
| <a href="#">r-hssvd</a>   | 1.2     | A data mining tool for discovering subgroups of patients and genes that simultaneously display unusual levels of variability compared to other genes and patients. Based on sparse singular value decomposition (SSVD), the method can detect both mean and variance biclusters in the presence of heterogeneous residual variance. / GPL-2   | noarch    |
| <a href="#">r-htm2txt</a> | 2.1.1   | Convert a html document to simple plain texts by removing all html tags. This package utilizes regular expressions to strip off html tags. It also offers gettxt() and browse() function, which enables you to get or browse texts at a certain web page. / GPL-2   | noarch    |
| <a href="#">r-htmltab</a> | 0.7.1   | HTML tables are a valuable data source but extracting and recasting these data into a useful format can be tedious. This package allows to collect structured information from HTML tables. It is similar to readHTMLTable() of the XML package but provides three major advantages. First, the function automatically expands row and column spans in the header and body cells. Second, users are given more control over the identification of header and body rows which will end up in the R table, including semantic header information that appear throughout the body. Third, the function preprocesses table code, corrects common types of malformations, removes unneeded parts and so helps to alleviate the need for tedious post-processing. / MIT | noarch    |

Table 51 – continued from previous page

| Name                          | Version | Summary/License  | Platforms   |
|-------------------------------|---------|--|---|
| <a href="#">r-htmltable</a>   | 1.13.1  | Tables with state-of-the-art layout elements such as row spanners, column spanners, table spanners, zebra striping, and more. While allowing advanced layout, the underlying css-structure is simple in order to maximize compatibility with word processors such as ‘MS Word’ or ‘LibreOffice’. The package also contains a few text formatting functions that help outputting text compatible with HTML/LaTeX. / GPL (>= 3)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-htmltools</a>   | 0.3.6   | Tools for HTML generation and output. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-htmlwidgets</a> | 1.3     | A framework for creating HTML widgets that render in various contexts including the R console, ‘R Markdown’ documents, and ‘Shiny’ web applications. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-httpcache</a>   | 1.1.0   | In order to improve performance for HTTP API clients, ‘httpcache’ provides simple tools for caching and invalidating cache. It includes the HTTP verb functions GET, PUT, PATCH, POST, and DELETE, which are drop-in replacements for those in the ‘httr’ package. These functions are cache-aware and provide default settings for cache invalidation suitable for RESTful APIs; the package also enables custom cache-management strategies. Finally, ‘httpcache’ includes a basic logging framework to facilitate the measurement of HTTP request time and cache performance. / MIT | noarch  |
| <a href="#">r-httpcode</a>    | 0.2.0   | Find and explain the meaning of ‘HTTP’ status codes. Functions included for searching for codes by full or partial number, by message, and get appropriate dog and cat images for many status codes. / MIT   | noarch  |
| <a href="#">r-httprequest</a> | 0.0.10  | HTTP Request protocols. Implements the GET, POST and multipart POST request. / GPL-2   | noarch  |

Table 51 – continued from previous page

| Name                          | Version | Summary/License   | Platforms   |
|-------------------------------|---------|---|---|
| <a href="#">r-httptest</a>    | 3.2.2   | Testing and documenting code that communicates with remote servers can be painful. Dealing with authentication, server state, and other complications can make testing seem too costly to bother with. But it doesn't need to be that hard. This package enables one to test all of the logic on the R sides of the API in your package without requiring access to the remote service. Importantly, it provides three contexts that mock the network connection in different ways, as well as testing functions to assert that HTTP requests were—or were not—made. It also allows one to safely record real API responses to use as test fixtures. The ability to save responses and load them offline also enables one to write vignettes and other dynamic documents that can be distributed without access to a live server. / MIT | noarch  |
| <a href="#">r-httpuv</a>      | 1.5.1   | Provides low-level socket and protocol support for handling HTTP and Web-Socket requests directly from within R. It is primarily intended as a building block for other packages, rather than making it particularly easy to create complete web applications using httpuv alone. httpuv is built on top of the libuv and http-parser C libraries, both of which were developed by Joyent, Inc. (See LICENSE file for libuv and http-parser license information.) / GPL (>= 2)   file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-httr</a>        | 1.4.0   | Useful tools for working with HTTP organised by HTTP verbs (GET(), POST(), etc). Configuration functions make it easy to control additional request components (authenticate(), add_headers() and so on). / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-hues</a>        | 0.1     | Creating effective colour palettes for figures is challenging. This package generates and plot palettes of optimally distinct colours in perceptually uniform colour space, based on 'iwanthue' < <a href="http://tools.medialab.sciences-po.fr/iwanthue/">http://tools.medialab.sciences-po.fr/iwanthue/</a> >. This is done through k-means clustering of CIE Lab colour space, according to user-selected constraints on hue, chroma, and lightness. / LGPL-3  | noarch  |
| <a href="#">r-humanformat</a> | 1.0     | Format quantities of time or bytes into human-friendly strings. / MIT   | noarch  |
| <a href="#">r-humanize</a>    | 0.2.0   | An almost direct port of the 'python' 'humanize' package < <a href="https://github.com/jmoiron/humanize">https://github.com/jmoiron/humanize</a> >. This package contains utilities to convert values into human readable forms. / MIT  | noarch  |
| <a href="#">r-humidity</a>    | 0.1.4   | Vapor pressure, relative humidity, absolute humidity, specific humidity, and mixing ratio are commonly used water vapor measures in meteorology. This R package provides functions for calculating saturation vapor pressure (hPa), partial water vapor pressure (Pa), relative humidity (%), absolute humidity (kg/m^3), specific humidity (kg/kg), and mixing ratio (kg/kg) from temperature (K) and dew point (K). Conversion functions between humidity measures are also provided. / GPL-3   | noarch  |

| Name                           | Version | Summary/License  | Platforms  |
|--------------------------------|---------|--|--|
| <a href="#">r-hunspell</a>     | 3.0     | Low level spell checker and morphological analyzer based on the famous ‘hunspell’ library < <a href="https://hunspell.github.io">https://hunspell.github.io</a> >. The package can analyze or check individual words as well as parse text, latex, html or xml documents. For a more user-friendly interface use the ‘spelling’ package which builds on this package to automate checking of files, documentation and vignettes in all common formats. / GPL-2   LGPL-2.1   MPL-1.1  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-hurdlr</a>       | 0.1     | When considering count data, it is often the case that many more zero counts than would be expected of some given distribution are observed. It is well established that data such as this can be reliably modelled using zero-inflated or hurdle distributions, both of which may be applied using the functions in this package. Bayesian analysis methods are used to best model problematic count data that cannot be fit to any typical distribution. The package functions are flexible and versatile, and can be applied to varying count distributions, parameter estimation with or without explanatory variable information, and are able to allow for multiple hurdles as it is also not uncommon that count data have an abundance of large-number observations which would be considered outliers of the typical distribution. In lieu of throwing out data or misspecifying the typical distribution, these extreme observations can be applied to a second, extreme distribution. With the given functions of this package, such a two-hurdle model may be easily specified in order to best manage data that is both zero-inflated and over-dispersed. / GPL-2 | noarch   |
| <a href="#">r-hw.pval</a>      | 1.0     | HW.pval calculates plain and fully conditional root-mean-square, chi-square, and log likelihood-ratio P-values for the user-provided genotypic counts to be consistent with the Hardy-Weinberg equilibrium model. For further information on the Hardy-Weinberg equilibrium model and the pseudocode, refer to the paper Testing Hardy-Weinberg equilibrium with a simple root-mean-square statistic by Rachel Ward. / GPL-3   | noarch   |
| <a href="#">r-hwde</a>         | 0.67    | Fits models for genotypic disequilibria, as described in Huttley and Wilson (2000), Weir (1996) and Weir and Wilson (1986). Contrast terms are available that account for first order interactions between loci. Also implements, for a single locus in a single population, a conditional exact test for Hardy-Weinberg equilibrium. / GPL-2  | noarch   |
| <a href="#">r-hweintrinsic</a> | 1.2.2   | General (multi-allelic) Hardy-Weinberg equilibrium problem from an objective Bayesian testing standpoint. This aim is achieved through the identification of a class of priors specifically designed for this testing problem. A class of intrinsic priors under the full model is considered. This class is indexed by a tuning quantity, the training sample size, as discussed in Consonni, Moreno and Venturini (2010). These priors are objective, satisfy Savage’s continuity condition and have proved to behave extremely well for many statistical testing problems. / GPL-2  | noarch   |
| <a href="#">r-hwriter</a>      | 1.3.2   | Easy-to-use and versatile functions to output R objects in HTML format / LGPL-2.1  | noarch   |
| <a href="#">r-hybridhclust</a> | 1.0_5   | Hybrid hierarchical clustering via mutual clusters. A mutual cluster is a set of points closer to each other than to all other points. Mutual clusters are used to enrich top-down hierarchical clustering. / GPL-2  | noarch   |

Continued on next page

Table 51 – continued from previous page

| Name              | Version | Summary/License   | Platforms |
|-------------------|---------|---|-----------|
| r-hydra           | 0.1.0   | Calculate an optimal embedding of a set of data points into low-dimensional hyperbolic space. This uses the strain-minimizing hyperbolic embedding of Keller-Ressel and Nargang (2019), see <arXiv:1903.08977>. / GPL-2   | noarch    |
| r-hydrogeo        | 0.6.1   | Contains one function for drawing Piper diagrams (also called Piper-Hill diagrams) of water analyses for major ions. / BSD_2_clause   | noarch    |
| r-hydrostats      | 0.2.7   | Calculates a suite of hydrologic indices for daily time series data that are widely used in hydrology and stream ecology. / GPL-2   | noarch    |
| r-hyperbolicdist  | 0.6.2   | This package provides functions for the hyperbolic and related distributions. Density, distribution and quantile functions and random number generation are provided for the hyperbolic distribution, the generalized hyperbolic distribution, the generalized inverse Gaussian distribution and the skew-Laplace distribution. Additional functionality is provided for the hyperbolic distribution, including fitting of the hyperbolic to data. / GPL-2  | noarch    |
| r-hypercube       | 0.1.0   | Provides methods for organizing data in a hypercube (i.e. a multi-dimensional cube). Cubes are generated from molten data frames. Each cube can be manipulated with five operations: rotation (changeDimensionOrder()), dicing and slicing (add.selection(), remove.selection()), drilling down (add.aggregation()), and rolling up (remove.aggregation()). / GPL-3   | noarch    |
| r-hypergate       | 0.8.1   | Given a high-dimensional dataset that typically represents a cytometry dataset, and a subset of the datapoints, this algorithm outputs an hyperrectangle so that datapoints within the hyperrectangle best correspond to the specified subset. In essence, this allows the conversion of clustering algorithms' outputs to gating strategies outputs. / GPL-3   | noarch    |
| r-hypergeo        | 1.2.1   | The Gaussian hypergeometric function for complex numbers. / GPL-2   | noarch    |
| r-hypersampleplan | 0.1.1   | Implements an algorithm for efficient and exact calculation of hypergeometric and binomial probabilities using Chebyshev polynomials, while other algorithm use an approximation when N is large. A useful applications is also considered in this package for the construction of attribute sampling plans which is an important field of statistical quality control. The quantile, and the confidence limit for the attribute sampling plan are also implemented in this package. The hypergeometric distribution can be represented in terms of Chebyshev polynomials. This representation is particularly useful in the calculation of exact values of hypergeometric variables. / GPL-2   | noarch    |
| r-hyphy           | 1.0     | A Bay Area high level phylogenetic analysis package mostly using the birth-death process. Analysis of species tree branching times and simulation of species trees under a number of different time variable birth-death processes. Analysis of gene tree species tree reconciliations and simulations of gene trees in species trees. / GPL-2  | noarch    |
| r-hypothesetest   | 1.0     | Compute the confidence interval of the population mean with one sample or of the difference of population means of two samples from normal distributions or t-distributions. Compute the confidence interval of population variance with one sample or of the difference of population variances of two samples by chi-square tests. Test for population mean or the differences of two normal samples under normality with the given null hypothesis H0, which depends on the user, so that he can know if he can reject H0 or not at the significance level alpha. Do the chi-square tests with one or two samples which have multinomial distributions by using an approximate chi-square distribution when n is large enough. / GPL-2 | noarch    |

| Name                             | Version | Summary/License   | Platforms |
|----------------------------------|---------|---|-----------|
| <a href="#">r-iabin</a>          | 1.0     | In randomized-controlled trials, interim analyses are often planned for possible early trial termination to claim superiority or futility of a new therapy. Blinded data also have information about the potential treatment difference between the groups. We developed a blinded data monitoring tool that enables investigators to predict whether they observe such an unblinded interim analysis results that supports early termination of the trial. Investigators may skip some of the planned interim analyses if an early termination is unlikely. This tool will provide reference information about N: Sample size at interim analysis, and T: Total number of responders at interim analysis for decision on performing an interim analysis. / GPL-2   | noarch    |
| <a href="#">r-iadapt</a>         | 0.1.0   | Simulate and implement early phase two-stage adaptive dose-finding design developed by Chiuzan et al. (2018) <DOI:10.1080/19466315.2018.1462727>. / LGPL-3  | noarch    |
| <a href="#">r-ialsasynthesis</a> | 0.1.6   | Synthesizes information across collaborating research. Created specifically for Integrative Analysis of Longitudinal Studies of Aging (IALSA). / GPL-2  | noarch    |
| <a href="#">r-iasd</a>           | 1.1     | Calculate AIC's and AICc's of unimodal model (one normal distribution) and bimodal model(a mixture of two normal distributions) which fit the distribution of indices of asymmetry (IAS), and plot their density, to help determine IAS distribution is unimodal or bimodal. / GPL-2  | noarch    |
| <a href="#">r-iatanalytics</a>   | 0.1.1   | Quickly score raw data outputted from an Implicit Association Test (IAT; Greenwald, McGhee, & Schwartz, 1998) <doi:10.1037/0022-3514.74.6.1464>. IAT scores are calculated as specified by Greenwald, Nosek, and Banaji (2003) <doi:10.1037/0022-3514.85.2.197>. The output of this function is a data frame that consists of four rows containing the following information: (1) the overall IAT effect size for the participant's dataset, (2) the effect size calculated for odd trials only, (3) the effect size calculated for even trials only, and (4) the proportion of trials with reaction times under 300ms (which is important for exclusion purposes). Items (2) and (3) allow for a measure of the internal consistency of the IAT. Specifically, you can use the subsetted IAT effect sizes for odd and even trials to calculate Cronbach's alpha across participants in the sample. The input function consists of three arguments. First, indicate the name of the dataset to be analyzed. This is the only required input. Second, indicate the number of trials in your entire IAT (the default is set to 220, which is typical for most IATs). Last, indicate whether congruent trials (e.g., flowers and pleasant) or incongruent trials (e.g., guns and pleasant) were presented first for this participant (the default is set to congruent). Data files should consist of six columns organized in order as follows: Block (0-6), trial (0-19 for training blocks, 0-39 for test blocks), category (dependent on your IAT), the type of item within that category (dependent on your IAT), a dummy variable indicating whether the participant was correct or incorrect on that trial (0=correct, 1=incorrect), and the participant's reaction time (in milliseconds). A sample dataset (titled 'sampledata') is included in this package to practice with. / MIT | noarch    |

|------------------------------------|---------|---|-----------|
| <a href="#">r-iatscore</a>         | 0.1.1   | This minimalist package is designed to quickly score raw data outputted from an Implicit Association Test (IAT; Greenwald, McGhee, & Schwartz, 1998) <doi:10.1037/0022-3514.74.6.1464>. IAT scores are calculated as specified by Greenwald, Nosek, and Banaji (2003) <doi:10.1037/0022-3514.85.2.197>. Outputted values can be interpreted as effect sizes. The input function consists of three arguments. First, indicate the name of the dataset to be analyzed. This is the only required input. Second, indicate the number of trials in your entire IAT (the default is set to 219, which is typical for most IATs). Last, indicate whether congruent trials (e.g., flowers and pleasant) or incongruent trials (e.g., guns and pleasant) were presented first for this participant (the default is set to congruent). The script will tell you how long it took to run the code, the effect size for the participant, and whether that participant should be excluded based on the criteria outlined by Greenwald et al. (2003). Data files should consist of six columns organized in order as follows: Block (0-6), trial (0-19 for training blocks, 0-39 for test blocks), category (dependent on your IAT), the type of item within that category (dependent on your IAT), a dummy variable indicating whether the participant was correct or incorrect on that trial (0=correct, 1=incorrect), and the participant's reaction time (in milliseconds). Three sample datasets are included in this package (labeled 'IAT', 'TooFastIAT', and 'BriefIAT') to practice with. / MIT | noarch    |
| <a href="#">r-ibdhaplortools</a>   | 1.8     | Functions to analyze, plot, and store the output of running IBD_Haplo software package. More information regarding IBD_Haplo can be found at <a href="http://www.stat.washington.edu/thompson/Genepi/pangaea.shtml">http://www.stat.washington.edu/thompson/Genepi/pangaea.shtml</a> . / GPL-3  | noarch    |
| <a href="#">r-ibdlabels</a>        | 1.1     | Convert label, lexicographic, jacquard and vec, full state description vector. All conversions are done to and from label, as used in IBD_Haplo. More information regarding IBD_Haplo can be found at <a href="http://www.stat.washington.edu/thompson/Genepi/pangaea.shtml">http://www.stat.washington.edu/thompson/Genepi/pangaea.shtml</a> . / GPL-3   | noarch    |
| <a href="#">r-ibelief</a>          | 1.2     | Some basic functions to implement belief functions including: transformation between belief functions using the method introduced by Philippe Smets (arXiv:1304.1122 [cs.AI]), evidence combination, evidence discounting, decision-making, and constructing masses. Currently, thirteen combination rules and five decision rules are supported. It can also be used to generate different types of random masses when working on belief combination and conflict management. / GPL-2  | noarch    |
| <a href="#">r-ibmsunburst</a>      | 0.1.1   | Generates Personality Insights sunburst diagrams based on 'IBM Watson' Personality Insights service output. / MIT   | noarch    |
| <a href="#">r-ibrokers</a>         | 0.9.1   | Provides native R access to Interactive Brokers Trader Workstation API. / GPL-3   | noarch    |
| <a href="#">r-ic10trainingdata</a> | 1.3.1   | Training datasets for iC10; which implements the classifier described in the paper 'Genome-driven integrated classification of breast cancer validated in over 7,500 samples' (Ali HR et al., Genome Biology 2014). It uses copy number and/or expression from breast cancer data, trains a pamr classifier (Tibshirani et al.) with the features available and predicts the iC10 group. Genomic annotation for the training dataset has been obtained from Mark Dunning's IlluminaHumanv3.db package. / GPL-3  | noarch    |
| <a href="#">r-ic2</a>              | 1.0.1   | Lorenz and concentration curves; Atkinson, Generalized entropy and SGini indices (with decomposition) / GPL-2   | noarch    |
| <a href="#">r-ic50</a>             | 1.4.2   | Calculation of IC50 values, automatic drawing of dose-response curves and validation of compound screens on 96- and 384-well plates. / GPL-3  | noarch    |

Continued on next page

Table 51 – continued from previous page

| Name              | Version | Summary/License   | Platforms |
|-------------------|---------|---|-----------|
| r-ica             | 1.0.2   | Independent Component Analysis (ICA) using various algorithms: FastICA, Information-Maximization (Infomax), and Joint Approximate Diagonalization of Eigenmatrices (JADE). / GPL-2  | noarch    |
| r-icaff           | 1.0.1   | Imperialist Competitive Algorithm (ICA) < <a href="http://en.wikipedia.org/wiki/Imperialist_competitive_algorithm">http://en.wikipedia.org/wiki/Imperialist_competitive_algorithm</a> > is a computational method that is used to solve optimization problems of different types and it is the mathematical model and the computer simulation of human social evolution. The package provides a minimum value for the cost function and the best value for the optimization variables by Imperialist Competitive Algorithm. Users can easily define their own objective function depending on the problem at hand. This version has been successfully applied to solve optimization problems, for continuous functions. / GPL-2 | noarch    |
| r-icarus          | 0.3.1   | Provides user-friendly tools for calibration in survey sampling. The package is production-oriented, and its interface is inspired by the famous popular macro ‘Calmar’ for SAS, so that ‘Calmar’ users can quickly get used to ‘icarus’. In addition to calibration (with linear, raking and logit methods), ‘icarus’ features functions for calibration on tight bounds and penalized calibration. / GPL-3  | noarch    |
| r-icc             | 2.3.0   | Assist in the estimation of the Intraclass Correlation Coefficient (ICC) from variance components of a one-way analysis of variance and also estimate the number of individuals or groups necessary to obtain an ICC estimate with a desired confidence interval width. / GPL-2   | noarch    |
| r-icc.sample.size | 1.0     | Provides functions to calculate the requisite sample size for studies where ICC is the primary outcome. Can also be used for calculation of power. In both cases it allows the user to test the impact of changing input variables by calculating the outcome for several different values of input variables. Based off the work of Zou. Zou, G. Y. (2012). Sample size formulas for estimating intraclass correlation coefficients with precision and assurance. Statistics in medicine, 31(29), 3972-3981. / GPL-3   | noarch    |
| r-iccbin          | 1.1.1   | Assists in generating binary clustered data, estimates of Intraclass Correlation coefficient (ICC) for binary response in 16 different methods, and 5 different types of confidence intervals. / GPL-2  | noarch    |
| r-icd.data        | 1.0     | Data from the United States Center for Medicare and Medicaid Services (CMS) is included in this package. There are ICD-9 and ICD-10 diagnostic and procedure codes, and lists of the chapter and sub-chapter headings and the ranges of ICD codes they encompass. There are also two sample datasets. These data are used by the ‘icd’ package for finding comorbidities. / GPL-3   | noarch    |
| r-icdglm          | 1.0.0   | Provides an estimator for generalized linear models with incomplete data for discrete covariates. The estimation is based on the EM algorithm by the method of weights by Ibrahim (1990) <DOI:10.2307/2290013>. / GPL-2   | noarch    |
| r-icebox          | 1.1.2   | Implements Individual Conditional Expectation (ICE) plots, a tool for visualizing the model estimated by any supervised learning algorithm. ICE plots refine Friedman’s partial dependence plot by graphing the functional relationship between the predicted response and a covariate of interest for individual observations. Specifically, ICE plots highlight the variation in the fitted values across the range of a covariate of interest, suggesting where and to what extent they may exist. / GPL-2   GPL-3   | noarch    |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms |
|------------------------------|---------|---|-----------|
| <a href="#">r-iceinfer</a>   | 1.1     | Given two unbiased samples of patient level data on cost and effectiveness for a pair of treatments, make head-to-head treatment comparisons by (i) generating the bivariate bootstrap resampling distribution of ICE uncertainty for a specified value of the shadow price of health, lambda, (ii) form the wedge-shaped ICE confidence region with specified confidence fraction within [0.50, 0.99] that is equivariant with respect to changes in lambda, (iii) color the bootstrap outcomes within the above confidence wedge with economic preferences from an ICE map with specified values of lambda, beta and gamma parameters, (iv) display VAGR and ALICE acceptability curves, and (v) illustrate variation in ICE preferences by displaying potentially non-linear indifference(iso-preference) curves from an ICE map with specified values of lambda, beta and either gamma or eta parameters. / GPL-3 | noarch    |
| <a href="#">r-icesadvice</a> | 2.0_0   | A collection of functions that facilitate computational steps related to advice for fisheries management, according to ICES guidelines. These include methods for calculating reference points and model diagnostics. / GPL-2   | noarch    |
| <a href="#">r-icesdatras</a> | 1.3_0   | R interface to access the web services of the ICES (International Council for the Exploration of the Sea) DATRAS trawl survey database < <a href="https://datras.ices.dk/WebServices/Webservices.aspx">https://datras.ices.dk/WebServices/Webservices.aspx</a> >. / GPL-2   | noarch    |
| <a href="#">r-icestaf</a>    | 3.1_1   | Functions to support the ICES Transparent Assessment Framework < <a href="http://taf.ices.dk">http://taf.ices.dk</a> > to organize data, methods, and results used in ICES assessments. ICES is an organization facilitating international collaboration in marine science. / GPL-2   | noarch    |
| <a href="#">r-icesvocab</a>  | 1.1_4   | R interface to access the RECO POX web services of the ICES (International Council for the Exploration of the Sea) Vocabularies database < <a href="https://vocab.ices.dk/services/POX.aspx">https://vocab.ices.dk/services/POX.aspx</a> >. / GPL-2   | noarch    |
| <a href="#">r-icge</a>       | 0.3     | ICGE is a package that helps to estimate the number of real clusters in data as well as to identify atypical units. The underlying methods are based on distances rather than on unit x variables. / GPL-2  | noarch    |
| <a href="#">r-iciter</a>     | 0.1.0   | A minimal wrapper around the NIH's 'iCite' API (< <a href="https://icite.od.nih.gov/api">https://icite.od.nih.gov/api</a> >). Given a vector of pubmed IDs, this package returns a dataframe of the information yielded by the 'iCite' API. The primary metric yielded by 'iCite' is the paper's relative citation ratio, but the API also returns other meta-data from the paper, including author names, publication journal, publication year, paper title, doi, and a number of other citation metrics. / MIT   | noarch    |
| <a href="#">r-icluster</a>   | 2.1.0   | Integrative clustering of multiple genomic data types using a joint latent variable model. / GPL-2  | noarch    |
| <a href="#">r-icods</a>      | 1.0     | Sieve semiparametric likelihood methods for analyzing interval-censored failure time data from an outcome-dependent sampling (ODS) design and from a case-cohort design. Zhou, Q., Cai, J., and Zhou, H. (2018) <doi:10.1111/biom.12744>; Zhou, Q., Zhou, H., and Cai, J. (2017) <doi:10.1093/biomet/asw067>. / GPL-2   | noarch    |
| <a href="#">r-icpsrdata</a>  | 0.4.0   | Reproducible, programmatic retrieval of datasets from the Inter-university Consortium for Political and Social Research archive. / MIT  | noarch    |
| <a href="#">r-icsw</a>       | 1.0.0   | Provides the necessary tools to estimate average treatment effects with an instrumental variable by re-weighting observations using a model of compliance. / MIT  | noarch    |
| <a href="#">r-icv</a>        | 1.0     | Functions for computing the global and local Gaussian density estimates based on the ICV bandwidth. See the article of Savchuk, O.Y., Hart, J.D., Sheather, S.J. (2010). Indirect cross-validation for density estimation. Journal of the American Statistical Association, 105(489), 415-423 <doi:10.1198/jasa.2010.tm08532>. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms |
|-----------------------------|---------|---|-----------|
| <code>r-idbg</code>         | 1.0     | An interactive R debugger / GPL-2   | noarch    |
| <code>r-idcard</code>       | 0.3.0   | The digits of the old version (before 2000 year) of ‘Chinese ID Card Number’ is 15, this package aims to update to the current version of 18 digits. Besides, this package can help check whether the given ‘ID’ is right or not. / GPL-3   | noarch    |
| <code>r-idendr0</code>      | 1.5.3   | Interactive dendrogram that enables the user to select and color clusters, to zoom and pan the dendrogram, and to visualize the clustered data not only in a built-in heat map, but also in ‘GGobi’ interactive plots and user-supplied plots. This is a backport of Qt-based ‘idendro’ (< <a href="https://github.com/tsieger/idendro">https://github.com/tsieger/idendro</a> >) to base R graphics and Tcl/Tk GUI. / GPL-2  | noarch    |
| <code>r-idetect</code>      | 0.1.0   | Provides efficient implementation of the Isolate-Detect methodology for the consistent estimation of the number and location of multiple change-points in one-dimensional data sequences from the deterministic noise model. For details on the Isolate-Detect methodology, please see Anastasiou and Fryzlewicz (2018) < <a href="https://docs.wixstatic.com/ugd/24cdcc_6a0866c574654163b8255e272bc0001b.pdf">https://docs.wixstatic.com/ugd/24cdcc_6a0866c574654163b8255e272bc0001b.pdf</a> >. Currently implemented scenarios are: piecewise-constant signal with Gaussian noise, piecewise-constant signal with heavy-tailed noise, continuous piecewise-linear signal with Gaussian noise, continuous piecewise-linear signal with heavy-tailed noise. / GPL-3 | noarch    |
| <code>r-idiogramfish</code> | 1.0.0   | Plot idiograms of several karyotypes having a set of dataframes for chromosome data and optionally mark data. Includes also a function to plot holocentrics and its marks supporting micrometers and Mb. Marks can have square or dot form, its legend (label) can be drawn inline or to the right of karyotypes. It is possible to calculate chromosome indices by Levan et al. (1964) <doi:10.1111/j.1601-5223.1964.tb01953.x>, karyotype indices of Watanabe et al. (1999) <doi:10.1007/PL00013869> and Romero-Zarco (1986) <doi:10.2307/1221906> and classify chromosomes by morphology Guerra (1986) and Levan et al. (1964). / GPL-2  | noarch    |
| <code>r-idmining</code>     | 1.0.6   | Contains techniques for mining large and high-dimensional data sets by using the concept of Intrinsic Dimension (ID). Here the ID is not necessarily an integer. It is extended to fractal dimensions. And the Morisita estimator is used for the ID estimation, but other tools are included as well. / CC BY-NC-SA 4.0  | noarch    |
| <code>r-idr</code>          | 1.2     | This is a package for estimating the copula mixture model and plotting correspondence curves in Measuring reproducibility of high-throughput experiments (2011), Annals of Applied Statistics, Vol. 5, No. 3, 1752-1779, by Li, Brown, Huang, and Bickel / GPL (>= 2.0)   | noarch    |
| <code>r-ids</code>          | 1.0.1   | Generate random or human readable and pronounceable identifiers. / MIT  | noarch    |
| <code>r-idx2r</code>        | 1.0.0   | Convert files to and from IDX format to vectors, matrices and arrays. IDX is a very simple file format designed for storing vectors and multidimensional matrices in binary format. The format is described on the website from Yann LeCun < <a href="http://yann.lecun.com/exdb/mnist/">http://yann.lecun.com/exdb/mnist/</a> >. / MIT   | noarch    |
| <code>r-iemiscdata</code>   | 0.6.1   | Miscellaneous data sets [Engineering Economics, Environmental/ Water Resources Engineering, US Presidential Elections]. / GPL-3   | noarch    |
| <code>r-iemisctext</code>   | 0.9.99  | The eclectic collection includes the following written pieces: The War Prayer by Mark Twain, War Is A Racket by Major General Smedley Butler, The Mask of Anarchy: Written on the Occasion of the Massacre at Manchester by Percy Bysshe Shelley, Connect the D.O.T.S. by Obiora Embry, Untitled: Climate Strange by Irucka Ajani Embry, and Untitled: Us versus Them or People Screwing over Other People (as we all live on one Earth and there is no us versus them in the actual Ultimate Reality) by Irucka Ajani Embry. / GPL-3   | noarch    |

| Name   | Version | Summary/License  | Platforms  |
|--|---------|--|--|
| <a href="#">r-ig.vancouver.2014.topcolours</a> | 0.1.2.0 | A dataset of the top colours of photos from Instagram taken in 2014 in the city of Vancouver, British Columbia, Canada. It consists of: top colour and counts data. This data was obtained using the Instagram API. Instagram is a web photo sharing service. It can be found at: < <a href="https://instagram.com">https://instagram.com</a> >. The Instagram API is documented at: < <a href="https://instagram.com/developer/">https://instagram.com/developer/</a> >. / CC0  | noarch   |
| <a href="#">r-igasso</a>                       | 1.4     | A collection of statistical tests for genetic association studies. / GPL-2   | noarch   |
| <a href="#">r-igor</a>                         | 0.8.1   | Provides function to read data from the ‘Igor Pro’ data analysis program by Wavemetrics. The data formats supported are ‘Igor’ packed experiment format (pxp) and ‘Igor’ binary wave (ibw). See: <a href="http://www.wavemetrics.com/">http://www.wavemetrics.com/</a> for details. Also includes functions to load special pxp files produced by the ‘Igor Pro’ ‘Neuromatic’ and ‘Nclamp’ packages for recording and analysing neuronal data. See <a href="http://www.neuromatic.thinkrandom.com/">http://www.neuromatic.thinkrandom.com/</a> for details. / GPL-2  | noarch   |
| <a href="#">r-igraph</a>                       | 1.2.4   | Routines for simple graphs and network analysis. It can handle large graphs very well and provides functions for generating random and regular graphs, graph visualization, centrality methods and much more. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-igraphdata</a>                   | 1.0.1   | A small collection of various network data sets, to use with the ‘igraph’ package: the Enron email network, various food webs, interactions in the immunoglobulin protein, the karate club network, Koenigsberg’s bridges, visuotactile brain areas of the macaque monkey, UK faculty friendship network, domestic US flights network, etc. / CC BY-SA 4.0 file LICENSE  | noarch   |
| <a href="#">r-igraphinshiny</a>                | 0.1     | Using ‘shiny’ to demo ‘igraph’ package makes learning graph theory easy and fun. / GPL-2   | noarch   |
| <a href="#">r-igraph-tonia</a>                 | 1.0     | This program facilitates exporting igraph graphs to the SoNIA file format / GPL-2  | noarch   |
| <a href="#">r-igsea</a>                        | 1.2     | To integrate multiple GSEA studies, we propose a hybrid strategy, iGSEA-AT, for choosing random effects (RE) versus fixed effect (FE) models, with an attempt to achieve the potential maximum statistical efficiency as well as stability in performance in various practical situations. In addition to iGSEA-AT, this package also provides options to perform integrative GSEA with testing based on a FE model (iGSEA-FE) and testing based on a RE model (iGSEA-RE). The approaches account for different set sizes when testing a database of gene sets. The function is easy to use, and the three approaches can be applied to both binary and continuous phenotypes. / GPL-2 | noarch   |
| <a href="#">r-ihs</a>                          | 1.0     | Density, distribution function, quantile function and random generation for the inverse hyperbolic sine distribution. This package also provides a function that can fit data to the inverse hyperbolic sine distribution using maximum likelihood estimation. / GPL-3   | noarch   |
| <a href="#">r-imageviewer</a>                  | 0.1.0   | Display a 2D-matrix data as a interactive zoomable gray-scale image viewer, providing tools for manual data inspection. The viewer window shows cursor guiding lines and a corresponding data slices for both axes at the current cursor position. A tool-bar allows adjusting image display brightness/contrast through WebGL filters and performing basic high-pass/low-pass filtering. / MIT  | noarch   |

| Name        | Version | Summary/License  | Platforms   |
|-------------|---------|--|---|
| r-imak      | 1.2.2   | This is an Automatic Item Generator for Psychological Assessment. Items created with the 'IMak' package should not be used in applied settings as part of the working protocol without ensuring first that the items meet the required psychometric quality standards (see Blum & Holling, 2018) <DOI:10.3389/fpsyg.2018.01286>. / GPL-3   | noarch  |
| r-imap      | 1.32    | Zoom in and out of maps or any supplied lines or points, with control for color, poly fill, and aspect. / GPL-2  | noarch  |
| r-imfdata   | 0.2.0   | Search, extract and formulate IMF's datasets. / MIT  | noarch  |
| r-imgur     | 1.0.3   | A complete API client for the image hosting service Imgur.com, including the an imgur graphics device, enabling the easy upload and sharing of plots. / GPL-3  | noarch  |
| r-imgw      | 0.2.0   | Download Polish meteorological and hydrological data from the Institute of Meteorology and Water Management - National Research Institute (< <a href="https://dane.imgw.pl/">https://dane.imgw.pl/</a> >). This package also allows for adding geographical coordinates for each observation. / MIT  | noarch  |
| r-imis      | 0.1     | IMIS algorithm draws samples from the posterior distribution. The user has to define the following R functions in advance: prior(x) calculates prior density of x, likelihood(x) calculates the likelihood of x, and sample.prior(n) draws n samples from the prior distribution. / GPL-2  | noarch  |
| r-immailgun | 0.1.2   | Send emails using the 'mailgun' api. To use this package you will need an account from < <a href="https://www.mailgun.com">https://www.mailgun.com</a> > . / GPL-3   | noarch  |
| r-impact    | 0.1.1   | Implement a multivariate analysis of the impact of items to identify a bias in the questionnaire validation of Likert-type scale variables. The items requires considering a null value (category doesn't have tendency). Offering frequency, importance and impact of the items. / GPL-2  | noarch  |
| r-impactiv  | 1.0     | In this package, you can find two functions proposed in Ding, Geng and Zhou (2011) to estimate direct and indirect causal effects with randomization and multiple-component intervention using instrumental variable method. / GPL-2   | noarch  |
| r-impimp    | 0.3.1   | Imputing blockwise missing data by imprecise imputation, featuring a domain-based, variable-wise, and case-wise strategy. Furthermore, the estimation of lower and upper bounds for unconditional and conditional probabilities based on the obtained imprecise data is implemented. Additionally, two utility functions are supplied: one to check whether variables in a data set contain set-valued observations; and another to merge two already imprecisely imputed data. The method is described in a technical report by Endres, Fink and Augustin (2018, <doi:10.5282/ubm/epub.42423>). / GPL-2   GPL-3 | noarch  |
| r-implyr    | 0.2.4   | 'SQL' back-end to 'dplyr' for Apache Impala, the massively parallel processing query engine for Apache 'Hadoop'. Impala enables low-latency 'SQL' queries on data stored in the 'Hadoop' Distributed File System '(HDFS)', Apache 'HBase', Apache 'Kudu', Amazon Simple Storage Service '(S3)', Microsoft Azure Data Lake Store '(ADLS)', and Dell 'EMC' 'Isilon'. See < <a href="https://impala.apache.org">https://impala.apache.org</a> > for more information about Impala. / Apache License 2.0   file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                             | Version | Summary/License  | Platforms |
|----------------------------------|---------|--|-----------|
| <a href="#">r-import</a>         | 1.1.0   | This is an alternative mechanism for importing objects from packages. The syntax allows for importing multiple objects from a package with a single command in an expressive way. The import package bridges some of the gap between using library (or require) and direct (single-object) imports. Furthermore the imported objects are not placed in the current environment. It is also possible to import objects from stand-alone .R files. For more information, refer to the package vignette. / MIT  | noarch    |
| <a href="#">r-importar</a>       | 0.1.1   | Enables ‘Python’-like importing/loading of packages or functions with aliasing to prevent namespace conflicts. / GPL-3   | noarch    |
| <a href="#">r-imprprobest</a>    | 1.0.1   | A minimum distance estimator is calculated for an imprecise probability model. The imprecise probability model consists of upper coherent previsions whose credal sets are given by a finite number of constraints on the expectations. The parameter set is finite. The estimator chooses that parameter such that the empirical measure lies next to the corresponding credal set with respect to the total variation norm. / LGPL-3   | noarch    |
| <a href="#">r-imputemissings</a> | 0.0.3   | Compute missing values on a training data set and impute them on a new data set. Current available options are median/mode and random forest. / GPL-2  | noarch    |
| <a href="#">r-imputer</a>        | 2.1     | Multivariate Expectation-Maximization (EM) based imputation framework that offers several different algorithms. These include regularisation methods like Lasso and Ridge regression, tree-based models and dimensionality reduction methods like PCA and PLS. / GPL-3   | noarch    |
| <a href="#">r-imputeyn</a>       | 1.3     | Method brings less bias and more efficient estimates for AFT models. / GPL-2   | noarch    |
| <a href="#">r-imrmc</a>          | 1.2.0   | Do Multi-Reader, Multi-Case (MRMC) analyses of data from imaging studies where clinicians (readers) evaluate patient images (cases). What does this mean? ... Many imaging studies are designed so that every reader reads every case in all modalities, a fully-crossed study. In this case, the data is cross-correlated, and we consider the readers and cases to be cross-correlated random effects. An MRMC analysis accounts for the variability and correlations from the readers and cases when estimating variances, confidence intervals, and p-values. The functions in this package can treat arbitrary study designs and studies with missing data, not just fully-crossed study designs. The initial package analyzes the reader-average area under the receiver operating characteristic (ROC) curve with U-statistics according to Gallas, Bandos, Samuelson, and Wagner 2009 <doi:10.1080/03610920802610084>. Additional functions analyze other endpoints with U-statistics (binary performance and score differences) following the work by Gallas, Pennello, and Myers 2007 <doi:10.1364/JOSAA.24.000B70>. Package development and documentation is at <https://github.com/DIDSR/iMRMC/tree/master>. / CC0 | noarch    |
| <a href="#">r-inbreedr</a>       | 0.3.2   | A framework for analysing inbreeding and heterozygosity-fitness correlations (HFCs) based on microsatellite and SNP markers. / GPL-2   | noarch    |
| <a href="#">r-indexnumr</a>      | 0.1.2   | Computes bilateral and multilateral index numbers. It has support for several standard bilateral indices as well as the GEKS multilateral index number methods (see Ivancic, Diewert and Fox (2011) <doi:10.1016/j.jeconom.2010.09.003>). It also supports updating of GEKS indexes using several splicing methods. / GPL-2  | noarch    |
| <a href="#">r-indiantaxcalc</a>  | 1.0.2   | Calculate Indian Income Tax liability for Financial years of Individual resident aged below 60 years, Senior Citizen, Super Senior Citizen, Firm, Local Authority, Any Non Resident Individual / Hindu Undivided Family / Association of Persons / Body of Individuals / Artificial Judicial Person, Co-operative Society. / GPL-2   | noarch    |

| Name                             | Version | Summary/License  | Platforms |
|----------------------------------|---------|--|-----------|
| <a href="#">r-indirect</a>       | 0.2.0   | Functions are provided to facilitate prior elicitation for Bayesian generalised linear models using independent conditional means priors. The package supports the elicitation of multivariate normal priors for generalised linear models. The approach can be applied to indirect elicitation for a generalised linear model that is linear in the parameters. The package is designed such that the facilitator executes functions within the R console during the elicitation session to provide graphical and numerical feedback at each design point. Various methodologies for eliciting fractiles (equivalently, percentiles or quantiles) are supported, including versions of the approach of Hosack et al. (2017) <doi:10.1016/j.jress.2017.06.011>. For example, experts may be asked to provide central credible intervals that correspond to a certain probability. Or experts may be allowed to vary the probability allocated to the central credible interval for each design point. Additionally, a median may or may not be elicited. / GPL-3 | noarch    |
| <a href="#">r-indtestpp</a>      | 1.0     | Several parametric and non-parametric tests and measures to check independence between two or more (homogeneous or nonhomogeneous) point processes in time are provided. Tools for simulating point processes in one dimension with different types of dependence are also implemented. / GPL-3  | noarch    |
| <a href="#">r-ineq</a>           | 0.2.1   | Inequality, concentration, and poverty measures. Lorenz curves (empirical and theoretical). / GPL-2   GPL-3  | noarch    |
| <a href="#">r-infdim</a>         | 1.0     | This package contains functions to perform calculations of the infinite-dimensional model (IDM) and to produce 95% confidence intervals around the model elements through bootstrapping. / GPL-2   | noarch    |
| <a href="#">r-inference</a>      | 0.1.0   | Collection of functions to extract inferential values (point estimates, confidence intervals, p-values, etc) of a fitted model object into a matrix-like object that can be used for table/report generation; transform point estimates via the delta method. / GPL-2  | noarch    |
| <a href="#">r-inferencesmr</a>   | 1.0     | The InferenceSMR package provides functions to make inference about the standardized mortality ratio (SMR) when evaluating the effect of a screening program. The package is based on methods described in Sasieni (2003) and Talbot et al. (2011). / GPL-2  | noarch    |
| <a href="#">r-inference</a>      | 1.0.0   | Provides methods for estimating causal effects in the presence of interference described in B. Saul and M. Hugdens (2017) <doi:10.18637/jss.v082.i02>. Currently it implements the inverse-probability weighted (IPW) estimators proposed by E.J. Tchetgen Tchetgen and T.J. Vanderweele (2012) <doi:10.1177/0962280210386779>. / GPL-2  | noarch    |
| <a href="#">r-infiniumpurify</a> | 1.3.1   | The proportion of cancer cells in solid tumor sample, known as the tumor purity, has adverse impact on a variety of data analyses if not properly accounted for. We develop ‘InfiniumPurify’, which is a comprehensive R package for estimating and accounting for tumor purity based on DNA methylation Infinium 450k array data. ‘InfiniumPurify’ provides functionalities for tumor purity estimation. In addition, it can perform differential methylation detection and tumor sample clustering with the consideration of tumor purities. / GPL-2   | noarch    |
| <a href="#">r-infix</a>          | 0.1.0   | Contains a number of infix binary operators that may be useful in day to day practices. / GPL-3  | noarch    |
| <a href="#">r-inflection</a>     | 1.3.5   | Implementation of methods Extremum Surface Estimator (ESE) and Extremum Distance Estimator (EDE) to identify the inflection point of a curve . Christopoulos, DT (2014) <arXiv:1206.5478v2 [math.NA]> . Christopoulos, DT (2016) <https://veltech.edu.in/wp-content/uploads/2016/04/Paper-04-2016.pdf> . Christopoulos, DT (2016) <doi:10.2139/ssrn.3043076> . / GPL-2   | noarch    |

| Name                            | Version | Summary/License   | Platforms  |
|---------------------------------|---------|---|--|
| <a href="#">r-influence.me</a>  | 0.9.9   | Provides a collection of tools for detecting influential cases in generalized mixed effects models. It analyses models that were estimated using ‘lme4’. The basic rationale behind identifying influential data is that when single units are omitted from the data, models based on these data should not produce substantially different estimates. To standardize the assessment of how influential a (single group of) observation(s) is, several measures of influence are common practice, such as Cook’s Distance. In addition, we provide a measure of percentage change of the fixed point estimates and a simple procedure to detect changing levels of significance. / GPL-3  | noarch   |
| <a href="#">r-influence.sem</a> | 2.2     | A set of tools for evaluating several measures of case influence for structural equation models. / GPL-2  | noarch   |
| <a href="#">r-influencer</a>    | 0.1.0   | Provides functionality to compute various node centrality measures on networks. Included are functions to compute betweenness centrality (by utilizing Madduri and Bader’s SNAP library), implementations of Burt’s constraint and effective network size (ENS) metrics, Borgatti’s algorithm to identify key players, and Valente’s bridging metric. On Unix systems, the betweenness, Key Players, and bridging implementations are parallelized with OpenMP, which may run faster on systems which have OpenMP configured. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-infodecompute</a> | 0.6.1   | The main purpose of this package is to generate the structure of the analysis of variance (ANOVA) table of the two-phase experiments. The user only need to input the design and the relationships of the random and fixed factors using the Wilkinson-Rogers’ syntax, this package can then quickly generate the structure of the ANOVA table with the coefficients of the variance components for the expected mean squares. Thus, the balanced incomplete block design and provides the efficiency factors of the fixed effects can also be studied and compared much easily. / GPL-3  | noarch   |
| <a href="#">r-infotrad</a>      | 1.2     | Estimates the probability of informed trading (PIN) initially introduced by Easley et. al. (1996) <doi:10.1111/j.1540-6261.1996.tb04074.x>. Contribution of the package is that it uses likelihood factorizations of Easley et. al. (2010) <doi:10.1017/S0022109010000074> (EHO factorization) and Lin and Ke (2011) <doi:10.1016/j.finmar.2011.03.001> (LK factorization). Moreover, the package uses different estimation algorithms. Specifically, the grid-search algorithm proposed by Yan and Zhang (2012) <doi:10.1016/j.jbankfin.2011.08.003>, hierarchical agglomerative clustering approach proposed by Gan et. al. (2015) <doi:10.1080/14697688.2015.1023336> and later extended by Ersan and Alici (2016) <doi:10.1016/j.intfin.2016.04.001>. / GPL-3 | noarch   |
| <a href="#">r-infra</a>         | 0.1.2   | Takes a data frame containing latitude and longitude coordinates and downloads images from map servers to determine their file size as a proxy of infrastructure / GPL-2  | noarch   |
| <a href="#">r-ini</a>           | 0.3.1   | Parse simple ‘.ini’ configuration files to an structured list. Users can manipulate this resulting list with lapply() functions. This same structured list can be used to write back to file after modifications. / GPL-3   | noarch   |
| <a href="#">r-injector</a>      | 0.2.4   | R dependency injection framework. Dependency injection allows a program design to follow the dependency inversion principle. The user delegates to external code (the injector) the responsibility of providing its dependencies. This separates the responsibilities of use and construction. / LGPL-3   | noarch   |

Table 51 – continued from previous page

| Name                              | Version | Summary/License   | Platforms   |
|-----------------------------------|---------|---|---|
| <a href="#">r-inline</a>          | 0.3.15  | Functionality to dynamically define R functions and S4 methods with ‘inlined’ C, C or Fortran code supporting the .C and .Call calling conventions. / LGPL  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-insiderode</a>      | 2.0     | insideRODE package includes builtin functions from deSolve, compiled functions from compiler, and C/FORTRAN code interfaces to nlme. It includes nlmLSODA, nlmODE, nlmVODE, nlmLSODE for general purpose; cflSODA, cflSODE, cfODE, cfVODE call C/FORTRAN compiled dll functions. ver2.0 add sink() function into example it helps to directly combine c/fortran source code in R files. Finally, with new compiler package, we generated compiled functions: nlmODEcp, nlmVODEcp, nlmLSODEcp, nlmLSODAc and cpODE, cpLSODA, cpLSODE, cpVODE. They will help to increase speed. / LGPL (> 2.0)                                     | noarch  |
| <a href="#">r-insight</a>         | 0.5.0   | A tool to provide an easy, intuitive and consistent access to information contained in various R models, like model formulas, model terms, information about random effects, data that was used to fit the model or data from response variables. ‘insight’ mainly revolves around two types of functions: Functions that find (the names of) information, starting with ‘ <b>find_</b> ’, and functions that get the underlying data, starting with ‘ <b>get_</b> ’. The package has a consistent syntax and works with many different model objects, where otherwise functions to access these information are missing. / GPL-3 | noarch  |
| <a href="#">r-inspectchangept</a> | 1.0.1   | Provides a data-driven projection-based method for estimating changepoints in high-dimensional time series. Multiple changepoints are estimated using a (wild) binary segmentation scheme. / GPL-3  | noarch  |
| <a href="#">r-inspectr</a>        | 1.0.0   | Check one column or multiple columns of a dataframe using the preset basic checks or your own functions. Enables checks without knowledge of lapply() or sapply(). / CC BY-SA 4.0   | noarch  |
| <a href="#">r-install.load</a>    | 1.2.1   | The function <i>install_load</i> checks the local R library(ies) to see if the required package(s) is/are installed or not. If the package(s) is/are not installed, then the package(s) will be installed along with the required dependency(ies). This function pulls source or binary packages from the Rstudio-sponsored CRAN mirror and/or the USGS GRAN Repository. Lastly, the chosen package(s) is/are loaded. The function <i>load_package</i> simply loads the provided packages. / CC BY-SA 4.0   | noarch  |
| <a href="#">r-instar</a>          | 0.2.4   | Provides an interface to the Instagram API < <a href="https://instagram.com/">https://instagram.com/</a> developer/>, which allows R users to download public pictures filtered by hashtag, popularity, user or location, and to access public users’ profile data. / GPL-2   | noarch  |
| <a href="#">r-insurancedata</a>   | 1.0     | Insurance datasets, which are often used in claims severity and claims frequency modelling. It helps testing new regression models in those problems, such as GLM, GLMM, HGLM, non-linear mixed models etc. Most of the data sets are applied in the project Mixed models in ratemaking supported by grant NN 111461540 from Polish National Science Center. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name                             | Version | Summary/License   | Platforms |
|----------------------------------|---------|---|-----------|
| <code>r-intccr</code>            | 1.1.4   | Semiparametric regression models on the cumulative incidence function with interval-censored competing risks data as described in Bakoyannis, Yu, & Yiannoutsos (2017) <doi:10.1002/sim.7350>. The main function fits the proportional subdistribution hazards model (Fine-Gray model), the proportional odds model, and other models that belong to the class of semiparametric generalized odds rate transformation models. / GPL-2   | noarch    |
| <code>r-integratebs</code>       | 0.1.0   | Integrated B-spline function. / GPL-2   | noarch    |
| <code>r-interactiontest</code>   | 1.2     | Implements the procedures suggested in Esarey and Sumner (2017) < <a href="http://justinesarey.com/interaction-overconfidence.pdf">http://justinesarey.com/interaction-overconfidence.pdf</a> > for controlling the false discovery rate when constructing marginal effects plots for models with interaction terms. / GPL-3  | noarch    |
| <code>r-interactiveigraph</code> | 1.0.6   | An extension of the package ‘igraph’. This package create possibly to work with ‘igraph’ objects interactively. / GPL-2   | noarch    |
| <code>r-interatrix</code>        | 1.1.1   | Chi-square tests are computed with corrections. / GPL-2   | noarch    |
| <code>r-intercure</code>         | 0.1.0   | Implementations of semiparametric cure rate estimators for interval censored data in R. The algorithms are based on the promotion time and frailty models, all for interval censoring. For the frailty model, there is also a implementation contemplating clustered data. / GPL-2   GPL-3  | noarch    |
| <code>r-interfaceqpcr</code>     | 1.0     | Graphical User Interface allowing to determine the concentration in the sample in CFU per mL or in number of copies per mL provided to qPCR results after with or without PMA treatment. This package is simply to use because no knowledge in R commands is necessary. A graphic represents the standard curve, and a table containing the result for each sample is created. / GPL-2  | noarch    |
| <code>r-interferenceci</code>    | 1.1     | Computes large sample confidence intervals of Liu and Hudgens (2014), exact confidence intervals of Tchetgen Tchetgen and VanderWeele (2012), and exact confidence intervals of Rigdon and Hudgens (2014) for treatment effects on a binary outcome in two-stage randomized experiments with interference. / GPL-3  | noarch    |
| <code>r-interim</code>           | 0.8.0   | Allows the simulation of the recruitment and both the event and treatment phase of a clinical trial. Based on these simulations, the timing of interim analyses can be assessed. / GPL-3  | noarch    |
| <code>r-interlinear</code>       | 1.0     | Interlinearized glossed texts (IGT) are used in descriptive linguistics for representing a morphological analysis of a text through a morpheme-by-morpheme gloss. ‘InterlinearR’ provide a set of functions that targets several popular formats of IGT (‘SIL Toolbox’, ‘EMELD XML’) and that turns an IGT into a set of data frames following a relational model (the tables represent the different linguistic units: texts, sentences, word, morphemes). The same pieces of software (‘SIL FLEX’, ‘SIL Toolbox’) typically produce dictionaries of the morphemes used in the glosses. ‘InterlinearR’ provide a function for turning the LIFT XML dictionary format into a set of data frames following a relational model in order to represent the dictionary entries, the sense(s) attached to the entries, the example(s) attached to senses, etc. / BSD_3_clause | noarch    |
| <code>r-interpol</code>          | 1.3.1   | A package for numerical encoding as well as for linear and non-linear interpolation of amino acid sequences. / GPL-2  | noarch    |
| <code>r-interpol.t</code>        | 2.1.1   | Hourly interpolation of daily minimum and maximum temperature series. Carries out interpolation on multiple series ad once. Requires some hourly series for calibration (alternatively can use default calibration table). / GPL-2  | noarch    |
| <code>r-interpret</code>         | 0.2.4   | Compute permutation- based performance measures and create partial dependence plots for (cross-validated) ‘randomForest’ and ‘ada’ models. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name                 | Version | Summary/License   | Platforms |
|----------------------|---------|---|-----------|
| r-interva4           | 1.7.5   | Provides an R version of the ‘InterVA4’ software (< <a href="http://www.interva.net">http://www.interva.net</a> >) for coding cause of death from verbal autopsies. It also provides simple graphical representation of individual and population level statistics. / GPL-3   | noarch    |
| r-interva5           | 1.0.2   | Provides an R version of the ‘InterVA5’ software (< <a href="http://www.interva.net">http://www.interva.net</a> >) for coding cause of death from verbal autopsies. It also provides simple graphical representation of individual and population level statistics. / GPL-3   | noarch    |
| r-intervcomp         | 0.1.2   | Performs hypothesis testing using the interval estimates (e.g., confidence intervals). The non-overlapping interval estimates indicates the statistical significance. References to these procedures can be found at Noguchi and Marmolejo-Ramos (2016) <doi:10.1080/00031305.2016.1200487>, Bonett and Seier (2003) <doi:10.1198/0003130032323>, and Lemm (2006) <doi:10.1300/J082v51n02_05>. / GPL-3  | noarch    |
| r-interventionaldbn  | 1.2.2   | This package allows a dynamic Bayesian network to be inferred from microarray timecourse data with interventions (inhibitors). / GPL-2  | noarch    |
| r-intlik             | 1.0     | This package calculates the integrated likelihood numerically. Given the Likelihood function and the prior function, this package integrates out the nuisance parameters by Metropolis-Hastings (MCMC) Algorithm. / GPL-2   | noarch    |
| r-intoo              | 0.3.1   | Contains attribute operators (%\$% and %\$%<-), convenience functions and functions for printing objects compactly but informatively. And partly supports nested matrices. / GPL-2  | noarch    |
| r-intriniostockapi   | 0.0.1   | Download financial data from the free ‘Intrinio Stock API’ (< <a href="https://intrinio.com/">https://intrinio.com/</a> >). ‘Intrinio’ offers a REST API which provides financial markets data including intra-day stock prices, historical stock prices, technical indicators, company fundamentals, and more. Complete documentation for the ‘Intrinio Stock API’ is available here: < <a href="https://intrinio.com/documentation/api/">https://intrinio.com/documentation/api/</a> >. To access the ‘Intrinio Stock API’, simply create a free account < <a href="https://intrinio.com/">https://intrinio.com/</a> >. / MIT | noarch    |
| r-intrval            | 0.1_1   | Evaluating if values of vectors are within different open/closed intervals ( $x \in ]c(a, b)$ ), or if two closed intervals overlap ( $c(a1, b1) \cap ]c(a2, b2)$ ). Operators for negation and directional relations also implemented. / GPL-2   | noarch    |
| r-intrvals           | 1.0.0   | Calculates event rates and compares means and variances of groups of interval data corrected for missed arrival observations. / GPL-3   | noarch    |
| r-intubate           | 1.0.0   | Interface to popular R functions with formulas and data, such as ‘lm’, so they can be included painlessly in data science pipelines implemented by ‘magrittr’ with the operator %>%. / GPL-2  | noarch    |
| r-inum               | 1.0_1   | Enum-type representation of vectors and representation of intervals, including a method of coercing variables in data frames. / GPL-2   | noarch    |
| r-invasioncorrection | 0.1     | The correction is achieved under the assumption that non-migrating cells of the essay approximately form a quadratic flow profile due to frictional effects, compare law of Hagen-Poiseuille for flow in a tube. The script fits a conical plane to give xyz-coordinates of the cells. It outputs the number of migrated cells and the new corrected coordinates. / GPL-3   | noarch    |
| r-invctr             | 0.1.0   | Vector operations between grapes: An infix-only package! The ‘invctr’ functions perform common and less common operations on vectors, data frames matrices and list objects: - Extracting a value (range), or, finding the indices of a value (range). - Trimming, or padding a vector with a value of your choice. - Simple polynomial regression. - Set and membership operations. - General check & replace function for NAs, Inf and other values. / GPL-3  | noarch    |

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms |
|-----------------------------|---------|---|-----------|
| <a href="#">r-investr</a>   | 1.4.0   | Functions to facilitate inverse estimation (e.g., calibration) in linear, generalized linear, nonlinear, and (linear) mixed-effects models. A generic function is also provided for plotting fitted regression models with or without confidence/prediction bands that may be of use to the general user. / GPL-2   | noarch    |
| <a href="#">r-invgamma</a>  | 1.1     | Light weight implementation of the standard distribution functions for the inverse gamma distribution, wrapping those for the gamma distribution in the stats package. / GPL-2  | noarch    |
| <a href="#">r-invlt</a>     | 0.2.1   | Provides two functions for the numerical inversion of Laplace-Transformed functions, returning the value of the standard (time) domain function at a specified value. The first algorithm is the first optimum contour algorithm described by Evans and Chung (2000)[1]. The second algorithm uses the Bromwich contour as per the definition of the inverse Laplace Transform. The latter is unstable for numerical inversion and mainly included for comparison or interest. There are also some additional functions provided for utility, including plotting and some simple Laplace Transform examples, for which there are known analytical solutions. Polar-cartesian conversion functions are included in this package and are used by the inversion functions. [1] Evans & Chung, 2000: Laplace transform inversions using optimal contours in the complex plane; International Journal of Computer Mathematics v73 pp531-543. / MIT | noarch    |
| <a href="#">r-ioncopy</a>   | 2.1.1   | Method for the calculation of copy numbers and calling of copy number alterations. The algorithm uses coverage data from amplicon sequencing of a sample cohort as input. The method includes significance assessment, correction for multiple testing and does not depend on normal DNA controls. Budczies (2016 Mar 15) <doi:10.18632/oncotarget.7451>. / GPL-3   | noarch    |
| <a href="#">r-ionr</a>      | 0.3.0   | Provides item exclusion procedure, which is a formal method to test ‘Indifference Of iNdicator’ (ION). When a latent personality trait-outcome association is assumed, then the association strength should not depend on which subset of indicators (i.e. items) has been chosen to reflect the trait. Personality traits are often measured (reflected) by a sum-score of a certain set of indicators. Item exclusion procedure randomly excludes items from a sum-score and tests, whether the sum-score - outcome correlation changes. ION has been achieved, when any item can be excluded from the sum-score without the sum-score - outcome correlation substantially changing . For more details, see Vainik, Mottus et. al, (2015) Are Trait-Outcome Associations Caused by Scales or Particular Items? Example Analysis of Personality Facets and BMI, European Journal of Personality DOI: <10.1002/per.2009> . / GPL-2            | noarch    |
| <a href="#">r-iosmooth</a>  | 0.94    | Density, spectral density, and regression estimation using infinite order flat-top kernels. / GPL-3   | noarch    |
| <a href="#">r-ipcswitch</a> | 1.0.3   | Contains functions for formatting clinical trials data and implementing inverse probability of censoring weights to handle treatment switches when estimating causal treatment effect in randomized clinical trials. / GPL-3  | noarch    |
| <a href="#">r-ipdmeta</a>   | 2.4     | This package provides functions to estimate an IPD linear mixed effects model for a continuous outcome and any categorical covariate from study summary statistics. There are also functions for estimating the power of a treatment-covariate interaction test in an individual patient data meta-analysis from aggregate data. / GPL-2  | noarch    |
| <a href="#">r-ipecc</a>     | 0.1.2   | Calculates the RMS intrinsic and parameter-effects curvatures of a nonlinear regression model. / GPL-2  | noarch    |

Continued on next page

Table 51 – continued from previous page

| Name                          | Version | Summary/License  | Platforms  |
|-------------------------------|---------|--|--|
| <a href="#">r-ipflasso</a>    | 0.2     | The core of the package is <code>cvr2.ipflasso()</code> , an extension of <code>glmnet</code> to be used when the (large) set of available predictors is partitioned into several modalities which potentially differ with respect to their information content in terms of prediction. For example, in biomedical applications patient outcome such as survival time or response to therapy may have to be predicted based on, say, mRNA data, miRNA data, methylation data, CNV data, clinical data, etc. The clinical predictors are on average often much more important for outcome prediction than the mRNA data. The <code>ipflasso</code> method takes this problem into account by using different penalty parameters for predictors from different modalities. The ratio between the different penalty parameters can be chosen by cross-validation. / GPL-3 | noarch   |
| <a href="#">r-ipmpack</a>     | 2.1     | IPMpack takes demographic vital rates and (optionally) environmental data to build integral projection models. A number of functional forms for growth and survival can be incorporated, as well as a range of reproductive strategies. The package also includes a suite of diagnostic routines, provides classic matrix model output (e.g., lambda, elasticities, sensitivities), and produces post-hoc metrics (e.g., passage time and life expectancy). / GPL-3  | noarch   |
| <a href="#">r-ipp</a>         | 1.1     | Generates random numbers corresponding to the events on a Poisson point process with changing event rates. This includes the possibility to incorporate additional information such as the number of events occurring or the location of an already known event. It can also generate the probability density functions of specific events in the cases where additional information is available. Based on Hohmann (2019) <arXiv:1901.10754>. / CC BY 4.0   | noarch   |
| <a href="#">r-ipred</a>       | 0.9_8   | Improved predictive models by indirect classification and bagging for classification, regression and survival problems as well as resampling based estimators of prediction error. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-iptmnet</a>     | 0.1.5   | Provides an R interface to the ‘iPTMnet’ database REST API, which can be used to retrieve Post Translational Modification (PTM) data in systems biology context. This package handles all the aspects of communicating with the API, which involve sending the request, checking the error codes and parsing the response in a format that is ready to integrate into existing workflows. / MIT  | noarch   |
| <a href="#">r-ipwsurvival</a> | 0.5     | In observational studies, the presence of confounding factors is common and the comparison of different groups of subjects requires adjustment. In this package, we propose simple functions to estimate adjusted survival curves and log-rank test based on inverse probability weighting (IPW). / GPL-2  | noarch   |
| <a href="#">r-iqlern</a>      | 1.5     | Estimate an optimal dynamic treatment regime using Interactive Q-learning. / GPL-2   | noarch   |
| <a href="#">r-irace</a>       | 3.3     | Iterated race is an extension of the Iterated F-race method for the automatic configuration of optimization algorithms, that is, (offline) tuning their parameters by finding the most appropriate settings given a set of instances of an optimization problem. / GPL-2   | noarch   |

Table 51 – continued from previous page

| Name                          | Version | Summary/License  | Platforms   |
|-------------------------------|---------|--|---|
| <a href="#">r-ircor</a>       | 1.0     | Provides implementation of various correlation coefficients of common use in Information Retrieval. In particular, it includes Kendall (1970, isbn:0852641990) tau coefficient as well as tau_a and tau_b for the treatment of ties. It also includes Yilmaz et al. (2008) <doi:10.1145/1390334.1390435> tauAP correlation coefficient, and versions tauAP_a and tauAP_b developed by Urbano and Marrero (2017) <doi:10.1145/3121050.3121106> to cope with ties. / MIT | noarch  |
| <a href="#">r-irdisplay</a>   | 0.7.0   | An interface to the rich display capabilities of ‘Jupyter’ front-ends (e.g. ‘Jupyter Notebook’) < <a href="https://jupyter.org">https://jupyter.org</a> >. Designed to be used from a running ‘IRkernel’ session < <a href="https://irkernel.github.io">https://irkernel.github.io</a> >. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-iregression</a> | 1.2.1   | Contains some important regression methods for interval-valued variables. For each method, it is available the fitted values, residuals and some goodness-of-fit measures. / GPL-2   | noarch  |
| <a href="#">r-irepro</a>      | 1.1     | Calculates intraclass correlation coefficient (ICC) for assessing reproducibility of interval-censored data with two repeated measurements (Kovacic and Varnai (2014) <doi:10.1097/EDE.000000000000139>). ICC is estimated by maximum likelihood from model with one fixed and one random effect (both intercepts). Help in model checking (normality of subjects’ means and residuals) is provided. / GPL-3   | noarch  |
| <a href="#">r-irg</a>         | 0.1.1   | Fits a double logistic function to NDVI time series and calculates instantaneous rate of green (IRG) according to methods described in Bischoff et al. (2012) <doi:10.1086/667590>. / GPL-3  | noarch  |
| <a href="#">r-irkernel</a>    | 0.8.15  | The R kernel for the ‘Jupyter’ environment executes R code which the front-end (‘Jupyter Notebook’ or other front-ends) submits to the kernel via the network. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-irlba</a>       | 2.3.3   | Fast and memory efficient methods for truncated singular value decomposition and principal components analysis of large sparse and dense matrices. / GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| Name                | Version    | Summary/License  | Platforms   |
|---------------------|------------|--|---|
| r-irr               | 0.84.1     | Coefficients of Interrater Reliability and Agreement for quantitative, ordinal and nominal data: ICC, Finn-Coefficient, Robinson's A, Kendall's W, Cohen's Kappa, ... / GPL-2  | noarch  |
| r-irtdemo           | 0.1.4      | Includes a collection of shiny applications to demonstrate or to explore fundamental item response theory (IRT) concepts such as estimation, scoring, and multidimensional IRT models. / GPL-2   | noarch  |
| r-irtrees           | 0.1.0      | Helper functions and example data sets accompanying De Boeck, P. and Partchev, I. (2012) IRTrees: Tree-Based Item Response Models of the GLMM Family, Journal of Statistical Software - Code Snippets, 48(1), 1-28. / GPL-2  | noarch  |
| r-isat              | 1.0.5      | Reads the output of the 'PerkinElmer InForm' software < <a href="http://www.perkinelmer.com/product/inform-cell-analysis-one-seat-cls135781">http://www.perkinelmer.com/product/inform-cell-analysis-one-seat-cls135781</a> >. In addition to cell-density count, it can derive statistics of intercellular spatial distance for each cell-type. / GPL-2   | noarch  |
| r-isco08conversions | 0.1.0      | Implementation of functions to assign corresponding common job prestige scores (SIOPS, ISEI), the official job or group title and the ISCO-88 code to given ISCO-08 codes. ISCO-08 is the latest version of the International Standard Classification of Occupations which is used to organise information on labour and jobs. / GPL-2   | noarch  |
| r-isdals            | 2.0_4      | Provides datasets for Introduction to Statistical Data Analysis for the Life Sciences / GPL-2  | noarch  |
| r-islr              | 1.2        | We provide the collection of data-sets used in the book 'An Introduction to Statistical Learning with Applications in R'. / GPL-2  | noarch  |
| r-ism               | 0.1.0      | The development of ISM was made by Warfield in 1974. ISM is the process of collaborating distinct or related essentials into a simplified and an organized format. Hence, ISM is a methodology that seeks the interrelationships among the various elements considered and endows with a hierarchical and multilevel structure. To run this package user needs to provide a matrix (VAXO) converted into 0's and 1's. Warfield,J.N. (1974) <doi:10.1109/TSMC.1974.5408524> Warfield,J.N. (1974, E-ISSN:2168-2909). / GPL-3 | noarch  |
| r-ismev             | 1.42       | Functions to support the computations carried out in 'An Introduction to Statistical Modeling of Extreme Values' by Stuart Coles. The functions may be divided into the following groups; maxima/minima, order statistics, peaks over thresholds and point processes. / GPL-2  | noarch  |
| r-isoci             | 1.1        | Some functions for confidence intervals for current status data based on transformations and bootstrap. / GPL-2  | noarch  |
| r-isocodes          | 2019.05.02 | language, territory, currency, script and character codes. Provides ISO 639 language codes, ISO 3166 territory codes, ISO 4217 currency codes, ISO 15924 script codes, and the ISO 8859 character codes as well as the UN M.49 area codes. / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-isopat            | 1.0        | The function calculates the isotopic pattern (fine structures) for a given chemical formula. / GPL-2   | noarch  |

Table 51 – continued from previous page

| Name                           | Version | Summary/License  | Platforms   |
|--------------------------------|---------|--|---|
| <a href="#">r-isoplotr</a>     | 3.0     | Plots U-Pb data on Wetherill and Tera-Wasserburg concordia diagrams. Calculates concordia and discordia ages. Performs linear regression of measurements with correlated errors using ‘York’, ‘Titterton’ and ‘Ludwig’ approaches. Generates Kernel Density Estimates (KDEs) and Cumulative Age Distributions (CADs). Produces Multidimensional Scaling (MDS) configurations and Shepard plots of multi-sample detrital datasets using the Kolmogorov-Smirnov distance as a dissimilarity measure. Calculates $^{40}\text{Ar}/^{39}\text{Ar}$ ages, isochrons, and age spectra. Computes weighted means accounting for overdispersion. Calculates U-Th-He (single grain and central) ages, logratio plots and ternary diagrams. Processes fission track data using the external detector method and LA-ICP-MS, calculates central ages and plots fission track and other data on radial (a.k.a. ‘Galbraith’) plots. Constructs total Pb-U, Pb-Pb, K-Ca, Re-Os, Sm-Nd, Lu-Hf, Rb-Sr and $^{230}\text{Th}$ -U isochrons as well as $^{230}\text{Th}$ -U evolution plots. / GPL-3 | noarch  |
| <a href="#">r-isotonic.pen</a> | 1.0     | Given a response $y$ and a one- or two-dimensional predictor, the isotonic regression estimator is calculated with the usual orderings. / GPL-2   GPL-3  | noarch  |
| <a href="#">r-isoweek</a>      | 0.6_2   | This is an substitute for the %V and %u formats which are not implemented on Windows. In addition, the package offers functions to convert from standard calender format yyyy-mm-dd to and from ISO 8601 week format yyyy-Www-d. / GPL-2   | noarch  |
| <a href="#">r-istacr</a>       | 0.1.0   | You can access to open data published in Instituto Canario De Estadística (IS-TAC) APIs at < <a href="https://www.gobiernodecanarias.org/istac/api/">https://www.gobiernodecanarias.org/istac/api/</a> >. / GPL-3  | noarch  |
| <a href="#">r-iswr</a>         | 2.0_7   | Data sets and scripts for text examples and exercises in P. Dalgaard (2008), ‘Introductory Statistics with R’, 2nd ed., Springer Verlag, ISBN 978-0387790534. / GPL-2  | noarch  |
| <a href="#">r-italy</a>        | 0.1.0   | Provides two record linkage data sets on the Italian Survey on Household and Wealth, 2008 and 2010, a sample survey conducted by the Bank of Italy every two years. The 2010 survey covered 13,702 individuals, while the 2008 survey covered 13,734 individuals. The following categorical variables are included in this data set: year of birth, working status, employment status, branch of activity, town size, geographical area of birth, sex, whether or not Italian national, and highest educational level obtained. Unique identifiers are available to assess the accuracy of one’s method. Please see Steorts (2015) <DOI:10.1214/15-BA965SI> to find more details about the data set. / CC0   | noarch  |
| <a href="#">r-iterators</a>    | 1.0.10  | Support for iterators, which allow a programmer to traverse through all the elements of a vector, list, or other collection of data. / Apache License (== 2.0)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name         | Version | Summary/License  | Platforms |
|--------------|---------|--|-----------|
| r-iterpc     | 0.4.1   | Iterator for generating permutations and combinations. They can be either drawn with or without replacement, or with distinct/ non-distinct items (multi-set). The generated sequences are in lexicographical order (dictionary order). The algorithms to generate permutations and combinations are memory efficient. These iterative algorithms enable users to process all sequences without putting all results in the memory at the same time. The algorithms are written in C/C for faster performance. Note: 'iterpc' is no longer being maintained. Users are recommended to switch to 'arrangements'. / GPL-2 | noarch    |
| r-itertools  | 0.1.3   | Various tools for creating iterators, many patterned after functions in the Python itertools module, and others patterned after functions in the 'snow' package. / GPL-2   | noarch    |
| r-itertools2 | 0.1.1   | A port of Python's excellent itertools module to R for efficient looping. / MIT  | noarch    |
| r-itop       | 1.0.2   | Infers a topology of relationships between different datasets, such as multi-omics and phenotypic data recorded on the same samples. We based this methodology on the RV coefficient (Robert & Escoufier, 1976, <doi:10.2307/2347233>), a measure of matrix correlation, which we have extended for partial matrix correlations and binary data (Aben et al., 2018, <doi:10.1101/293993>). / GPL-2   | noarch    |
| r-itsmr      | 1.9     | Provides functions for modeling and forecasting time series data. Forecasting is based on the innovations algorithm. A description of the innovations algorithm can be found in the textbook Introduction to Time Series and Forecasting by Peter J. Brockwell and Richard A. Davis. < <a href="http://www.springer.com/us/book/9781475777505">http://www.springer.com/us/book/9781475777505</a> >. / FreeBSD  | noarch    |
| r-itunesr    | 0.1.3   | To enable 'iOS' App Developers to access iTunes App Store Ratings and Reviews using R to extract Basic App Information and Reviews submitted by their App users, Since Apple Store does not provide this straightforward. / CC0  | noarch    |
| r-ivfixed    | 1.0     | Fit an Instrumental least square dummy variable model / Artistic-2.0   | noarch    |
| r-ivpanel    | 1.0     | Fit the instrumental panel data models: the fixed effects, random effects and between models. / GPL-3  | noarch    |
| r-ivprobit   | 1.1     | Compute the instrumental variables probit model using the Amemiya's Generalized Least Squares estimators (Amemiya, Takeshi, (1978) <doi: 10.2307/1911443>). / GPL-3  | noarch    |
| r-jaatha     | 3.2.1   | An estimation method that can use computer simulations to approximate maximum-likelihood estimates even when the likelihood function can not be evaluated directly. It can be applied whenever it is feasible to conduct many simulations, but works best when the data is approximately Poisson distributed. It was originally designed for demographic inference in evolutionary biology. It has optional support for conducting coalescent simulation using the 'coala' package. / GPL-3  | noarch    |
| r-jacpop     | 0.6     | Uses the Jaccard similarity index to account for population structure in sequencing studies. This method was specifically designed to detect population stratification based on rare variants, hence it will be especially useful in rare variant analysis. / GPL-3  | noarch    |

| Name          | Version | Summary/License  | Platforms   |
|---------------|---------|--|---|
| r-jaggr       | 0.1.1   | All the data and functions used to produce the book. We do not expect most people to use the package for any other reason than to get simple access to the ‘JAGS’ model files, the data, and perhaps run some of the simple examples. The authors of the book are David Lucy (now sadly deceased) and James Curran. It is anticipated that a manuscript will be provided to Taylor and Francis around February 2020, with bibliographic details to follow at that point. Until such time, further information can be obtained by emailing James Curran. / GPL-2  | noarch  |
| r-janeaustenr | 0.1.5   | Full texts for Jane Austen’s 6 completed novels, ready for text analysis. These novels are Sense and Sensibility, Pride and Prejudice, Mansfield Park, Emma, Northanger Abbey, and Persuasion. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-jcp         | 1.0     | Procedures for joint detection of changes in both expectation and variance in univariate sequences. Performs a statistical test of the null hypothesis of the absence of change points. In case of rejection performs an algorithm for change point detection. References - Bivariate change point detection (2019), Michael Messer. / GPL-3   | noarch  |
| r-jdmb        | 1.3     | Black-Scholes model [Black (1973) <doi:10.1086/260062>] is important to calculate option prices in the stock market and a variety of improved models are studied. In this package, I propose methods in order to calculate both Black-Scholes model and Jump diffusion model [Kou (2002) <doi:10.1287/mnsc.48.8.1086.166>] by Monte Carlo methods. This package can be used for computational finance. / GPL-2   | noarch  |
| r-jdx         | 0.1.3   | Simplifies and extends data exchange between ‘R’ and ‘Java’. / GPL-2   BSD_3_clause  | noarch  |
| r-jeeK        | 1.1.1   | Provides a fast and scalable joint estimator for integrating additional knowledge in learning multiple related sparse Gaussian Graphical Models (JEEK). The JEEK algorithm can be used to fast estimate multiple related precision matrices in a large-scale. For instance, it can identify multiple gene networks from multi-context gene expression datasets. By performing data-driven network inference from high-dimensional and heterogeneous data sets, this tool can help users effectively translate aggregated data into knowledge that take the form of graphs among entities. Please run demo(jeeK) to learn the basic functions provided by this package. For further details, please read the original paper: Beilun Wang, Arshdeep Sekhon, Yanjun Qi A Fast and Scalable Joint Estimator for Integrating Additional Knowledge in Learning Multiple Related Sparse Gaussian Graphical Models (ICML 2018) <arXiv:1806.00548>. / GPL-2 | noarch  |
| r-jenkins     | 1.0     | Manage jobs and builds on your Jenkins CI server < <a href="https://jenkins.io/">https://jenkins.io/</a> >. Create and edit projects, schedule builds, manage the queue, download build logs, and much more. / MIT   | noarch  |
| r-jetpack     | 0.4.3   | Manage project dependencies from your DESCRIPTION file. Create a reproducible virtual environment with minimal additional files in your project. Provides tools to add, remove, and update dependencies as well as install existing dependencies with a single function. / MIT   | noarch  |

| Name         | Version | Summary/License   | Platforms |
|--------------|---------|---|-----------|
| r-jgl        | 2.3.1   | The Joint Graphical Lasso is a generalized method for estimating Gaussian graphical models/ sparse inverse covariance matrices/ biological networks on multiple classes of data. We solve JGL under two penalty functions: The Fused Graphical Lasso (FGL), which employs a fused penalty to encourage inverse covariance matrices to be similar across classes, and the Group Graphical Lasso (GGL), which encourages similar network structure between classes. FGL is recommended over GGL for most applications. Reference: Danaher P, Wang P, Witten DM. (2013) <doi:10.1111/rssb.12033>. / GPL-2  | noarch    |
| r-jiebard    | 0.1     | jiebaR is a package for Chinese text segmentation, keyword extraction and speech tagging. This package provides the data files required by jiebaR. / MIT  | noarch    |
| r-jjb        | 0.1.0   | Set of common functions used for manipulating colors, detecting and interacting with 'RStudio', modeling, formatting, determining users' operating system, feature scaling, and more! / GPL-2   | noarch    |
| r-jlctree    | 0.0.1   | Implements the tree-based approach to joint modeling of time-to-event and longitudinal data. This approach looks for a tree-based partitioning such that within each estimated latent class defined by a terminal node, the time-to-event and longitudinal responses display a lack of association. See Zhang and Simonoff (2018) <arXiv:1812.01774>. / GPL-3   | noarch    |
| r-jm         | 1.4_8   | Shared parameter models for the joint modeling of longitudinal and time-to-event data. / GPL-2  | noarch    |
| r-jmdesign   | 1.1     | Performs power calculations for joint modeling of longitudinal and survival data with k-th order trajectories when the variance-covariance matrix, Sigma_theta, is unknown. / GPL-2   | noarch    |
| r-jmetrik    | 1.1     | The main purpose of this package is to make it easy for userR's to interact with 'jMetrik' an open source application for psychometric analysis. For example it allows userR's to write data frames to file in a format that can be used by 'jMetrik'. It also allows userR's to read *.jmetrik files (e.g. output from an analysis) for follow-up analysis in R. The *.jmetrik format is a flat file that includes a multiline header and the data as comma separated values. The header includes metadata about the file and one row per variable with the following information in each row: variable name, data type, item scoring, special data codes, and variable label. / GPL-3 | noarch    |
| r-jmisc      | 0.3.1   | Some handy function in R / GPL-2  | noarch    |
| r-jmuoutlier | 2.2     | Performs a permutation test on the difference between two location parameters, a permutation correlation test, a permutation F-test, the Siegel-Tukey test, a ratio mean deviance test. Also performs some graphing techniques, such as for confidence intervals, vector addition, and Fourier analysis; and includes functions related to the Laplace (double exponential) and triangular distributions. Performs power calculations for the binomial test. / GPL-3  | noarch    |
| r-jmvc       | 1.0.0   | A framework for creating rich interactive analyses for the jamovi platform (see < <a href="https://www.jamovi.org">https://www.jamovi.org</a> > for more information). / GPL-2  | noarch    |
| r-johnson    | 1.4     | RE.Johnson performs the Johnson Transformation to increase the normality. / GPL-2   | noarch    |

|-----------------------------|---------|---|--|
| <a href="#">r-joint.cox</a> | 3.5     | Perform likelihood estimation and dynamic prediction under joint frailty-copula models for tumour progression and death in meta-analysis. A penalized likelihood method is employed for estimating model parameters, where the baseline hazard functions are modeled by smoothing splines. The methods are applicable for meta-analytic data combining several studies. The methods can analyze data having information on both terminal event time (e.g., time-to-death) and non-terminal event time (e.g., time-to-tumour progression). See Emura et al. (2017) <doi:10.1177/0962280215604510> for likelihood estimation, and Emura et al. (2018) <doi:10.1177/0962280216688032> for dynamic prediction. More details on these methods can also be found in a book of Emura et al. (2019) <10.1007/978-981-13-3516-7>. Survival data from ovarian cancer patients are also available. / GPL-2 | noarch   |
| <a href="#">r-jointnmix</a> | 1.0     | Fits univariate and joint N-mixture models for data on two unmarked site-associated species. Includes functions to estimate latent abundances through empirical Bayes methods. / GPL-2  | noarch   |
| <a href="#">r-jointpm</a>   | 2.3.1   | A bivariate integration method to estimate risk caused by two extreme and dependent forcing variables. / GPL-2  | noarch   |
| <a href="#">r-josae</a>     | 0.3.0   | Implementation of some unit and area level EBLUP estimators as well as the estimators of their MSE also under heteroscedasticity. The package further documents the publications Breidenbach and Astrup (2012) <DOI:10.1007/s10342-012-0596-7>, Breidenbach et al. (2016) <DOI:10.1016/j.rse.2015.07.026> and Breidenbach et al. (2018 in press). The vignette further explains the use of the implemented functions. / GPL-2   | noarch   |
| <a href="#">r-josaplay</a>  | 0.1.3   | Josa in Korean is often determined by judging the previous word. When writing reports using Rmd, a function that prints the appropriate investigation for each case is helpful. The ‘josaplay’ package then evaluates the previous word to determine which josa is appropriate. / MIT   | noarch   |
| <a href="#">r-jose</a>      | 1.0     | Read and write JSON Web Keys (JWK, rfc7517), generate and verify JSON Web Signatures (JWS, rfc7515) and encode/decode JSON Web Tokens (JWT, rfc7519). These standards provide modern signing and encryption formats that are the basis for services like OAuth 2.0 or LetsEncrypt and are natively supported by browsers via the JavaScript WebCryptoAPI. / MIT   | noarch   |
| <a href="#">r-jpeg</a>      | 0.1.8   | This package provides an easy and simple way to read, write and display bitmap images stored in the JPEG format. It can read and write both files and in-memory raw vectors. / GPL-2   GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-jpen</a>      | 1.0     | A Joint PENalty Estimation of Covariance and Inverse Covariance Matrices. / GPL-2   | noarch   |
| <a href="#">r-jrc</a>       | 0.1.1   | An ‘httpuv’ based bridge between R and ‘JavaScript’. Provides an easy way to exchange commands and data between a web page and a currently running R session. / GPL-3   | noarch   |

| Name                         | Version | Summary/License  | Platforms  |
|------------------------------|---------|--|--|
| <a href="#">r-jrich</a>      | 0.60.3  | These functions calculate the taxonomic measures presented in Miranda-Esquivel (2016). The package introduces Jack-knife resampling in evolutionary distinctiveness prioritization analysis, as a way to evaluate the support of the ranking in area prioritization, and the persistence of a given area in a conservation analysis. The algorithm is described in: Miranda-Esquivel, D (2016) <DOI:10.1007/978-3-319-22461-9_11>. / GPL-3   | noarch   |
| <a href="#">r-jrvfinance</a> | 1.4.1   | Implements the basic financial analysis functions similar to (but not identical to) what is available in most spreadsheet software. This includes finding the IRR and NPV of regularly spaced cash flows and annuities. Bond pricing and YTM calculations are included. In addition, Black Scholes option pricing and Greeks are also provided. / GPL-2  | noarch   |
| <a href="#">r-json64</a>     | 0.1.3   | Encode/Decode 'base64', with support for JSON format, using two functions: <code>j_encode()</code> and <code>j_decode()</code> . 'Base64' is a group of similar binary-to-text encoding schemes that represent binary data in an ASCII string format by translating it into a radix-64 representation, used when there is a need to encode binary data that needs to be stored and transferred over media that are designed to deal with textual data, ensuring that the data will remain intact and without modification during transport. < <a href="https://developer.mozilla.org/en-US/docs/Web/API/WindowBase64/Base64_encoding_and_decoding">https://developer.mozilla.org/en-US/docs/Web/API/WindowBase64/Base64_encoding_and_decoding</a> > On the other side, JSON (JavaScript Object Notation) is a lightweight data-interchange format. Easy to read, write, parse and generate. It is based on a subset of the JavaScript Programming Language. JSON is a text format that is completely language independent but uses conventions that are familiar to programmers of the C-family of languages, including C, C#, Java, JavaScript, Perl, Python, and many others. JSON structure is built around name:value pairs and ordered list of values. < <a href="https://www.json.org">https://www.json.org</a> > The first function, <code>j_encode()</code> , let you transform a data.frame or list to a 'base64' encoded JSON (or JSON string). The <code>j_decode()</code> function takes a 'base64' string (could be an encoded JSON) and transform it to a data.frame (or list, depending of the JSON structure). / MIT | noarch   |
| <a href="#">r-jsonarr</a>    | 1.1.1   | This package enables users to access MongoDB by running queries and returning their results in R data frames. Usually, data in MongoDB is only available in the form of a JSON document. jSonarR uses data processing and conversion capabilities in the jSonar Analytics Platform and the JSON Studio Gateway ( <a href="http://www.jsonstudio.com">http://www.jsonstudio.com</a> ), to convert it to a tabular format which is easy to use with existing R packages. / AGPL-3  | noarch   |
| <a href="#">r-jsonlite</a>   | 1.6     | A fast JSON parser and generator optimized for statistical data and the web. Started out as a fork of 'RJSONIO', but has been completely rewritten in recent versions. The package offers flexible, robust, high performance tools for working with JSON in R and is particularly powerful for building pipelines and interacting with a web API. The implementation is based on the mapping described in the vignette (Ooms, 2014). In addition to converting JSON data from/to R objects, 'jsonlite' contains functions to stream, validate, and prettify JSON data. The unit tests included with the package verify that all edge cases are encoded and decoded consistently for use with dynamic data in systems and applications. / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-jstree</a>     | 1.0.1   | Create and customize interactive trees using the 'jQuery' 'jsTree' < <a href="https://www.jstree.com/">https://www.jstree.com/</a> > plugin library and the 'htmlwidgets' package. These trees can be used directly from the R console, from 'RStudio', in Shiny apps and R Markdown documents. / GPL-2   GPL-3  | noarch   |

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms |
|-----------------------------|---------|---|-----------|
| <a href="#">r-jtrans</a>    | 0.2.1   | Transforming univariate non-normal data to normality using Johnson families of distributions. Johnson family is a comprehensive distribution family that accommodates many kinds of non-normal distributions. A bunch of distributions with various parameters will be fit and the corresponding p-values under a user-specified normality test will be given. The final transformation will be the one with the largest p-value under the given normality test. / GPL-2  | noarch    |
| <a href="#">r-julia</a>     | 1.1     | Generates image data for fractals (Julia and Mandelbrot sets) on the complex plane in the given region and resolution. / GPL-3  | noarch    |
| <a href="#">r-junr</a>      | 0.1.3   | The ‘Junar’ API is a commercial platform to organize and publish data < <a href="http://www.junar.com">http://www.junar.com</a> >. It has been used in a number of national and local government Open Data initiatives in Latin America and the USA. This package is a wrapper to make it easier to access data made public through the ‘Junar’ API. / MIT  | noarch    |
| <a href="#">r-jvcoords</a>  | 1.0.2   | Provides functions to standardize and whiten data, and to perform Principal Component Analysis (PCA). The main advantage of this package over alternatives like prcomp() is, that jvcoords makes it easy to convert (additional) data between the original and the transformed coordinates. The package also provides a class coords, which can represent affine coordinate transformations. This class forms the basis of the transformations provided by the package, but can also be used independently. The implementation has been optimized to be of comparable speed (and sometimes even faster) than existing alternatives. / GPL-3   | noarch    |
| <a href="#">r-jvnvar</a>    | 1.0     | Many method to compute, predict and back-test VaR. For more detail, see the report: Value at Risk < <a href="http://researchgate.net">researchgate.net</a> >. / GPL-3   | noarch    |
| <a href="#">r-kader</a>     | 0.0.8   | Implementation of various kernel adaptive methods in nonparametric curve estimation like density estimation as introduced in Stute and Srihera (2011) < <a href="https://doi.org/10.1016/j.spl.2011.01.013">doi:10.1016/j.spl.2011.01.013</a> > and Eichner and Stute (2013) < <a href="https://doi.org/10.1016/j.jspi.2012.03.011">doi:10.1016/j.jspi.2012.03.011</a> > for pointwise estimation, and like regression as described in Eichner and Stute (2012) < <a href="https://doi.org/10.1080/10485252.2012.760737">doi:10.1080/10485252.2012.760737</a> >. / GPL-3  | noarch    |
| <a href="#">r-kaphom</a>    | 0.3     | Tests the homogeneity of intraclass kappa statistics obtained from independent studies or a stratified study with binary results. It is desired to compare the kappa statistics obtained in multi-center studies or in a single stratified study to give a common or summary kappa using all available information. If the homogeneity test of these kappa statistics is not rejected, then it is possible to make inferences over a single kappa statistic that summarizes all the studies. Muammer Albayrak, Kemal Turhan, Yasemin Yavuz, Zeliha Aydin Kasap (2019) < <a href="https://doi.org/10.1080/03610918.2018.1538457">doi:10.1080/03610918.2018.1538457</a> > Jun-mo Nam (2003) < <a href="https://doi.org/10.1111/j.0006-341X.2003.00118.x">doi:10.1111/j.0006-341X.2003.00118.x</a> > Jun-mo Nam (2005) < <a href="https://doi.org/10.1002/sim.2321">doi:10.1002/sim.2321</a> > Mousumi Banerjee, Michelle Capozzoli, Laura McSweeney, Debajyoti Sinha (1999) < <a href="https://doi.org/10.2307/3315487">doi:10.2307/3315487</a> > Allan Donner, Michael Eliasziw, Neil Klar (1996) < <a href="https://doi.org/10.2307/2533154">doi:10.2307/2533154</a> >. / GPL-3 | noarch    |
| <a href="#">r-kappasize</a> | 1.2     | Contains basic tools for sample size estimation in studies of interobserver/interrater agreement (reliability). Includes functions for both the power-based and confidence interval-based methods, with binary or multinomial outcomes and two through six raters. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name       | Version | Summary/License  | Platforms  |
|------------|---------|--|--|
| r-kdensity | 1.0.1   | Handles univariate non-parametric density estimation with parametric starts and asymmetric kernels in a simple and flexible way. Kernel density estimation with parametric starts involves fitting a parametric density to the data before making a correction with kernel density estimation, see Hjort & Glad (1995) <doi:10.1214/aos/1176324627>. Asymmetric kernels make kernel density estimation more efficient on bounded intervals such as (0, 1) and the positive half-line. Supported asymmetric kernels are the gamma kernel of Chen (2000) <doi:10.1023/A:1004165218295>, the beta kernel of Chen (1999) <doi:10.1016/S0167-9473(99)00010-9>, and the copula kernel of Jones & Henderson (2007) <doi:10.1093/biomet/asm068>. User-supplied kernels, parametric starts, and bandwidths are supported. / MIT | noarch   |
| r-kdist    | 0.2     | Density, distribution function, quantile function and random generation for the K-distribution. A plotting function that plots data on Weibull paper and another function to draw additional lines. See results from package in T Lamont-Smith (2018), submitted J. R. Stat. Soc. / GPL-3  | noarch   |
| r-kedd     | 1.0.3   | Smoothing techniques and computing bandwidth selectors of the nth derivative of a probability density for one-dimensional data. / GPL-2  | noarch   |
| r-keep     | 1.0     | Provides arrays with flexible control over dimension dropping when subscripting. / GPL-3   | noarch   |
| r-kendl    | 1.1     | Calculate the kernel-smoothed nonparametric estimator for the exposure distribution in presence of detection limits. / GPL-2   | noarch   |
| r-keras    | 2.2.4   | Interface to ‘Keras’ < <a href="https://keras.io">https://keras.io</a> >, a high-level neural networks ‘API’. ‘Keras’ was developed with a focus on enabling fast experimentation, supports both convolution based networks and recurrent networks (as well as combinations of the two), and runs seamlessly on both ‘CPU’ and ‘GPU’ devices. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-64 |
| r-kerasr   | 0.6.1   | Provides a consistent interface to the ‘Keras’ Deep Learning Library directly from within R. ‘Keras’ provides specifications for describing dense neural networks, convolution neural networks (CNN) and recurrent neural networks (RNN) running on top of either ‘TensorFlow’ or ‘Theano’. Type conversions between Python and R are automatically handled correctly, even when the default choices would otherwise lead to errors. Includes complete R documentation and many working examples. / LGPL-2   | noarch   |
| r-kernlab  | 0.9_2   | Kernel-based machine learning methods for classification, regression, clustering, novelty detection, quantile regression and dimensionality reduction. Among other methods ‘kernlab’ includes Support Vector Machines, Spectral Clustering, Kernel PCA, Gaussian Processes and a QP solver. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-kernscr  | 1.0.5   | Kernel Machine Score Test for Pathway Analysis in the Presence of Semi-Competing Risks. Method is detailed in: Neykov, Hejblum & Sinnott (2018) <doi: 10.1177/0962280216653427>. / GPL-2   | noarch   |

Table 51 – continued from previous page

| Name         | Version | Summary/License   | Platforms  |
|--------------|---------|---|--|
| r-kernsmooth | 2.23    | Functions for kernel smoothing (and density estimation) corresponding to the book: Wand, M.P. and Jones, M.C. (1995) Kernel Smoothing. / Unlimited  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-keyring    | 0.4.0   | Decrypts passwords stored in the Gnome Keyring, macOS Keychain and strings encrypted with the Windows Data Protection API. / MIT  | noarch   |
| r-kfda       | 1.0.0   | Kernel Fisher Discriminant Analysis (KFDA) is performed using Kernel Principal Component Analysis (KPCA) and Fisher Discriminant Analysis (FDA). There are some similar packages. First, 'lfda' is a package that performs Local Fisher Discriminant Analysis (LFDA) and performs other functions. In particular, 'lfda' seems to be impossible to test because it needs the label information of the data in the function argument. Also, the 'ks' package has a limited dimension, which makes it difficult to analyze properly. This package is a simple and practical package for KFDA based on the paper of Yang, J., Jin, Z., Yang, J. Y., Zhang, D., and Frangi, A. F. (2004) <DOI:10.1016/j.patcog.2003.10.015>. / GPL-3  | noarch   |
| r-kfigr      | 1.2     | A streamlined cross-referencing system for R Markdown documents generated with 'knitr'. R Markdown is an authoring format for generating dynamic content from R. 'kfigr' provides a hook for anchoring code chunks and a function to cross-reference document elements generated from said chunks, e.g. figures and tables. / GPL-3   | noarch   |
| r-kgc        | 1.0.0   | Aids in identifying the Koeppen-Geiger (KG) climatic zone for a given location. The Koeppen-Geiger climate zones were first published in 1884, as a system to classify regions of the earth by their relative heat and humidity through the year, for the benefit of human health, plant and agriculture and other human activity [1]. This climate zone classification system, applicable to all of the earth's surface, has continued to be developed by scientists up to the present day. Recently one of use (FZ) has published updated, higher accuracy KG climate zone definitions [2]. In this package we use these updated high-resolution maps as the data source [3]. We provide functions that return the KG climate zone for a given longitude and latitude, or for a given United States zip code. In addition the CZUncertainty() function will check climate zones nearby to check if the given location is near a climate zone boundary. In addition an interactive shiny app is provided to define the KG climate zone for a given longitude and latitude, or United States zip code. Digital data, as well as animated maps, showing the shift of the climate zones are provided on the following website < <a href="http://koeppen-geiger.vu-wien.ac.at">http://koeppen-geiger.vu-wien.ac.at</a> >. This work was supported by the DOE-EERE SunShot award DE-EE-0007140. [1] W. Koeppen, (2011) <doi:10.1127/0941-2948/2011/105>. [2] F. Rubel and M. Kottek, (2010) <doi:10.1127/0941-2948/2010/0430>. [3] F. Rubel, K. Brugger, K. Haslinger, and I. Auer, (2016) <doi:10.1127/metz/2016/0816>. / BSD_2_clause | noarch   |

| Name                           | Version    | Summary/License   | Platforms |
|--------------------------------|------------|---|-----------|
| <a href="#">r-kidney.epi</a>   | 1.1.0      | Contains kidney care oriented functions. Current version contains only function for calculation of Kidney Donor Risk Index and Kidney Donor Profile Index for kidney transplant donors by Rao et al. (2009) <doi:10.1097/TP.0b013e3181ac620b>. Citation: Bikbov B. R open source programming code for calculation of the Kidney Donor Profile Index and Kidney Donor Risk Index. Kidney Diseases (2018) <doi:10.1159/000492427>. / LGPL-2   | noarch    |
| <a href="#">r-kimisc</a>       | 0.4        | A collection of useful functions not found anywhere else, mainly for programming: Pretty intervals, generalized lagged differences, checking containment in an interval, and an alternative interface to assign(). / GPL-3  | noarch    |
| <a href="#">r-kin.cohort</a>   | 0.7        | Analysis of kin-cohort studies. kin.cohort provides estimates of age-specific cumulative risk of a disease for carriers and noncarriers of a mutation. The cohorts are retrospectively built from relatives of probands for whom the genotype is known. Currently the method of moments and marginal maximum likelihood are implemented. Confidence intervals are calculated from bootstrap samples. Most of the code is a translation from previous ‘MATLAB’ code by N. Chatterjee. / GPL-2  | noarch    |
| <a href="#">r-kinship2</a>     | 1.8.4      | Routines to handle family data with a pedigree object (2014, <doi: 10.1159/000363105>). The initial purpose was to create correlation structures that describe family relationships such as kinship and identity-by-descent, which can be used to model family data in mixed effects models, such as in the coxme function. Also includes a tool for pedigree drawing which is focused on producing compact layouts without intervention. Recent additions include utilities to trim the pedigree object with various criteria, and kinship for the X chromosome. / GPL-2 | noarch    |
| <a href="#">r-kirby21.base</a> | 1.7.0      | Multi-modal magnetic resonance imaging (‘MRI’) data from the ‘Kirby21’ ‘reproducibility’ study < <a href="https://www.nitrc.org/projects/multimodal/">https://www.nitrc.org/projects/multimodal/</a> >, including functional and structural imaging. / GPL-2  | noarch    |
| <a href="#">r-klin</a>         | 2007.06.05 | The package implements efficient ways to evaluate and solve equations of the form $Ax=b$ , where A is a kronecker product of matrices. Functions to solve least squares problems of this type are also included. / GPL-2  | noarch    |
| <a href="#">r-klustr</a>       | 0.1.0      | Used to create dynamic, interactive ‘D3.js’ based parallel coordinates and principal component plots in ‘R’. The plots make visualizing k-means or other clusters simple and informative. / GPL-3   | noarch    |
| <a href="#">r-km.ci</a>        | 0.5_2      | Computes various confidence intervals for the Kaplan-Meier estimator, namely: Petos CI, Rothman CI, CI’s based on Greenwoods variance, Thomas and Grunkemeier CI and the simultaneous confidence bands by Nair and Hall and Wellner. / GPL-2  | noarch    |
| <a href="#">r-kmconfband</a>   | 0.1        | Computes and plots an exact nonparametric band for any user-specified level of confidence from a single-sample survfit object / GPL-2   | noarch    |
| <a href="#">r-kmda</a>         | 1.0        | Compute p-values of metabolite differential expression analysis using the kernel-based approach. / GPL-3  | noarch    |
| <a href="#">r-kmlcov</a>       | 1.0.1      | ‘kmlcov’ Cluster longitudinal data using the likelihood as a metric of distance. The generalised linear model allow the user to introduce covariates with different level effects (2 levels). / GPL-2   | noarch    |

Continued on next page

Table 51 – continued from previous page

| Name               | Version | Summary/License  | Platforms   |
|--------------------|---------|--|---|
| r-kmodr            | 0.1.0   | An implementation of the ‘k-means-’ algorithm proposed by Chawla and Gionis, 2013 in their paper, k-means- : A unified approach to clustering and outlier detection. SIAM International Conference on Data Mining (SDM13), and using ‘ordering’ described by Howe, 2013 in the thesis, Clustering and anomaly detection in tropical cyclones. Useful for creating (potentially) tighter clusters than standard k-means and simultaneously finding outliers inexpensively in multidimensional space. / GPL-3  | noarch  |
| r-kmsurv           | 0.1_5   | Data sets and functions for Klein and Moeschberger (1997), Survival Analysis, Techniques for Censored and Truncated Data, Springer. / GPL-3  | noarch  |
| r-knapsacksampling | 0.1.0   | The <code>sampl.mcmc()</code> function creates samples of the feasible region of a knapsack problem with both equalities and inequalities constraints. / GPL-2   | noarch  |
| r-knitlatex        | 0.9.0   | Provides several helper functions for working with ‘knitr’ and ‘LaTeX’. It includes ‘xTab’ for creating traditional ‘LaTeX’ tables, ‘lTab’ for generating ‘longtable’ environments, and ‘sTab’ for generating a ‘supertabular’ environment. Additionally, this package contains a <code>knitr_setup()</code> function which fixes a well-known bug in ‘knitr’, which distorts the ‘ <code>results=asis</code> ’ command when used in conjunction with user-defined commands; and a <code>com</code> command ( <code>&lt;&lt;com=TRUE&gt;&gt;=</code> ) which renders the output from ‘knitr’ as a ‘LaTeX’ command. / GPL-3 | noarch  |
| r-knitr            | 1.22    | Provides a general-purpose tool for dynamic report generation in R using Literate Programming techniques. / GPL  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-knitrbootstrap   | 1.0.2   | A framework to create Bootstrap <a href="http://getbootstrap.com/">http://getbootstrap.com/</a> HTML reports from ‘knitr’ ‘rmarkdown’. / MIT   | noarch  |
| r-knitrprogressbar | 1.1.0   | Provides a progress bar similar to ‘dplyr’ that can write progress out to a variety of locations, including <code>stdout()</code> , <code>stderr()</code> , or from <code>file()</code> . Useful when using ‘knitr’ or ‘rmarkdown’, and you still want to see progress of calculations in the terminal. / MIT  | noarch  |
| r-knnngarden       | 1.0.1   | Multi-distance based k-Nearest Neighbors Classification with K Threshold Value Check and Same K_i Problem Dealing, Missing Observations Filling / GPL-2  | noarch  |
| r-knnindep         | 2.0     | This package provides the implementation of an exact formula of the <i>i</i> th nearest neighbour distance distribution and implementations of tests of independence based on that formula. Furthermore the package provides a general framework to benchmark tests of independence. / GPL-3   | noarch  |
| r-knoema           | 0.1.16  | Using this package, users can access to the largest collection of public data and statistics on the Internet featuring about 2.5 billion time series from thousands of sources collected in ‘Knoema’ repository and use rich R calculations in order to analyze the data. Because data in ‘Knoema’ is time series data, ‘Knoema’ function offers data in a number of formats usable in R such as ‘ts’, ‘xts’ or ‘zoo’. For more information about ‘Knoema’ API go to <a href="https://knoema.com/dev/docs">https://knoema.com/dev/docs</a> . / MIT   | noarch  |

Table 51 – continued from previous page

| Name         | Version | Summary/License   | Platforms  |
|--------------|---------|---|--|
| r-knotr      | 1.0_2   | Makes nice pictures of knots using Bezier curves and numerical optimization. / GPL-2  | noarch   |
| r-kofdata    | 0.1.3   | Read Swiss time series data from the ‘KOF Datenservice’ API, < <a href="https://datenservice.kof.ethz.ch">https://datenservice.kof.ethz.ch</a> >. The API provides macroeconomic survey data, business cycle and further macro economic time series about Switzerland. The package itself is a set of wrappers around the ‘KOF Datenservice’ API. The ‘kofdata’ package is able to consume public information as well as data that requires an API token. / GPL-2   | noarch   |
| r-kofnga     | 1.3     | Provides a function that uses a genetic algorithm to search for a subset of size k from the integers 1:n, such that a user-supplied objective function is minimized at that subset. The selection step is done by tournament selection based on ranks, and elitism may be used to retain a portion of the best solutions from one generation to the next. Population objective function values may optionally be evaluated in parallel. / GPL-2   | noarch   |
| r-kohonen    | 3.0.8   | Functions to train self-organising maps (SOMs). Also interrogation of the maps and prediction using trained maps are supported. The name of the package refers to Teuvo Kohonen, the inventor of the SOM. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-komadown   | 0.2.0   | R Markdown templates based on the ‘KOMA-Script’ classes for LaTeX, additionally offering cross-referencing via the ‘bookdown’ package. / GPL-3  | noarch   |
| r-komaletter | 0.3.1   | An R Markdown template for writing beautiful yet versatile letters, using the ‘KOMA-Script’ letter class ‘scrlltr2’ and an adaptation of the ‘pandoc-letter’ template. ‘scrlltr2’ provides layouts for many different window envelope types and the possibility to define your own. / GPL-3   | noarch   |
| r-kpart      | 1.2.2   | Cubic spline fitting along with knot selection, includes support for additional variables. / GPL-2  | noarch   |
| r-kpeaks     | 0.1.0   | The input argument k which is the number of clusters is needed to start all of the partitioning clustering algorithms. In unsupervised learning applications, an optimal value of this argument is widely determined by using the internal validity indexes. Since these indexes suggest a k value which is computed on the clustering results after several runs of a clustering algorithm they are computationally expensive. On the contrary, ‘kpeaks’ enables to estimate k before running any clustering algorithm. It is based on a simple novel technique using the descriptive statistics of peak counts of the features in a data set. / GPL-2 | noarch   |
| r-kpmt       | 0.1.0   | Functions that implement the known population median test. / MIT  | noarch   |
| r-kpodclustr | 1.0     | The kpodclustr package implements the k-POD method for clustering partially observed data. / MIT  | noarch   |
| r-kriens     | 0.1     | Provides basic functions for Continuation-Passing Style development. / BSD_3_clause   | noarch   |
| r-krige      | 0.2_1   | Estimates kriging models for geographical point-referenced data. Method is described in Monogan and Gill (2016) <doi:10.1017/psrm.2015.5>. / GPL-2  | noarch   |

Table 51 – continued from previous page

| Name           | Version | Summary/License  | Platforms |
|----------------|---------|--|-----------|
| r-krls         | 1.0_0   | Package implements Kernel-based Regularized Least Squares (KRLS), a machine learning method to fit multidimensional functions $y=f(x)$ for regression and classification problems without relying on linearity or additivity assumptions. KRLS finds the best fitting function by minimizing the squared loss of a Tikhonov regularization problem, using Gaussian kernels as radial basis functions. For further details see Hainmueller and Hazlett (2014). / GPL-2  | noarch    |
| r-krm          | 1.0     | Solves kernel ridge regression, within the the mixed model framework, for the linear, polynomial, Gaussian, Laplacian and ANOVA kernels. The model components (i.e. fixed and random effects) and variance parameters are estimated using the expectation-maximization (EM) algorithm. All the estimated components and parameters, e.g. BLUP of dual variables and BLUP of random predictor effects for the linear kernel (also known as RR-BLUP), are available. The kernel ridge mixed model (KRMM) is described in Jacquin L, Cao T-V and Ahmadi N (2016) A Unified and Comprehensible View of Parametric and Kernel Methods for Genomic Prediction with Application to Rice. Front. Genet. 7:145. <doi:10.3389/fgene.2016.00145>. / GPL-2   GPL-3 | noarch    |
| r-ksd          | 1.0.0   | An adaptation of Kernelized Stein Discrepancy, this package provides a goodness-of-fit test of whether a given i.i.d. sample is drawn from a given distribution. It works for any distribution once its score function (the derivative of log-density) can be provided. This method is based on A Kernelized Stein Discrepancy for Goodness-of-fit Tests and Model Evaluation by Liu, Lee, and Jordan, available at < <a href="http://arxiv.org/abs/1602.03253">http://arxiv.org/abs/1602.03253</a> >. / MIT   | noarch    |
| r-kseaapp      | 0.99.0  | Infers relative kinase activity from phosphoproteomics data using the method described by Casado et al. (2013) <doi:10.1126/scisignal.2003573>. / MIT  | noarch    |
| r-kselection   | 0.2.0   | Selection of k in k-means clustering based on Pham et al. paper “Selection of k in k-means clustering”. / GPL-3  | noarch    |
| r-kstatistics  | 1.0     | Methods and tools for estimate (joint) cumulants of a given population distribution using (multivariate) k-statistics and (multivariate) polykays, symmetric unbiased estimators with minimum variance. For more details see Di Nardo E., Guarino G., Senato D. (2009) <arXiv:0807.5008>. / GPL-3  | noarch    |
| r-kstmatrix    | 0.1_2   | Knowledge space theory by Doignon and Falmagne (1999) <doi:10.1007/978-3-642-58625-5> is a set- and order-theoretical framework, which proposes mathematical formalisms to operationalize knowledge structures in a particular domain. The ‘kstMatrix’ package provides basic functionalities to generate, handle, and manipulate knowledge structures and knowledge spaces. Opposed to the ‘kst’ package, ‘kstMatrix’ uses matrix representations for knowledge structures. Furthermore, ‘kstMatrix’ contains several knowledge spaces developed by the research group around Cornelia Dowling through querying experts. / GPL-3  | noarch    |
| r-kuiper.2samp | 1.0     | This function performs the two-sample Kuiper test to assess the anomaly of continuous, one-dimensional probability distributions. References used for this method are (1). Kuiper, N. H. (1960). <DOI:10.1016/S1385-7258(60)50006-0> and (2). Paltani, S. (2004). <DOI:10.1051/0004-6361:20034220>. / AGPL-3   | noarch    |
| r-kulife       | 0.1_1   | Provides various functions and data sets from experiments at the Faculty of Life Sciences, University of Copenhagen. This package will be discontinued and archived, and the functions and datasets will be maintained and updated in the MESS package / GPL-2   | noarch    |
| r-kzs          | 1.4     | A spatial smoothing algorithm based on convolutions of finite rectangular kernels that provides sharp resolution in the presence of high levels of noise. / GPL-2  | noarch    |

| Name                              | Version | Summary/License   | Platforms   |
|-----------------------------------|---------|---|---|
| <a href="#">r-l2boost</a>         | 1.0.1   | Efficient implementation of Friedman’s boosting algorithm with l2-loss function and coordinate direction (design matrix columns) basis functions. / GPL-2   | noarch  |
| <a href="#">r-label.switching</a> | 1.8     | The Bayesian estimation of mixture models (and more general hidden Markov models) suffers from the label switching phenomenon, making the MCMC output non-identifiable. This package can be used in order to deal with this problem using various relabelling algorithms. / GPL-2   | noarch  |
| <a href="#">r-labeledloop</a>     | 0.1     | Support labeled loop and escape from nested loop / MIT  | noarch  |
| <a href="#">r-labeling</a>        | 0.3     | Provides a range of axis labeling algorithms / MIT file LICENSE   Unlimited   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-labelvector</a>     | 0.1.0   | Labels are a common construct in statistical software providing a human readable description of a variable. While variable names are succinct, quick to type, and follow a language’s naming conventions, labels may be more illustrative and may use plain text and spaces. R does not provide native support for labels. Some packages, however, have made this feature available. Most notably, the ‘Hmisc’ package provides labelling methods for a number of different object. Due to design decisions, these methods are not all exported, and so are unavailable for use in package development. The ‘labelVector’ package supports labels for atomic vectors in a light-weight design that is suitable for use in other packages. / MIT | noarch  |
| <a href="#">r-labrs</a>           | 0.1.0   | Dati, scripts e funzioni per il libro Ricerca sociale con R. Concetti e funzioni base per la ricerca sociale (Datasets, scripts and functions to support the book Ricerca sociale con R. Concetti e funzioni base per la ricerca sociale). / GPL-3  | noarch  |
| <a href="#">r-labstatr</a>        | 1.0.9   | Insieme di funzioni di supporto al volume Laboratorio di Statistica con R, Iacus-Masarotto, MacGraw-Hill Italia, 2006. This package contains sets of functions defined in Laboratorio di Statistica con R, Iacus-Masarotto, MacGraw-Hill Italia, 2006. Function names and docs are in italian as well. / GPL-2  | noarch  |
| <a href="#">r-labstats</a>        | 1.0.1   | Contains data sets to accompany the book: Lazic SE (2016). Experimental Design for Laboratory Biologists: Maximising Information and Improving Reproducibility. Cambridge University Press. / GPL-3   | noarch  |
| <a href="#">r-laeken</a>          | 0.5.0   | Estimation of indicators on social exclusion and poverty, as well as Pareto tail modeling for empirical income distributions. / GPL-2   | noarch  |
| <a href="#">r-laercio</a>         | 1.0.1   | The package contains functions to compare and group means. / GPL-3  | noarch  |
| <a href="#">r-lagged</a>          | 0.3.0   | Provides classes and methods for lagged objects. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name                            | Version | Summary/License  | Platforms   |
|---------------------------------|---------|--|---|
| <a href="#">r-lagsequential</a> | 0.1.1   | Lag-sequential analysis is a method of assessing of patterns (what tends to follow what?) in sequences of codes. The codes are typically for discrete behaviors or states. The functions in this package read a stream of codes, or a frequency transition matrix, and produce a variety of lag sequential statistics, including transitional frequencies, expected transitional frequencies, transitional probabilities, z values, adjusted residuals, Yule's Q values, likelihood ratio tests of stationarity across time and homogeneity across groups or segments, transformed kappas for unidirectional dependence, bidirectional dependence, parallel and nonparallel dominance, and significance levels based on both parametric and randomization tests. The methods are described in Bakeman & Quera (2011) <doi:10.1017/CBO9781139017343>, O'Connor (1999) <doi:10.3758/BF03200753>, Wampold & Margolin (1982) <doi:10.1037/0033-2909.92.3.755>, and Wampold (1995, ISBN:0-89391-919-5). / GPL-2 | noarch  |
| <a href="#">r-lahman</a>        | 6.0_0   | Provides the tables from the 'Sean Lahman Baseball Database' as a set of R data.frames. It uses the data on pitching, hitting and fielding performance and other tables from 1871 through 2015, as recorded in the 2016 version of the database. / GPL   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-lambda.r</a>      | 1.2.3   | A language extension to efficiently write functional programs in R. Syntax extensions include multi-part function definitions, pattern matching, guard statements, built-in (optional) type safety. / LGPL-3   | noarch  |
| <a href="#">r-lambda4</a>       | 3.0     | Currently the package includes 14 methods for calculating internal consistency reliability but is still growing. The package allows users access to whichever reliability estimator is deemed most appropriate for their situation. / GPL-2  | noarch  |
| <a href="#">r-lamme</a>         | 0.0.1   | Log-analytic methods intended for testing multiplicative effects. / GPL-3  | noarch  |
| <a href="#">r-landest</a>       | 1.0     | Provides functions to estimate survival and a treatment effect using a landmark estimation approach. / GPL-3   | noarch  |
| <a href="#">r-landpred</a>      | 1.0     | This package includes functions for landmark prediction of a survival outcome incorporating covariate and short-term event information. For more information about landmark prediction please see: Parast, Layla, Su-Chun Cheng, and Tianxi Cai. Incorporating short-term outcome information to predict long-term survival with discrete markers. Biometrical Journal 53.2 (2011): 294-307. / GPL-3   | noarch  |
| <a href="#">r-languagelayer</a> | 1.2.4   | Improve your text analysis with languagelayer < <a href="https://languagelayer.com">https://languagelayer.com</a> >, a powerful language detection API. / MIT  | noarch  |
| <a href="#">r-languager</a>     | 1.5.0   | Data sets exemplifying statistical methods, and some facilitatory utility functions used in "Analyzing Linguistic Data: A practical introduction to statistics using R", Cambridge University Press, 2008. / GPL-2   | noarch  |
| <a href="#">r-laplacesdemon</a> | 16.1    | Provides a complete environment for Bayesian inference using a variety of different samplers (see ?LaplacesDemon for an overview). The README describes the history of the package development process. / MIT  | noarch  |
| <a href="#">r-larf</a>          | 1.4     | Provides instrumental variable estimation of treatment effects when both the endogenous treatment and its instrument are binary. Applicable to both binary and continuous outcomes. / GPL-3  | noarch  |

Table 51 – continued from previous page

| Name                         | Version | Summary/License  | Platforms  |
|------------------------------|---------|--|--|
| <a href="#">r-lars</a>       | 1.2     | Efficient procedures for fitting an entire lasso sequence with the cost of a single least squares fit. Least angle regression and infinitesimal forward stagewise regression are related to the lasso, as described in the paper below. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-lassopv</a>    | 0.2.0   | Estimate the p-values for predictors x against target variable y in lasso regression, using the regularization strength when each predictor enters the active set of regularization path for the first time as the statistic. This is based on the assumption that predictors (of the same variance) that (first) become active earlier tend to be more significant. Three null distributions are supported: normal and spherical, which are computed separately for each predictor and analytically under approximation, which aims at efficiency and accuracy for small p-values. / GPL-3  | noarch   |
| <a href="#">r-lassosir</a>   | 0.1.1   | Estimate the sufficient dimension reduction space using sparsed sliced inverse regression via Lasso (Lasso-SIR) introduced in Lin, Zhao, and Liu (2017) <arxiv:1611.06655>. The Lasso-SIR is consistent and achieve the optimal convergence rate under certain sparsity conditions for the multiple index models. / GPL-3  | noarch   |
| <a href="#">r-latdiag</a>    | 0.2.4   | A graph proposed by Rosenbaum is useful for checking some properties of various sorts of latent scale, this program generates commands to obtain the graph using 'dot' from 'graphviz'. / GPL-2  | noarch   |
| <a href="#">r-later</a>      | 0.8.0   | Executes arbitrary R or C functions some time after the current time, after the R execution stack has emptied. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-laterality</a> | 0.9.3   | Calculates and plots Handedness index (HI), absolute HI, mean HI and z-score which are commonly used indexes for the study of hand preference (laterality) in non-human primates. / GPL (>= 2.0)   | noarch   |
| <a href="#">r-latex2exp</a>  | 0.4.0   | Parses and converts LaTeX math formulas to R's plotmath expressions, used to enter mathematical formulas and symbols to be rendered as text, axis labels, etc. throughout R's plotting system. / MIT   | noarch   |
| <a href="#">r-latexpdf</a>   | 0.1.6   | Converts table-like objects to stand-alone PDF or PNG. Can be used to embed tables and arbitrary content in PDF or Word documents. Provides a low-level R interface for creating 'LaTeX' code, e.g. <code>command()</code> and a high-level interface for creating PDF documents, e.g. <code>as.pdf.data.frame()</code> . Extensive customization is available via mid-level functions, e.g. <code>as.tabular()</code> . See also 'package?latexpdf'. Support for PNG is experimental; see 'as.png.data.frame'. Adapted from 'metrumrg' < <a href="http://r-forge.r-project.org/R/?group_id=1215">http://r-forge.r-project.org/R/?group_id=1215</a> >. Requires a compatible installation of 'pdflatex', e.g. < <a href="https://miktex.org/">https://miktex.org/</a> >. / GPL-3 | noarch   |

| Name                           | Version | Summary/License   | Platforms   |
|--------------------------------|---------|---|---|
| <a href="#">r-lattice</a>      | 0.20_38 | A powerful and elegant high-level data visualization system inspired by Trellis graphics, with an emphasis on multivariate data. Lattice is sufficient for typical graphics needs, and is also flexible enough to handle most nonstandard requirements. See ?Lattice for an introduction. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-latticeextra</a> | 0.6_28  | Building on the infrastructure provided by the lattice package, this package provides several new high-level functions and methods, as well as additional utilities such as panel and axis annotation functions. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-lava</a>         | 1.6.5   | A general implementation of Structural Equation Models with latent variables (MLE, 2SLS, and composite likelihood estimators) with both continuous, censored, and ordinal outcomes (Holst and Budtz-Joergensen (2013) <doi:10.1007/s00180-012-0344-y>). Mixture latent variable models and non-linear latent variable models (Holst and Budtz-Joergensen (2019) <doi:10.1093/biostatistics/kxy082>). The package also provides methods for graph exploration (d-separation, back-door criterion), simulation of general non-linear latent variable models, and estimation of influence functions for a broad range of statistical models. / GPL-3 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-lavaan</a>       | 0.6_3   | Fit a variety of latent variable models, including confirmatory factor analysis, structural equation modeling and latent growth curve models. / GPL (>= 2)  | linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64              |
| <a href="#">r-lazydata</a>     | 1.1.0   | Supplies a LazyData facility for packages which have data sets but do not provide LazyData: true. A single function is included, requireData, which is a drop-in replacement for base::require, but carrying the additional functionality. By default, it suppresses package startup messages as well. See argument 'reallyQuietly'. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name          | Version | Summary/License   | Platforms  |
|---------------|---------|---|--|
| r-lazyeval    | 0.2.2   | An alternative approach to non-standard evaluation using formulas. Provides a full implementation of LISP style ‘quasiquote’, making it easier to generate code with other code. / GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-lazyrmd     | 0.2.0   | An R Markdown html document format that provides the ability to lazily load plot outputs as the user scrolls over them. This is useful for large R Markdown documents with many plots, as it allows for a fast initial page load and defers loading of individual graphics to the time that the user navigates near them. / MIT   | noarch   |
| r-lazysql     | 0.1.3   | Helper functions to build SQL statements for dbGetQuery or dbSendQuery under program control. They are intended to increase speed of coding and to reduce coding errors. Arguments are carefully checked, in particular SQL identifiers such as names of tables or columns. More patterns will be added as required. / MIT  | noarch   |
| r-lbreg       | 1.2     | Maximum likelihood estimation of log-binomial regression with special functionality when the MLE is on the boundary of the parameter space. / GPL-2   | noarch   |
| r-lca         | 0.1.1   | Performs model fitting and significance estimation for Localised Co-Dependency between pairs of features of a numeric dataset. / GPL-2  | noarch   |
| r-lcf         | 1.7.0   | Baseline correction, normalization and linear combination fitting (LCF) of X-ray absorption near edge structure (XANES) spectra. The package includes data loading of .xmu files exported from ‘ATHENA’ (Ravel and Newville, 2005) <doi:10.1107/S0909049505012719>. Loaded spectra can be background corrected and all standards can be fitted at once. Two linear combination fitting functions can be used: (1) fit_athena(): Simply fitting combinations of standards as in ATHENA, (2) fit_float(): Fitting all standards with changing baseline correction and edge-step normalization parameters. / GPL-3 | noarch   |
| r-lcfdata     | 2.0     | This package contains (1) event-related brain potential data recorded from 10 participants at electrodes Fz, Cz, Pz, and Oz (0–300 ms) in the context of Antoine Tremblay’s PhD thesis (Tremblay, 2009); (2) ERP amplitudes at electrode Fz restricted to the 100 to 175 millisecond time window; and (3) plotting data generated from a linear mixed-effects model. / GPL-2  | noarch   |
| r-lcpm        | 0.1.0   | An implementation of the Log Cumulative Probability Model (LCPM) and Proportional Probability Model (PPM) for which the Maximum Likelihood Estimates are determined using constrained optimization. This implementation accounts for the implicit constraints on the parameter space. Other features such as standard errors, z tests and p-values use standard methods adapted from the results based on constrained optimization. / GPL-3   | noarch   |
| r-lcyanalysis | 1.0.3   | Analysis of stock data ups and downs trend, the stock technical analysis indicators function have trend line, reversal pattern and market trend. / GPL-3  | noarch   |
| r-ldbounds    | 1.1.1   | Computations related to group sequential boundaries. Includes calculation of bounds using the Lan-DeMets alpha spending function approach. / GPL-2  | noarch   |

Table 51 – continued from previous page

| Name                                | Version | Summary/License  | Platforms   |
|-------------------------------------|---------|--|---|
| <a href="#">r-ldcorsv</a>           | 1.3.2   | Four measures of linkage disequilibrium are provided: the usual $r^2$ measure, the $r^2_S$ measure ( $r^2$ corrected by the structure sample), the $r^2_V$ ( $r^2$ corrected by the relatedness of genotyped individuals), the $r^2_{VS}$ measure ( $r^2$ corrected by both the relatedness of genotyped individuals and the structure of the sample). / GPL-2   | noarch  |
| <a href="#">r-ldlinkr</a>           | 1.0.0   | Provides access to the LDlink API ( <a href="https://ldlink.nci.nih.gov/?tab=apiaccess">https://ldlink.nci.nih.gov/?tab=apiaccess</a> ) using the R console. This programmatic access facilitates researchers who are interested in performing batch queries in 1000 Genomes Project data using LDlink. / GPL-2  | noarch  |
| <a href="#">r-ldrtools</a>          | 0.2.1   | Linear dimension reduction subspaces can be uniquely defined using orthogonal projection matrices. This package provides tools to compute distances between such subspaces and to compute the average subspace. For details see Liski, E.Nordhausen K., Oja H., Ruiz-Gazen A. (2016) Combining Linear Dimension Reduction Subspaces <doi:10.1007/978-81-322-3643-6_7>. / GPL-2   | noarch  |
| <a href="#">r-ldtests</a>           | 1.0     | Exact tests for Linkage Disequilibrium (LD) and Hardy-Weinberg Equilibrium (HWE). - 2-sided LD tests based on different measures of LD (Kulinskaya and Lewin 2008) - 1-sided Fisher's exact test for LD - 2-sided Haldane test for HWE (Wigginton 2005) - 1-sided test for inbreeding - conditional p-values proposed in Kulinskaya (2008) to overcome the problems of asymmetric distributions (for both LD and HWE) / GPL-3  | noarch  |
| <a href="#">r-leabra</a>            | 0.1.0   | The algorithm Leabra (local error driven and associative biologically realistic algorithm) allows for the construction of artificial neural networks that are biologically realistic and balance supervised and unsupervised learning within a single framework. This package is based on the 'MATLAB' version by Sergio Verduzco-Flores, which in turn was based on the description of the algorithm by Randall O'Reilly (1996) < <a href="ftp://grey.colorado.edu/pub/oreilly/thesis/oreilly_thesis.all.pdf">ftp://grey.colorado.edu/pub/oreilly/thesis/oreilly_thesis.all.pdf</a> >. For more general (not 'R' specific) information on the algorithm Leabra see < <a href="https://grey.colorado.edu/emergent/index.php/Leabra">https://grey.colorado.edu/emergent/index.php/Leabra</a> >. / GPL-2 | noarch  |
| <a href="#">r-leafarea</a>          | 0.1.8   | An interface for the image processing program 'ImageJ', which allows a rapid digital image analysis for particle sizes. This package includes function to write an 'ImageJ' macro which is optimized for a leaf area analysis by default. / GPL-2  | noarch  |
| <a href="#">r-leaflet</a>           | 2.0.2   | Create and customize interactive maps using the 'Leaflet' JavaScript library and the 'htmlwidgets' package. These maps can be used directly from the R console, from 'RStudio', in Shiny applications and R Markdown documents. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-leaflet.opacity</a>   | 0.1.0   | Extends the 'leaflet' R package with the 'Leaflet.OpacityControls' JavaScript plugin. Adds controls to the leaflet map for adjusting the opacity of a layer. / GPL-3   | noarch  |
| <a href="#">r-leaflet.providers</a> | 1.8.0   | Contains third-party map tile provider information from 'Leaflet.js', < <a href="https://github.com/leaflet-extras/leaflet-providers">https://github.com/leaflet-extras/leaflet-providers</a> >, to be used with the 'leaflet' R package. Additionally, 'leaflet.providers' enables users to retrieve up-to-date provider information between package updates. / BSD_2_clause  | noarch  |

Table 51 – continued from previous page

| Name                       | Version | Summary/License  | Platforms  |
|----------------------------|---------|--|--|
| <a href="#">r-leaflet</a>  | 0.4.0   | Display your spatial data on interactive web-maps using the open-source JavaScript library Leaflet. ‘leafletR’ provides basic web-mapping functionality to combine vector data and online map tiles from different sources. See <a href="http://leafletjs.com">http://leafletjs.com</a> for more information on Leaflet. / GPL-2   | noarch   |
| <a href="#">r-leafstar</a> | 1.0     | Implementation of trigonometric functions to calculate the exposure of flat, tilted surfaces, such as leaves and slopes, to direct solar radiation. It implements the equations in A.G. Escribano-Rocafort, A. Ventre-Lespiauq, C. Granado-Yela, et al. (2014) <doi:10.1111/2041-210X.12141> in a few user-friendly R functions. All functions handle data obtained with ‘Ahmes’ 1.0 for Android, as well as more traditional data sources (compass, protractor, inclinometer). The main function (star()) calculates the potential exposure of flat, tilted surfaces to direct solar radiation (silhouette to area ratio, STAR). It is equivalent to the ratio of the leaf projected area to total leaf area, but instead of using area data it uses spatial position angles, such as pitch, roll and course, and information on the geographical coordinates, hour, and date. The package includes additional functions to recalculate STAR with custom settings of location and time, to calculate the tilt angle of a surface, and the minimum angle between two non-orthogonal planes. / AGPL-3 | noarch   |
| <a href="#">r-leanpubr</a> | 0.3.1   | Provides access to the ‘Leanpub’ API < <a href="https://leanpub.com/help/api">https://leanpub.com/help/api</a> > for gathering information about publications and submissions to the ‘Leanpub’ platform. / GPL-3   | noarch   |
| <a href="#">r-leanr</a>    | 1.4.9   | Implements the method described in Network-based analysis of omics data: The LEAN method [Gwinner Boulday (2016) <DOI:10.1093/bioinformatics/btw676>] Given a protein interaction network and a list of p-values describing a measure of interest (as e.g. differential gene expression) this method computes an enrichment p-value for the protein neighborhood of each gene and compares it to a background distribution of randomly drawn p-values. The resulting scores are corrected for multiple testing and significant hits are returned in tabular format. / GPL-3  | noarch   |
| <a href="#">r-leap</a>     | 0.2     | Advances in sequencing technology now allow researchers to capture the expression profiles of individual cells. Several algorithms have been developed to attempt to account for these effects by determining a cell’s so-called ‘pseudotime’, or relative biological state of transition. By applying these algorithms to single-cell sequencing data, we can sort cells into their pseudotemporal ordering based on gene expression. LEAP (Lag-based Expression Association for Pseudotime-series) then applies a time-series inspired lag-based correlation analysis to reveal linearly dependent genetic associations. / GPL-2   | noarch   |
| <a href="#">r-leapfrog</a> | 1.0.7   | Contains LEAPFrOG Gradient Optimisation and Expectation Maximisation functions for inferring parental admixture proportions from an offspring with SNP genotypes. / GPL-3  | noarch   |
| <a href="#">r-leaps</a>    | 3.0     | Regression subset selection, including exhaustive search. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms |
|------------------------------|---------|---|-----------|
| <a href="#">r-learnbayes</a> | 2.15.1  | A collection of functions helpful in learning the basic tenets of Bayesian statistical inference. It contains functions for summarizing basic one and two parameter posterior distributions and predictive distributions. It contains MCMC algorithms for summarizing posterior distributions defined by the user. It also contains functions for regression models, hierarchical models, Bayesian tests, and illustrations of Gibbs sampling. / GPL-2  | noarch    |
| <a href="#">r-learngeom</a>  | 1.4     | Contains some functions to learn and teach basic plane Geometry at undergraduate level with the aim of being helpful to young students with little programming skills. / GPL-2  | noarch    |
| <a href="#">r-learningr</a>  | 0.29    | Crabs in the English channel, deer skulls, English monarchs, half-caste Manga characters, Jamaican cities, Shakespeare's The Tempest, drugged up cyclists and sexually transmitted diseases. / Unlimited  | noarch    |
| <a href="#">r-learnn</a>     | 0.2.0   | Implementations of several basic neural network concepts in R, as based on posts on url{ <a href="http://qua.st/">http://qua.st/</a> }. / GPL-3   | noarch    |
| <a href="#">r-learnr</a>     | 0.9.2   | Create interactive tutorials using R Markdown. Use a combination of narrative, figures, videos, exercises, and quizzes to create self-paced tutorials for learning about R and R packages. / Apache License 2.0   file LICENSE  | noarch    |
| <a href="#">r-learnrbook</a> | 0.0.2   | Datasets used in the book Learn R ... as you learnt your mother tongue by Pedro J. Aphalo (2017) < <a href="https://leanpub.com/learnr">https://leanpub.com/learnr</a> >. / GPL-2   | noarch    |
| <a href="#">r-leersiecyl</a> | 1.0.2   | Functions to download data from the SIE, which is the Statistical Information System (Sistema de Información Estadística) in the Statistical Portal of the Government of Castilla y León (Spain) < <a href="https://estadistica.jcyl.es">https://estadistica.jcyl.es</a> >. / GPL-2   | noarch    |
| <a href="#">r-legocolors</a> | 0.2.0   | Provides a dataset containing several color naming conventions established by multiple sources, along with associated color metadata. The package also provides related helper functions for mapping among the different Lego color naming conventions and between Lego colors, hex colors, and 'R' color names, making it easy to convert any color palette to one based on existing Lego colors while keeping as close to the original color palette as possible. The functions use nearest color matching based on Euclidean distance in RGB space. Naming conventions for color mapping include those from 'BrickLink' (< <a href="https://www.bricklink.com">https://www.bricklink.com</a> >), 'The Lego Group' (< <a href="https://www.lego.com">https://www.lego.com</a> >), 'LDraw' (< <a href="https://www.ldraw.org/">https://www.ldraw.org/</a> >), and 'Peeon' (< <a href="http://www.peeron.com/">http://www.peeron.com/</a> >). / MIT | noarch    |
| <a href="#">r-leiden</a>     | 0.3.1   | Implements the 'Python leidenalg' module to be called in R. Enables clustering using the leiden algorithm for partition a graph into communities. See the 'Python' repository for more details: < <a href="https://github.com/vtraag/leidenalg">https://github.com/vtraag/leidenalg</a> > Traag et al (2018) From Louvain to Leiden: guaranteeing well-connected communities. <arXiv:1810.08473>. / GPL-3   | noarch    |
| <a href="#">r-leiv</a>       | 2.0_7   | Estimate the slope and intercept of a bivariate linear relationship by calculating a posterior density that is invariant to interchange and scaling of the coordinates. / GPL-2   | noarch    |
| <a href="#">r-lenses</a>     | 0.0.3   | Provides tools for creating and using lenses to simplify data manipulation. Lenses are composable getter/setter pairs for working with data in a purely functional way. Inspired by the 'Haskell' library 'lens' (Kmett, 2012) < <a href="https://hackage.haskell.org/package/lens">https://hackage.haskell.org/package/lens</a> >. For a fairly comprehensive (and highly technical) history of lenses please see the 'lens' wiki < <a href="https://github.com/ekmett/lens/wiki/History-of-Lenses">https://github.com/ekmett/lens/wiki/History-of-Lenses</a> >. / MIT   | noarch    |
| <a href="#">r-lero.lero</a>  | 0.2     | Generates quotes from 'Lero Lero', a database for meaningless sentences filled with corporate buzzwords, intended to be used as corporate lorem ipsum (see < <a href="http://www.lerolero.com/">http://www.lerolero.com/</a> > for more information). Unfortunately, quotes are currently portuguese-only. / GPL-3  | noarch    |

Table 51 – continued from previous page

| Name                 | Version | Summary/License   | Platforms                                 |
|----------------------|---------|---|---|
| r-lest               | 1.0.0   | Functions for vectorised conditional recoding of variables. case_when() enables you to vectorise multiple if and else statements (like 'CASE WHEN' in 'SQL'). if_else() is a stricter and more predictable version of ifelse() in 'base' that preserves attributes. These functions are forked from 'dplyr' with all package dependencies removed and behave identically to the originals. / MIT  | noarch                                    |
| r-lestat             | 1.9     | Some simple objects and functions to do statistics using linear models and a Bayesian framework. / GPL-2  | noarch                                    |
| r-lettercase         | 0.13.1  | Utilities for formatting strings and character vectors to for capitalization, word break and white space. Supported formats are: snake_case, spine-case, camel-Case, PascalCase, Title Case, UPPERCASE, lowercase, Sentence case or combinations thereof. 'lettercase' strives to provide a simple, consistent, intuitive and high performing interface. / GPL-2  | noarch                                    |
| r-lexiconpt          | 0.1.0   | Provides easy access for sentiment lexicons for those who want to do text analysis in Portuguese texts. As of now, two Portuguese lexicons are available: 'SentiLex-PT02' and 'OpLexicon' (v2.1 and v3.0). / GPL-2  | noarch                                    |
| r-lfactors           | 1.0.4   | Provides an extension to factors called 'lfactor' that are similar to factors but allows users to refer to 'lfactor' levels by either the level or the label. / GPL-2   | noarch                                    |
| r-lfdr.mle           | 1.0     | Suite of R functions for the estimation of the local false discovery rate (LFDR) using Type II maximum likelihood estimation (MLE). / GPL-3   | noarch                                    |
| r-lfdrempiricalbayes | 1.0     | New empirical Bayes methods aiming at analyzing the association of single nucleotide polymorphisms (SNPs) to some particular disease are implemented in this package. The package uses local false discovery rate (LFDR) estimates of SNPs within a sample population defined as a reference class and discovers if SNPs are associated with the corresponding disease. Although SNPs are used throughout this document, other biological data such as protein data and other gene data can be used. Karimnezhad, Ali and Bickel, D. R. (2016) < <a href="http://hdl.handle.net/10393/34889">http://hdl.handle.net/10393/34889</a> >. / GPL-3 | noarch                                    |
| r-lga                | 1.1_1   | Tools for linear grouping analysis. Three user-level functions: gap, rlga and lga. / GPL-3  | noarch                                    |
| r-lgr                | 0.3.2   | A flexible, feature-rich yet light-weight logging framework based on 'R6' classes. It supports hierarchical loggers, custom log levels, arbitrary data fields in log events, logging to plaintext, 'JSON', (rotating) files, memory buffers, and databases, as well as email and push notifications. For a full list of features with examples please refer to the package vignette. / MIT  | noarch                                    |
| r-lgrdata            | 0.1.1   | A largish collection of example datasets, including several classics. Many of these datasets are well suited for regression, classification, and visualization. / CC0   | noarch                                    |
| r-lgtldl             | 1.1.5   | A very simple implementation of a class for longitudinal data. / GPL-2  | noarch                                    |
| r-lhmixr             | 0.1.0   | Fits sex-specific life-history models for fish and other taxa where some of the individuals have unknown sex. / GPL-3   | noarch                                    |
| r-libcoin            | 1.0_4   | Basic infrastructure for linear test statistics and permutation inference in the framework of Strasser and Weber (1999) < <a href="http://epub.wu.ac.at/102/">http://epub.wu.ac.at/102/</a> >. This package must not be used by end-users. CRAN package 'coin' implements all user interfaces and is ready to be used by anyone. / GPL-2  | linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Continued on next page

Table 51 – continued from previous page

| Name                  | Version | Summary/License  | Platforms |
|-----------------------|---------|--|-----------|
| r-librarian           | 1.7.0   | Automatically install, update, and load ‘CRAN’, ‘GitHub’, and ‘Bioconductor’ packages in a single function call. By accepting bare unquoted names for packages, it’s easy to add or remove packages from the list. / GPL-3   | noarch    |
| r-librarysnapshot     | 0.1.2   | Generate a local library copy with relevant packages. All packages currently found within the search path - except base packages - will be copied to the directory provided and can be used later on with the .libPaths() function. / MIT  | noarch    |
| r-lift                | 0.0.2   | Compute the top decile lift and plot the lift curve. Cumulative lift curves are also supported. / GPL-2  | noarch    |
| r-liftr               | 0.9.2   | Persistent reproducible reporting by containerization of R Markdown documents. / GPL-3   | noarch    |
| r-lightningr          | 1.0.2   | The purpose of this package is to enable usage of lightningviz server to be accessible from R. The server itself can be found at <a href="http://lightning-viz.org/">http://lightning-viz.org/</a> and is required to work with this package. Package by itself cannot and will not create any visualizations. / MIT   | noarch    |
| r-lightsout           | 0.3     | Lights Out is a puzzle game consisting of a grid of lights that are either on or off. Pressing any light will toggle it and its adjacent lights. The goal of the game is to switch all the lights off. This package provides an interface to play the game on different board sizes, both through the command line or with a visual application. Puzzles can also be solved using the automatic solver included. View a demo online at <a href="http://daattali.com/shiny/lightsout/">http://daattali.com/shiny/lightsout/</a> . / MIT                               | noarch    |
| r-likelihood          | 1.7     | Tools for maximum likelihood estimation of parameters of scientific models. / GPL-2  | noarch    |
| r-likelihoodexplore   | 0.1.0   | Provides likelihood functions as defined by Fisher (1922) <doi:10.1098/rsta.1922.0009> and a function that creates likelihood functions from density functions. The functions are meant to aid in education of likelihood based methods. / GPL-2   | noarch    |
| r-limitplot           | 1.2     | Values below a specified limit of detection are stacked in rows in order to reduce overplotting and create a clear graphical representation of your data. / GPL-2  | noarch    |
| r-linbin              | 0.1.2   | Short for ‘linear binning’, the linbin package provides functions for manipulating, binning, and plotting linearly referenced data. Although developed for data collected on river networks, it can be used with any interval or point data referenced to a 1-dimensional coordinate system. Flexible bin generation and batch processing makes it easy to compute and visualize variables at multiple scales, useful for identifying patterns within and between variables and investigating the influence of scale of observation on data interpretation. / AGPL-3 | noarch    |
| r-lincal              | 1.0     | Estimate and confidence/credible intervals for an unknown regressor x0 given an observed y0. / GPL-2   | noarch    |
| r-lindenmayer         | 0.1.13  | L-systems or Lindenmayer systems are parallel rewriting systems which can be used to simulate biological forms and certain kinds of fractals. Briefly, in an L-system a series of symbols in a string are replaced iteratively according to rules to give a more complex string. Eventually, the symbols are translated into turtle graphics for plotting. Wikipedia has a very good introduction: <a href="http://en.wikipedia.org/wiki/L-system">en.wikipedia.org/wiki/L-system</a> This package provides basic functions for exploring L-systems. / GPL-3         | noarch    |
| r-linearregressionmde | 1.0     | Consider linear regression model $Y = Xb + \text{error}$ where the distribution function of errors is unknown, but errors are independent and symmetrically distributed. The package contains a function named LRMDE which takes Y and X as input and returns minimum distance estimator of parameter b in the model. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name                                | Version | Summary/License   | Platforms   |
|-------------------------------------|---------|---|---|
| <a href="#">r-linkedmatrix</a>      | 1.3.1   | A class that links matrix-like objects (nodes) by rows or by columns while behaving similarly to a base R matrix. Very large matrices are supported if the nodes are memory-mapped objects. / MIT   | noarch  |
| <a href="#">r-linkim</a>            | 0.1     | A linkage information based method for imputing missing diploid genotypes / GPL-2   | noarch  |
| <a href="#">r-linl</a>              | 0.0.3   | A ‘LaTeX’ Letter class for ‘rmarkdown’, using the ‘pandoc-letter’ template adapted for use with ‘markdown’. / GPL-3   | noarch  |
| <a href="#">r-linlir</a>            | 1.1     | This package implements the methodology of Likelihood-based Imprecise Regression (LIR) for the case of linear regression with interval data. / GPL-2  | noarch  |
| <a href="#">r-linpk</a>             | 1.0     | Generate concentration-time profiles from linear pharmacokinetic (PK) systems, possibly with first-order absorption or zero-order infusion, possibly with one or more peripheral compartments, and possibly under steady-state conditions. Single or multiple doses may be specified. Secondary (derived) PK parameters (e.g. Cmax, Ctrough, AUC, Tmax, half-life, etc.) are computed. / GPL-3  | noarch  |
| <a href="#">r-linprog</a>           | 0.9_2   | This package can be used to solve Linear Programming / Linear Optimization problems by using the simplex algorithm. / GPL-2   | noarch  |
| <a href="#">r-linreginteractive</a> | 0.3_1   | Interactive visualization of effects, response functions and marginal effects for different kinds of regression models. In this version linear regression models, generalized linear models, generalized additive models and linear mixed-effects models are supported. Major features are the interactive approach and the handling of the effects of categorical covariates: if two or more factors are used as covariates every combination of the levels of each factor is treated separately. The automatic calculation of marginal effects and a number of possibilities to customize the graphical output are useful features as well. / GPL-2 | noarch  |
| <a href="#">r-linselect</a>         | 1.1.1   | Estimate the mean of a Gaussian vector, by choosing among a large collection of estimators. In particular it solves the problem of variable selection by choosing the best predictor among predictors emanating from different methods as lasso, elastic-net, adaptive lasso, pls, randomForest. Moreover, it can be applied for choosing the tuning parameter in a Gauss-lasso procedure. / GPL-3  | noarch  |
| <a href="#">r-lintr</a>             | 1.0.3   | Checks adherence to a given style, syntax errors and possible semantic issues. Supports on the fly checking of R code edited with ‘RStudio IDE’, ‘Emacs’, ‘Vim’, ‘Sublime Text’ and ‘Atom’. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-lisa</a>              | 0.1.0   | Contains 128 palettes from Color Lisa. All palettes are based on masterpieces from the worlds greatest artists. For more information, see < <a href="http://colorlisa.com/">http://colorlisa.com/</a> >. / MIT  | noarch  |
| <a href="#">r-lisp</a>              | 0.1     | Though SRFI-1 scopes both list-processing and higher-order programming, we’ll save some list-orthogonal functions for the ‘functional’ package; this is freely a mixture of implementation and API. / GPL-2   | noarch  |
| <a href="#">r-lisreltor</a>         | 0.1.4   | This is an unofficial package aimed at automating the import of LISREL output in R. This package or its maintainer is not in any way affiliated with the creators of LISREL and SSI, Inc. / GPL-2   | noarch  |

Continued on next page

Table 51 – continued from previous page

| Name                               | Version | Summary/License   | Platforms  |
|------------------------------------|---------|---|--|
| <a href="#">r-listarrays</a>       | 0.2.0   | A toolbox for R arrays. Flexibly split, bind, reshape, modify, subset and name arrays. / GPL-3  | noarch   |
| <a href="#">r-listenv</a>          | 0.7.0   | List environments are environments that have list-like properties. For instance, the elements of a list environment are ordered and can be accessed and iterated over using index subsetting, e.g. <code>'x &lt;- listenv(a = 1, b = 2); for (i in seq_along(x)) x[[i]] &lt;- x[[i]] ^ 2; y &lt;- as.list(x)'</code> . / LGPL-2.1   | noarch   |
| <a href="#">r-listest</a>          | 2.1     | Tests for independence between X and Y computed from a paired sample (x1,y1),... (xn,yn) of (X,Y), using one of the following statistics (a) the Longest Increasing Subsequence (Ln), (b) JLn, a Jackknife version of Ln or (c) JLMn, a Jackknife version of the longest monotonic subsequence. This family of tests can be applied under the assumption of continuity of X and Y. / GPL-2  | noarch   |
| <a href="#">r-listviewer</a>       | 2.1.0   | R lists, especially nested lists, can be very difficult to visualize or represent. Sometimes <code>'str()'</code> is not enough, so this suite of <code>htmlwidgets</code> is designed to help see, understand, and maybe even modify your R lists. The function <code>'reactjson()'</code> requires a package <code>'reactR'</code> that can be installed from CRAN or <a href="https://github.com/timelyportfolio/reactR">https://github.com/timelyportfolio/reactR</a> . / MIT   | noarch   |
| <a href="#">r-listwithdefaults</a> | 1.2.0   | Provides a function that, as an alternative to <code>base::list</code> , allows default values to be inherited from another list. / GPL-2   | noarch   |
| <a href="#">r-liureg</a>           | 1.1.2   | Linear Liu regression coefficient's estimation and testing with different Liu related measures such as MSE, R-squared etc. REFERENCES i. Akdeniz and Kaciranlar (1995) <doi:10.1080/03610929508831585> ii. Druilhet and Mom (2008) <doi:10.1016/j.jmva.2006.06.011> iii. Imdadullah, Aslam, and Saima (2017) iv. Liu (1993) <doi:10.1080/03610929308831027> v. Liu (2001) <doi:10.1016/j.jspi.2010.05.030>. / GPL-2   GPL-3   | noarch   |
| <a href="#">r-lllrcrc</a>          | 1.2     | Applies local log-linear capture-recapture models (LLLMs) for closed populations, as described in the doctoral thesis of Zachary Kurtz. The method is relevant when there are 3-5 capture occasions, with auxiliary covariates available for all capture occasions. As part of estimating the number of missing population units, the method estimates the rate of missingness as it varies over the covariate space. In addition, user-friendly functions are provided to recreate (approximately) the method of Zwane and van der Heijden (2004), which applied the VGAM package in a way that is closely related to LLLMs. / GPL-2 | noarch   |
| <a href="#">r-llogistic</a>        | 1.0.3   | Density, distribution function, quantile function and random generation for the L-Logistic distribution with parameters m and phi. The parameter m is the median of the distribution. / GPL-3   | noarch   |
| <a href="#">r-lm.beta</a>          | 1.5_1   | Adds standardized regression coefficients to objects created by <code>lm</code> . Also extends the S3 methods <code>print</code> , <code>summary</code> and <code>coef</code> with additional boolean argument <code>standardized</code> . / GPL-2  | noarch   |
| <a href="#">r-lme4</a>             | 1.1_2   | Fit linear and generalized linear mixed-effects models. The models and their components are represented using S4 classes and methods. The core computational algorithms are implemented using the 'Eigen' C library for numerical linear algebra and 'RcppEigen' glue. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name         | Version | Summary/License   | Platforms   |
|--------------|---------|---|---|
| r-lmec       | 1.0     | This package includes a function to fit a linear mixed-effects model in the formulation described in Laird and Ware (1982) but allowing for censored normal responses. In this version, the with-in group errors are assumed independent and identically distributed. / GPL-2   | noarch  |
| r-lmertest   | 3.1_0   | Provides p-values in type I, II or III anova and summary tables for lmer model fits (cf. lme4) via Satterthwaite's degrees of freedom method. A Kenward-Roger method is also available via the pbkrtest package. Model selection methods include step, drop1 and anova-like tables for random effects (ranova). Methods for Least-Square means (LS-means) and tests of linear contrasts of fixed effects are also available. / GPL (>= 2) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-lmesplines | 1.1_10  | Add smoothing spline modelling capability to nlme. Fit smoothing spline terms in Gaussian linear and nonlinear mixed-effects models / GPL-2   | noarch  |
| r-lmf        | 1.2     | This R package provide methods for estimation and statistical inference on directional and fluctuating selection in age-structured populations. / GPL-2   | noarch  |
| r-lmfilter   | 0.1.2   | We present a method based on filtering algorithms to estimate the parameters of linear regressions, i.e. the coefficients and the variance of the error term. The proposed algorithms make use of Particle Filters following Ristic, B., Arulampalam, S., Gordon, N. (2004, ISBN: 158053631X) resampling methods. / GPL-2   | noarch  |
| r-lmmot      | 0.1.4   | Fit right censored Multiple Ordinal Tobit (MOT) model. / GPL-3  | noarch  |
| r-lmodel2    | 1.7_3   | Computes model II simple linear regression using ordinary least squares (OLS), major axis (MA), standard major axis (SMA), and ranged major axis (RMA). / GPL-2   | noarch  |
| r-lmreg      | 1.2     | Data files and a few functions used in the book 'Linear Models and Regression with R: An Integrated Approach' by Debasis Sengupta and Sreenivas Rao Jammalamadaka (2019). / GPL-2   | noarch  |
| r-lmridge    | 1.2     | Linear ridge regression coefficient's estimation and testing with different ridge related measures such as MSE, R-squared etc. REFERENCES i. Hoerl and Kennard (1970) <doi:10.2307/1267351> ii. Halawa and El-Bassiouni (2000) <doi:10.1080/00949650008812006> iii. Imdadullah, Aslam, and Saima (2017) iv. Marquardt (1970) <doi:10.2307/1267205>. / GPL (>= 2.0)  | noarch  |
| r-lmtest     | 0.9_36  | A collection of tests, data sets, and examples for diagnostic checking in linear regression models. Furthermore, some generic tools for inference in parametric models are provided. / GPL-2   GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| r-lmviz      | 0.1.2   | Contains three shiny applications. Two are meant to explore linear model inference feature through simulation. The third is a game to learn interpreting diagnostic plots. / GPL-3  | noarch  |

Table 51 – continued from previous page

| Name                      | Version | Summary/License  | Platforms |
|---------------------------|---------|--|-----------|
| <a href="#">r-In0scis</a> | 0.1.5   | Construct the simultaneous confidence intervals for ratios of means of Log-normal populations with zeros. It also has a Python module that do the same thing, and can be applied to multiple comparisons of parameters of any k mixture distributions. And we provide four methods, the method based on generalized pivotal quantity with order statistics and the quantity based on Wilson by Li et al. (2009) <doi:10.1016/j.spl.2009.03.004> (GPQW), and the methods based on generalized pivotal quantity with order statistics and the quantity based on Hannig (2009) <doi:10.1093/biomet/asp050> (GPQH). The other two methods are based on two-step MOVER intervals by Amany H, Abdel K (2015) <doi:10.1080/03610918.2013.767911>. We deduce Fiducial generalized pivotal two-step MOVER intervals based on Wilson quantity (FMW) and based on Hannig's quantity (FMWH). All these approach you can find in the paper of us which it has been submitted. / GPL-2         | noarch    |
| <a href="#">r-lncpath</a> | 1.1     | Identifies pathways synergistically regulated by the interested lncRNA(long non-coding RNA) sets based on a lncRNA-mRNA(messenger RNA) interaction network. 1) The lncRNA-mRNA interaction network was built from the protein-protein interactions and the lncRNA-mRNA co-expression relationships in 28 RNA-Seq data sets. 2) The interested lncRNAs can be mapped into networks as seed nodes and a random walk strategy will be performed to evaluate the rate of each coding genes influenced by the seed lncRNAs. 3) Pathways regulated by the lncRNA set will be evaluated by a weighted Kolmogorov-Smirnov statistic as an ES Score. 4) The p value and false discovery rate value will also be calculated through a permutation analysis. 5) The running score of each pathway can be plotted and the heat map of each pathway can also be plotted if an expression profile is provided. 6) The rank and scores of the gene list of each pathway can be printed. / GPL-2 | noarch    |
| <a href="#">r-lnirt</a>   | 0.4.0   | Allows the simultaneous analysis of responses and response times in an Item Response Theory (IRT) modelling framework. Supports variable person speed functions (intercept, trend, quadratic), and covariates for item and person (random) parameters. Data missing-by-design can be specified. Parameter estimation is done with a MCMC algorithm. LNIRT replaces the package CIRT, which was written by Rinke Klein Entink. For reference, see the paper by Fox, Klein Entink and Van der Linden (2007), Modeling of Responses and Response Times with the Package cirt, Journal of Statistical Software, <doi:10.18637/jss.v020.i07>. / GPL-3   | noarch    |
| <a href="#">r-loadr</a>   | 0.1.2   | Provides intuitive functions for loading objects into environments, encouraging less cluttered workspaces and sharing variables with large or reusable data across users and sessions. The user provides named variables which are loaded into the variable environment for later retrieval. / BSD_2_clause  | noarch    |

| Name                                   | Version | Summary/License   | Platforms |
|--|---------|---|-----------|
| <a href="#">r-localcontrolstrategy</a> | 1.3.3   | Especially when cross-sectional data are observational, effects of treatment selection bias and confounding are revealed by using the Nonparametric and Unsupervised preprocessing methods central to Local Control (LC) Strategy. The LC objective is to estimate the effect-size distribution that best quantifies a potentially causal relationship between a numeric y-Outcome variable and a t-Treatment variable. This t-variable may be either binary {1 = new vs 0 = control} or a numeric measure of Exposure level. LC Strategy starts by CLUSTERING experimental units (patients) on their pre-exposure X-Covariates, forming mutually exclusive and exhaustive BLOCKS of relatively well-matched units. The implicit statistical model for LC is thus simple one-way ANOVA. The Within-Block measures of effect-size are Local Rank Correlations (LRCs) when Exposure is numeric with more than two levels. Otherwise, Treatment choice is Nested within BLOCKS, and effect-sizes are LOCAL Treatment Differences (LTDs) between within-cluster y-Outcome Means [new minus control]. An Instrumental Variable (IV) method is also provided so that Local Average y-Outcomes (LAOs) within BLOCKS may also contribute information for effect-size inferences ... assuming that X-Covariates influence only Treatment choice or Exposure level and otherwise have no direct effects on y-Outcome. Finally, a Most-Like-Me function provides histograms of effect-size distributions to aid Doctor-Patient communications about Personalized Medicine. / GPL-2 | noarch    |
| <a href="#">r-localsolver</a>          | 2.3     | The package converts R data onto input and data for LocalSolver, executes optimization and exposes optimization results as R data. LocalSolver ( <a href="http://www.localsolver.com/">http://www.localsolver.com/</a> ) is an optimization engine developed by Innovation24 ( <a href="http://www.innovation24.fr/">http://www.innovation24.fr/</a> ). It is designed to solve large-scale mixed-variable non-convex optimization problems. The localsolver package is developed and maintained by WLOG Solutions ( <a href="http://www.wlogsolutions.com/en/">http://www.wlogsolutions.com/en/</a> ) in collaboration with Decision Support and Analysis Division at Warsaw School of Economics ( <a href="http://www.sgh.waw.pl/en/">http://www.sgh.waw.pl/en/</a> ). / LGPL-2.1   | noarch    |
| <a href="#">r-locfdr</a>               | 1.1_8   | Computation of local false discovery rates. / GPL-2   | noarch    |
| <a href="#">r-lock5data</a>            | 2.8     | Datasets for Statistics: Unlocking the Power of Data by Lock^5 Datasets for the first and second editions of the book. Older editions of revised data often have an extra 1e in the name. / GPL-2   | noarch    |
| <a href="#">r-lock5withr</a>           | 1.2.2   | Data sets and other utilities for ‘Statistics: Unlocking the Power of Data’ by Lock, Lock, Lock, Lock and Lock (ISBN : 978-0-470-60187-7, <a href="http://lock5stat.com/">http://lock5stat.com/</a> ). / GPL-2  | noarch    |
| <a href="#">r-lodi</a>                 | 0.9.1   | Impute observed values below the limit of detection (LOD) via censored likelihood multiple imputation (CLMI) in single-pollutant models, developed by Boss et al (2019) <doi:10.1097/EDE.0000000000001052>. CLMI handles exposure detection limits that may change throughout the course of exposure assessment. ‘lodi’ provides functions for imputing and pooling for this method. / GPL-3  | noarch    |
| <a href="#">r-logcondiscr</a>          | 1.0.6   | Given independent and identically distributed observations $X(1), \dots, X(n)$ , allows to compute the maximum likelihood estimator (MLE) of probability mass function (pmf) under the assumption that it is log-concave, see Weyermann (2007) and Balabdaoui, Jankowski, Rufibach, and Pavlides (2012). The main functions of the package are ‘logConDiscrMLE’ that allows computation of the log-concave MLE, ‘logConDiscrCI’ that computes pointwise confidence bands for the MLE, and ‘kInflatedLogConDiscr’ that computes a mixture of a log-concave PMF and a point mass at k. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name         | Version | Summary/License  | Platforms   |
|--------------|---------|--|---|
| r-logger     | 0.1     | Inspired by the the ‘futile.logger’ R package and ‘logging’ Python module, this utility provides a flexible and extensible way of formatting and delivering log messages with low overhead. / AGPL-3   | noarch  |
| r-logging    | 0.9.1   | Pure R implementation of the ubiquitous log4j package. It offers hierarchic loggers, multiple handlers per logger, level based filtering, space handling in messages and custom formatting. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-logicoil   | 0.99.0  | This package contains the functions necessary to run the LOGICOIL algorithm. LOGICOIL can be used to differentiate between antiparallel dimers, parallel dimers, trimers and higher-order coiled-coil sequence. By covering >90 percent of the known coiled-coil structures, LOGICOIL is a net improvement compared with other existing methods, which achieve a predictive coverage of around 31 percent of this population. As such, LOGICOIL is particularly useful for researchers looking to characterize novel coiled-coil sequences or studying coiled-coil containing protein assemblies. It may also be used to assist in the structural characterization of synthetic coiled-coil sequences. / GPL-2 | noarch  |
| r-logistic4p | 1.5     | Error in a binary dependent variable, also known as misclassification, has not drawn much attention in psychology. Ignoring misclassification in logistic regression can result in misleading parameter estimates and statistical inference. This package conducts logistic regression analysis with misspecification in outcome variables. / GPL-3  | noarch  |
| r-logisticrr | 0.2.0   | Adjusted odds ratio conditional on potential confounders can be directly obtained from logistic regression. However, those adjusted odds ratios have been widely incorrectly interpreted as a relative risk. As relative risk is often of interest in public health, we provide a simple code to return adjusted relative risks from logistic regression model under potential confounders. / GPL-3  | noarch  |
| r-logitnorm  | 0.8.37  | Density, distribution, quantile and random generation function for the logit-normal distribution. Estimation of the mode and the first two moments. Estimation of distribution parameters. / GPL-2   | noarch  |
| r-lognorm    | 0.1.6   | The lognormal distribution (Limpert et al. (2001) <doi:10.1641/0006-3568(2001)051%5B0341:Indats%5D2.0.co;2>) can characterize uncertainty that is bounded by zero. This package provides estimation of distribution parameters, computation of moments and other basic statistics, and an approximation of the distribution of the sum of several correlated lognormally distributed variables (Lo 2013 <doi:10.12988/ams.2013.39511>). / GPL-2  | noarch  |
| r-lognormreg | 0.2.0   | Functions to fits simple linear regression models with log normal errors and identity link (taking the responses on the original scale). See Muggeo (2018) <doi:10.13140/RG.2.2.18118.16965>. / GPL-3  | noarch  |
| r-logofgamma | 0.0.1   | Uses approximations to compute the natural logarithm of the Gamma function for large values. / GPL-3   | noarch  |
| r-logranka   | 1.0     | LogrankA provides a logrank test across unlimited groups with the possibility to input aggregated survival data. / GPL-2   | noarch  |

Table 51 – continued from previous page

| Name                           | Version | Summary/License   | Platforms |
|--------------------------------|---------|---|-----------|
| <a href="#">r-lomb</a>         | 1.1     | Computes the Lomb-Scargle Periodogram for unevenly sampled time series. Includes a randomization procedure to obtain reliable p-values. / GPL-2   | noarch    |
| <a href="#">r-longcateda</a>   | 0.31    | Methods for plotting categorical longitudinal and time-series data by mapping individuals to the vertical space (each horizontal line represents a participant), time (or repeated measures) to the horizontal space, categorical (or discrete) states as facets using color or shade, and events to points using plotting characters. Sorting individuals in the vertical space and (or) stratifying them by groups can reveal patterns in the changes over time. / GPL-3  | noarch    |
| <a href="#">r-longitudinal</a> | 1.1.12  | Contains general data structures and functions for longitudinal data with multiple variables, repeated measurements, and irregularly spaced time points. Also implements a shrinkage estimator of dynamical correlation and dynamical covariance. / GPL-3   | noarch    |
| <a href="#">r-longmemo</a>     | 1.1_1   | Datasets and Functionality from ‘Jan Beran’ (1994). Statistics for Long-Memory Processes; Chapman & Hall. Estimation of Hurst (and more) parameters for fractional Gaussian noise, ‘fARIMA’ and ‘FEXP’ models. / GPL-2  | noarch    |
| <a href="#">r-longpower</a>    | 1.0_1   | Compute power and sample size for linear models of longitudinal data. Supported models include mixed-effects models and models fit by generalized least squares and generalized estimating equations. Relevant formulas are derived by Liu and Liang (1997) <DOI:10.2307/2533554>, Diggle et al (2002) <ISBN:9780199676750>, and Lu, Luo, and Chen (2008) <DOI:10.2202/1557-4679.1098>. / GPL-2   | noarch    |
| <a href="#">r-longroc</a>      | 1.0     | Time-dependent Receiver Operating Characteristic curves, Area Under the Curve, and Net Reclassification Indexes for repeated measures. It is based on methods in Barbaty and Farcomeni (2017) <doi:10.1007/s10260-017-0410-2>. / GPL-2  | noarch    |
| <a href="#">r-loo</a>          | 2.1.0   | Efficient approximate leave-one-out cross-validation (LOO) for Bayesian models fit using Markov chain Monte Carlo. The approximation uses Pareto smoothed importance sampling (PSIS), a new procedure for regularizing importance weights. As a byproduct of the calculations, we also obtain approximate standard errors for estimated predictive errors and for the comparison of predictive errors between models. The package also provides methods for using stacking and other model weighting techniques to average Bayesian predictive distributions. / GPL (>= 3)  | noarch    |
| <a href="#">r-loon.data</a>    | 0.0.5   | Data used as examples in the ‘loon’ package. / GPL-2  | noarch    |
| <a href="#">r-loop</a>         | 1.1     | The program can perform loop analysis and plot network structure (especially for food webs), including minimum spanning tree, loop decomposition of weighted directed graphs, and other network properties which may be related to food chain properties in ecology. / GPL-2  | noarch    |
| <a href="#">r-loopanalyst</a>  | 1.2_6   | Loop analysis makes qualitative predictions of variable change in a system of causally interdependent variables, where qualitative means sign only (i.e. increases, decreases, non change, and ambiguous). This implementation includes output support for graphs in .dot file format for use with visualization software such as ‘graphviz’ (< <a href="http://graphviz.org">http://graphviz.org</a> >). ‘LoopAnalyst’ provides tools for the construction and output of community matrices, computation and output of community effect matrices, tables of correlations, adjoint, absolute feedback, weighted feedback and weighted prediction matrices, change in life expectancy matrices, and feedback, path and loop enumeration tools. / GPL-2 | noarch    |
| <a href="#">r-lotkaslaw</a>    | 0.0.1   | Running Lotka’s Law following Pao (1985)(DOI: 10.1016/0306-4573(85)90055-X). The Law is based around the proof that the number of authors making n contributions is about $1/n^a$ of those making one contribution. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name        | Version | Summary/License  | Platforms                                 |
|-------------|---------|--|---|
| r-lotri     | 0.1.1   | Provides a simple mechanism to specify a symmetric block diagonal matrices (often used for covariance matrices). This is based on the domain specific language implemented in ‘nlmixr’ but expanded to create matrices in R generally instead of specifying parts of matrices to estimate. / GPL-2   | noarch                                    |
| r-lpbrim    | 1.0.0   | Optimization of bipartite modularity using LP-BRIM (Label propagation followed by Bipartite Recursively Induced Modularity). / BSD_2_clause  | noarch                                    |
| r-lpc       | 1.0.2   | Implements the LPC method of Witten&Tibshirani(Annals of Applied Statistics 2008) for identification of significant genes in a microarray experiment. / GPL-2  | noarch                                    |
| r-lpcm      | 0.46    | Fitting multivariate data patterns with local principal curves, including tools for data compression (projection) and measuring goodness-of-fit; with some additional functions for mean shift clustering. / GPL-2   | noarch                                    |
| r-lpint     | 2.0     | Estimates the intensity function, or its derivative of a given order, of a multiplicative counting process using the local polynomial method / GPL (>= 2.0)  | noarch                                    |
| r-lpm       | 2.7     | Apply Univariate Long Memory Models, Apply Multivariate Short Memory Models To Hydrological Dataset, Estimate Intensity Duration Frequency curve to rainfall series. / GPL-2   | noarch                                    |
| r-lpmodeler | 0.2_1   | lpmodeler is a set of user-friendly functions to simplify the modelling of linear programs (LP) and mixed integer programs (MIP). It provides a unified interface compatible with optimization packages: Rsymphony. / GPL-2   BSD_2_clause   | noarch                                    |
| r-lpower    | 0.1.0   | Computes power, or sample size or the detectable difference for a repeated measures model with attrition. It requires the variance covariance matrix of the observations but can compute this matrix for several common random effects models. See Diggle, P, Liang, KY and Zeger, SL (1994, ISBN:9780198522843). / Unlimited              | noarch                                    |
| r-lps       | 1.0.10  | An implementation of the Linear Predictor Score approach, as initiated by Radmacher et al. (J Comput Biol 2001) and enhanced by Wright et al. (PNAS 2003) for gene expression signatures. Several tools for unsupervised clustering of gene expression data are also provided. / GPL-3   | noarch                                    |
| r-lpsolve   | 5.6.13  | Lp_solve is freely available (under LGPL 2) software for solving linear, integer and mixed integer programs. In this implementation we supply a wrapper function in C and some R functions that solve general linear/integer problems, assignment problems, and transportation problems. This version calls lp_solve version 5.5. / LGPL-2 | linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-lpwc      | 0.99.5  | Computes a time series distance measure for clustering based on weighted correlation and introduction of lags. The lags capture delayed responses in a time series dataset. The timepoints must be specified. T. Chandereeng, A. Gitter (2018) <doi:10.1101/292615>. / MIT   | noarch                                    |
| r-lrequire  | 0.1.3   | In the fashion of ‘node.js’ < <a href="https://nodejs.org/">https://nodejs.org/</a> >, requires a file, sourcing into the current environment only the variables explicitly specified in the module.exports or exports list variable. If the file was already sourced, the result of the earlier sourcing is returned to the caller. / MIT | noarch                                    |

Table 51 – continued from previous page

| Name     | Version | Summary/License   | Platforms |
|----------|---------|---|-----------|
| r-lrgs   | 0.5.3   | Implements a Gibbs sampler to do linear regression with multiple covariates, multiple responses, Gaussian measurement errors on covariates and responses, Gaussian intrinsic scatter, and a covariate prior distribution which is given by either a Gaussian mixture of specified size or a Dirichlet process with a Gaussian base distribution. / MIT  | noarch    |
| r-lrmest | 3.0     | When multicollinearity exists among predictor variables of the linear model, least square estimators does not provide a better solution for estimating parameters. To deal with multicollinearity several estimators are proposed in the literature. Some of these estimators are Ordinary Least Square Estimator (OLSE), Ordinary Generalized Ordinary Least Square Estimator (OGOLSE), Ordinary Ridge Regression Estimator (ORRE), Ordinary Generalized Ridge Regression Estimator (OGRRE), Restricted Least Square Estimator (RLSE), Ordinary Generalized Restricted Least Square Estimator (OGRLE), Ordinary Mixed Regression Estimator (OMRE), Ordinary Generalized Mixed Regression Estimator (OGMRE), Liu Estimator (LE), Ordinary Generalized Liu Estimator (OGLE), Restricted Liu Estimator (RLE), Ordinary Generalized Restricted Liu Estimator (OGRLE), Stochastic Restricted Liu Estimator (SRLE), Ordinary Generalized Stochastic Restricted Liu Estimator (OGSRLE), Type (1),(2),(3) Liu Estimator (Type-1,2,3 LTE), Ordinary Generalized Type (1),(2),(3) Liu Estimator (Type-1,2,3 OGLTE), Type (1),(2),(3) Adjusted Liu Estimator (Type-1,2,3 ALTE), Ordinary Generalized Type (1),(2),(3) Adjusted Liu Estimator (Type-1,2,3 OGALTE), Almost Unbiased Ridge Estimator (AURE), Ordinary Generalized Almost Unbiased Ridge Estimator (OGAURE), Almost Unbiased Liu Estimator (AULE), Ordinary Generalized Almost Unbiased Liu Estimator (OGAULE), Stochastic Restricted Ridge Estimator (SRRE), Ordinary Generalized Stochastic Restricted Ridge Estimator (OGSRRE), Restricted Ridge Regression Estimator (RRRE) and Ordinary Generalized Restricted Ridge Regression Estimator (OGRRE). To select the best estimator in a practical situation the Mean Square Error (MSE) is used. Using this package scalar MSE value of all the above estimators and Prediction Sum of Square (PRESS) values of some of the estimators can be obtained, and the variation of the MSE and PRESS values for the relevant estimators can be shown graphically. / GPL-2   GPL-3 | noarch    |
| r-lrth   | 1.3     | R code of a likelihood ratio test for genome-wide association under genetic heterogeneity. / GPL-3  | noarch    |
| r-lsa    | 0.73.1  | The basic idea of latent semantic analysis (LSA) is, that text do have a higher order (=latent semantic) structure which, however, is obscured by word usage (e.g. through the use of synonyms or polysemy). By using conceptual indices that are derived statistically via a truncated singular value decomposition (a two-mode factor analysis) over a given document-term matrix, this variability problem can be overcome. / GPL-2  | noarch    |
| r-lsasim | 1.0.1   | Provides functions to simulate data from large-scale educational assessments, including background questionnaire data and cognitive item responses that adhere to a multiple-matrix sampled design. / GPL-3   | noarch    |
| r-lsd    | 4.0_0   | Create lots of colorful plots in a plethora of variations. Try the LSD demo-tour(). / Unlimited   | noarch    |

Table 51 – continued from previous page

| Name                           | Version | Summary/License   | Platforms   |
|--------------------------------|---------|---|---|
| <a href="#">r-lsdinterface</a> | 0.4.0   | Interfaces R with LSD. Reads object-oriented data in results files (.res) produced by LSD and creates appropriate multi-dimensional arrays in R. Supports multiple core parallelization of multi-file data reading for increased performance. Also provides functions to extract basic information and statistics from data files. LSD (Laboratory for Simulation Development) is free software developed by Marco Valente (documentation and downloads available at <a href="http://labsimdev.org">http://labsimdev.org</a> ). / GPL-3   | noarch  |
| <a href="#">r-lsdv</a>         | 1.1     | Fit a least square dummy variable regression / Artistic-2.0   | noarch  |
| <a href="#">r-lshorth</a>      | 0.1_6   | Calculates the (localised) length of the shorth and supplies corresponding diagnostic plots. / LGPL-3   | noarch  |
| <a href="#">r-lsm</a>          | 0.1.8   | When the values of the outcome variable Y are either 0 or 1, the function lsm() calculates the estimation of the log likelihood in the saturated model. This model is characterized by Llinas (2006, ISSN:2389-8976) in section 2.3 through the assumptions 1 and 2. The function LogLik() works (almost perfectly) when the number of independent variables K is high, but for small K it calculates wrong values in some cases. For this reason, when Y is dichotomous and the data are grouped in J populations, it is recommended to use the function lsm() because it works very well for all K. / MIT   | noarch  |
| <a href="#">r-lsmeans</a>      | 2.30_0  | Obtain least-squares means for linear, generalized linear, and mixed models. Compute contrasts or linear functions of least-squares means, and comparisons of slopes. Plots and compact letter displays. Least-squares means were proposed in Harvey, W (1960) Least-squares analysis of data with unequal subclass numbers, Tech Report ARS-20-8, USDA National Agricultural Library, and discussed further in Searle, Speed, and Milliken (1980) Population marginal means in the linear model: An alternative to least squares means, The American Statistician 34(4), 216-221 <doi:10.1080/00031305.1980.10483031>. NOTE: lsmeans now relies primarily on code in the 'emmeans' package. 'lsmeans' will be archived in the near future. / GPL-2   GPL-3 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-lsmontecarlo</a> | 1.0     | The package compiles functions for calculating prices of American put options with Least Squares Monte Carlo method. The option types are plain vanilla American put, Asian American put, and Quanto American put. The pricing algorithms include variance reduction techniques such as Antithetic Variates and Control Variates. Additional functions are given to derive price surfaces at different volatilities and strikes, create 3-D plots, quickly generate Geometric Brownian motion, and calculate prices of European options with Black & Scholes analytical solution. / GPL-3   | noarch  |
| <a href="#">r-lspline</a>      | 1.0_0   | Linear splines with convenient parametrisations such that (1) coefficients are slopes of consecutive segments or (2) coefficients are slope changes at consecutive knots. Knots can be set manually or at break points of equal-frequency or equal-width intervals covering the range of 'x'. The implementation follows Greene (2003), chapter 7.2.5. / MIT  | noarch  |
| <a href="#">r-lsplsls</a>      | 0.2_2   | Implements the LS-PLS (least squares - partial least squares) method described in for instance Jørgensen, K., Segtnan, V. H., Thyholt, K., Næs, T. (2004) A Comparison of Methods for Analysing Regression Models with Both Spectral and Designed Variables Journal of Chemometrics, 18(10), 451–464, <doi:10.1002/cem.890>. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name                            | Version | Summary/License   | Platforms  |
|---------------------------------|---------|---|--|
| <a href="#">r-lsplsglm</a>      | 1.0     | Fit logistic regression models using LS-PLS approaches to analyse both clinical and genomic data. (C. Bazzoli and S. Lambert-Lacroix. (2017) Classification using LS-PLS with logistic regression based on both clinical and gene expression variables < <a href="https://hal.archives-ouvertes.fr/hal-01405101">https://hal.archives-ouvertes.fr/hal-01405101</a> >). / GPL-2  | noarch   |
| <a href="#">r-lsr</a>           | 0.5     | A collection of tools intended to make introductory statistics easier to teach, including wrappers for common hypothesis tests and basic data manipulation. It accompanies Navarro, D. J. (2015). Learning Statistics with R: A Tutorial for Psychology Students and Other Beginners, Version 0.5. [Lecture notes] School of Psychology, University of Adelaide, Adelaide, Australia. ISBN: 978-1-326-18972-3. URL: <a href="http://health.adelaide.edu.au/psychology/ccs/teaching/lsr/">http://health.adelaide.edu.au/psychology/ccs/teaching/lsr/</a> . / GPL-3   | noarch   |
| <a href="#">r-lsrs</a>          | 0.2.0   | Rapid satellite data streams in operational applications have clear benefits for monitoring land cover, especially when information can be delivered as fast as changing surface conditions. Over the past decade, remote sensing has become a key tool for monitoring and predicting environmental variables by using satellite data. This package presents the main applications in remote sensing for land surface monitoring and land cover mapping (soil, vegetation, water...). Tomlinson, C.J., Chapman, L., Thornes, E., Baker, C (2011) < <a href="https://doi.org/10.1002/met.287">doi:10.1002/met.287</a> >. / GPL-3 | noarch   |
| <a href="#">r-ltable</a>        | 1.0     | Constructs tables of counts and proportions out of data sets. It has simplified syntax appealing for novice and even for advanced user under time pressure. It is particularly suitable for exploratory data analysis or presentation to single out most appropriate pieces of tabulated information. The other important feature is possibility to insert tables to Excel and Word documents. / GPL-2  | noarch   |
| <a href="#">r-ltpdvar</a>       | 1.2     | Calculation of rectifying LTPD and AOQL plans for sampling inspection by variables which minimize mean inspection cost per lot of process average quality. / GPL-2  | noarch   |
| <a href="#">r-ltr</a>           | 1.0.0   | A set of functions to execute the linear-transformation of replicate (LTR) algorithm for preprocessing of microarray data / GPL-2   | noarch   |
| <a href="#">r-ltsbase</a>       | 1.0.1   | This is a new tool to estimate Ridge and Liu estimators based on LTS method in multiple linear regression analysis. / GPL-3   | noarch   |
| <a href="#">r-ltxsparklines</a> | 1.1.2   | Sparklines are small plots (about one line of text high), made popular by Edward Tufte. This package is the interface from R to the LaTeX package sparklines by Andreas Loeffler and Dan Luecking (< <a href="http://www.ctan.org/pkg/sparklines">http://www.ctan.org/pkg/sparklines</a> >). It can work with Sweave or knitr or other engines that produce TeX. The package can be used to plot vectors, matrices, data frames, time series (in ts or zoo format). / GPL-2   GPL-3   | noarch   |
| <a href="#">r-lubridate</a>     | 1.7.4   | Functions to work with date-times and time-spans: fast and user friendly parsing of date-time data, extraction and updating of components of a date-time (years, months, days, hours, minutes, and seconds), algebraic manipulation on date-time and time-span objects. The ‘lubridate’ package has a consistent and memorable syntax that makes working with dates easy and fun. Parts of the ‘CCTZ’ source code, released under the Apache 2.0 License, are included in this package. See < <a href="https://github.com/google/cctz">https://github.com/google/cctz</a> > for more details. / GPL (>= 2)                      | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                  | Version | Summary/License  | Platforms |
|-----------------------|---------|--|-----------|
| r-lucid               | 1.7     | Print vectors (and data frames) of floating point numbers using a non-scientific format optimized for human readers. Vectors of numbers are rounded using significant digits, aligned at the decimal point, and all zeros trailing the decimal point are dropped. See: Wright (2016). Lucid: An R Package for Pretty-Printing Floating Point Numbers. In JSM Proceedings, Statistical Computing Section. Alexandria, VA: American Statistical Association. 2270-2279. / GPL-3  | noarch    |
| r-lumberjack          | 1.0.3   | A framework that allows for easy logging of changes in data. Main features: start tracking changes by adding a single line of code to an existing script. Track changes in multiple datasets, using multiple loggers. Add custom-built loggers or use loggers offered by other packages. / GPL-3   | noarch    |
| r-lunar               | 0.1_04  | Provides functions to calculate lunar and other environmental covariates. / MIT  | noarch    |
| r-luzlogr             | 0.2.0   | Provides flexible but lightweight logging facilities for R scripts. Supports priority levels for logs and messages, flagging messages, capturing script output, switching logs, and logging to files or connections. / MIT   | noarch    |
| r-lzerospikeinference | 1.0.3   | An implementation of algorithms described in Jewell and Witten (2017) <arXiv:1703.08644>. / GPL-3  | noarch    |
| r-mac                 | 1.1.1   | This is an integrated meta-analysis package for conducting a correlational research synthesis. One of the unique features of this package is in its integration of user-friendly functions to facilitate statistical analyses at each stage in a meta-analysis with correlations. It uses recommended procedures as described in The Handbook of Research Synthesis and Meta-Analysis (Cooper, Hedges, & Valentine, 2009). / GPL-2   | noarch    |
| r-mad                 | 0.8_2   | A collection of functions for conducting a meta-analysis with mean differences data. It uses recommended procedures as described in The Handbook of Research Synthesis and Meta-Analysis (Cooper, Hedges, & Valentine, 2009). / GPL-2  | noarch    |
| r-maddison            | 0.1     | Contains the Maddison Project database, which provides estimates of GDP per capita for all countries in the world between AD 1 and 2010. See <a href="http://www.ggdc.net/maddison">http://www.ggdc.net/maddison</a> for more information. / CC0   | noarch    |
| r-maditr              | 0.6.2   | Package provides pipe-style interface for 'data.table'. It preserves all 'data.table' features without significant impact on performance. 'let' and 'take' functions are simplified interfaces for most common data manipulation tasks. For example, you can write 'mtcars %>% take(mean(mpg), by = am)' for aggregation or 'mtcars %>% let(hp_wt = hp/wt, hp_wt_mpg = hp_wt/mpg)' for modification. Use 'take_if/let_if' for conditional aggregation/modification. 'query_if' function translates its arguments one-to-one to '[.data.table]' method. Additionally there are some conveniences such as automatic 'data.frame' conversion to 'data.table'. / GPL-2 | noarch    |
| r-madr                | 1.0.0   | Estimates average treatment effects using model average double robust (MA-DR) estimation. The MA-DR estimator is defined as weighted average of double robust estimators, where each double robust estimator corresponds to a specific choice of the outcome model and the propensity score model. The MA-DR estimator extend the desirable double robustness property by achieving consistency under the much weaker assumption that either the true propensity score model or the true outcome model be within a specified, possibly large, class of models. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name              | Version | Summary/License   | Platforms   |
|-------------------|---------|---|---|
| r-madsim          | 1.2.1   | This function allows to generate two biological conditions synthetic microarray dataset which has similar behavior to those currently observed with common platforms. User provides a subset of parameters. Available default parameters settings can be modified. / GPL ( $\geq 2.0$ )   | noarch  |
| r-magclass        | 4.107   | Data class for increased interoperability working with spatial- temporal data together with corresponding functions and methods (conversions, basic calculations and basic data manipulation). The class distinguishes between spatial, temporal and other dimensions to facilitate the development and interoperability of tools build for it. Additional features are name-based addressing of data and internal consistency checks (e.g. checking for the right data order in calculations). / LGPL-3  | noarch  |
| r-magic           | 1.5_9   | A collection of efficient, vectorized algorithms for the creation and investigation of magic squares and hypercubes, including a variety of functions for the manipulation and analysis of arbitrarily dimensioned arrays. The package includes methods for creating normal magic squares of any order greater than 2. The ultimate intention is for the package to be a computerized embodiment all magic square knowledge, including direct numerical verification of properties of magic squares (such as recent results on the determinant of odd-ordered semimagic squares). Some antimagic functionality is included. The package also serves as a rebuttal to the often-heard comment I thought R was just for statistics. / GPL-2 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-magicfor        | 0.1.0   | Magic functions to obtain results from for loops. / MIT   | noarch  |
| r-magrittr        | 1.5     | Provides a mechanism for chaining commands with a new forward-pipe operator, <code>%&gt;%</code> . This operator will forward a value, or the result of an expression, into the next function call/expression. There is flexible support for the type of right-hand side expressions. For more information, see package vignette. To quote Rene Magritte, Ceci n'est pas un pipe. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-mail            | 1.0     | Easy to use package for sending email notifications with status information from R / GPL-2  | noarch  |
| r-mailr           | 0.4.1   | Interface to Apache Commons Email to send emails from R. / GPL-3  | noarch  |
| r-makefiler       | 1.0     | A user-friendly interface for the construction of 'Makefiles'. / GPL-3  | noarch  |
| r-makeproject     | 1.0     | This package creates an empty framework of files and directories for the Load, Clean, Func, Do structure described by Josh Reich. / GPL-3   | noarch  |
| r-malani          | 1.0     | Find dark genes. These genes are often disregarded due to no detected mutation or differential expression, but are important in coordinating the functionality in cancer networks. / GPL-3  | noarch  |
| r-mallet          | 1.0     | This package allows you to train topic models in mallet and load results directly into R. / MIT   | noarch  |
| r-mams            | 1.3     | Designing multi-arm multi-stage studies with (asymptotically) normal endpoints and known variance. / GPL-2  | noarch  |
| r-managelocalrepo | 0.1.5   | This will allow easier management of a CRAN-style repository on local networks (i.e. not on CRAN). This might be necessary where hosted packages contain intellectual property owned by a corporation. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name                               | Version | Summary/License   | Platforms   |
|------------------------------------|---------|---|---|
| <a href="#">r-mancie</a>           | 1.4     | High-dimensional data integration is a critical but difficult problem in genomics research because of potential biases from high-throughput experiments. We present MANCIE, a computational method for integrating two genomic data sets with homogenous dimensions from different sources based on a PCA procedure as an approximation to a Bayesian approach. / GPL-2               | noarch  |
| <a href="#">r-mangotraining</a>    | 1.0.7   | Datasets designed to be used in conjunction with Mango Solutions training materials and the book SAMS Teach Yourself R in 24 Hours (ISBN: 978-0-672-33848-9). / GPL-2   | noarch  |
| <a href="#">r-mangrove</a>         | 1.21    | Methods for performing genetic risk prediction from genotype data. You can use it to perform risk prediction for individuals, or for families with missing data. / GPL-2  | noarch  |
| <a href="#">r-manipulate</a>       | 1.0.1   | Interactive plotting functions for use within RStudio. The manipulate function accepts a plotting expression and a set of controls (e.g. slider, picker, checkbox, or button) which are used to dynamically change values within the expression. When a value is changed using its corresponding control the expression is automatically re-executed and the plot is redrawn. / GPL-2 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-manipulatewidget</a> | 0.10.0  | Like package ‘manipulate’ does for static graphics, this package helps to easily add controls like sliders, pickers, checkboxes, etc. that can be used to modify the input data or the parameters of an interactive chart created with package ‘htmlwidgets’. / GPL (>= 2)   file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-manytests</a>        | 1.2     | Performs the multiple testing procedures of Cox (2011) <doi:10.5170/CERN-2011-006> and Wong and Cox (2007) <doi:10.1080/02664760701240014>. / GPL-2   | noarch  |
| <a href="#">r-maples</a>           | 1.0     | MAPLES is a general method for the estimation of age profiles that uses standard micro-level demographic survey data. The aim is to estimate smoothed age profiles and relative risks for time-fixed and time-varying covariates. / GPL-2   | noarch  |
| <a href="#">r-mapmisc</a>          | 1.7.2   | A minimal, light-weight set of tools for producing nice looking maps in R, with support for map projections. / GPL-3  | noarch  |
| <a href="#">r-mapplots</a>         | 1.5.1   | Create simple maps; add sub-plots like pie plots to a map or any other plot; format, plot and export gridded data. The package was developed for displaying fisheries data but most functions can be used for more generic data visualisation. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name       | Version | Summary/License   | Platforms  |
|------------|---------|---|--|
| r-mapproj  | 1.2.6   | Converts latitude/longitude into projected coordinates. / Lucent Public License   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-maps     | 3.3.0   | Display of maps. Projection code and larger maps are in separate packages ('mapproj' and 'mapdata'). / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-maptools | 0.9_5   | Set of tools for manipulating and reading geographic data, in particular 'ESRI Shapefiles'; C code used from 'shapelib'. It includes binary access to 'GSHHG' shoreline files. The package also provides interface wrappers for exchanging spatial objects with packages such as 'PBSmapping', 'spatstat', 'maps', 'RArcInfo', 'Stata tmap', 'WinBUGS', 'Mondrian', and others. / GPL (>= 2)    | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-maptree  | 1.4_7   | Functions with example data for graphing, pruning, and mapping models from hierarchical clustering, and classification and regression trees. / Unlimited  | noarch   |
| r-mar      | 1.1_2   | R functions for multivariate autoregressive analysis / GPL-2  | noarch   |
| r-march    | 3.1     | Computation of various Markovian models for categorical data including homogeneous Markov chains of any order, MTD models, Hidden Markov models, and Double Chain Markov Models. / GPL-2  | noarch   |
| r-mareymap | 1.3.4   | Local recombination rates are graphically estimated across a genome using Marey maps. / GPL-2   | noarch   |
| r-marima   | 2.2     | Multivariate ARIMA and ARIMA-X estimation using Spliid's algorithm (marima()) and simulation (marima.sim()). / GPL-2  | noarch   |
| r-markdown | 0.9     | Provides R bindings to the 'Sundown' 'Markdown' rendering library ( <a href="https://github.com/vmg/sundown">https://github.com/vmg/sundown</a> ). 'Markdown' is a plain-text formatting syntax that can be converted to 'XHTML' or other formats. See <a href="http://en.wikipedia.org/wiki/Markdown">http://en.wikipedia.org/wiki/Markdown</a> for more information about 'Markdown'. / GPL-2 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                               | Version | Summary/License   | Platforms  |
|------------------------------------|---------|---|--|
| <a href="#">r-markmyassignment</a> | 0.8.2   | Automatic marking of R assignments for students and teachers based on ‘test-that’ test suites. / BSD_2_clause   | noarch   |
| <a href="#">r-marl</a>             | 1.0     | Functions provided allow data simulation; construction of weighted relative likelihood functions; clustering and principal component analysis based on weighted relative likelihood functions. / GPL-2  | noarch   |
| <a href="#">r-masae</a>            | 0.1_5   | An S4 implementation of the unbiased extension of the model-assisted synthetic-regression estimator proposed by Mandallaz (2013) <DOI:10.1139/cjfr-2012-0381>, Mandallaz et al. (2013) <DOI:10.1139/cjfr-2013-0181> and Mandallaz (2014) <DOI:10.1139/cjfr-2013-0449>. It yields smaller variances than the standard bias correction, the generalised regression estimator. / GPL-2   | noarch   |
| <a href="#">r-mass</a>             | 7.3_5   | Functions and datasets to support Venables and Ripley, Modern Applied Statistics with S (4th edition, 2002). / GPL-2   GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-massign</a>          | 1.1.0   | Constructing matrices for quick prototyping can be a nuisance, requiring the user to think about how to fill the matrix with values using the matrix() function. The %<-% operator solves that issue by allowing the user to construct matrices using code that shows the actual matrices. / MIT  | noarch   |
| <a href="#">r-masstimate</a>       | 1.3     | Estimation equations are from a variety of sources but are, in general, based on regressions between skeletal measurements (e.g., femoral circumference) and body mass in living taxa. / GPL-2  | noarch   |
| <a href="#">r-mata</a>             | 0.4     | Calculates Model-Averaged Tail Area Wald (MATA-Wald) confidence intervals, which are constructed using single-model estimators and model weights. See Turek and Fletcher (2012) <doi:10.1016/j.csda.2012.03.002> for details. / GPL-2   | noarch   |
| <a href="#">r-matchbook</a>        | 1.0.7   | Provides a wrapper for the some basic functionality around the ‘Matchbook’ < <a href="http://www.matchbook.com">http://www.matchbook.com</a> > REST API. It features calls to get events, markets and runners in data frame format. It features functions for bet placement and position management and also allows reporting of settled bet transactions. Note: this package uses the back-lay format. The default for odds type, currency and language are set according to those of the registered user account. / MIT   | noarch   |
| <a href="#">r-matconv</a>          | 0.4.0   | Transferring over a code base from Matlab to R is often a repetitive and inefficient use of time. This package provides a translator for Matlab / Octave code into R code. It does some syntax changes, but most of the heavy lifting is in the function changes since the languages are so similar. Options for different data structures and the functions that can be changed are given. The Matlab code should be mostly in adherence to the standard style guide but some effort has been made to accommodate different number of spaces and other small syntax issues. This will not make the code more R friendly and may not even run afterwards. However, the rudimentary syntax, base function and data structure conversion is done quickly so that the maintainer can focus on changes to the design structure. / GPL-2 | noarch   |

Table 51 – continued from previous page

| Name                           | Version | Summary/License   | Platforms   |
|--------------------------------|---------|---|---|
| <a href="#">r-mathgraph</a>    | 0.9_1   | Simple tools for constructing and manipulating objects of class mathgraph from the book S Poetry, available at <a href="http://www.burns-stat.com/pages/spoetry.html">http://www.burns-stat.com/pages/spoetry.html</a> . / GPL-2  | noarch  |
| <a href="#">r-matlab</a>       | 1.0.2   | Emulate MATLAB code using R / Artistic-2.0  | noarch  |
| <a href="#">r-matlabr</a>      | 1.5.2   | Provides users to call MATLAB from using the system command. Allows users to submit lines of code or MATLAB m files. This is in comparison to 'R.matlab', which creates a MATLAB server. / GPL-2  | noarch  |
| <a href="#">r-matpow</a>       | 0.1.1   | A general framework for computing powers of matrices. A key feature is the capability for users to write callback functions, called after each iteration, thus enabling customization for specific applications. Diverse types of matrix classes/matrix multiplication are accommodated. If the multiplication type computes in parallel, then the package computation is also parallel. / GPL-2  | noarch  |
| <a href="#">r-matrix</a>       | 1.2_1   | A rich hierarchy of matrix classes, including triangular, symmetric, and diagonal matrices, both dense and sparse and with pattern, logical and numeric entries. Numerous methods for and operations on these matrices, using 'LAPACK' and 'SuiteSparse' libraries. / GPL (>= 2)   file LICENCE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-matrixcalc</a>   | 1.0_3   | A collection of functions to support matrix calculations for probability, econometric and numerical analysis. There are additional functions that are comparable to APL functions which are useful for actuarial models such as pension mathematics. This package is used for teaching and research purposes at the Department of Finance and Risk Engineering, New York University, Polytechnic Institute, Brooklyn, NY 11201. / GPL (>= 2)  | linux-64,<br>noarch,<br>win-64                                    |
| <a href="#">r-matrixeqtl</a>   | 2.2     | Matrix eQTL is designed for fast eQTL analysis on large datasets. Matrix eQTL can test for association between genotype and gene expression using linear regression with either additive or ANOVA genotype effects. The models can include covariates to account for factors as population stratification, gender, and clinical variables. It also supports models with heteroscedastic and/or correlated errors, false discovery rate estimation and separate treatment of local (cis) and distant (trans) eQTLs. / LGPL-3 | noarch  |
| <a href="#">r-matrixmodels</a> | 0.4_1   | Modelling with sparse and dense 'Matrix' matrices, using modular prediction and response module classes. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-matrixnormal</a> | 0.0.1   | Computes densities, probabilities, and random deviates of the Matrix Normal (Iranmanesh et al. (2010) <doi:10.7508/ijmsi.2010.02.004>). Also includes simple but useful matrix functions. See the vignette for more information. / GPL-3  | noarch  |

Table 51 – continued from previous page

| Name                              | Version | Summary/License   | Platforms   |
|-----------------------------------|---------|---|---|
| <a href="#">r-matrixstats</a>     | 0.54.0  | High-performing functions operating on rows and columns of matrices, e.g. <code>col / rowMedians()</code> , <code>col / rowRanks()</code> , and <code>col / rowSds()</code> . Functions optimized per data type and for subsetting calculations such that both memory usage and processing time is minimized. There are also optimized vector-based methods, e.g. <code>binMeans()</code> , <code>madDiff()</code> and <code>weightedMedian()</code> . / Artistic-2.0   | linux-64,<br>osx-64,<br>win-32,<br>win-64                         |
| <a href="#">r-matrixstructest</a> | 1.0.0   | Tests for block-diagonal structure in symmetric matrices (e.g. correlation matrices) under the null hypothesis of exchangeable off-diagonal elements. As described in Segal et al. (2019), these tests can be useful for construct validation either by themselves or as a complement to confirmatory factor analysis. Monte Carlo methods are used to approximate the permutation p-value with Hubert's Gamma (Hubert, 1976) and a t-statistic. This package also implements the chi-squared statistic described by Steiger (1980). Please see Segal, et al. (2019) <doi:10.1007/s11336-018-9647-4> for more information. / GPL-3  | noarch  |
| <a href="#">r-matrixtests</a>     | 0.1.5   | Functions to perform fast statistical hypothesis tests on rows/columns of matrices. The main goals are: 1) speed via vectorization, 2) output that is detailed and easy to use, 3) compatibility with tests implemented in R (like those available in the 'stats' package). / GPL-2   | noarch  |
| <a href="#">r-matskew</a>         | 0.1.5   | Performs matrix skew-t parameter estimation, Gallagher and McNicholas (2017) <doi: 10.1002/sta4.143>. / GPL-2   | noarch  |
| <a href="#">r-mattools</a>        | 1.1     | This package includes functions for receiver operating characteristic (ROC) analyses as well as Monte Carlo simulation. It includes specific graphical functions for interpreting the output of these techniques. / GPL-2   | noarch  |
| <a href="#">r-mavtgsa</a>         | 1.3     | This package is a gene set analysis function for one-sided test (OLS), two-sided test (multivariate analysis of variance). If the experimental conditions are equal to 2, the p-value for Hotelling's $t^2$ test is calculated. If the experimental conditions are greater than 2, the p-value for Wilks' Lambda is determined and post-hoc test is reported too. Three multiple comparison procedures, Dunnett, Tukey, and sequential pairwise comparison, are implemented. The program computes the p-values and FDR (false discovery rate) q-values for all gene sets. The p-values for individual genes in a significant gene set are also listed. MAVTgsa generates two visualization output: a p-value plot of gene sets (GSA plot) and a GST-plot of the empirical distribution function of the ranked test statistics of a given gene set. A Random Forests-based procedure is to identify gene sets that can accurately predict samples from different experimental conditions or are associated with the continuous phenotypes. / GPL-2 | noarch  |
| <a href="#">r-maxlik</a>          | 1.3_4   | Functions for Maximum Likelihood (ML) estimation and non-linear optimization, and related tools. It includes a unified way to call different optimizers, and classes and methods to handle the results from the ML viewpoint. It also includes a number of convenience tools for testing and developing your own models. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Continued on next page

Table 51 – continued from previous page

| Name            | Version | Summary/License   | Platforms |
|-----------------|---------|---|-----------|
| r-maxlike       | 0.1.7   | Provides a likelihood-based approach to modeling species distributions using presence-only data. In contrast to the popular software program MAXENT, this approach yields estimates of the probability of occurrence, which is a natural descriptor of a species' distribution. / GPL-3   | noarch    |
| r-maxmatching   | 0.1.0   | Computes the maximum matching for unweighted graph and maximum matching for (un)weighted bipartite graph efficiently. / CC0   | noarch    |
| r-maxnet        | 0.1.2   | Procedures to fit species distributions models from occurrence records and environmental variables, using 'glmnet' for model fitting. Model structure is the same as for the 'Maxent' Java package, version 3.4.0, with the same feature types and regularization options. See the 'Maxent' website < <a href="http://biodiversityinformatics.amnh.org/open_source/maxent">http://biodiversityinformatics.amnh.org/open_source/maxent</a> > for more details. / MIT | noarch    |
| r-maxskew       | 1.1     | It finds Orthogonal Data Projections with Maximal Skewness. The first data projection in the output is the most skewed among all linear data projections. The second data projection in the output is the most skewed among all data projections orthogonal to the first one, and so on. / GPL-2  | noarch    |
| r-mazegen       | 0.1.3   | A maze generator that creates the Elithorn Maze (HTML file) and the functions to calculate the associated maze parameters (i.e. Difficulty and Ability). / GPL-3  | noarch    |
| r-mazeinda      | 0.0.1   | Methods for calculating and testing the significance of pairwise monotonic association from and based on the work of Pimentel (2009) <doi:10.4135/9781412985291.n2>. Computation of association of vectors from one or multiple sets can be performed in parallel thanks to the packages 'foreach' and 'doMC'. / GPL-3  | noarch    |
| r-mbc           | 0.10.4  | Calibrate and apply multivariate bias correction algorithms for climate model simulations of multiple climate variables. Three methods described by Cannon (2016) <doi:10.1175/JCLI-D-15-0679.1> and Cannon (2018) <doi:10.1007/s00382-017-3580-6> are implemented: (i) MBC Pearson correlation (MBCp), (ii) MBC rank correlation (MBCr), and (iii) MBC N-dimensional PDF transform (MBCn). / GPL-2   | noarch    |
| r-mbcluster.seq | 1.0     | Cluster genes based on Poisson or Negative-Binomial model for RNA-Seq or other digital gene expression (DGE) data / GPL-3   | noarch    |
| r-mbi           | 1.0     | Over 20 multiple-site diversity indices can be calculated. Later versions will include phylogenetic diversity / GPL-2   | noarch    |
| r-mbir          | 1.3.5   | Allows practitioners and researchers a wholesale approach for deriving magnitude-based inferences from raw data. A major goal of 'mbir' is to programmatically detect appropriate statistical tests to run in lieu of relying on practitioners to determine correct stepwise procedures independently. / GPL-2  | noarch    |
| r-mblm          | 0.12.1  | Provides linear models based on Theil-Sen single median and Siegel repeated medians. They are very robust (29 or 50 percent breakdown point, respectively), and if no outliers are present, the estimators are very similar to OLS. / GPL-2   | noarch    |
| r-mc2d          | 0.1.18  | A complete framework to build and study Two-Dimensional Monte-Carlo simulations, aka Second-Order Monte-Carlo simulations. Also includes various distributions (pert, triangular, Bernoulli, empirical discrete and continuous). / GPL-2  | noarch    |
| r-mcbftest      | 0.1.0   | Monte Carol based tests for the Behrens Fisher Problem enhance the statistical power and performs better than Welch's t-approximation, see Ullah et al. (2019). / GPL (>= 2.0)  | noarch    |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms |
|------------------------------|---------|---|-----------|
| <a href="#">r-mcbiopi</a>    | 1.1.6   | Computes the prime implicants or a minimal disjunctive normal form for a logic expression presented by a truth table or a logic tree. Has been particularly developed for logic expressions resulting from a logic regression analysis, i.e. logic expressions typically consisting of up to 16 literals, where the prime implicants are typically composed of a maximum of 4 or 5 literals. / LGPL-2   | noarch    |
| <a href="#">r-mcc</a>        | 1.0     | A number of biomedical problems involve performing many hypothesis tests, with an attendant need to apply stringent thresholds. Often the data take the form of a series of predictor vectors, each of which must be compared with a single response vector, perhaps with nuisance covariates. Parametric tests of association are often used, but can result in inaccurate type I error at the extreme thresholds, even for large sample sizes. Furthermore, standard two-sided testing can reduce power compared to the doubled p-value, due to asymmetry in the null distribution. Exact (permutation) testing approaches are attractive, but can be computationally intensive and cumbersome. MCC is an approximation to exact association testing of two vectors that is accurate and fast enough for standard use in high-throughput settings, and can easily provide standard two-sided or doubled p-values. / GPL-2 | noarch    |
| <a href="#">r-mccmeiv</a>    | 2.1     | Applying the methodology from Manuel et al. to estimate parameters using a matched case control data with a mismeasured exposure variable that is accompanied by instrumental variables (Submitted). / GPL-2  | noarch    |
| <a href="#">r-mccr</a>       | 0.4.4   | The Matthews correlation coefficient (MCC) score is calculated (Matthews BW (1975) <DOI:10.1016/0005-2795(75)90109-9>). / MIT   | noarch    |
| <a href="#">r-mcgibbsit</a>  | 1.1.0   | 'mcgibbsit' provides an implementation of Warnes & Raftery's MCGibbsit run-length diagnostic for a set of (not-necessarily independent) MCMC samplers. It combines the estimate error-bounding approach of the Raftery and Lewis MCMC run length diagnostic with the between verses within chain approach of the Gelman and Rubin MCMC convergence diagnostic. / GPL-3  | noarch    |
| <a href="#">r-mcheatmaps</a> | 1.0.0   | mcheatmaps serves to visualize multiple different symmetric matrices and matrix clusters in a single figure using a dendrogram, two half matrices and various color labels. / GPL-3   | noarch    |
| <a href="#">r-mchtest</a>    | 1.0.3   | Performs Monte Carlo hypothesis tests, allowing a couple of different sequential stopping boundaries. For example, a truncated sequential probability ratio test boundary (Fay, Kim and Hachey, 2007 <DOI:10.1198/106186007X257025>) and a boundary proposed by Besag and Clifford, 1991 <DOI:10.1093/biomet/78.2.301>. Gives valid p-values and confidence intervals on p-values. / GPL-3  | noarch    |
| <a href="#">r-mci</a>        | 1.3.3   | Market area models are used to analyze and predict store choices and market areas concerning retail and service locations. This package implements two market area models (Huff Model, Multiplicative Competitive Interaction Model) into R, while the emphases lie on 1.) fitting these models based on empirical data via OLS regression and nonlinear techniques and 2.) data preparation and processing (esp. interaction matrices and data preparation for the MCI Model). / GPL-2   | noarch    |
| <a href="#">r-mcmcplots</a>  | 0.4.3   | Functions for convenient plotting and viewing of MCMC output. / GPL-2   | noarch    |
| <a href="#">r-mconjoint</a>  | 0.1     | The package aids in creating a Conjoint Analysis design with extra cards. Unlike traditional holdout cards these cards are used to create a set of good (balanced and low correlation) designs. Each of these designs is analyzed and the average calculated. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name                         | Version | Summary/License  | Platforms |
|------------------------------|---------|--|-----------|
| <code>r-mcparallel</code>    | 1.1.0   | Provides a function that wraps <code>mcparallel()</code> and <code>mccollect()</code> from ‘parallel’ with temporary variables and a task handler. Wrapped in this way the results of an <code>mcparallel()</code> call can be returned to the R session when the fork is complete without explicitly issuing a specific <code>mccollect()</code> to retrieve the value. Outside of top-level tasks, multiple <code>mcparallel()</code> jobs can be retrieved with a single call to <code>mcparallelDoCheck()</code> . / GPL-2   | noarch    |
| <code>r-mcpmod</code>        | 1.0_1   | Implements a methodology for the design and analysis of dose-response studies that combines aspects of multiple comparison procedures and modeling approaches (Bretz, Pinheiro and Branson, 2005, Biometrics 61, 738-748, <doi:10.1111/j.1541-0420.2005.00344.x>). The package provides tools for the analysis of dose finding trials as well as a variety of tools necessary to plan a trial to be conducted with the MCP-Mod methodology. Please note: The ‘MCPMod’ package will not be further developed, all future development of the MCP-Mod methodology will be done in the ‘DoseFinding’ R-package. / GPL-3  | noarch    |
| <code>r-mcpmodgeneral</code> | 0.1_0   | Analyzes non-normal data via the Multiple Comparison Procedures and Modeling approach (MCP-Mod). Many functions rely on the ‘DoseFinding’ package. This package makes it so the user does not need to provide or calculate the mu vector and S matrix. Instead, the user typically supplies the data in its raw form, and this package will calculate the needed objects and passes them into the ‘DoseFinding’ functions. If the user wishes to primarily use the functions provided in the ‘DoseFinding’ package, a singular function ( <code>prepareGen()</code> ) will provide mu and S. The package currently handles power analysis and the MCP-Mod procedure for negative binomial, Poisson, and binomial data. The MCP-Mod procedure can also be applied to survival data, but power analysis is not available. Bretz, F., Pinheiro, J. C., and Branson, M. (2005) <doi:10.1111/j.1541-0420.2005.00344.x>. Buckland, S. T., Burnham, K. P. and Augustin, N. H. (1997) <doi:10.2307/2533961>. Pinheiro, J. C., Bornkamp, B., Glimm, E. and Bretz, F. (2014) <doi:10.1002/sim.6052>. / GPL-3 | noarch    |
| <code>r-mcs</code>           | 0.1.3   | Perform the model confidence set procedure of Hansen et al (2011) <doi:10.3982/ECTA5771>. / GPL-2  | noarch    |
| <code>r-mcsim</code>         | 1.0     | Identifies the optimal number of clusters by calculating the similarity between two clustering methods at the same number of clusters using the corrected indices of Rand and Jaccard as described in Albatineh and Niewiadomska-Bugaj (2011). The number of clusters at which the index attain its maximum more frequently is a candidate for being the optimal number of clusters. / GPL-2   | noarch    |
| <code>r-mcsm</code>          | 1.0     | <code>mcsm</code> contains a collection of functions that allows the reenactment of the R programs used in the book <i>EnteR Monte Carlo Methods</i> without further programming. Programs being available as well, they can be modified by the user to conduct one’s own simulations. / GPL-2   | noarch    |
| <code>r-mctest</code>        | 1.2     | Package computes popular and widely used multicollinearity diagnostic measures. Package also indicates which regressors may be the reason of collinearity among regressors. / GPL-2  | noarch    |
| <code>r-mctm</code>          | 1.0     | Transition matrices (probabilities or counts) estimation for discrete Markov Chains of order n ( $1 \leq n \leq 5$ ). / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name           | Version    | Summary/License  | Platforms |
|----------------|------------|--|-----------|
| r-md           | 1.0.4      | Selects bandwidth for the kernel density estimator with minimum distance method as proposed by Devroye and Lugosi (1996). The minimum distance method directly selects the optimal kernel density estimator from countably infinite kernel density estimators and indirectly selects the optimal bandwidth. This package selects the optimal bandwidth from finite kernel density estimators. / GPL-2   GPL-3  | noarch    |
| r-mdatools     | 0.9.4      | Package implements projection based methods for preprocessing, exploring and analysis of multivariate data used in chemometrics. / MIT   | noarch    |
| r-mded         | 0.1_2      | Provides a function for measuring the difference between two independent or non-independent empirical distributions and returning a significance level of the difference. / CC0  | noarch    |
| r-mdendro      | 1.0.1      | A collection of methods for agglomerative hierarchical clustering strategies on a matrix of distances, implemented using the variable-group approach introduced in Fernandez and Gomez (2008) <doi:10.1007/s00357-008-9004-x>. Descriptive measures to analyze the resulting hierarchical trees are also provided. In addition to the usual clustering methods, two parameterized methods are provided to explore an infinite family of hierarchical clustering strategies. When there are ties in proximity values, the hierarchical trees obtained are unique and independent of the order of the elements in the input matrix. / LGPL-2.1 | noarch    |
| r-mdhglm       | 1.8        | Allows various models for multivariate response variables where each response is assumed to follow double hierarchical generalized linear models. In double hierarchical generalized linear models, the mean, dispersion parameters for variance of random effects, and residual variance can be further modeled as random-effect models. / Unlimited  | noarch    |
| r-mdimnormn    | 0.8.0      | Normalize data to minimize the difference between sample plates (batch effects). For given data in a matrix and grouping variable (or plate), the function 'normn_MA' normalizes the data on MA coordinates. More details are in the citation. The primary method is 'Multi-MA'. Other fitting functions on MA coordinates can also be employed e.g. loess. / GPL-3  | noarch    |
| r-mdir.logrank | 0.0.4      | Implemented are the one-sided and two-sided multiple-direction logrank test for two-sample right censored data. In addition to the statistics p-values are calculated: 1. For the one-sided testing problem one p-value based on a wild bootstrap approach is determined. 2. In the two-sided case one p-value based on a chi-squared approximation and a second p-values based on a permutation approach are calculated. Ditzhaus, M. and Friedrich, S. (2018) <arXiv:1807.05504>. Ditzhaus, M. and Pauly, M. (2018) <arXiv:1808.05627>. / GPL-2   GPL-3  | noarch    |
| r-mdplot       | 1.0.1      | Provides automatization for plot generation succeeding common molecular dynamics analyses. This includes straightforward plots, such as RMSD (Root-Mean-Square-Deviation) and RMSF (Root-Mean-Square-Fluctuation) but also more sophisticated ones such as dihedral angle maps, hydrogen bonds, cluster bar plots and DSSP (Definition of Secondary Structure of Proteins) analysis. Currently able to load GROMOS, GROMACS and AMBER formats, respectively. / GPL-3   | noarch    |
| r-mdscore      | 0.1_3      | A set of functions to obtain modified score test for generalized linear models. / GPL-2  | noarch    |
| r-mdw          | 2017.12.03 | Dimension-reduction methods aim at defining a score that maximizes signal diversity. Two approaches, namely maximum entropy weights and maximum variance weights, are provided. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name           | Version | Summary/License  | Platforms |
|----------------|---------|--|-----------|
| r-measurements | 1.4.0   | Collection of tools to make working with physical measurements easier. Convert between metric and imperial units, or calculate a dimension's unknown value from other dimensions' measurements. / GPL-3  | noarch    |
| r-measures     | 0.2     | Provides the biggest amount of statistical measures in the whole R world. Includes measures of regression, (multiclass) classification and multilabel classification. The measures come mainly from the 'mlr' package and were programmed by several 'mlr' developers. / GPL-3   | noarch    |
| r-med          | 0.1.0   | Nonparametric estimation and inference for natural direct and indirect effects by Chan, Imai, Yam and Zhang (2016) <arXiv:1601.03501>. / GPL-2   | noarch    |
| r-meddietcalc  | 0.1.1   | Multi Calculator of different scores to measure adherence to Mediterranean Diet, to compute them in nutriepidemiological data. Additionally, a sample dataset of this kind of data is provided, and some other minor tools useful in epidemiological studies. / GPL-3  | noarch    |
| r-mederrrank   | 0.0.8   | Two distinct but related statistical approaches to the problem of identifying the combinations of medication error characteristics that are more likely to result in harm are implemented in this package: 1) a Bayesian hierarchical model with optimal Bayesian ranking on the log odds of harm, and 2) an empirical Bayes model that estimates the ratio of the observed count of harm to the count that would be expected if error characteristics and harm were independent. In addition, for the Bayesian hierarchical model, the package provides functions to assess the sensitivity of results to different specifications of the random effects distributions. / GPL-2 | noarch    |
| r-medextractr  | 0.1     | Function and support for medication and dosing information extraction from free-text clinical notes. Medication entities that can be extracted include drug name, strength, dose amount, dose, frequency, intake time, and time of last dose. / GPL-2  | noarch    |
| r-mediadcloudr | 0.1.0   | API wrapper to gather news stories, media information and tags from the 'mediadcloud.org' API, based on a multilevel query < <a href="https://mediadcloud.org/">https://mediadcloud.org/</a> >. A personal API key is required. / MIT  | noarch    |
| r-mediana      | 1.0.8   | Provides a general framework for clinical trial simulations based on the Clinical Scenario Evaluation (CSE) approach. The package supports a broad class of data models (including clinical trials with continuous, binary, survival-type and count-type endpoints as well as multivariate outcomes that are based on combinations of different endpoints), analysis strategies and commonly used evaluation criteria. / GPL-2   | noarch    |
| r-medicare     | 0.2.1   | Publicly available data from Medicare frequently requires extensive initial effort to extract desired variables and merge them; this package formalizes the techniques I've found work best. More information on the Medicare program, as well as guidance for the publicly available data this package targets, can be found on CMS's website covering publicly available data. See < <a href="https://www.cms.gov/Research-Statistics-Data-and-Systems/Research-Statistics-Data-and-Systems.html">https://www.cms.gov/Research-Statistics-Data-and-Systems/Research-Statistics-Data-and-Systems.html</a> >. / MIT  | noarch    |
| r-meditations  | 1.0.1   | Prints a random quote from Marcus Aurelius' book Meditations. / GPL-3  | noarch    |
| r-medor        | 0.1     | This package contains the functions used to perform some confidence statistics based in population median. / GPL-3   | noarch    |

| Name        | Version | Summary/License  | Platforms   |
|-------------|---------|--|---|
| r-mefa      | 3.2.7   | A framework package aimed to provide standardized computational environment for specialist work via object classes to represent the data coded by samples, taxa and segments (i.e. subpopulations, repeated measures). It supports easy processing of the data along with cross tabulation and relational data tables for samples and taxa. An object of class ‘mefa’ is a project specific compendium of the data and can be easily used in further analyses. Methods are provided for extraction, aggregation, conversion, plotting, summary and reporting of ‘mefa’ objects. Reports can be generated in plain text or LaTeX format. Vignette contains worked examples. / GPL-2 | noarch  |
| r-mefa4     | 0.3.6   | An S4 update of the ‘mefa’ package using sparse matrices for enhanced efficiency. Sparse array-like objects are supported via lists of sparse matrices. / GPL-2  | noarch  |
| r-meifly    | 0.3     | Exploratory model analysis. Fit and graphical explore ensembles of linear models. / MIT  | noarch  |
| r-memoise   | 1.1.0   | Cache the results of a function so that when you call it again with the same arguments it returns the pre-computed value. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-memor     | 0.2     | A ‘markdown’ template that supports company logo, contact info, watermarks and more. Currently restricted to ‘Latex’/‘Markdown’; a similar ‘HTML’ theme will be added in the future. / GPL-3   | noarch  |
| r-memss     | 0.9.3   | Data sets and sample analyses from Pinheiro and Bates, Mixed-effects Models in S and S-PLUS (Springer, 2000). / GPL-2  | noarch  |
| r-merror    | 2.0.2   | N>=3 methods are used to measure each of n items. The data are used to estimate simultaneously systematic error (bias) and random error (imprecision). Observed measurements for each method or device are assumed to be linear functions of the unknown true values and the errors are assumed normally distributed. Maximum likelihood estimation is used for the imprecision standard deviation estimates. Pairwise calibration curves and plots can be easily generated. / GPL-2   | noarch  |
| r-meta4diag | 2.0.8   | Bayesian inference analysis for bivariate meta-analysis of diagnostic test studies using integrated nested Laplace approximation with INLA. A purpose built graphic user interface is available. The installation of R package INLA is compulsory for successful usage. The INLA package can be obtained from < <a href="http://www.r-inla.org">http://www.r-inla.org</a> >. We recommend the testing version, which can be downloaded by running: <code>install.packages(INLA, repos=c(getOption(repos), INLA=https://inla.r-inla-download.org/R/testing), dep=TRUE)</code> . / GPL-3   | noarch  |
| r-metabel   | 0.2.0   | A package for meta-analysis of genome-wide association scans between quantitative or binary traits and SNPs / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name           | Version | Summary/License  | Platforms |
|----------------|---------|--|-----------|
| r-metablue     | 1.0.0   | The sample mean and standard deviation are two commonly used statistics in meta-analyses, but some trials use other summary statistics such as the median and quartiles to report the results. Therefore, researchers need to transform those information back to the sample mean and standard deviation. This package implemented sample mean estimators by Luo et al. (2016) <arXiv:1505.05687>, sample standard deviation estimators by Wan et al. (2014) <arXiv:1407.8038>, and the best linear unbiased estimators (BLUEs) of location and scale parameters by Yang et al. (2018, submitted) based on sample quantiles derived summaries in a meta-analysis. / GPL-2  | noarch    |
| r-metabolouise | 1.0.0   | Simulating dynamic (longitudinal, time-resolved) metabolomics data based on an underlying biological network. The network is initiating with certain concentrations and evolves over a simulated time period. Optionally external influxes (concentration drivers) can be added. / GPL-3   | noarch    |
| r-metaboqc     | 1.0     | Takes QC signal for each day and normalize metabolomic data that has been acquired in a certain period of time. At least three QC per day are required. / GPL-2  | noarch    |
| r-metafor      | 2.1_0   | A comprehensive collection of functions for conducting meta-analyses in R. The package includes functions to calculate various effect sizes or outcome measures, fit fixed-, random-, and mixed-effects models to such data, carry out moderator and meta-regression analyses, and create various types of meta-analytical plots (e.g., forest, funnel, radial, L'Abbe, Baujat, GOSH plots). For meta-analyses of binomial and person-time data, the package also provides functions that implement specialized methods, including the Mantel-Haenszel method, Peto's method, and a variety of suitable generalized linear (mixed-effects) models (i.e., mixed-effects logistic and Poisson regression models). Finally, the package provides functionality for fitting meta-analytic multivariate/multilevel models that account for non-independent sampling errors and/or true effects (e.g., due to the inclusion of multiple treatment studies, multiple endpoints, or other forms of clustering). Network meta-analyses and meta-analyses accounting for known correlation structures (e.g., due to phylogenetic relatedness) can also be conducted. / GPL-2 | noarch    |

Table 51 – continued from previous page

| Name                               | Version | Summary/License  | Platforms |
|------------------------------------|---------|--|-----------|
| <a href="#">r-metaheuristicopt</a> | 2.0.0   | An implementation of metaheuristic algorithms for continuous optimization. Currently, the package contains the implementations of 21 algorithms, as follows: particle swarm optimization (Kennedy and Eberhart, 1995), ant lion optimizer (Mirjalili, 2015 <doi:10.1016/j.advengsoft.2015.01.010>), grey wolf optimizer (Mirjalili et al., 2014 <doi:10.1016/j.advengsoft.2013.12.007>), dragonfly algorithm (Mirjalili, 2015 <doi:10.1007/s00521-015-1920-1>), firefly algorithm (Yang, 2009 <doi:10.1007/978-3-642-04944-6_14>), genetic algorithm (Holland, 1992, ISBN:978-0262581110), grasshopper optimisation algorithm (Saremi et al., 2017 <doi:10.1016/j.advengsoft.2017.01.004>), harmony search algorithm (Mahdavi et al., 2007 <doi:10.1016/j.amc.2006.11.033>), moth flame optimizer (Mirjalili, 2015 <doi:10.1016/j.knosys.2015.07.006>), sine cosine algorithm (Mirjalili, 2016 <doi:10.1016/j.knosys.2015.12.022>), whale optimization algorithm (Mirjalili and Lewis, 2016 <doi:10.1016/j.advengsoft.2016.01.008>), clonal selection algorithm (Castro, 2002 <doi:10.1109/TEVC.2002.1011539>), differential evolution (Das & Suganthan, 2011), shuffled frog leaping (Eusuff, Landsey & Pasha, 2006), cat swarm optimization (Chu et al., 2006), artificial bee colony algorithm (Karaboga & Akay, 2009), krill-herd algorithm (Gandomi & Alavi, 2012), cuckoo search (Yang & Deb, 2009), bat algorithm (Yang, 2012), gravitational based search (Rashedi et al., 2009) and black hole optimization (Hatamlou, 2013). / GPL-2 | noarch    |
| <a href="#">r-metalik</a>          | 0.43.0  | First- and higher-order likelihood inference in meta-analysis and meta-regression models. / GPL-2  | noarch    |
| <a href="#">r-metansue</a>         | 2.3     | Novel method to unbiasedly include studies with Non-statistically Significant Unreported Effects (NSUEs) in a meta-analysis <doi:10.1001/jamapsychiatry.2015.2196> and <doi:10.1177/0962280218811349>. Briefly, the method first calculates the interval where the unreported effects (e.g. t-values) should be according to the threshold of statistical significance used in each study. Afterwards, maximum likelihood techniques are used to impute the expected effect size of each study with NSUEs, accounting for between-study heterogeneity and potential covariates. Multiple imputations of the NSUEs are then randomly created based on the expected value, variance and statistical significance bounds. Finally, a restricted-maximum likelihood random-effects meta-analysis is separately conducted for each set of imputations, and estimations from these meta-analyses are pooled. Please read the reference in ‘metansue’ for details of the procedure. / GPL-3   | noarch    |
| <a href="#">r-metapca</a>          | 0.1.4   | MetaPCA implements simultaneous dimension reduction using PCA when multiple studies are combined. We propose two basic ideas to find a common PC subspace by eigenvalue maximization approach and angle minimization approach, and we extend the concept to incorporate Robust PCA and Sparse PCA in the meta-analysis realm. / GPL-2  | noarch    |
| <a href="#">r-metarnaseq</a>       | 1.0.2   | Implementation of two p-value combination techniques (inverse normal and Fisher methods). A vignette is provided to explain how to perform a meta-analysis from two independent RNA-seq experiments. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name                            | Version | Summary/License   | Platforms |
|---------------------------------|---------|---|-----------|
| <a href="#">r-metasubtract</a>  | 1.50    | If results from a meta-GWAS are used for validation in one of the cohorts that was included in the meta-analysis, this will yield biased (i.e. too optimistic) results. The validation cohort needs to be independent from the meta-Genome-Wide-Association-Study (meta-GWAS) results. ‘MetaSubtract’ will subtract the results of the respective cohort from the meta-GWAS results analytically without having to redo the meta-GWAS analysis using the leave-one-out methodology. It can handle different meta-analyses methods and takes into account if single or double genomic control correction was applied to the original meta-analysis. It can also handle different meta-analysis methods. It can be used for whole GWAS, but also for a limited set of genetic markers. / GPL-3  | noarch    |
| <a href="#">r-metatest</a>      | 1.0_5   | Fits and tests meta regression models and generates a number of useful test statistics: next to t- and z-tests, the likelihood ratio, bartlett corrected likelihood ratio and permutation tests are performed on the model coefficients. / GPL-3  | noarch    |
| <a href="#">r-metavcov</a>      | 1.1     | Compute variance-covariance matrix for multivariate meta-analysis. Effect sizes include correlation (r), mean difference (MD), standardized mean difference (SMD), log odds ratio (logOR), log risk ratio (logRR), and risk difference (RD). / GPL-2  | noarch    |
| <a href="#">r-meth27qc</a>      | 1.1     | Meth27QC is a tool for analyzing Illumina Infinium HumanMethylation27 BeadChip Data and generating QC reports. This package allows users quickly assess data quality of the Assay. Users can evaluate the data quality in the way that Illumina GenomeStudio/BeadStudio recommended based on the control probes. The package reads files exported from GenomeStudio/BeadStudio software, generating intensity and standard deviation plots grouped by the types of the control probes. Meth27 carries 40 control probes for staining, hybridization, target removal, extension, bisulfite conversion, specificity, negative and non-polymorphic controls. Details of those control probes can be found in the Infinium Assay for Methylation Protocol Guide from Illumina. We also used the other non-control probes to plot intensity of detected genes, signal average for green and red. Outliers can be identified. / GPL-2 | noarch    |
| <a href="#">r-methodcompare</a> | 0.1.0   | Implementation of the methodology from the paper titled Effective plots to assess bias and precision in method comparison studies published in Statistical Methods in Medical Research, P. Taffe (2016) <doi:10.1177/0962280216666667>. / GPL-3   | noarch    |
| <a href="#">r-metnorm</a>       | 0.1     | Metabolomics data are inevitably subject to a component of unwanted variation, due to factors such as batch effects, matrix effects, and confounding biological variation. This package contains a collection of R functions which can be used to remove unwanted variation and obtain normalized metabolomics data. / GPL-2   GPL-3  | noarch    |
| <a href="#">r-meto</a>          | 0.1.0   | Meteorological Tools following the FAO56 irrigation paper of Allen et al. (1998) [1]. Functions for calculating: reference evapotranspiration (ETref), extraterrestrial radiation (Ra), net radiation (Rn), saturation vapor pressure (satVP), global radiation (Rs), soil heat flux (G), daylight hours, and more. [1] Allen, R. G., Pereira, L. S., Raes, D., & Smith, M. (1998). Crop evapotranspiration-Guidelines for computing crop water requirements-FAO Irrigation and drainage paper 56. FAO, Rome, 300(9). / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name                           | Version | Summary/License  | Platforms |
|--------------------------------|---------|--|-----------|
| <code>r-metrics</code>         | 0.1.4   | An implementation of evaluation metrics in R that are commonly used in supervised machine learning. It implements metrics for regression, time series, binary classification, classification, and information retrieval problems. It has zero dependencies and a consistent, simple interface for all functions. / BSD_3_clause  | noarch    |
| <code>r-metricsgraphics</code> | 0.9.0   | Provides an ‘htmlwidgets’ interface to the ‘MetricsGraphics.js’ (‘D3’-based) charting library which is geared towards displaying time-series data. Chart types include line charts, scatterplots, histograms and rudimentary bar charts. Support for laying out multiple charts into a grid layout is also provided. All charts are interactive and many have an option for line, label and region annotations. / MIT  | noarch    |
| <code>r-metricsweighted</code> | 0.2.0   | Provides weighted versions of several metrics, scoring functions and performance measures used in machine learning, including average unit deviances of the Bernoulli, Tweedie, Poisson, and Gamma distributions, see Jorgensen B. (1997, ISBN: 978-0412997112). The package also contains a weighted version of generalized R-squared, see e.g. Cohen, J. et al. (2002, ISBN: 978-0805822236). Furthermore, ‘dplyr’ chains are supported. / GPL-2   | noarch    |
| <code>r-metrology</code>       | 0.9.2   | Provides classes and calculation and plotting functions for metrology applications, including measurement uncertainty estimation and inter-laboratory metrology comparison studies. / GPL-2  | noarch    |
| <code>r-metstat</code>         | 1.0     | A diverse collection of metabolomics related statistical tools. / Apache License (== 2.0)  | noarch    |
| <code>r-mf</code>              | 4.3.2   | Calculate MF (mitigated fraction) with clustering and bootstrap options. See <a href="http://goo.gl/pcXYVr">http://goo.gl/pcXYVr</a> for definition of MF. / MIT   | noarch    |
| <code>r-mfag</code>            | 1.5     | Performs Multiple Factor Analysis method for quantitative, categorical, frequency and mixed data, in addition to generating a lot of graphics, also has other useful functions. / GPL-2  | noarch    |
| <code>r-mfilter</code>         | 0.1.5   | The mFilter package implements several time series filters useful for smoothing and extracting trend and cyclical components of a time series. The routines are commonly used in economics and finance, however they should also be interest to other areas. Currently, Christiano-Fitzgerald, Baxter-King, Hodrick-Prescott, Butterworth, and trigonometric regression filters are included in the package. / GPL-2   | noarch    |
| <code>r-mfp</code>             | 1.5.2   | Fractional polynomials are used to represent curvature in regression models. A key reference is Royston and Altman, 1994. / GPL-2  | noarch    |
| <code>r-mft</code>             | 2.0     | Provides statistical tests and algorithms for the detection of change points in time series and point processes - particularly for changes in the mean in time series and for changes in the rate and in the variance in point processes. References - Michael Messer, Marietta Kirchner, Julia Schiemann, Jochen Roeper, Ralph Neiningen and Gaby Schneider (2014), A multiple filter test for the detection of rate changes in renewal processes with varying variance <doi:10.1214/14-AOAS782>. Stefan Albert, Michael Messer, Julia Schiemann, Jochen Roeper, Gaby Schneider (2017), Multi-scale detection of variance changes in renewal processes in the presence of rate change points <doi:10.1111/jtsa.12254>. Michael Messer, Kaue M. Costa, Jochen Roeper and Gaby Schneider (2017), Multi-scale detection of rate changes in spike trains with weak dependencies <doi:10.1007/s10827-016-0635-3>. Michael Messer, Stefan Albert and Gaby Schneider (2018), The multiple filter test for change point detection in time series <doi:10.1007/s00184-018-0672-1>. Michael Messer, Hendrik Backhaus, Albrecht Stroh and Gaby Schneider (2019) Peak detection in time series. / GPL-3 | noarch    |

Table 51 – continued from previous page

| Name         | Version | Summary/License  | Platforms  |
|--------------|---------|--|--|
| r-mgcv       | 1.8.28  | Generalized additive (mixed) models, some of their extensions and other generalized ridge regression with multiple smoothing parameter estimation by (Restricted) Marginal Likelihood, Generalized Cross Validation and similar. Includes a gam() function, a wide variety of smoothers, JAGS support and distributions beyond the exponential family. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-mglm       | 0.2.0   | Provides functions that (1) fit multivariate discrete distributions, (2) generate random numbers from multivariate discrete distributions, and (3) run regression and penalized regression on the multivariate categorical response data. Implemented models include: multinomial logit model, Dirichlet multinomial model, generalized Dirichlet multinomial model, and negative multinomial model. Making the best of the minorization-maximization (MM) algorithm and Newton-Raphson method, we derive and implement stable and efficient algorithms to find the maximum likelihood estimates. On a multi-core machine, multi-threading is supported. / GPL-2   | noarch   |
| r-mgraster   | 0.9     | Convenience Functions for R Language Access to the v.1 API of the MG-RAST Metagenome Annotation Server, part of the US Department of Energy (DOE) Systems Biology Knowledge Base (KBase). / BSD_2_clause   | noarch   |
| r-mgsub      | 1.7.1   | Designed to enable simultaneous substitution in strings in a safe fashion. Safe means it does not rely on placeholders (which can cause errors in same length matches). / MIT  | noarch   |
| r-mhadaptive | 1.1.8   | Performs general Metropolis-Hastings Markov Chain Monte Carlo sampling of a user defined function which returns the un-normalized value (likelihood times prior) of a Bayesian model. The proposal variance-covariance structure is updated adaptively for efficient mixing when the structure of the target distribution is unknown. The package also provides some functions for Bayesian inference including Bayesian Credible Intervals (BCI) and Deviance Information Criterion (DIC) calculation. / GPL-3  | noarch   |
| r-mhctools   | 1.2.1   | Ten tools for analysis of major histocompatibility complex (MHC) data in non- model species. The functions are tailored for amplicon data sets that have been filtered using the 'dada2' method (for more information visit < <a href="https://benjjneb.github.io/dada2">https://benjjneb.github.io/dada2</a> >), but even other data sets can be analyzed, if the data tables are formatted according to the description in each function. The ReplMatch() function matches replicates in data sets in order to evaluate genotyping success. The GetReplTable() and GetReplStats() functions perform such an evaluation. The HpltFind() function infers putative haplotypes from families in the data set. The GetHpltTable() and GetHpltStats() functions evaluate the accuracy of the haplotype inference. The PapaDiv() function compares parent pairs in the data set and calculate their joint MHC diversity, taking into account sequence variants that occur in both parents. The CalcPdist() function calculates the p-distances from pairwise comparisons of all sequences in a data set, and mean p-distances of all pairwise comparisons within each sample in a data set. The function includes the options to specify which codons to compare and to calculate amino acid p-distances. The CreateFas() function creates a fasta file with all the sequences in the data set. The CreateSamplesFas() function creates a fasta file for each sample in the data set. / MIT | noarch   |

Table 51 – continued from previous page

| Name            | Version | Summary/License  | Platforms |
|-----------------|---------|--|-----------|
| r-mhg           | 1.1     | Runs a minimum-hypergeometric (mHG) test as described in: Eden, E. (2007). Discovering Motifs in Ranked Lists of DNA Sequences. Haifa. / GPL-2   | noarch    |
| r-mhtdiscrete   | 1.0.1   | A comprehensive tool for almost all existing multiple testing methods for discrete data. The package also provides some novel multiple testing procedures controlling FWER/FDR for discrete data. Given discrete p-values and their domains, the [method].p.adjust function returns adjusted p-values, which can be used to compare with the nominal significant level alpha and make decisions. For users' convenience, the functions also provide the output option for printing decision rules. / GPL-2   | noarch    |
| r-mhtrajectoryr | 1.0.1   | Spontaneous adverse event reports have a high potential for detecting adverse drug reactions. However, due to their dimension, the analysis of such databases requires statistical methods. We propose to use a logistic regression whose sparsity is viewed as a model selection challenge. Since the model space is huge, a Metropolis-Hastings algorithm carries out the model selection by maximizing the BIC criterion. / GPL-2   | noarch    |
| r-mi            | 1.0     | The mi package provides functions for data manipulation, imputing missing values in an approximate Bayesian framework, diagnostics of the models used to generate the imputations, confidence-building mechanisms to validate some of the assumptions of the imputation algorithm, and functions to analyze multiply imputed data sets with the appropriate degree of sampling uncertainty. / GPL-2  | noarch    |
| r-micar         | 1.1.1   | 'Mica' is a server application used to create data web portals for large-scale epidemiological studies or multiple-study consortia. 'Mica' helps studies to provide scientifically robust data visibility and web presence without significant information technology effort. 'Mica' provides a structured description of consortia, studies, annotated and searchable data dictionaries, and data access request management. This 'Mica' client allows to perform data extraction for reporting purposes. / GPL-3   | noarch    |
| r-miceconindex  | 0.1_6   | Tools for calculating Laspeyres, Paasche, and Fisher price and quantity indices. / GPL-2   | noarch    |
| r-michelrodange | 1.0.0   | Michel Rodange was a Luxembourgish writer and poet who lived in the 19th century. His most notable work is Rodange (1872, ISBN:1166177424), (Renert oder de Fuuß am Frack an a Ma'nsgrëßt), but he also wrote many more works, including Rodange, Tockert (1928) < <a href="https://www.autorenlexikon.lu/page/document/361/3614/1/FRE/index.html">https://www.autorenlexikon.lu/page/document/361/3614/1/FRE/index.html</a> > (D'Léierchen - Dem Léiweckerche säi Lidd) and Rodange, Welter (1929) < <a href="https://www.autorenlexikon.lu/page/document/361/3615/1/FRE/index.html">https://www.autorenlexikon.lu/page/document/361/3615/1/FRE/index.html</a> > (Dem Grow Sigfrid seng Goldkuommer). This package contains three datasets, each made from the plain text versions of his works available on < <a href="https://data.public.lu/fr/datasets/the-works-in-luxembourgish-of-michel-rodange/">https://data.public.lu/fr/datasets/the-works-in-luxembourgish-of-michel-rodange/</a> >. / CC0 | noarch    |
| r-micompr       | 1.1.0   | A procedure for comparing multivariate samples associated with different groups. It uses principal component analysis to convert multivariate observations into a set of linearly uncorrelated statistical measures, which are then compared using a number of statistical methods. The procedure is independent of the distributional properties of samples and automatically selects features that best explain their differences, avoiding manual selection of specific points or summary statistics. It is appropriate for comparing samples of time series, images, spectrometric measures or similar multivariate observations. / MIT  | noarch    |

| Name                                   | Version | Summary/License  | Platforms  |
|--|---------|--|--|
| <a href="#">r-microbats</a>            | 0.1_1   | A nature-inspired metaheuristic algorithm based on the echolocation behavior of microbats that uses frequency tuning to optimize problems in both continuous and discrete dimensions. This R package makes it easy to implement the standard bat algorithm on any user-supplied function. The algorithm was first developed by Xin-She Yang in 2010 (<DOI:10.1007/978-3-642-12538-6_6>, <DOI:10.1109/CINTI.2014.7028669>). / GPL-2   | noarch   |
| <a href="#">r-microbenchmark</a>       | 1.4_6   | Provides infrastructure to accurately measure and compare the execution time of R expressions. / BSD_2_clause file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-micromacromultilevel</a> | 0.4.0   | Most multilevel methodologies can only model macro-micro multilevel situations in an unbiased way, wherein group-level predictors (e.g., city temperature) are used to predict an individual-level outcome variable (e.g., citizen personality). In contrast, this R package enables researchers to model micro-macro situations, wherein individual-level (micro) predictors (and other group-level predictors) are used to predict a group-level (macro) outcome variable in an unbiased way. / GPL-2  | noarch   |
| <a href="#">r-micromapst</a>           | 1.1.1   | Provides the users with the ability to quickly create Linked Micromap plots for a collection of geographic areas. Linked Micromaps are visualizations of georeferenced data that link statistical graphics to an organized series of small maps or graphic images. The Help description contains examples of how to use the micromapST function. Contained in this package are border group datasets to support creating micromaps for the 50 U.S. states and District of Columbia (51 areas), the U. S. 20 Seer Registries, the 105 counties in the state of Kansas, the 62 counties of New York, the 24 counties of Maryland, the 29 counties of Utah, the 32 administrative areas in China, the 218 administrative areas in the UK and Ireland (for testing only), the 25 districts in the city of Seoul South Korea, and the 52 counties on the Africa continent. A border group dataset contains the boundaries related to the data level areas, a second layer boundaries, a top or third layer boundary, a parameter list of run options, and a cross indexing table between area names, abbreviations, numeric identification and alias matching strings for the specific geographic area. By specifying a border group, the package create micromaps for any geographic region. The user can create and provide their own border group dataset for any area beyond the areas contained within the package. Copyrighted 2013, 2014, 2015 and 2016 by Carr, Pearson and Pickle. / GPL-2 | noarch   |
| <a href="#">r-micropop</a>             | 1.5     | Modelling interacting microbial populations - example applications include human gut microbiota, rumen microbiota and phytoplankton. Solves a system of ordinary differential equations to simulate microbial growth and resource uptake over time. / GPL-3  | noarch   |

| Name                | Version   | Summary/License   | Platforms  |
|---------------------|-----------|---|--|
| r-microsoft         | 3.5.0.108 | Umbrella package with licenses and notices for all Microsoft R packages / file LICENSE  | linux-64,<br>osx-64,<br>win-64                         |
| r-midas             | 1.0.1     | Contains functions for converting existing HTML/JavaScript source into equivalent ‘shiny’ functions. Bootstraps the process of making new ‘shiny’ functions by allowing us to turn HTML snippets directly into R functions. / GPL-3   | noarch   |
| r-midastouch        | 1.3       | Contains the function mice.impute.midastouch(). Technically this function is to be run from within the ‘mice’ package (van Buuren et al. 2011), type ??mice. It substitutes the method ‘pmm’ within mice by ‘midastouch’. The authors have shown that ‘midastouch’ is superior to default ‘pmm’. Many ideas are based on Siddique / Belin 2008’s MIDAS. / GPL-2   GPL-3 | noarch   |
| r-midn              | 1.0       | Implementation of the mid-n algorithms presented in Wellek S (2015) <DOI:10.1111/stan.12063> Statistica Neerlandica 69, 358-373 for exact sample size calculation for superiority trials with binary outcome. / CC0   | noarch   |
| r-migest            | 1.8.0     | Indirect methods for estimating bilateral migration flows in the presence of partial or missing data, including the estimation of bilateral migration flows from changes in bilateral migrant stock tables (e.g. Abel (2013) <doi:10.4054/DemRes.2013.28.18>). / GPL-3  | noarch   |
| r-migration.indices | 0.3.0     | This package provides various indices, like Crude Migration Rate, different Gini indices or the Coefficient of Variation among others, to show the (un)equality of migration. / AGPL-3  | noarch   |
| r-milc              | 1.0       | The MILC package is designed to predict individual trajectories using the continuous time microsimulation model MILC, that describes the natural history of lung cancer. / GPL-2  | noarch   |
| r-mime              | 0.6       | Guesses the MIME type from a filename extension using the data derived from /etc/mime.types in UNIX-type systems. / GPL   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-mimix             | 1.0       | Tools to combine results for multiply-imputed data using mixture approximations / GPL-2   | noarch   |
| r-mindonstats       | 0.11      | 66 data sets that were imported using read.table() where appropriate but more commonly after converting to a csv file for importing via read.csv(). / GPL-3   | noarch   |
| r-miney             | 0.1       | This package implements the core idea of games known as ‘Minesweeper’ on Microsoft Windows or ‘K Mines’ for KDE on Unix-like operating systems. / GPL-2   | noarch   |

Table 51 – continued from previous page

| Name         | Version | Summary/License  | Platforms   |
|--------------|---------|--|---|
| r-minicran   | 0.2.12  | Makes it possible to create an internally consistent repository consisting of selected packages from CRAN-like repositories. The user specifies a set of desired packages, and 'miniCRAN' recursively reads the dependency tree for these packages, then downloads only this subset. The user can then install packages from this repository directly, rather than from CRAN. This is useful in production settings, e.g. server behind a firewall, or remote locations with slow (or zero) Internet access. / GPL-2 | noarch  |
| r-minigui    | 0.8_1   | Quick and simple Tcl/Tk Graphical User Interface to call functions. Also comprises a very simple experimental GUI framework. / GPL (<= 2.0)  | noarch  |
| r-minimalrsd | 1.0.0   | Generate central composite designs (CCD) with full as well as fractional factorial points (half replicate) and Box Behnken designs (BBD) with minimally changed run sequence. / GPL-2  | noarch  |
| r-minimap    | 0.1.0   | Create tile grid maps, which are like choropleth maps except each region is represented with equal visual space. / MIT   | noarch  |
| r-minimax    | 1.0     | The minimax family of distributions is a two-parameter family like the beta family, but computationally a lot more tractable. / GPL-2   GPL-3  | noarch  |
| r-minirand   | 0.1.0   | Randomization schedules are generated in the schemes with k (k>=2) treatment groups and any allocation ratios by minimization algorithms. / GPL-2  | noarch  |
| r-miniui     | 0.1.1   | Provides UI widget and layout functions for writing Shiny apps that work well on small screens. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-minqa      | 1.2.4   | Derivative-free optimization by quadratic approximation based on an interface to Fortran implementations by M. J. D. Powell. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| r-minval     | 0.8_1   | For a given set of stoichiometric reactions, this package evaluates the mass and charge balance, extracts all reactants, products, orphan metabolites, metabolite names and compartments. Also are included some options to characterize and write models in TSV and SBML formats. / GPL-2   | noarch  |
| r-minxent    | 0.01    | This package implements entropy optimization distribution under specified constraints. It also offers an R interface to the MinxEnt and MaxEnt distributions. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms   |
|-----------------------------|---------|---|---|
| <a href="#">r-mirsea</a>    | 1.1     | The tools for ‘MicroRNA Set Enrichment Analysis’ can identify risk pathways(or prior gene sets) regulated by microRNA set in the context of microRNA expression data. (1) This package constructs a correlation profile of microRNA and pathways by the hypergeometric statistic test. The gene sets of pathways derived from the three public databases (Kyoto Encyclopedia of Genes and Genomes (‘KEGG’); ‘Reactome’; ‘Biocarta’) and the target gene sets of microRNA are provided by four databases(‘TarBaseV6.0’; ‘mir2Disease’; ‘miRecords’; ‘miRTarBase’;). (2) This package can quantify the change of correlation between microRNA for each pathway(or prior gene set) based on a microRNA expression data with cases and controls. (3) This package uses the weighted Kolmogorov-Smirnov statistic to calculate an enrichment score (ES) of a microRNA set that co-regulate to a pathway , which reflects the degree to which a given pathway is associated with the specific phenotype. (4) This package can provide the visualization of the results. / GPL-2 | noarch  |
| <a href="#">r-misaem</a>    | 0.9.1   | Estimate parameters of logistic regression with missing data and perform model selection, using algorithm Stochastic Approximation EM. / GPL-3  | noarch  |
| <a href="#">r-misc3d</a>    | 0.8_4   | A collection of miscellaneous 3d plots, including isosurfaces. / GPL-3  | noarch  |
| <a href="#">r-miscfuncs</a> | 1.2_1   | Implementing various things including functions for LaTeX tables, the Kalman filter, web scraping, development tools, relative risk and odds ratio. / GPL-3   | noarch  |
| <a href="#">r-miscor</a>    | 0.1_1   | Statistical test for the product-moment correlation coefficient based on $H_0: \rho = \rho_0$ including sample size computation, statistical test for comparing the product-moment correlation coefficient in independent and dependent samples, sequential triangular test for the product-moment correlation coefficient, partial and semipartial correlation, simulation of bivariate normal and non-normal distribution with a specified correlation. / GPL-3   | noarch  |
| <a href="#">r-misctools</a> | 0.6_2   | Miscellaneous small tools and utilities. Many of them facilitate the work with matrices, e.g. inserting rows or columns, creating symmetric matrices, or checking for semidefiniteness. Other tools facilitate the work with regression models, e.g. extracting the standard errors, obtaining the number of (estimated) parameters, or calculating R-squared values. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-mise</a>      | 0.1.0   | Clears the workspace. Useful for the beginnings of R scripts, to avoid potential problems with accidentally using information from variables or functions from previous script evaluations, too many figure windows open at the same time, packages that you don’t need any more, or a cluttered console. Uses code from various StackOverflow users. See help(mise) for pointers to the relevant StackOverflow pages. / MIT  | noarch  |
| <a href="#">r-misreport</a> | 0.1.1   | Enables investigation of the predictors of misreporting on sensitive survey questions through a multivariate list experiment regression method. The method permits researchers to model whether a survey respondent’s answer to the sensitive item in a list experiment is different from his or her answer to an analogous direct question. / GPL-3  | noarch  |

Table 51 – continued from previous page

| Name            | Version | Summary/License   | Platforms |
|-----------------|---------|---|-----------|
| r-missmech      | 1.0.2   | To test whether the missing data mechanism, in a set of incompletely observed data, is one of missing completely at random (MCAR). For detailed description see Jamshidian, M. Jalal, S., and Jansen, C. (2014). MissMech: An R Package for Testing Homoscedasticity, Multivariate Normality, and Missing Completely at Random (MCAR), Journal of Statistical Software, 56(6), 1-31. URL <a href="http://www.jstatsoft.org/v56/i06/">http://www.jstatsoft.org/v56/i06/</a> . / GPL-2  | noarch    |
| r-mist          | 1.0     | Test for association between a set of SNPS/genes and continuous or binary outcomes by including variant characteristic information and using (weighted) score statistics. / LGPL (>= 2.0)   | noarch    |
| r-mistat        | 1.0.5   | Provide all the data sets and statistical analysis applications used in Modern Industrial Statistics: with applications in R, MINITAB and JMP by R.S. Kenett and S. Zacks with contributions by D. Amberti, John Wiley and Sons, 2013, which is a second revised and expanded revision of Modern Industrial Statistics: Design and Control of Quality and Reliability, R. Kenett and S. Zacks, Duxbury/Wadsworth Publishing, 1998. / GPL-2  | noarch    |
| r-mistr         | 0.0.2   | A flexible computational framework for mixture distributions with the focus on the composite models. / GPL-3  | noarch    |
| r-mitsem        | 1.2     | Flexible multivariate function approximation using adapted Mixture of Student t Distributions. Mixture of t distribution is obtained using Importance Sampling weighted Expectation Maximization algorithm. / GPL-3   | noarch    |
| r-mitools       | 2.4     | Tools to perform analyses and combine results from multiple-imputation datasets. / GPL-2  | noarch    |
| r-mittagleffler | 0.3.0   | Implements the Mittag-Leffler function, distribution, random variate generation, and estimation. Based on the Laplace-Inversion algorithm by Garrappa, R. (2015) <doi:10.1137/140971191>. / GPL-2   | noarch    |
| r-mixdist       | 0.5.5   | Fit finite mixture distribution models to grouped data and conditional data by maximum likelihood using a combination of a Newton-type algorithm and the EM algorithm. / GPL-2  | noarch    |
| r-mixedpsy      | 1.0.0   | Tools for the analysis of psychophysical data. This package allows to estimate the Point of Subjective Equivalence (PSE) and the Just Noticeable Difference (JND), either from a psychometric function or from a Generalized Linear Mixed Model (GLMM). Additionally, the package allows plotting the fitted models and the response data, simulating psychometric functions of different shapes, and simulating data sets. For a description of the use of GLMMs applied to psychophysical data, refer to Moscatelli et al. (2012), <doi:10.1167/12.11.26>. / GPL-2  | noarch    |
| r-mixedts       | 1.0.4   | We provide detailed functions for univariate Mixed Tempered Stable distribution. / GPL-2  | noarch    |
| r-mixemm        | 1.0     | Contains functions for estimating a mixed-effects model for clustered data (or batch-processed data) with cluster-level (or batch-level) missing values in the outcome, i.e., the outcomes of some clusters are either all observed or missing altogether. The model is developed for analyzing incomplete data from labeling-based quantitative proteomics experiments but is not limited to this type of data. We used an expectation conditional maximization (ECM) algorithm for model estimation. The cluster-level missingness may depend on the average value of the outcome in the cluster (missing not at random). / GPL-3 | noarch    |
| r-mixmap        | 1.3.4   | A collection of functions to implement the MixMAP algorithm, which performs gene level tests of association using data from a previous GWAS or data from a meta-analysis of several GWAS. Conceptually, genes are detected as significant if the collection of p-values within a gene are determined to be collectively smaller than would be observed by chance. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms |
|------------------------------|---------|---|-----------|
| <code>r-mixmeta</code>       | 1.0.3   | A collection of functions to perform various meta-analytical models through a unified mixed-effects framework, including standard univariate fixed and random-effects meta-analysis and meta-regression, and non-standard extensions such as multivariate, multilevel, longitudinal, and dose-response models. / GPL-2  | noarch    |
| <code>r-mixphm</code>        | 0.7_2   | Fits multiple variable mixtures of various parametric proportional hazard models using the EM-Algorithm. Proportionality restrictions can be imposed on the latent groups and/or on the variables. Several survival distributions can be specified. Missing values and censored values are allowed. Independence is assumed over the single variables. / GPL-2  | noarch    |
| <code>r-mixrasch</code>      | 1.1     | Estimates Rasch models and mixture Rasch models, including the dichotomous Rasch model, the rating scale model, and the partial credit model. / GPL-2   | noarch    |
| <code>r-mixraschtools</code> | 1.1     | Provides supplemental functions for the ‘mixRasch’ package (Willse, 2014), < <a href="https://cran.r-project.org/package=mixRasch/mixRasch.pdf">https://cran.r-project.org/package=mixRasch/mixRasch.pdf</a> > including a plotting function to compare item parameters for multiple class models and a function that provides average theta values for each class in a mixture model. / GPL-3  | noarch    |
| <code>r-mixreg</code>        | 0.0_6   | Fits mixtures of (possibly multivariate) regressions (which has been described as doing ANCOVA when you don’t know the levels). / GPL-2   | noarch    |
| <code>r-mixrf</code>         | 1.0     | It offers random-forest-based functions to impute clustered incomplete data. The package is tailored for but not limited to imputing multitissue expression data, in which a gene’s expression is measured on the collected tissues of an individual but missing on the uncollected tissues. / GPL-3  | noarch    |
| <code>r-mixsal</code>        | 1.0     | The current version of the ‘MixSAL’ package allows users to generate data from a multivariate SAL distribution or a mixture of multivariate SAL distributions, evaluate the probability density function of a multivariate SAL distribution or a mixture of multivariate SAL distributions, and fit a mixture of multivariate SAL distributions using the Expectation-Maximization (EM) algorithm (see Franczak et. al, 2014, <doi:10.1109/TPAMI.2013.216>, for details). / GPL-2 | noarch    |
| <code>r-mixsmn</code>        | 1.1_5   | Functions to fit finite mixture of scale mixture of skew-normal (FM-SMSN) distributions. / GPL (>= 2.0)   | noarch    |
| <code>r-mixspe</code>        | 0.1.1   | Mixtures of skewed and elliptical distributions are implemented using mixtures of multivariate skew power exponential and power exponential distributions, respectively. A generalized expectation-maximization framework is used for parameter estimation. Methodology for mixtures of power exponential distributions is from Dang et al. (2015) <doi: 10.1111/biom.12351>. / GPL-2   | noarch    |
| <code>r-mixtnb</code>        | 1.0     | Differential expression analysis of RNA-Seq data when replicates under two conditions are available is performed. First, mixtures of Negative Binomial distributions are fitted on the data in order to estimate the dispersions, then the Wald test is computed. / GPL-3   | noarch    |
| <code>r-mixtureinf</code>    | 1.1     | Functions for computing the penalized maximum likelihood estimate (PMLE) or maximum likelihood estimate (MLE), testing the order of a finite mixture model using EM-test, drawing histogram of observations and the fitted density or probability mass function of the mixture model. / AGPL-3  | noarch    |

Table 51 – continued from previous page

| Name             | Version | Summary/License  | Platforms |
|------------------|---------|--|-----------|
| r-mize           | 0.2.2   | Optimization algorithms implemented in R, including conjugate gradient (CG), Broyden-Fletcher-Goldfarb-Shanno (BFGS) and the limited memory BFGS (L-BFGS) methods. Most internal parameters can be set through the call interface. The solvers hold up quite well for higher-dimensional problems. / BSD_2_clause  | noarch    |
| r-mkin           | 0.9.4   | Calculation routines based on the FOCUS Kinetics Report (2006, 2014). Includes a function for conveniently defining differential equation models, model solution based on eigenvalues if possible or using numerical solvers and a choice of the optimisation methods made available by the 'FME' package. If a C compiler (on windows: 'Rtools') is installed, differential equation models are solved using compiled C functions. Please note that no warranty is implied for correctness of results or fitness for a particular purpose. / GPL-3  | noarch    |
| r-mkle           | 0.05    | Package for fast computation of the maximum kernel likelihood estimator (mkle) / GPL-3   | noarch    |
| r-mknapsack      | 0.1.0   | Package solves multiple knapsack optimisation problem. Given a set of items, each with volume and value, it will allocate them to knapsacks of a given size in a way that value of top N knapsacks is as large as possible. / GPL-2  | noarch    |
| r-mkssd          | 1.1     | mkssd is a package that generates efficient balanced non-aliased multi-level k-circulant supersaturated designs by interchanging the elements of the generator vector. The package tries to generate a supersaturated design that has chisquare efficiency more than user specified efficiency level (mef). The package also displays the progress of generation of an efficient multi-level k-circulant design through a progress bar. The progress of 100% means that one full round of interchange is completed. More than one full round (typically 4-5 rounds) of interchange may be required for larger designs. / GPL-2 | noarch    |
| r-ml.msbd        | 1.1.1   | Inference of a multi-states birth-death model from a phylogeny, comprising a number of states N, birth and death rates for each state and on which edges each state appears. Inference is done using a hybrid approach: states are progressively added in a greedy approach. For a fixed number of states N the best model is selected via maximum likelihood. Reference: J. Barido-Sottani and T. Stadler (2017) <doi:10.1101/215491>. / GPL-3  | noarch    |
| r-mlapi          | 0.1.0   | Provides 'R6' abstract classes for building machine learning models with 'scikit-learn' like API. < <a href="http://scikit-learn.org/">http://scikit-learn.org/</a> > is a popular module for 'Python' programming language which design became de facto a standard in industry for machine learning tasks. / MIT  | noarch    |
| r-mlbstats       | 0.1.0   | Computational functions for player metrics in major league baseball including batting, pitching, fielding, base-running, and overall player statistics. This package is actively maintained with new metrics being added as they are developed. / MIT  | noarch    |
| r-mlcm           | 0.4.2   | Conjoint measurement is a psychophysical procedure in which stimulus pairs are presented that vary along 2 or more dimensions and the observer is required to compare the stimuli along one of them. This package contains functions to estimate the contribution of the n scales to the judgment by a maximum likelihood method under several hypotheses of how the perceptual dimensions interact. Reference: Knoblauch & Maloney (2012) Modeling Psychophysical Data in R. <doi:10.1007/978-1-4614-4475-6>. / GPL-2   | noarch    |
| r-mlldr.datasets | 0.4.2   | Large collection of multilabel datasets along with the functions needed to export them to several formats, to make partitions, and to obtain bibliographic information. / LGPL-3   | noarch    |

|-----------------------------|---------|---|---|
| <a href="#">r-mls</a>       | 0.4.5   | Difference scaling is a method for scaling perceived supra-threshold differences. The package contains functions that allow the user to design and run a difference scaling experiment, to fit the resulting data by maximum likelihood and test the internal validity of the estimated scale. / GPL-2  | noarch  |
| <a href="#">r-mle.tools</a> | 1.0.0   | Calculates the expected/observed Fisher information and the bias-corrected maximum likelihood estimate(s) via Cox-Snell Methodology. / GPL-2  | noarch  |
| <a href="#">r-mlearning</a> | 1.0_0   | This package provides a unified interface to various machine learning algorithms. Confusion matrices are provided too. / GPL-2  | noarch  |
| <a href="#">r-mleur</a>     | 1.0_6   | Provides functions for unit root testing using MLE method / GPL-2   | noarch  |
| <a href="#">r-mlf</a>       | 1.2.1   | Offers a gentle introduction to machine learning concepts for practitioners with a statistical pedigree: decomposition of model error (bias-variance trade-off), nonlinear correlations, information theory and functional permutation/bootstrap simulations. Székely GJ, Rizzo ML, Bakirov NK. (2007). <doi:10.1214/009053607000000505>. Reshef DN, Reshef YA, Finucane HK, Grossman SR, McVean G, Turnbaugh PJ, Lander ES, Mitzenmacher M, Sabeti PC. (2011). <doi:10.1126/science.1205438>. / GPL-2  | noarch  |
| <a href="#">r-mlca2</a>     | 2.1     | An R code implementation of the maximum likelihood (fixed point) algorithm of Hyvärinen, Karhuna, and Oja for independent component analysis. / GPL-2   | noarch  |
| <a href="#">r-mlid</a>      | 1.0.1   | Tools and functions to fit a multilevel index of dissimilarity. / GPL-3   | noarch  |
| <a href="#">r-mlmetrics</a> | 1.1.1   | A collection of evaluation metrics, including loss, score and utility functions, that measure regression, classification and ranking performance. / GPL-2   | noarch  |
| <a href="#">r-mlml2r</a>    | 0.3.2   | Maximum likelihood estimates (MLE) of the proportions of 5-mC and 5-hmC in the DNA using information from BS-conversion, TAB-conversion, and oxBS-conversion methods. One can use information from all three methods or any combination of two of them. Estimates are based on Binomial model by Qu et al. (2013) <doi:10.1093/bioinformatics/btt459> and Kiihl et al. (2019) <doi:10.1515/sagmb-2018-0031>. / MIT  | noarch  |
| <a href="#">r-mlmrev</a>    | 1.0_7   | Data and examples from a multilevel modelling software review as well as other well-known data sets from the multilevel modelling literature. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-mlphaser</a>  | 0.01    | Phase haplotypes from genotypes based on a list of known haplotypes. Suited to highly diverse loci such as HLA. / GPL-2   | noarch  |
| <a href="#">r-mlpugs</a>    | 0.2.0   | An implementation of classifier chains (CC's) for multi-label prediction. Users can employ an external package (e.g. 'randomForest', 'C50'), or supply their own. The package can train a single set of CC's or train an ensemble of CC's – in parallel if running in a multi-core environment. New observations are classified using a Gibbs sampler since each unobserved label is conditioned on the others. The package includes methods for evaluating the predictions for accuracy and aggregating across iterations and models to produce binary or probabilistic classifications. / MIT | noarch  |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms |
|------------------------------|---------|---|-----------|
| <a href="#">r-mlsjunkgen</a> | 0.1.1   | Generate a stream of pseudo-random numbers generated using the MLS Junk Generator algorithm. Functions exist to generate single pseudo-random numbers as well as a vector, data frame, or matrix of pseudo-random numbers. / MIT  | noarch    |
| <a href="#">r-mltest</a>     | 1.0.1   | A fast, robust and easy-to-use calculation of multi-class classification evaluation metrics based on confusion matrix. / GPL-2  | noarch    |
| <a href="#">r-mltools</a>    | 0.3.5   | A collection of machine learning helper functions, particularly assisting in the Exploratory Data Analysis phase. Makes heavy use of the ‘data.table’ package for optimal speed and memory efficiency. Highlights include a versatile bin_data() function, sparsify() for converting a data.table to sparse matrix format with one-hot encoding, fast evaluation metrics, and empirical_cdf() for calculating empirical Multivariate Cumulative Distribution Functions. / MIT   | noarch    |
| <a href="#">r-mmacc</a>      | 0.1.2   | Contains the data sets for the textbook Mathematical Modeling and Applied Calculus by Joel Kilty and Alex M. McAllister. The book will be published by Oxford University Press in 2018 with ISBN-13: 978-019882472. / GPL-2   | noarch    |
| <a href="#">r-mmcc</a>       | 0.0.3   | Provides routines for multivariate measurement error correction. Includes procedures for linear, logistic and Cox regression models. Bootstrapped standard errors and confidence intervals can be obtained for corrected estimates. / GPL-3   | noarch    |
| <a href="#">r-mmds</a>       | 1.1     | This library implements mixture model distance sampling methods. See Miller and Thomas (in prep.). / GPL-2  | noarch    |
| <a href="#">r-mme</a>        | 0.1_6   | Fit Gaussian Multinomial mixed-effects models for small area estimation: Model 1, with one random effect in each category of the response variable (Lopez-Vizcaino,E. et al., 2013) <doi:10.1177/1471082X13478873>; Model 2, introducing independent time effect; Model 3, introducing correlated time effect. mme calculates direct and parametric bootstrap MSE estimators (Lopez-Vizcaino,E et al., 2014) <doi:10.1111/rssa.12085>. / GPL-2  | noarch    |
| <a href="#">r-mmeln</a>      | 1.3     | Fit multivariate mixture of normal distribution using covariance structure. / GPL-3   | noarch    |
| <a href="#">r-mmgee</a>      | 1.20    | Provides global hypothesis tests, multiple testing procedures and simultaneous confidence intervals for multiple linear contrasts of regression coefficients in a single generalized estimating equation (GEE) model or across multiple GEE models. GEE models are fit by a modified version of the ‘geeM’ package. / GPL-3   | noarch    |
| <a href="#">r-mmms</a>       | 0.1     | The package implements a multi-marker molecular signature (MMMS) approach for treatment-specific subgroup identification. / GPL-3   | noarch    |
| <a href="#">r-mmpa</a>       | 1.2.0   | To determine the number of quantitative assays needed for a sample of data using pooled testing methods, which include mini-pooling (MP), MP with algorithm (MPA), and marker-assisted MPA (mMPA). To estimate the number of assays needed, the package also provides a tool to conduct Monte Carlo (MC) to simulate different orders in which the sample would be collected to form pools. Using MC avoids the dependence of the estimated number of assays on any specific ordering of the samples to form pools. / MIT | noarch    |
| <a href="#">r-mmpf</a>       | 0.0.5   | Marginalizes prediction functions using Monte-Carlo integration and computes permutation importance. / MIT  | noarch    |
| <a href="#">r-mmpp</a>       | 0.6     | Compute similarities and distances between marked point processes. / GPL-2  | noarch    |

| Name                       | Version | Summary/License   | Platforms  |
|----------------------------|---------|---|--|
| <a href="#">r-mmtsne</a>   | 0.1.0   | An implementation of multiple maps t-distributed stochastic neighbor embedding (t-SNE). Multiple maps t-SNE is a method for projecting high-dimensional data into several low-dimensional maps such that non-metric space properties are better preserved than they would be by a single map. Multiple maps t-SNE with only one map is equivalent to standard t-SNE. When projecting onto more than one map, multiple maps t-SNE estimates a set of latent weights that allow each point to contribute to one or more maps depending on similarity relationships in the original data. This implementation is a port of the original ‘Matlab’ library by Laurens van der Maaten. See Van der Maaten and Hinton (2012) <doi:10.1007/s10994-011-5273-4>. This material is based upon work supported by the United States Air Force and Defense Advanced Research Project Agency (DARPA) under Contract No. FA8750-17-C-0020. Any opinions, findings and conclusions or recommendations expressed in this material are those of the author(s) and do not necessarily reflect the views of the United States Air Force and Defense Advanced Research Projects Agency. Distribution Statement A: Approved for Public Release; Distribution Unlimited. / FreeBSD   file LICENSE | noarch   |
| <a href="#">r-mmwrweek</a> | 0.1.1   | The first day of any MMWR week is Sunday. MMWR week numbering is sequential beginning with 1 and incrementing with each week to a maximum of 52 or 53. MMWR week #1 of an MMWR year is the first week of the year that has at least four days in the calendar year. This package provides functionality to convert Dates to MMWR day, week, and year and the reverse. / GPL-2   | noarch   |
| <a href="#">r-mnormt</a>   | 1.5_5   | Functions are provided for computing the density and the distribution function of multivariate normal and t random variables, and for generating random vectors sampled from these distributions. Probabilities are computed via non-Monte Carlo methods; different routines are used in the case d=1, d=2, d>2, if d denotes the number of dimensions. / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-mns</a>      | 1.0     | An implementation of the mixed neighbourhood selection (MNS) algorithm. The MNS algorithm can be used to estimate multiple related precision matrices. In particular, the motivation behind this work was driven by the need to understand functional connectivity networks across multiple subjects. This package also contains an implementation of a novel algorithm through which to simulate multiple related precision matrices which exhibit properties frequently reported in neuroimaging analysis. / GPL-2  | noarch   |
| <a href="#">r-mocca</a>    | 1.3     | Provides methods to analyze cluster alternatives based on multi-objective optimization of cluster validation indices. For details see Kraus et al. (2011) <doi:10.1007/s00180-011-0244-6>. / Artistic-2.0   | noarch   |
| <a href="#">r-mockery</a>  | 0.4.2   | The two main functionalities of this package are creating mock objects (functions) and selectively intercepting calls to a given function that originate in some other function. It can be used with any testing framework available for R. Mock objects can be injected with either this package’s own stub() function or a similar with_mock() facility present in the ‘testthat’ package. / MIT  | noarch   |
| <a href="#">r-mockr</a>    | 0.1     | Provides a means to mock a package function, i.e., temporarily substitute it for testing. Designed as a drop-in replacement for ‘testthat::with_mock()’, which may break in R 3.4.0 and later. / GPL-3  | noarch   |

| Name                           | Version | Summary/License  | Platforms  |
|--------------------------------|---------|--|--|
| <a href="#">r-mod</a>          | 0.1.3   | Creates modules inline or from a file. Modules can contain any R object and be nested. Each module have their own scope and package search path that does not interfere with one another or the user's working environment. / GPL-3  | noarch   |
| <a href="#">r-mod09nrt</a>     | 0.14    | Package for processing downloaded MODIS Surface reflectance Product HDF files. Specifically, MOD09 surface reflectance product files, and the associated MOD03 geolocation files (for MODIS-TERRA). The package will be most effective if the user installs MRTSwath (MODIS Reprojection Tool for swath products; < <a href="https://lpdaac.usgs.gov/tools/modis_reprojection_tool_swath">https://lpdaac.usgs.gov/tools/modis_reprojection_tool_swath</a> >, and adds the directory with the MRTSwath executable to the default R PATH by editing ~/.Rprofile. / GPL-2   | noarch   |
| <a href="#">r-modalclust</a>   | 0.7     | Performs Modal Clustering (MAC) including Hierarchical Modal Clustering (HMAC) along with their parallel implementation (PHMAC) over several processors. These model-based non-parametric clustering techniques can extract clusters in very high dimensions with arbitrary density shapes. By default clustering is performed over several resolutions and the results are summarised as a hierarchical tree. Associated plot functions are also provided. There is a package vignette that provides many examples. This version adheres to CRAN policy of not spanning more than two child processes by default. / GPL-2   | noarch   |
| <a href="#">r-modcmftr</a>     | 0.1.0   | Fits a modified version of the Connor-Mosimann distribution (Connor & Mosimann (1969)<doi:10.2307/2283728>), a Connor-Mosimann distribution or Dirichlet distribution (e.g. Gelman, Carlin, Stern & Rubin Chapter 3.5 (2004, <ISBN:1-58488-388-X>) to elicited quantiles of a multinomial distribution. Code is also provided to sample from the distributions, generating inputs suitable for a probabilistic sensitivity analysis / Monte Carlo simulation in a decision model. / GPL-2  | noarch   |
| <a href="#">r-modehunt</a>     | 1.0.7   | Given independent and identically distributed observations $X(1), \dots, X(n)$ from a density $f$ , provides five methods to perform a multiscale analysis about $f$ as well as the necessary critical values. The first method, introduced in Duembgen and Walther (2008), provides simultaneous confidence statements for the existence and location of local increases (or decreases) of $f$ , based on all intervals $I(\text{all})$ spanned by any two observations $X(j), X(k)$ . The second method approximates the latter approach by using only a subset of $I(\text{all})$ and is therefore computationally much more efficient, but asymptotically equivalent. Omitting the additive correction term $\Gamma$ in either method offers another two approaches which are more powerful on small scales and less powerful on large scales, however, not asymptotically minimax optimal anymore. Finally, the block procedure is a compromise between adding $\Gamma$ or not, having intermediate power properties. The latter is again asymptotically equivalent to the first and was introduced in Rufibach and Walther (2010). / GPL-2 | noarch   |
| <a href="#">r-modelmetrics</a> | 1.2.2   | Collection of metrics for evaluating models written in C using 'Rcpp'. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                             | Version | Summary/License  | Platforms   |
|----------------------------------|---------|--|---|
| <a href="#">r-modelobj</a>       | 4.0     | A utility library to facilitate the generalization of statistical methods built on a regression framework. Package developers can use ‘modelObj’ methods to initiate a regression analysis without concern for the details of the regression model and the method to be used to obtain parameter estimates. The specifics of the regression step are left to the user to define when calling the function. The user of a function developed within the ‘modelObj’ framework creates as input a ‘modelObj’ that contains the model and the R methods to be used to obtain parameter estimates and to obtain predictions. In this way, a user can easily go from linear to non-linear models within the same package. / GPL-2  | noarch  |
| <a href="#">r-modelr</a>         | 0.1.4   | Functions for modelling that help you seamlessly integrate modelling into a pipeline of data manipulation and visualisation. / GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-modeltools</a>     | 0.2_2   | A collection of tools to deal with statistical models. The functionality is experimental and the user interface is likely to change in the future. The documentation is rather terse, but packages ‘coin’ and ‘party’ have some working examples. However, if you find the implemented ideas interesting we would be very interested in a discussion of this proposal. Contributions are more than welcome! / GPL-2  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-modelwordcloud</a> | 0.1     | Makes a word cloud of text, sized by the frequency of the word, and colored either by user-specified colors or colored by the strength of the coefficient of that text derived from a regression model. / LGPL-2.1   | noarch  |
| <a href="#">r-modes</a>          | 0.7.0   | Designed with a dual purpose of accurately estimating the mode (or modes) as well as characterizing the modality of data. The specific application area includes complex or mixture distributions particularly in a big data environment. The heterogeneous nature of (big) data may require deep introspective statistical and machine learning techniques, but these statistical tools often fail when applied without first understanding the data. In small datasets, this often isn’t a big issue, but when dealing with large scale data analysis or big data thoroughly inspecting each dimension typically yields an $O(n^{n-1})$ problem. As such, dealing with big data require an alternative toolkit. This package not only identifies the mode or modes for various data types, it also provides a programmatic way of understanding the modality (i.e. uni-modal, bimodal, etc.) of a dataset (whether it’s big data or not). See <a href="http://www.sdeevi.com/modes_package">http://www.sdeevi.com/modes_package</a> for examples and discussion. / CC BY-NC-SA 4.0 | noarch  |

Table 51 – continued from previous page

| Name          | Version | Summary/License   | Platforms |
|---------------|---------|---|-----------|
| r-modeva      | 1.3.2   | Analyses species distribution models and evaluates their performance. It includes functions for performing variation partitioning, calculating several measures of model discrimination and calibration, optimizing prediction thresholds based on a number of criteria, performing multivariate environmental similarity surface (MESS) analysis, and displaying various analytical plots. / GPL-3   | noarch    |
| r-modifiedmk  | 1.4.0   | Power of non-parametric Mann-Kendall test and Spearman's Rho test is highly influenced by serially correlated data. To address this issue, trend tests may be applied on the modified versions of the time series data by Block Bootstrapping (BBS), Prewhitening (PW), Trend Free Prewhitening (TFPW), Bias Corrected Prewhitening and Variance Correction Approach by calculating effective sample size. Mann, H. B. (1945).<doi:10.1017/CBO9781107415324.004>. Kendall, M. (1975). Multivariate analysis. Charles Griffin&Company Ltd., sen, P. K. (1968).<doi:10.2307/2285891>. Önöz, B., & Bayazit, M. (2012) <doi:10.1002/hyp.8438>. Hamed, K. H. (2009).<doi:10.1016/j.jhydrol.2009.01.040>. Yue, S., & Wang, C. Y. (2002) <doi:10.1029/2001WR000861>. Yue, S., Pilon, P., Phinney, B., & Cavadias, G. (2002) <doi:10.1002/hyp.1095>. Hamed, K. H., & Ramachandra Rao, A. (1998) <doi:10.1016/S0022-1694(97)00125-X>. Yue, S., & Wang, C. Y. (2004) <doi:10.1023/B:WARM.0000043140.61082.60>. / AGPL-3 | noarch    |
| r-modmarg     | 0.9.2   | Calculate predicted levels and marginal effects, using the delta method to calculate standard errors. This is an R-based version of the 'margins' command from Stata. / GPL-3   | noarch    |
| r-modmax      | 1.1     | The algorithms implemented here are used to detect the community structure of a network. These algorithms follow different approaches, but are all based on the concept of modularity maximization. / GPL-2   | noarch    |
| r-modtempeff  | 1.5.2   | Fits a Constrained Segmented Distributed Lag regression model to epidemiological time series of mortality, temperature, and other confounders. / GPL-3  | noarch    |
| r-modturpoint | 0.1.0   | Turning point method is a method proposed by Choi (1990) <doi:10.2307/2531453> to estimate 50 percent effective dose (ED50) in the study of drug sensitivity. The method has its own advantages for that it can provide robust ED50 estimation. This package contains the modified function of Choi's turning point method. / GPL-3   | noarch    |
| r-modules     | 0.8.0   | Provides modules as an organizational unit for source code. Modules enforce to be more rigorous when defining dependencies and have a local search path. They can be used as a sub unit within packages or in scripts. / MIT  | noarch    |
| r-modygliani  | 1.0     | RMSD and Internal Energy analysis of NAMD and YASARA Molecular Dynamics output files. Allows to comparison of different dynamics per different complexes. Input files have to be ASCII files tab separated. / MIT   | noarch    |
| r-mogavs      | 1.1.0   | Functions for exploring the best subsets in regression with a genetic algorithm. The package is much faster than methods relying on complete enumeration, and is suitable for data sets with large number of variables. For more information, see Sinha, Malo & Kuosmanen (2015) <doi:10.1080/10618600.2014.899236>. / GPL-2  | noarch    |

| Name                         | Version | Summary/License   | Platforms |
|------------------------------|---------|---|-----------|
| <a href="#">r-mole</a>       | 1.0.1   | Model for simulating language evolution in terms of cultural evolution (Smith & Kirby (2008) <DOI:10.1098/rstb.2008.0145>; Deacon 1997). The focus is on the emergence of argument-marking systems (Dowty (1991) <DOI:10.1353/lan.1991.0021>, Van Valin 1999, Dryer 2002, Lestrade 2015a), i.e. noun marking (Aristar (1997) <DOI:10.1075/sl.21.2.04ari>, Lestrade (2010) <DOI:10.7282/T3ZG6R4S>), person indexing (Ariel 1999, Dahl (2000) <DOI:10.1075/fol.7.1.03dah>, Bhat 2004), and word order (Dryer 2013), but extensions are foreseen. Agents start out with a protolanguage (a language without grammar; Bickerton (1981) <DOI:10.17169/langsci.b91.109>, Jackendoff 2002, Arbib (2015) <DOI:10.1002/9781118346136.ch27>) and interact through language games (Steels 1997). Over time, grammatical constructions emerge that may or may not become obligatory (for which the tolerance principle is assumed; Yang 2016). Throughout the simulation, uniformitarianism of principles is assumed (Hopper (1987) <DOI:10.3765/bls.v13i0.1834>, Givon (1995) <DOI:10.1075/z.74>, Croft (2000), Saffran (2001) <DOI:10.1111/1467-8721.01243>, Heine & Kuteva 2007), in which maximal psychological validity is aimed at (Grice (1975) <DOI:10.1057/9780230005853_5>, Levelt 1989, Gaerdenfors 2000) and language representation is usage based (Tomasello 2003, Bybee 2010). In Lestrade (2015b) <DOI:10.15496/publikation-8640>, Lestrade (2015c) <DOI:10.1075/avt.32.08les>, and Lestrade (2016) <DOI:10.17617/2.2248195>), which reported on the results of preliminary versions, this package was announced as WDWTW (for who does what to whom), but for reasons of pronunciation and generalization the title was changed. / GPL-2 | noarch    |
| <a href="#">r-momentchi2</a> | 0.1.5   | A collection of moment-matching methods for computing the cumulative distribution function of a positively-weighted sum of chi-squared random variables. Methods include the Satterthwaite-Welch method, Hall-Buckley-Eagleson method, Wood's F method, and the Lindsay-Pilla-Basak method. / GPL-2   GPL-3   | noarch    |
| <a href="#">r-moments</a>    | 0.14    | Functions to calculate: moments, Pearson's kurtosis, Geary's kurtosis and skewness; tests related to them (Anscombe-Glynn, D'Agostino, Bonett-Seier). / GPL-2   | noarch    |
| <a href="#">r-momtrunc</a>   | 4.51    | It computes the raw moments for the truncated and folded multivariate normal, Skew-normal (SN), Extended skew normal (ESN) and Student's t-distribution. It also offers specific functions to compute the mean and variance-covariance matrix as well as the cumulative distribution function (cdf) for the folded normal, SN, ESN, and folded t-distribution. Density and random deviates are offered for the ESN (SN as particular case) distribution. Most algorithms are extensions based on Kan, R., & Robotti, C. (2017) <doi:10.1080/10618600.2017.1322092>. / GPL-2   | noarch    |
| <a href="#">r-mondate</a>    | 0.10.0  | Keep track of dates in terms of months. Model dates as at close of business. Perform date arithmetic in units of months and years (multiples of months). Allow infinite dates to model ultimate time spans. / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name                             | Version | Summary/License   | Platforms  |
|----------------------------------|---------|---|--|
| <a href="#">r-mondrian</a>       | 1.0_0   | The unique function of this package allows representing in a single graph the relative occurrence and co-occurrence of events measured in a sample. As examples, the package was applied to describe the occurrence and co-occurrence of different species of bacterial or viral symbionts infecting arthropods at the individual level. The graphics allows determining the prevalence of each symbiont and the patterns of multiple infections (i.e. how different symbionts share or not the same individual hosts). We named the package after the famous painter as the graphical output recalls Mondrian's paintings. / GPL (>= 2.0)  | noarch   |
| <a href="#">r-mongolite</a>      | 2.0.1   | High-performance 'MongoDB' client based on 'libmongoc' and 'jsonlite'. Includes support for aggregation, indexing, map-reduce, streaming, encryption, enterprise authentication. The online user manual provides an overview of the available methods in the package: < <a href="https://jeroen.github.io/mongolite/">https://jeroen.github.io/mongolite/</a> >. / Apache License 2.0   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-monographar</a>    | 1.2.0   | Contains functions intended to facilitate the production of plant taxonomic monographs. The package includes functions to convert tables into taxonomic descriptions, lists of collectors, examined specimens, and can generate a monograph skeleton. Additionally, wrapper functions to batch the production of phenology charts and distributional and diversity maps are also available. / GPL-2   | noarch   |
| <a href="#">r-monotonicity</a>   | 1.3     | Test for monotonicity in financial variables sorted by portfolios. It is conventional practice in empirical research to form portfolios of assets ranked by a certain sort variable. A t-test is then used to consider the mean return spread between the portfolios with the highest and lowest values of the sort variable. Yet comparing only the average returns on the top and bottom portfolios does not provide a sufficient way to test for a monotonic relation between expected returns and the sort variable. This package provides nonparametric tests for the full set of monotonic patterns by Patton, A. and Timmermann, A. (2010) < <a href="https://doi.org/10.1016/j.jfineco.2010.06.006">doi:10.1016/j.jfineco.2010.06.006</a> > and compares the proposed results with extant alternatives such as t-tests, Bonferroni bounds, and multivariate inequality tests through empirical applications and simulations. / BSD_3_clause | noarch   |
| <a href="#">r-monte.carlo.se</a> | 0.1.0   | Computes Monte Carlo standard errors for summaries of Monte Carlo output. Summaries and their standard errors are based on columns of Monte Carlo simulation output. Dennis D. Boos and Jason A. Osborne (2015) < <a href="https://doi.org/10.1111/insr.12087">doi:10.1111/insr.12087</a> >. / GPL-3  | noarch   |
| <a href="#">r-mopsocd</a>        | 0.5.1   | A multi-objective optimization solver based on particle swarm optimization with crowding distance. / GPL-2  | noarch   |
| <a href="#">r-morder</a>         | 0.1     | MOrder provide functions to check time homogeneity and order of markov chain by using chi-squared test, AIC value and BIC value. / GPL-2  | noarch   |
| <a href="#">r-morgenstemning</a> | 1.0     | This package is a port of the MATLAB colourmap functions accompanying the paper M. Geissbuehler and T. Lasser, How to display data by color schemes compatible with red-green color perception deficiencies, Opt. Express 21, 9862-9874 (2013) to R. / GPL-3  | noarch   |

| Name                        | Version | Summary/License  | Platforms |
|-----------------------------|---------|--|-----------|
| <code>r-morsegen</code>     | 1.2     | MorseGen is a program for generating raw data based on user-specified summary (descriptive) statistics. Samples based on the supplied statistics are drawn from a normal distribution (or, in some cases, an exponential distribution) and scaled to match the desired descriptive statistics. Intended uses include creating raw data that fits desired characteristics or to replicate the results in a published study. / GPL-2   | noarch    |
| <code>r-mosaicdata</code>   | 0.17.0  | Data sets from Project MOSAIC (< <a href="http://mosaic-web.org">http://mosaic-web.org</a> >) used to teach mathematics, statistics, computation and modeling. Funded by the NSF, Project MOSAIC is a community of educators working to tie together aspects of quantitative work that students in science, technology, engineering and mathematics will need in their professional lives, but which are usually taught in isolation, if at all. / GPL-2   | noarch    |
