| <code>r-most</code>         | 0.1.0   | Provides functions similar to the ‘SAS’ macros previously provided to accompany Collins, Dziak, and Li (2009) <DOI:10.1037/a0015826> and Dziak, Nahum-Shani, and Collins (2012) <DOI:10.1037/a0026972>, papers which outline practical benefits and challenges of factorial and fractional factorial experiments for scientists interested in developing biological and/or behavioral interventions, especially in the context of the multiphase optimization strategy (see Collins, Kugler & Gwadz 2016) <DOI:10.1007/s10461-015-1145-4>. The package currently contains three functions. First, RelativeCosts1() draws a graph of the relative cost of complete and reduced factorial designs versus other alternatives. Second, RandomAssignmentGenerator() returns a dataframe which contains a list of random numbers that can be used to conveniently assign participants to conditions in an experiment with many conditions. Third, FactorialPowerPlan() estimates the power, detectable effect size, or required sample size of a factorial or fractional factorial experiment, for main effects or interactions, given several possible choices of effect size metric, and allowing pretests and clustering. / GPL-2 | noarch    |
| <code>r-motilitylab</code>  | 0.2.5   | Statistics to quantify tracks of moving things (x-y-z-t data), such as cells, bacteria or animals. Available measures include mean square displacement, confinement ratio, autocorrelation, straightness, turning angle, and fractal dimension. / GPL-2  | noarch    |
| <code>r-moult</code>        | 2.1.0   | Functions to estimate start and duration of moult from moult data, based on models developed in Underhill and Zucchini (1988, 1990). / GPL-2   | noarch    |
| <code>r-mountainplot</code> | 1.2     | Lattice functions for drawing folded empirical cumulative distribution plots, or mountain plots. A mountain plot is similar to an empirical CDF plot, except that the curve increases from 0 to 0.5, then decreases from 0.5 to 1 using an inverted scale at the right side. / GPL-3   | noarch    |
| <code>r-mozzie</code>       | 0.1.0   | Weekly notified dengue cases in 25 districts of Sri Lanka from 2008/ week-52 to 2014/ week-21. / CC0   | noarch    |
| <code>r-mpci</code>         | 1.0.7   | It performs the followings Multivariate Process Capability Indices: Shahriari et al. (1995) Multivariate Capability Vector, Taam et al. (1993) Multivariate Capability Index (MCpm), Pan and Lee (2010) proposal (NMCpm) and the followings based on Principal Component Analysis (PCA): Wang and Chen (1998), Xekalaki and Perakis (2002) and Wang (2005). Two datasets are included. / GPL-2   | noarch    |
| <code>r-mpcmp</code>        | 0.1.3   | A collection of functions for estimation, testing and diagnostic checking for the mean-parametrized Conway-Maxwell Poisson (COM-Poisson) regression model of Huang (2017) <doi:10.1177/1471082X17697749>. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name             | Version | Summary/License   | Platforms |
|------------------|---------|---|-----------|
| r-mpcv           | 1.1     | Multivariate process capability analysis using the multivariate process capability vector. Allows to analyze a multivariate process with both normally and non-normally distributed and also with dependent and independent quality characteristics. / GPL (>= 2.0)   | noarch    |
| r-mpdir          | 0.1_1   | Data sets and scripts for Modeling Psychophysical Data in R (Springer). / GPL-2   | noarch    |
| r-mpe            | 1.0     | Functions for calculating sample size and power for clinical trials with multiple (co-)primary endpoints. / LGPL-3  | noarch    |
| r-mpinet         | 1.0     | (1) Our system provides a network-based strategies for metabolite pathway identification.(2) The MPINet can support the identification of pathways using Hypergeometric test based on metabolite set. (3)MPINet can support pathways from multiple databases. / GPL-2   | noarch    |
| r-mpkn           | 0.1.0   | A matrix discrete model having the form ' $M[i1] = (I Q)*M[i]$ '. The calculation of the values of ' $M[i]$ ' only for pre-selected values of ' $i$ '. The method of calculation is presented in the vignette 'Fundament' ('Base'). Maybe it's own idea of the author of the package. A weakness is that the method gives information only in selected steps of the process. It mainly refers to cases with matrices that are not Markov chain. If ' $Q$ ' is Markov transition matrix, then MUPkL() may be used to calculate the steady-state distribution ' $p$ ' for ' $p = Q*p$ '. Matrix power of non integer (matrix.powerni()) gives the same results as a mpower() from package 'matlib'. References: Markov chains, (< <a href="https://en.wikipedia.org/wiki/Markov_chain#Expected_number_of_visits">https://en.wikipedia.org/wiki/Markov_chain#Expected_number_of_visits</a> >). Donald R. Burleson, Ph.D. (2005), ON NON-INTEGERS POWERS OF A SQUARE MATRIX, (< <a href="http://www.blackmesapress.com/Eigenvalues.htm">http://www.blackmesapress.com/Eigenvalues.htm</a> >). / GPL-3 | noarch    |
| r-mplikelihoodwb | 1.1     | Computing modified profile likelihood estimates for Weibull Shape and Regression Parameters. Modified likelihood estimates are provided. / GPL-2  | noarch    |
| r-mpm            | 1.0_2   | Exploratory graphical analysis of multivariate data, specifically gene expression data with different projection methods: principal component analysis, correspondence analysis, spectral map analysis. / GPL-2   | noarch    |
| r-mpn            | 0.3.0   | Calculates the Most Probable Number (MPN) to quantify the concentration (density) of microbes in serial dilutions of a laboratory sample (described in Jarvis, 2010 <doi:10.1111/j.1365-2672.2010.04792.x>). Also calculates the Aerobic Plate Count (APC) for similar microbial enumeration experiments. / Unlimited   | noarch    |
| r-mppa           | 1.0     | A procedure to test for dependence between point processes on the real line, e.g. causal dependence, correlation, inhibition or anti-correlation. The package also provides a number of utilities for plotting simultaneous point processes, and combining p-values. / GPL-2  | noarch    |
| r-mpr            | 1.0.4   | Package for fitting Multi-Parameter Regression (MPR) models to right-censored survival data. These are flexible parametric regression models which extend standard models, for example, proportional hazards. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name       | Version | Summary/License   | Platforms           |
|------------|---------|---|---------------------|
| r-mps      | 2.3.0   | Developed for computing the probability density function, computing the cumulative distribution function, computing the quantile function, random generation, and estimating the parameters of 24 G-family of statistical distributions via the maximum product spacing approach introduced in < <a href="https://www.jstor.org/stable/2345411">https://www.jstor.org/stable/2345411</a> >. The set of families contains: beta G distribution, beta exponential G distribution, beta extended G distribution, exponentiated G distribution, exponentiated exponential Poisson G distribution, exponentiated generalized G distribution, exponentiated Kumaraswamy G distribution, gamma type I G distribution, gamma type II G distribution, gamma uniform G distribution, gamma-X generated of log-logistic family of G distribution, gamma-X family of modified beta exponential G distribution, geometric exponential Poisson G distribution, generalized beta G distribution, generalized transmuted G distribution, Kumaraswamy G distribution, log gamma type I G distribution, log gamma type II G distribution, Marshall Olkin G distribution, Marshall Olkin Kumaraswamy G distribution, modified beta G distribution, odd log-logistic G distribution, truncated-exponential skew-symmetric G distribution, and Weibull G distribution. / GPL-2 | noarch              |
| r-mpsychor | 0.10    | Supplementary materials and datasets for the book Modern Psychometrics With R (Mair, 2018, Springer userR! series). / GPL-2   | noarch              |
| r-mpt      | 0.6.0   | Fitting and testing multinomial processing tree (MPT) models, a class of nonlinear models for categorical data. The parameters are the link probabilities of a tree-like graph and represent the latent cognitive processing steps executed to arrive at observable response categories (Batchelder & Riefer, 1999 <doi:10.3758/bf03210812>; Erdfelder et al., 2009 <doi:10.1027/0044-3409.217.3.108>; Riefer & Batchelder, 1988 <doi:10.1037/0033-295x.95.3.318>). / GPL-2   | noarch              |
| r-mpv      | 1.55    | Most of this package consists of data sets from the textbook Introduction to Linear Regression Analysis (3rd ed), by Montgomery, Peck and Vining. Some additional data sets and functions related to visualization of linear and non-parametric regression results are included. / Unlimited  | noarch              |
| r-mratios  | 1.4.0   | Performs (simultaneous) inferences for ratios of linear combinations of coefficients in the general linear model. Multiple comparisons and simultaneous confidence interval estimations can be performed for ratios of treatment means in the normal one-way layout with homogeneous and heterogeneous treatment variances, according to Dilba et al. (2007) < <a href="https://cran.r-project.org/doc/Rnews/Rnews_2007-1.pdf">https://cran.r-project.org/doc/Rnews/Rnews_2007-1.pdf</a> > and Hasler and Hothorn (2008) <doi:10.1002/bimj.200710466>. Confidence interval estimations for ratios of linear combinations of linear model parameters like in (multiple) slope ratio and parallel line assays can be carried out. Moreover, it is possible to calculate the sample sizes required in comparisons with a control based on relative margins. For the simple two-sample problem, functions for a t-test for ratio-formatted hypotheses and the corresponding confidence interval are provided assuming homogeneous or heterogeneous group variances. / GPL-2   | noarch              |
| r-mrbayes  | 0.1.0   | Bayesian estimation of inverse variance weighted (IVW), Burgess et al. (2013) <doi:10.1002/gepi.21758>, and MR-Egger, Bowden et al. (2015) <doi:10.1093/ije/dyv080>, summary data models for Mendelian randomization analyses. / GPL-3  | noarch              |
| r-mrclient | 3.4.3   | A free, community-supported, data science tool for high performance analytics / Proprietary   | linux-64,<br>win-64 |

Table 51 – continued from previous page

| Name                            | Version | Summary/License  | Platforms           |
|---------------------------------|---------|--|---------------------|
| <a href="#">r-mrclient-mlm</a>  | 3.4.3   | Pre-trained machine learning models for sentiment analysis and image detection / Proprietary   | noarch              |
| <a href="#">r-mrclient-mml</a>  | 3.4.3   | Provides state-of-the-art fast, scalable machine learning algorithms and transforms for R / Proprietary  | linux-64,<br>win-64 |
| <a href="#">r-mreg</a>          | 1.1     | Implements the methods described in Bond S, Farewell V, 2006, Exact Likelihood Estimation for a Negative Binomial Regression Model with Missing Outcomes, Biometrics / GPL-3   | noarch              |
| <a href="#">r-mri</a>           | 1.0.1   | It provides functions to compute the values of different modifications of the Rand and Wallace indices. The indices are used to measure the stability or similarity of two partitions obtained on two different sets of units with a non-empty intercept. Splitting and merging of clusters can (depends on the selected index) have a different effect on the value of the indices. The indices are proposed in Cugmas and Ferligoj (2018) < <a href="http://ibmi.mf.uni-lj.si/mz/2018/no-1/Cugmas2018.pdf">http://ibmi.mf.uni-lj.si/mz/2018/no-1/Cugmas2018.pdf</a> >. / GPL-2 | noarch              |
| <a href="#">r-mro</a>           | 0.1.1   | Computes multiple correlation coefficient when the data matrix is given and tests its significance. / GPL-2  | linux-64,<br>win-64 |
| <a href="#">r-mrpostman</a>     | 0.2.0   | Multiple IMAP (Internet Message Access Protocol) commands based on the RFC 3501 manual (Crispin, 2003, <doi:10.17487/RFC3501>), its updates, and other related documents. Besides other features, 'mRpostman' provides functions for listing, selecting and renaming mailboxes, as well as moving, fetching, and searching for messages using several criteria. / GPL-3  | noarch              |
| <a href="#">r-mrqol</a>         | 1.0     | We can calculate directly used this package the Minimal Clinically Important Difference by applying the Anchor-based method and the Response shift effect by applying the Then-Test method. / GPL (>= 2.0)   | noarch              |
| <a href="#">r-mrsurv</a>        | 0.2     | This package contains functions, data and examples to compute a multiplicative-regression model for relative survival. / GPL-2   | noarch              |
| <a href="#">r-mrtsamplesize</a> | 0.1.0   | Provide a sample size calculator for micro-randomized trials (MRTs) based on methodology developed in Sample Size Calculations for Micro-randomized Trials in mHealth by Liao et al. (2016) <DOI:10.1002/sim.6847>. / GPL-2  | noarch              |
| <a href="#">r-ms.sev</a>        | 1.0.4   | Calculates ARMSS (age related multiple sclerosis severity), and both local and global MSSS (multiple sclerosis severity score). / GPL-2  | noarch              |
| <a href="#">r-msaface</a>       | 0.1.0   | The new methodology moving subset analysis provides functions to investigate the effect of environmental conditions on the CO2 fertilization effect within longterm free air carbon enrichment (FACE) experiments. In general, the functionality is applicable to derive the influence of a third variable (forcing experiment-support variable) on the relation between a dependent and an independent variable. / GPL-3  | noarch              |
| <a href="#">r-msap</a>          | 1.1.8   | Statistical Analyses of Methylation-sensitive Amplification Polymorphism (MSAP) assays. / GPL-2  | noarch              |
| <a href="#">r-msar</a>          | 0.3.0   | Visualises multiple sequence alignments dynamically within the Shiny web application framework. / BSL-1.0  | noarch              |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms |
|------------------------------|---------|---|-----------|
| <a href="#">r-msbox</a>      | 1.2.1   | Common mass spectrometry tools described in John Roboz (2013) <doi:10.1201/b15436>. It allows checking element isotopes, calculating (isotope labelled) exact monoisotopic mass, m/z values and mass accuracy, and inspecting possible contaminant mass peaks, examining possible adducts in electrospray ionization (ESI) and matrix-assisted laser desorption ionization (MALDI) ion sources. / GPL-2   | noarch    |
| <a href="#">r-mscombine</a>  | 1.4     | Find common entities detected in both positive and negative ionization mode, delete this entity in the less sensible mode and combine both matrices. / GPL-2  | noarch    |
| <a href="#">r-mseapca</a>    | 1.0     | This package provides functions for metabolite set enrichment analysis (MSEA) and principal component analysis (PCA), and converting metabolite set list from your own csv files or KEGG's tar.gz files to XML documents. This package is suitable for computation of MSEA for factor loading in PCA. / BSD   | noarch    |
| <a href="#">r-msg</a>        | 0.4     | A companion to the Chinese book ‘Modern Statistical Graphics’. / GPL-3  | noarch    |
| <a href="#">r-msgpackr</a>   | 1.1     | This is the library that can serialize or unserialize MessagePack format data. / BSD_2_clause   | noarch    |
| <a href="#">r-msma</a>       | 2.0     | Several functions can be used to analyze multiblock multivariable data. If the input is a single matrix, then principal components analysis (PCA) is implemented. If the input is a list of matrices, then multiblock PCA is implemented. If the input is two matrices, for exploratory and objective variables, then partial least squares (PLS) analysis is implemented. If the input is two lists of matrices, for exploratory and objective variables, then multiblock PLS analysis is implemented. Additionally, if an extra outcome variable is specified, then a supervised version of the methods above is implemented. For each method, sparse modeling is also incorporated. Functions for selecting the number of components and regularized parameters are also provided. / GPL-2 | noarch    |
| <a href="#">r-msme</a>       | 0.5.3   | Functions and datasets from Hilbe, J.M., and Robinson, A.P. 2013. Methods of Statistical Model Estimation. Chapman & Hall / CRC. / GPL-3  | noarch    |
| <a href="#">r-msmwra</a>     | 1.3     | Data sets in the book entitled Multivariate Statistical Methods with R Applications, H.Bulut (2018). The book will be published in Turkish and the original name of this book will be R Uygulamaları ile Çok Degiskenli Istatistiksel Yontemler. / GPL-3  | noarch    |
| <a href="#">r-mssqlr</a>     | 1.0.0   | Can be used to query data from data from Microsoft SQL Server (MSSQL, see < <a href="http://www.microsoft.com/sqlserver/">http://www.microsoft.com/sqlserver/</a> > for more information). Based on the concepts of Entity Framework, the package allows querying data from MSSQL Database. / GPL-3   | noarch    |
| <a href="#">r-mstknncust</a> | 0.1.0   | Implements the MST-kNN clustering algorithm which was proposed by Inostroza-Ponta, M. (2008) < <a href="https://trove.nla.gov.au/work/28729389?selectedversion=NBD44634158">https://trove.nla.gov.au/work/28729389?selectedversion=NBD44634158</a> >. / GPL-2   | noarch    |
| <a href="#">r-mstr</a>       | 1.2     | Generation of response patterns under dichotomous and polytomous computerized multistage testing (MST) framework. It holds various item response theory (IRT) and score-based methods to select the next module and estimate ability levels (Magis, Yan and von Davier (2017, ISBN:978-3-319-69218-0)). / GPL-2   | noarch    |
| <a href="#">r-mstrio</a>     | 10.1.1  | Interface for creating data sets and extracting data through the ‘MicroStrategy’ REST API. Access the demo API at < <a href="https://demo.microstrategy.com/MicroStrategyLibrary/api-docs/index.html">https://demo.microstrategy.com/MicroStrategyLibrary/api-docs/index.html</a> >. / Apache License 2.0   file LICENSE  | noarch    |

Table 51 – continued from previous page

| Name                              | Version | Summary/License  | Platforms |
|-----------------------------------|---------|--|-----------|
| <a href="#">r-msu</a>             | 0.0.1   | Estimators for multivariate symmetrical uncertainty based on the work of Gustavo Sosa et al. (2016) <arXiv:1709.08730>, total correlation, information gain and symmetrical uncertainty of categorical variables. / GPL-3  | noarch    |
| <a href="#">r-mswm</a>            | 1.4     | Estimation, inference and diagnostics for Univariate Autoregressive Markov Switching Models for Linear and Generalized Models. Distributions for the series include gaussian, Poisson, binomial and gamma cases. The EM algorithm is used for estimation (see Perlin (2012) <doi:10.2139/ssrn.1714016>). / GPL (>= 2.0)  | noarch    |
| <a href="#">r-mtdrh</a>           | 0.1.0   | The Mass Transportation Distance rank histogram was developed to assess the reliability of scenarios with equal or different probabilities of occurrence <doi:10.1002/we.1872>. / GPL-2  | noarch    |
| <a href="#">r-mthapower</a>       | 0.1.1   | Calculate Sample Size and Power for Association Studies Involving Mitochondrial DNA Haplogroups. Based on formulae by Samuels et al. AJHG, 2006. 78(4):713-720. <DOI:10.1086/502682>. / GPL-3  | noarch    |
| <a href="#">r-mtsys</a>           | 1.2.0   | Mahalanobis-Taguchi (MT) system is a collection of multivariate analysis methods developed for the field of quality engineering. MT system consists of two families depending on their purpose. One is a family of Mahalanobis-Taguchi (MT) methods (in the broad sense) for diagnosis (see Woodall, W. H., Koudelik, R., Tsui, K. L., Kim, S. B., Stoumbos, Z. G., and Carvounis, C. P. (2003) <doi:10.1198/004017002188618626>) and the other is a family of Taguchi (T) methods for forecasting (see Kawada, H., and Nagata, Y. (2015) <doi:10.17929/tqs.1.12>). The MT package contains three basic methods for the family of MT methods and one basic method for the family of T methods. The MT method (in the narrow sense), the Mahalanobis-Taguchi Adjoint (MTA) methods, and the Recognition-Taguchi (RT) method are for the MT method and the two-sided Taguchi (T1) method is for the family of T methods. In addition, the Ta and Tb methods, which are the improved versions of the T1 method, are included. / MIT | noarch    |
| <a href="#">r-muckrock</a>        | 0.1.0   | A data package containing public domain information on requests made by the ‘MuckRock’ ( <a href="https://www.muckrock.com/">https://www.muckrock.com/</a> ) project under the United States Freedom of Information Act. / Unlimited   | noarch    |
| <a href="#">r-muerelativerisk</a> | 0.1.1   | Implements an estimator for relative risk based on the median unbiased estimator. The relative risk estimator is well defined and performs satisfactorily for a wide range of data configurations. The details of the method are available in Carter et al (2010) <doi:10.1111/j.1467-9876.2010.00711.x>. / GPL-3  | noarch    |
| <a href="#">r-muficokriging</a>   | 1.2     | This package builds multi-fidelity cokriging models from responses with different levels of fidelity. Important functions : MuFicokm, predict.MuFicokm, summary.MuFicokm. / GPL-3  | noarch    |

Continued on next page

Table 51 – continued from previous page

| Name                           | Version | Summary/License   | Platforms   |
|--------------------------------|---------|---|---|
| <a href="#">r-mullerplot</a>   | 0.1.2   | Generates Muller plot from parental/genealogy/phylogeny information and population/abundance/frequency dynamics data. Muller plots are plots which combine information about succession of different OTUs (genotypes, phenotypes, species, ...) and information about dynamics of their abundances (populations or frequencies) over time. They are powerful and fascinating tools to visualize evolutionary dynamics. They may be employed also in study of diversity and its dynamics, i.e. how diversity emerges and how changes over time. They are called Muller plots in honor of Hermann Joseph Muller which used them to explain his idea of Muller's ratchet (Muller, 1932, American Naturalist). A big difference between Muller plots and normal box plots of abundances is that a Muller plot depicts not only the relative abundances but also succession of OTUs based on their genealogy/phylogeny/parental relation. In a Muller plot, horizontal axis is time/generations and vertical axis represents relative abundances of OTUs at the corresponding times/generations. Different OTUs are usually shown with polygons with different colors and each OTU originates somewhere in the middle of its parent area in order to illustrate their succession in evolutionary process. To generate a Muller plot one needs the genealogy/phylogeny/parental relation of OTUs and their abundances over time. MullerPlot package has the tools to generate Muller plots which clearly depict the origin of successors of OTUs. / GPL-3 | noarch  |
| <a href="#">r-mulset</a>       | 1.0.0   | Computes efficient data distributions from highly inconsistent datasets with many missing values using multi-set intersections. Based upon hash functions, 'mulset' can quickly identify intersections from very large matrices of input vectors across columns and rows and thus provides scalable solution for dealing with missing values. Tomic et al. (2019) <doi:10.1101/545186>. / EUPL (>= 1.2)   | noarch  |
| <a href="#">r-multcomp</a>     | 1.4.1   | Simultaneous tests and confidence intervals for general linear hypotheses in parametric models, including linear, generalized linear, linear mixed effects, and survival models. The package includes demos reproducing analyzes presented in the book Multiple Comparisons Using R (Bretz, Hothorn, Westfall, 2010, CRC Press). / GPL-2  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-multcompview</a> | 0.1.7   | Convert a logical vector or a vector of p-values or a correlation, difference, or distance matrix into a display identifying the pairs for which the differences were not significantly different. Designed for use in conjunction with the output of functions like TukeyHSD, dist{stats}, simint, simtest, csimint, csimtest{multcomp}, friedmanmc, kruskalmc{pgirmess}. / GPL-3  | noarch  |
| <a href="#">r-multdm</a>       | 1.0     | Allows to perform the multivariate version of the Diebold-Mariano test for equal predictive ability of multiple forecast comparison. Main reference: Mariano, R.S., Preve, D. (2012) <doi:10.1016/j.jeconom.2012.01.014>. / GPL-3   | noarch  |
| <a href="#">r-multeq</a>       | 2.3     | Equivalence tests and related confidence intervals for the comparison of two treatments, simultaneously for one or many normally distributed, primary response variables (endpoints). The step-up procedure of Quan et al. (2001) is both applied for differences and extended to ratios of means. A related single-step procedure is also available. / GPL-3   | noarch  |

| Name                                | Version | Summary/License  | Platforms |
|-------------------------------------|---------|--|-----------|
| <a href="#">r-multfisher</a>        | 1.1     | Calculates exact hypothesis tests to compare a treatment and a reference group with respect to multiple binary endpoints. The tested null hypothesis is an identical multidimensional distribution of successes and failures in both groups. The alternative hypothesis is a larger success proportion in the treatment group in at least one endpoint. The tests are based on the multivariate permutation distribution of subjects between the two groups. For this permutation distribution, rejection regions are calculated that satisfy one of different possible optimization criteria. In particular, regions with maximal exhaustion of the nominal significance level, maximal power under a specified alternative or maximal number of elements can be found. Optimization is achieved by a branch-and-bound algorithm. By application of the closed testing principle, the global hypothesis tests are extended to multiple testing procedures. / GPL-3  | noarch    |
| <a href="#">r-multiapply</a>        | 2.1.1   | The base apply function and its variants, as well as the related functions in the ‘plyr’ package, typically apply user-defined functions to a single argument (or a list of vectorized arguments in the case of mapply). The ‘multiApply’ package extends this paradigm with its only function, Apply, which efficiently applies functions taking one or a list of multiple unidimensional or multidimensional arrays (or combinations thereof) as input. The input arrays can have different numbers of dimensions as well as different dimension lengths, and the applied function can return one or a list of unidimensional or multidimensional arrays as output. This saves development time by preventing the R user from writing often error-prone and memory-inefficient loops dealing with multiple complex arrays. Also, a remarkable feature of Apply is the transparent use of multi-core through its parameter ‘ncores’. In contrast to the base apply function, this package suggests the use of ‘target dimensions’ as opposite to the ‘margins’ for specifying the dimensions relevant to the function to be applied. / LGPL-3 | noarch    |
| <a href="#">r-multiassetoptions</a> | 0.1.1   | Efficient finite difference method for valuing European and American multi-asset options. / GPL-2   GPL-3  | noarch    |
| <a href="#">r-multiband</a>         | 0.1.0   | Algorithms for performing joint parameter estimation in astronomical survey data acquired in multiple bands. / MIT   | noarch    |
| <a href="#">r-multica</a>           | 1.1     | Implements a generalization of the Cochran-Armitage trend test to multinomial data. In addition to an overall test, multiple testing adjusted p-values for trend in individual outcomes and power calculation is available. / GPL-2  | noarch    |
| <a href="#">r-multicmp</a>          | 1.1     | A toolkit containing statistical analysis models motivated by multivariate forms of the Conway-Maxwell-Poisson (COM-Poisson) distribution for flexible modeling of multivariate count data, especially in the presence of data dispersion. Currently the package only supports bivariate data, via the bivariate COM-Poisson distribution described in Sellers et al. (2016) <doi:10.1016/j.jmva.2016.04.007>. Future development will extend the package to higher-dimensional data. / GPL-3  | noarch    |

|---------------------------------|---------|--|-----------|
| <a href="#">r-multicoll</a>     | 1.0     | The detection of worrying approximate collinearity in a multiple linear regression model is a problem addressed in all existing statistical packages. However, we have detected deficits regarding to the incorrect treatment of qualitative independent variables and the role of the intercept of the model. The objective of this package is to correct these deficits. In this package will be available detection and treatment techniques traditionally used as the recently developed. D.A. Belsley (1982) <doi:10.1016/0304-4076(82)90020-3>. D. A. Belsley (1991, ISBN: 978-0471528890). C. Garcia, R. Salmeron and C.B. Garcia (2019) <doi:10.1080/00949655.2018.1543423>. R. Salmeron, C.B. Garcia and J. Garcia (2018) <doi:10.1080/00949655.2018.1463376>. G.W. Stewart (1987) <doi:10.1214/ss/1177013444>. / GPL-2 | noarch    |
| <a href="#">r-multifwf</a>      | 0.2.2   | Read a table of fixed width formatted data of different types into a data.frame for each type. / GPL-2   | noarch    |
| <a href="#">r-multigroup</a>    | 0.4.4   | Several functions are presented in order to study data in a group structure, where the same set of variables are measured on different groups of individuals. / GPL-3  | noarch    |
| <a href="#">r-multijoin</a>     | 0.1.1   | Wrapper around the Unix join facility which is more efficient than the built-in R routine merge(). The package enables the joining of multiple files on disk at once. The files can be compressed and various filters can be deployed before joining. Compiles only under Unix. / GPL-3  | noarch    |
| <a href="#">r-multilaterals</a> | 1.0     | Computing transitive (and non-transitive) index numbers (Coelli et al., 2005 <doi:10.1007/b136381>) for cross-sections and panel data. For the calculation of transitive indexes, the EKS (Coelli et al., 2005 <doi:10.1007/b136381>; Rao et al., 2002 <doi:10.1007/978-1-4615-0851-9_4>) and Minimum spanning tree (Hill, 2004 <doi:10.1257/0002828043052178>) methods are implemented. Traditional fixed-base and chained indexes, and their growth rates, can also be derived using the Paasche, Laspeyres, Fisher and Tornqvist formulas. / GPL-3  | noarch    |
| <a href="#">r-multilevel</a>    | 2.6     | The functions in this package are designed to be used in the analysis of multilevel data by applied psychologists. The package includes functions for estimating common within-group agreement and reliability indices. The package also contains basic data manipulation functions that facilitate the analysis of multilevel and longitudinal data. / GPL-2  | noarch    |
| <a href="#">r-multinbmod</a>    | 1.0     | This is a likelihood approach for the regression analysis of overdispersed correlated count data with cluster varying covariates. The approach fits a multivariate negative binomial model by maximum likelihood and provides robust estimates of the regression coefficients. / GPL-2   | noarch    |
| <a href="#">r-multinomialci</a> | 1.1     | An implementation of a method for building simultaneous confidence intervals for the probabilities of a multinomial distribution given a set of observations, proposed by Sison and Glaz in their paper: Sison, C.P and J. Glaz. Simultaneous confidence intervals and sample size determination for multinomial proportions. Journal of the American Statistical Association, 90:366-369 (1995). The method is an R translation of the SAS code implemented by May and Johnson in their paper: May, W.L. and W.D. Johnson. Constructing two-sided simultaneous confidence intervals for multinomial proportions for small counts in a large number of cells. Journal of Statistical Software 5(6) (2000). Paper and code available at <DOI:10.18637/jss.v005.i06>. / LGPL-3   | noarch    |
| <a href="#">r-multiord</a>      | 2.4.1   | A method for multivariate ordinal data generation given marginal distributions and correlation matrix based on the methodology proposed by Demirtas (2006). / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name              | Version | Summary/License   | Platforms |
|-------------------|---------|---|-----------|
| r-multiplebubbles | 0.2.0   | Provides the Augmented Dickey-Fuller test and its variations to check the existence of bubbles (explosive behavior) for time series, based on the article by Peter C. B. Phillips, Shuping Shi and Jun Yu (2015a) <doi:10.1111/iere.12131>. Some functions may take a while depending on the size of the data used, or the number of Monte Carlo replications applied. / GPL-2  | noarch    |
| r-multiplesc      | 1.2.1   | Fit Cox proportional hazard models with a weighted partial likelihood. It handles one or multiple endpoints, additional matching and makes it possible to reuse controls for other endpoints. / GPL-2   | noarch    |
| r-multiplex       | 2.9     | Algebraic procedures for the analysis of multiple social networks are delivered with this package. Among other things, it makes possible to create and manipulate multivariate network data with different formats, and there are effective ways available to treat multiple networks with routines that combine algebraic systems like the partially ordered semigroup or the semiring structure together with the relational bundles occurring in different types of multivariate network data sets. It also provides an algebraic approach for two-mode networks through Galois derivations between families of the pairs of subsets in the two domains. / GPL-3   | noarch    |
| r-multipol        | 1.0.7   | Various utilities to manipulate multivariate polynomials. / GPL-3   | noarch    |
| r-multirdpg       | 1.0.1   | Fits the Multiple Random Dot Product Graph Model and performs a test for whether two networks come from the same distribution. Both methods are proposed in Nielsen, A.M., Witten, D., (2018) The Multiple Random Dot Product Graph Model, arXiv preprint <arXiv:1811.12172> (Submitted to Journal of Computational and Graphical Statistics). / GPL-2  | noarch    |
| r-multirich       | 2.1.1   | Functions to calculate Unique Trait Combinations (UTC) and scaled Unique Trait Combinations (sUTC) as measures of multivariate richness. The package can also calculate beta-diversity for trait richness and can partition this into nestedness-related and turnover components. The code will also calculate several measures of overlap. / GPL-2   | noarch    |
| r-multirng        | 1.2.2   | Pseudo-random number generation for 11 multivariate distributions: Normal, t, Uniform, Bernoulli, Hypergeometric, Beta (Dirichlet), Multinomial, Dirichlet-Multinomial, Laplace, Wishart, and Inverted Wishart. The details of the method are explained in Demirtas (2004) <DOI:10.22237/jmasm/1099268340>. / GPL-2   GPL-3   | noarch    |
| r-multirobust     | 1.0.5   | Multiply robust estimation for population mean (Han and Wang 2013) <doi:10.1093/biomet/ass087>, regression analysis (Han 2014) <doi:10.1080/01621459.2014.880058> (Han 2016) <doi:10.1111/sjos.12177> and quantile regression (Han et al. 2019) <doi:10.1111/rssb.12309>. / GPL-2   | noarch    |
| r-multiroc        | 1.1.1   | Tools to solve real-world problems with multiple classes classifications by computing the areas under ROC and PR curve via micro-averaging and macro-averaging. The vignettes of this package can be found via < <a href="https://github.com/WandeRum/multiROC">https://github.com/WandeRum/multiROC</a> >. The methodology is described in V. Van Asch (2013) < <a href="https://www.clips.uantwerpen.be/~vincent/pdf/microaverage.pdf">https://www.clips.uantwerpen.be/~vincent/pdf/microaverage.pdf</a> > and Pedregosa et al. (2011) < <a href="http://scikit-learn.org/stable/auto_examples/model_selection/plot_roc.html">http://scikit-learn.org/stable/auto_examples/model_selection/plot_roc.html</a> >. / GPL-3 | noarch    |

Table 51 – continued from previous page

| Name                                 | Version | Summary/License  | Platforms |
|--------------------------------------|---------|--|-----------|
| <a href="#">r-multirr</a>            | 1.1     | Calculates bias, precision, and power for multi-level random regressions. Random regressions are types of hierarchical models in which data are structured in groups and (regression) coefficients can vary by groups. Tools to estimate model performance are designed mostly for scenarios where (regression) coefficients vary at just one level. ‘MultiRR’ provides simulation and analytical tools (based on ‘lme4’) to study model performance for random regressions that vary at more than one level (multi-level random regressions), allowing researchers to determine optimal sampling designs. / GPL-2 | noarch    |
| <a href="#">r-multisom</a>           | 1.3     | Implements two versions of the algorithm namely: stochastic and batch. The package determines also the best number of clusters and offers to the user the best clustering scheme from different results. / GPL-2   | noarch    |
| <a href="#">r-multisv</a>            | 0.0_6   | MultiSV is an R package for identification of structural variations in multiple populations based on whole genome resequencing. It fits linear mixed model and identifies structural variations in multiple populations using whole genome sequencing data. It could also be manipulated to use on RNA-seq data for differential gene expression (implementation in future releases). Main steps for analysis include generating read depth in bins using ComputeBinCounts. conversion of bins to MultiSV format using Bin2MultiSV. Finally, identification of structural variations using CallMultiSV. / LGPL-3   | noarch    |
| <a href="#">r-multivarsel</a>        | 1.1.3   | It performs variable selection in a multivariate linear model by estimating the covariance matrix of the residuals then use it to remove the dependence that may exist among the responses and eventually performs variable selection by using the Lasso criterion. The method is described in the paper Perrot-Dockès et al. (2017) <arXiv:1704.00076>. / GPL-2   | noarch    |
| <a href="#">r-multivator</a>         | 1.1_9   | A multivariate generalization of the emulator package. / GPL-2   | noarch    |
| <a href="#">r-multiwave</a>          | 1.4     | Computation of an estimation of the long-memory parameters and the long-run covariance matrix using a multivariate model (Lobato (1999) <doi:10.1016/S0304-4076(98)00038-4>; Shimotsu (2007) <doi:10.1016/j.jeconom.2006.01.003>). Two semi-parametric methods are implemented: a Fourier based approach (Shimotsu (2007) <doi:10.1016/j.jeconom.2006.01.003>) and a wavelet based approach (Achard and Gannaz (2016) <doi:10.1111/jtsa.12170>). / GPL-2   | noarch    |
| <a href="#">r-multiway</a>           | 1.0_6   | Fits multi-way component models via alternating least squares algorithms with optional constraints. Fit models include N-way Canonical Polyadic Decomposition, Individual Differences Scaling, Multiway Covariates Regression, Parallel Factor Analysis (1 and 2), Simultaneous Component Analysis, and Tucker Factor Analysis. / GPL-2  | noarch    |
| <a href="#">r-multiwayregression</a> | 1.2     | Functions to predict one multi-way array (i.e., a tensor) from another multi-way array, using a low-rank CANDECOMP/PARAFAC (CP) factorization and a ridge (L_2) penalty [Lock, EF (2018) <doi:10.1080/10618600.2017.1401544>]. Also includes functions to sample from the Bayesian posterior of a tensor-on-tensor model. / GPL-3  | noarch    |
| <a href="#">r-multiwayvcov</a>       | 1.2.3   | Exports two functions implementing multi-way clustering using the method suggested by Cameron, Gelbach, & Miller (2011) and cluster (or block) bootstrapping for estimating variance-covariance matrices. Normal one and two-way clustering matches the results of other common statistical packages. Missing values are handled transparently and rudimentary parallelization support is provided. / BSD_2_clause   | noarch    |

Table 51 – continued from previous page

| Name                            | Version | Summary/License  | Platforms   |
|---------------------------------|---------|--|---|
| <a href="#">r-multxpt</a>       | 0.1     | Implementation of commonly used p-value-based and parametric multiple testing procedures (computation of adjusted p-values and simultaneous confidence intervals) and parallel gatekeeping procedures based on the methodology presented in the book Multiple Testing Problems in Pharmaceutical Statistics (edited by Alex Dmitrienko, Ajit C. Tamhane and Frank Bretz) published by Chapman and Hall/CRC Press 2009. / GPL-2 | noarch  |
| <a href="#">r-mumin</a>         | 1.43.6  | Tools for performing model selection and model averaging. Automated model selection through subsetting the maximum model, with optional constraints for model inclusion. Model parameter and prediction averaging based on model weights derived from information criteria (AICc and alike) or custom model weighting schemes. / GPL-2   | noarch  |
| <a href="#">r-munsell</a>       | 0.5.0   | Provides easy access to, and manipulation of, the Munsell colours. Provides a mapping between Munsell's original notation (e.g. 5R 5/10) and hexadecimal strings suitable for use directly in R graphics. Also provides utilities to explore slices through the Munsell colour tree, to transform Munsell colours and display colour palettes. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-murl</a>          | 0.1_1   | Provides mailmerge methods for reading spreadsheets of addresses and other relevant information to create standardized but customizable letters. Provides a method for mapping US ZIP codes, including those of letter recipients. Provides a method for parsing and processing html code from online job postings of the American Political Science Association. / GPL-2  | noarch  |
| <a href="#">r-murphydiagram</a> | 0.11    | Data and code for the paper by Ehm, Gneiting, Jordan and Krueger ('Of Quantiles and Expectiles: Consistent Scoring Functions, Choquet Representations, and Forecast Rankings', 2015). / GPL-3  | noarch  |
| <a href="#">r-murty</a>         | 0.3.0   | Calculates k-best solutions and costs for an assignment problem following the method outlined in Murty (1968) <doi:10.1287/opre.16.3.682>. / MIT   | noarch  |
| <a href="#">r-mus</a>           | 0.1.6   | Sampling and evaluation methods to apply Monetary Unit Sampling (or in older literature Dollar Unit Sampling) during an audit of financial statements. / GPL-2   | noarch  |
| <a href="#">r-music</a>         | 0.1.1   | An aid for learning and using music theory. You can build chords, scales, and chord progressions using 12-note equal temperament tuning (12-ET) or user-defined tuning. Includes functions to visualize notes on a piano using ASCII plots in the console and to plot waveforms using base graphics. It allows simple playback of notes and chords using the 'audio' package. / GPL-3  | noarch  |
| <a href="#">r-mustat</a>        | 1.7.0   | Performs Wilcoxon rank sum test, Kruskal rank sum test, Friedman rank sum test and McNemar test. / GPL-2   | noarch  |

Table 51 – continued from previous page

| Name                          | Version | Summary/License  | Platforms |
|-------------------------------|---------|--|-----------|
| <a href="#">r-mvbinary</a>    | 1.1     | Modelling Multivariate Binary Data with Blocks of Specific One-Factor Distribution. Variables are grouped into independent blocks. Each variable is described by two continuous parameters (its marginal probability and its dependency strength with the other block variables), and one binary parameter (positive or negative dependency). Model selection consists in the estimation of the repartition of the variables into blocks. It is carried out by the maximization of the BIC criterion by a deterministic (faster) algorithm or by a stochastic (more time consuming but optimal) algorithm. Tool functions facilitate the model interpretation. / GPL-2   | noarch    |
| <a href="#">r-mvbutils</a>    | 2.8.23  | Hierarchical workspace tree, code editing and backup, easy package prep, editing of packages while loaded, per-object lazy-loading, easy documentation, macro functions, and miscellaneous utilities. Needed by debug package. / GPL-2   | noarch    |
| <a href="#">r-mvcwt</a>       | 1.3.1   | Computes the continuous wavelet transform of irregularly sampled time series. / GPL-3  | noarch    |
| <a href="#">r-mvglmmrank</a>  | 1.2_2   | Maximum likelihood estimates are obtained via an EM algorithm with either a first-order or a fully exponential Laplace approximation. / GPL-2  | noarch    |
| <a href="#">r-mvisage</a>     | 0.2.1   | Pearson and Spearman correlation coefficients are commonly used to quantify the strength of bivariate associations of genomic variables. For example, correlations of gene-level DNA copy number and gene expression measurements may be used to assess the impact of DNA copy number changes on gene expression in tumor tissue. ‘MVisAGE’ enables users to quickly compute and visualize the correlations in order to assess the effect of regional genomic events such as changes in DNA copy number or DNA methylation level. Please see Walter V, Du Y, Danilova L, Hayward MC, Hayes DN, 2018. Cancer Research <doi:10.1158/0008-5472.CAN-17-3464>. / GPL-3  | noarch    |
| <a href="#">r-mvglm</a>       | 0.1.4   | Allows a user to conduct multivariate multiple regression using analytic p-values rather than classic approximate F-tests. / GPL-2   | noarch    |
| <a href="#">r-mvmeta</a>      | 0.4.1   | Collection of functions to perform fixed and random-effects multivariate and univariate meta-analysis and meta-regression. / GPL-2   | noarch    |
| <a href="#">r-mvmise</a>      | 1.0     | Offers a general framework of multivariate mixed-effects models for the joint analysis of multiple correlated outcomes with clustered data structures and potential missingness proposed by Wang et al. (2018) <doi:10.1093/biostatistics/kxy022>. The missingness of outcome values may depend on the values themselves (missing not at random and non-ignorable), or may depend on only the covariates (missing at random and ignorable), or both. This package provides functions for two models: 1) mvMISE_b() allows correlated outcome-specific random intercepts with a factor-analytic structure, and 2) mvMISE_e() allows the correlated outcome-specific error terms with a graphical lasso penalty on the error precision matrix. Both functions are motivated by the multivariate data analysis on data with clustered structures from labelling-based quantitative proteomic studies. These models and functions can also be applied to univariate and multivariate analyses of clustered data with balanced or unbalanced design and no missingness. / GPL-3 | noarch    |
| <a href="#">r-mvnbayesian</a> | 0.0.8   | Tools of Bayesian analysis framework using the method suggested by Berger (1985) <doi:10.1007/978-1-4757-4286-2> for multivariate normal (MVN) distribution and multivariate normal mixture (MixMVN) distribution: a) calculating Bayesian posteriori of (Mix)MVN distribution; b) generating random vectors of (Mix)MVN distribution; c) Markov chain Monte Carlo (MCMC) for (Mix)MVN distribution. / GPL-2   | noarch    |
| <a href="#">r-mvnggrad</a>    | 0.1.5   | Package for moving grid adjustment in plant breeding field trials. / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms  |
|------------------------------|---------|---|--|
| <code>r-mvnormtest</code>    | 0.1_9   | Generalization of shapiro-wilk test for multivariate variables. / GPL-3   | noarch   |
| <code>r-mvnpermute</code>    | 1.0.0   | Given a vector of multivariate normal data, a matrix of covariates and the data covariance matrix, generate new multivariate normal samples that have the same covariance matrix based on permutations of the transformed data residuals. / GPL (>= 3.0)  | noarch   |
| <code>r-mvntest</code>       | 1.1_0   | Routines for assessing multivariate normality. Implements three Wald's type chi-squared tests; non-parametric Anderson-Darling and Cramer-von Mises tests; Doornik-Hansen test, Royston test and Henze-Zirkler test. / GPL-2  | noarch   |
| <code>r-mvprobit</code>      | 0.1_8   | Tools for estimating multivariate probit models, calculating conditional and unconditional expectations, and calculating marginal effects on conditional and unconditional expectations. / GPL-2  | noarch   |
| <code>r-mvprpb</code>        | 1.0.4   | Computes orthant probabilities multivariate normal distribution. / BSD_3_clause   | noarch   |
| <code>r-mvshapirotest</code> | 1.0     | This package implements the generalization of the Shapiro-Wilk test for multivariate normality proposed by Villaseñor-Alva and Gonzalez-Estrada (2009). / GPL-3   | noarch   |
| <code>r-mvtmeta</code>       | 1.0     | This package contains functions to run fixed effects or random effects multivariate meta-analysis. / GPL-2  | noarch   |
| <code>r-mvtnorm</code>       | 1.0_1   | Computes multivariate normal and t probabilities, quantiles, random deviates and densities. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-mvtplot</code>       | 1.0_1   | A function for plotting multivariate time series data / GPL-2   | noarch   |
| <code>r-mwlasso</code>       | 1.3.1   | The Moving-Window Lasso (MWLasso) method for genome-wide association studies. A window scans the design matrix. For predictors in the same window, their coefficients estimates are smoothed. / GPL-3   | noarch   |
| <code>r-mwridge</code>       | 1.0.0   | A two stage moving-window Ridge method for coefficients estimation and model prediction. In the first stage, moving-window penalty and L1 penalty are applied. In the second stage, ridge regression is applied. / GPL-3  | noarch   |
| <code>r-mwright</code>       | 0.3.2   | Implements random number generation, plotting, and estimation algorithms for the two-parameter one-sided and two-sided M-Wright (Mainardi-Wright) family. The M-Wright distributions naturally generalize the widely used one-sided (Airy and half-normal or half-Gaussian) and symmetric (Airy and Gaussian or normal) models. These are widely studied in time-fractional differential equations. References: Cahoy and Minkabo (2017) <doi:10.3233/MAS-170388>; Cahoy (2012) <doi:10.1007/s00180-011-0269-x>; Cahoy (2012) <doi:10.1080/03610926.2010.543299>; Cahoy (2011); Mainardi, Mura, and Pagnini (2010) <doi:10.1155/2010/104505>. / GPL-3 | noarch   |
| <code>r-mwshiny</code>       | 2.0.0   | A simple function, mwsApp(), that runs a 'shiny' app spanning multiple, connected windows. This uses all standard 'shiny' conventions, and depends only on the 'shiny' package. / MIT   | noarch   |

|--------------------------------|-----------|---|-----------|
| <a href="#">r-mxkssd</a>       | 1.1       | mxkssd is a package that generates efficient balanced mixed-level k-circulant supersaturated designs by interchanging the elements of the generator vector. The package tries to generate a supersaturated design that has EfNOD efficiency more than user specified efficiency level (mef). The package also displays the progress of generation of an efficient mixed-level k-circulant design through a progress bar. The progress of 100 per cent means that one full round of interchange is completed. More than one full round (typically 4-5 rounds) of interchange may be required for larger designs. / GPL-2 | noarch    |
| <a href="#">r-mycobacrvr</a>   | 1.0       | The mycobacrvR package contains utilities to provide detailed information for B cell and T cell epitopes for predicted adhesins from various servers such as ABCpred, Bcepred, Bimas, Propred, NetMHC and IEDB. Please refer the URL below to download data files (data_mycobacrvR.zip) used in functions of this package. / GPL-2  | noarch    |
| <a href="#">r-mycor</a>        | 0.1.1     | Perform correlation and linear regression test among the numeric fields in a data.frame automatically and make plots using pairs or lattice::parallelplot. / CC0  | noarch    |
| <a href="#">r-myepisodes</a>   | 1.1.1     | Useful functions for accessing MyEpisodes feeds and episode information as well as other tv episode related actions through www.myepisodes.com / GPL-2  | noarch    |
| <a href="#">r-myrrixjars</a>   | 1.0_2     | External jars required for package ‘Myrrix’. ‘Myrrix’ is a recommendation engine. / Apache License (== 2.0)   | noarch    |
| <a href="#">r-na.tools</a>     | 0.3.1     | This comprehensive toolkit provide a consistent and extensible framework for working with missing values in vectors. The companion package ‘tidyimpute’ provides similar functionality for list-like and table-like structures). Functions exist for detection, removal, replacement, imputation, recollection, etc. of ‘NAs’. / GPL-3  | noarch    |
| <a href="#">r-nada</a>         | 1.6_1     | Contains methods described by Dennis Helsel in his book Nondetects And Data Analysis: Statistics for Censored Environmental Data. / GPL-2   | noarch    |
| <a href="#">r-naepprimer</a>   | 1.0.1     | Contains a sample of the 2005 Grade 8 Mathematics data from the National Assessment of Educational Progress (NAEP). This data set is called the NAEP Primer. / GPL-2  | noarch    |
| <a href="#">r-naivebayes</a>   | 0.9.6     | In this implementation of the Naive Bayes classifier following class conditional distributions are available: Bernoulli, Categorical, Gaussian, Poisson and non-parametric representation of the class conditional density estimated via Kernel Density Estimation. / GPL-2   | noarch    |
| <a href="#">r-namedcapture</a> | 2019.1.30 | Useful friendly wrappers for named capture regular expressions. / GPL-3   | noarch    |
| <a href="#">r-nameneedle</a>   | 1.2.4     | The Needleman-Wunsch global alignment algorithm can be used to find approximate matches between sample names in different data sets. See Wang et al. (2010) <doi:10.4137/CIN.S5613>. / Apache License (== 2.0)  | noarch    |
| <a href="#">r-naptime</a>      | 1.3.0     | Provides a near drop-in replacement for base::Sys.sleep() that allows more types of input to produce delays in the execution of code and can silence/prevent typical sources of error. / GPL-2  | noarch    |
| <a href="#">r-nardl</a>        | 0.1.5     | Computes the nonlinear cointegrating autoregressive distributed lag model with p lags of the dependent variables and q lags of independent variables proposed by (Shin, Yu & Greenwood-Nimmo, 2014 <doi:10.1007/978-1-4899-8008-3_9>). / GPL-3  | noarch    |
| <a href="#">r-nasaweather</a>  | 0.1       | This package contains tidied data from the ASA 2006 data expo, as well as a number of useful other related data sets. / GPL-3   | noarch    |

| Name                           | Version    | Summary/License   | Platforms                      |
|--------------------------------|------------|---|--------------------------------|
| <a href="#">r-nat.utils</a>    | 0.5.1      | Utility functions that may be of general interest but are specifically required by the ‘NeuroAnatomy Toolbox’ (‘nat’). Includes functions to provide a basic make style system to update files based on timestamp information, file locking and ‘touch’ utility. Convenience functions for working with file paths include ‘abs2rel’, ‘split_path’ and ‘common_path’. Finally there are utility functions for working with ‘zip’ and ‘gzip’ files including integrity tests. / GPL-3  | noarch                         |
| <a href="#">r-natural</a>      | 0.9.0      | Implementation of the two error variance estimation methods in high-dimensional linear models of Yu, Bien (2017) <arXiv:1712.02412>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-naturalsort</a>  | 0.1.3      | Provides functions related to human natural ordering. It handles adjacent digits in a character sequence as a number so that natural sort function arranges a character vector by their numbers, not digit characters. It is typically seen when operating systems lists file names. For example, a sequence a-1.png, a-2.png, a-10.png looks naturally ordered because $1 < 2 < 10$ and natural sort algorithm arranges so whereas general sort algorithms arrange it into a-1.png, a-10.png, a-2.png owing to their third and fourth characters. / BSD_3_clause | noarch                         |
| <a href="#">r-naturesounds</a> | 1.0.1      | Collection of example animal sounds for bioacoustic analysis. / GPL-2   | noarch                         |
| <a href="#">r-nb</a>           | 0.9        | Estimate the effective population size of a closed population using genetic data collected from two or more data points. / GPL-2  | noarch                         |
| <a href="#">r-nb.mclust</a>    | 1.1.1      | Model-based clustering of high-dimensional non-negative data that follow Generalized Negative Binomial distribution. All functions in this package applies to either continuous or integer data. Correlation between variables are allowed, while samples are assumed to be independent. / GPL-2  | noarch                         |
| <a href="#">r-nbc4va</a>       | 1.1        | An implementation of the Naive Bayes Classifier (NBC) algorithm used for Verbal Autopsy (VA) built on code from Miasnikof et al (2015) <DOI:10.1186/s12916-015-0521-2>. / GPL-3   | noarch                         |
| <a href="#">r-nbclust</a>      | 3.0        | It provides 30 indexes for determining the optimal number of clusters in a data set and offers the best clustering scheme from different results to the user. / GPL-2   | noarch                         |
| <a href="#">r-nbconverttr</a>  | 1.0.2      | Calls the ‘Jupyter’/‘IPython’ script ‘nbconvert’ to create vignettes from notebooks. Those notebooks (‘.ipynb’ files) are files containing rich text, code, and its output. Code cells can be edited and evaluated interactively. See < <a href="http://ipython.org/notebook.html">http://ipython.org/notebook.html</a> > for more information. / GPL-3   | noarch                         |
| <a href="#">r-nbdirichlet</a>  | 1.3        | The Dirichlet (aka NBD-Dirichlet) model describes the purchase incidence and brand choice of consumer products. We estimate the model and summarize various theoretical quantities of interest to marketing researchers. Also provides functions for making tables that compare observed and theoretical statistics. / GPL-3  | noarch                         |
| <a href="#">r-ncbit</a>        | 2013.03.29 | making NCBI taxonomic data locally available and searchable as an R object / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name                         | Version | Summary/License  | Platforms                      |
|------------------------------|---------|--|--------------------------------|
| <a href="#">r-ncdf4</a>      | 1.16.1  | Provides a high-level R interface to data files written using Unidata's netCDF library (version 4 or earlier), which are binary data files that are portable across platforms and include metadata information in addition to the data sets. Using this package, netCDF files (either version 4 or classic version 3) can be opened and data sets read in easily. It is also easy to create new netCDF dimensions, variables, and files, in either version 3 or 4 format, and manipulate existing netCDF files. This package replaces the former ncdf package, which only worked with netcdf version 3 files. For various reasons the names of the functions have had to be changed from the names in the ncdf package. The old ncdf package is still available at the URL given below, if you need to have backward compatibility. It should be possible to have both the ncdf and ncdf4 packages installed simultaneously without a problem. However, the ncdf package does not provide an interface for netcdf version 4 files. / GPL-3   | linux-64,<br>osx-64            |
| <a href="#">r-ncdunnnett</a> | 1.1.0   | Computes the noncentral Dunnett's test distribution (pdf, cdf and quantile) and generates random numbers. / GPL-2  | noarch                         |
| <a href="#">r-ncf</a>        | 1.2.8   | R functions for analyzing spatial (cross-)covariance: the nonparametric (cross-)covariance function, the spline correlogram, the nonparametric phase coherence function, local indicators of spatial association (LISA), (Mantel) correlogram, (Partial) Mantel test. / GPL-3  | noarch                         |
| <a href="#">r-ncg</a>        | 0.1.1   | Computes the noncentral gamma function: pdf, cdf, quantile function and inverse for the noncentrality parameter. / GPL-2   | noarch                         |
| <a href="#">r-ncopula</a>    | 0.1.1   | Construct and manipulate hierarchical Archimedean copulas with multivariate compound distributions. The model used is the one of Cossette et al. (2017) <doi:10.1016/j.insmatheco.2017.06.001>. / GPL-2  | noarch                         |
| <a href="#">r-ncpen</a>      | 1.0.0   | An efficient unified nonconvex penalized estimation algorithm for Gaussian (linear), binomial Logit (logistic), Poisson, multinomial Logit, and Cox proportional hazard regression models. The unified algorithm is implemented based on the convex concave procedure and the algorithm can be applied to most of the existing nonconvex penalties. The algorithm also supports convex penalty: least absolute shrinkage and selection operator (LASSO). Supported nonconvex penalties include smoothly clipped absolute deviation (SCAD), minimax concave penalty (MCP), truncated LASSO penalty (TLP), clipped LASSO (CLASSO), sparse ridge (SRIDGE), modified bridge (MBRIDGE) and modified log (MLOG). For high-dimensional data (data set with many variables), the algorithm selects relevant variables producing a parsimonious regression model. Kim, D., Lee, S. and Kwon, S. (2018) <arXiv:1811.05061>, Lee, S., Kwon, S. and Kim, Y. (2016) <doi:10.1016/j.csda.2015.08.019>, Kwon, S., Lee, S. and Kim, Y. (2015) <doi:10.1016/j.csda.2015.07.001>. (This research is funded by Julian Virtue Professorship from Center for Applied Research at Pepperdine Graziadio Business School and the National Research Foundation of Korea.) / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ncvreg</a>     | 3.11    | Fits regularization paths for linear regression, GLM, and Cox regression models using lasso or nonconvex penalties, in particular the minimax concave penalty (MCP) and smoothly clipped absolute deviation (SCAD) penalty, with options for additional L2 penalties (the elastic net idea). Utilities for carrying out cross-validation as well as post-fitting visualization, summarization, inference, and prediction are also provided. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name               | Version | Summary/License  | Platforms                      |
|--------------------|---------|--|--------------------------------|
| r-ndp              | 0.1.0   | An interactive presentation on the topic of normal distribution using ‘rmarkdown’ and ‘shiny’ packages. It is helpful to those who want to learn normal distribution quickly and get a hands on experience. The presentation has a template for solving problems on normal distribution. Runtime examples are provided in the package function as well as at <a href="https://kartikeyastat.shinyapps.io/NormalDistribution/">https://kartikeyastat.shinyapps.io/NormalDistribution/</a> . / GPL-2 | noarch                         |
| r-nearender        | 1.5     | Performs network enrichment analysis against functional gene sets. Benchmarks networks. Renders raw gene profile matrices of dimensionality N genes x N samples into the space of gene set (typically pathway) enrichment scores of dimensionality N pathways x N samples. / GPL-3   | noarch                         |
| r-neariso          | 1.0.1   | Implements a path algorithm for Near-Isotonic Regression. For more details see the help files. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-neat             | 1.1.3   | Includes functions and examples to compute NEAT, the Network Enrichment Analysis Test described in Signorelli et al. (2016, <DOI:10.1186/s12859-016-1203-6>). / GPL-3  | noarch                         |
| r-neatranges       | 0.1.0   | Collapse, partition, combine, fill gaps in and expand date/time ranges. / MIT  | noarch                         |
| r-needs            | 0.0.3   | A simple function for easier package loading and auto-installation. / MIT  | noarch                         |
| r-needy            | 0.2     | needy is a small utility library designed to make testing function inputs less difficult. R is a dynamically typed language, but larger projects need input checking for scalability. needy offers a single function, <code>require_a()</code> , which lets you specify the traits an input object should have, such as class, size, numerical properties or number of parameters, while reducing boilerplate code and aiding debugging. / MIT   | noarch                         |
| r-negbinbetabinreg | 1.0     | The Negative Binomial regression with mean and shape modeling and mean and variance modeling and Beta Binomial regression with mean and dispersion modeling. / GPL-2   | noarch                         |
| r-negenes          | 1.0_1   | Estimating the number of essential genes in a genome on the basis of data from a random transposon mutagenesis experiment, through the use of a Gibbs sampler. Lamichhane et al. (2003) <doi:10.1073/pnas.1231432100>. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-neighbr          | 1.0.2   | Classification, regression, and clustering with k nearest neighbors algorithm. Implements several distance and similarity measures, covering continuous and logical features. Outputs ranked neighbors. Most features of this package are directly based on the PMML specification for KNN. / GPL (>= 2.1)   | noarch                         |
| r-nephro           | 1.2     | Set of functions to estimate renal function and other phenotypes of interest in nephrology based on different biomechical traits. MDRD, CKD-EPI, and Virga equations are compared in Pattaro (2013) <doi:10.1159/000351043>, where the respective references are given. In addition, the software includes Stevens (2008) <doi:10.1053/j.ajkd.2007.11.018> and Cockcroft (1976) <doi:10.1159/000180580> formulas. / GPL-3  | noarch                         |
| r-nestedcohort     | 1.1_3   | Estimate hazard ratios, survival curves and attributable risks for cohorts with missing covariates, using Cox models or Kaplan-Meier estimated for strata. This handles studies nested within cohorts, such as case-cohort studies with stratified sampling. See <a href="http://www.r-project.org/doc/Rnews/Rnews_2008-1.pdf">http://www.r-project.org/doc/Rnews/Rnews_2008-1.pdf</a> / GPL-2   | noarch                         |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms                      |
|------------------------------|---------|---|--------------------------------|
| <a href="#">r-nestfs</a>     | 0.9.2   | Implementation of forward selection based on cross-validated linear and logistic regression. / GPL-2  | noarch                         |
| <a href="#">r-netchain</a>   | 0.1.0   | In networks, treatments may spill over from the treated individual to his or her social contacts and outcomes may be contagious over time. Under this setting, causal inference on the collective outcome observed over all network is often of interest. We use chain graph models approximating the projection of the full longitudinal data onto the observed data to identify the causal effect of the intervention on the whole outcome. Justification of such approximation is demonstrated in Ogburn et al. (2018) <arXiv:1812.04990>. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-netcoh</a>     | 0.2     | Model fitting procedures for regression with network cohesion effects, when a network connecting sample individuals is available in a regression problem. In the future, other commonly used statistical models will be added, such as gaussian graphical model. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-netcomp</a>    | 1.6     | This package contains functions to carry out high throughput data analysis and to conduct data set comparisons. Similarity matrices from high throughput phenotypic data containing uninformative (e.g. wild type) or missing data can be calculated to report similarity of response. A suite of graph comparisons using an adjacency or correlation matrix format are included to facilitate quick network analysis. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-netdata</a>    | 0.3     | This package contains all data needed for Dan McFarland's SNA R labs. / GPL-2   | noarch                         |
| <a href="#">r-netindices</a> | 1.4.4   | Given a network (e.g. a food web), estimates several network indices. These include: Ascendency network indices, Direct and indirect dependencies, Effective measures, Environ network indices, General network indices, Pathway analysis, Network uncertainty indices and constraint efficiencies and the trophic level and omnivory indices of food webs. / GPL-2   | noarch                         |
| <a href="#">r-netrankr</a>   | 0.2.1   | Implements methods for centrality related analyses of networks. While the package includes the possibility to build more than 20 indices, its main focus lies on index-free assessment of centrality via partial rankings obtained by neighborhood-inclusion or positional dominance. These partial rankings can be analyzed with different methods, including probabilistic methods like computing expected node ranks and relative rank probabilities (how likely is it that a node is more central than another?). The methodology is described in depth in the vignettes and in Schoch (2018) <doi:10.1016/j.socnet.2017.12.003>. / MIT | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-netregr</a>    | 1.0.1   | Regress network responses (both directed and undirected) onto covariates of interest that may be actor-, relation-, or network-valued. In addition, compute principled variance estimates of the coefficients assuming that the errors are jointly exchangeable. Missing data is accommodated. Additionally implements building and inversion of covariance matrices under joint exchangeability, and generates random covariance matrices from this class. For more detail on methods, see Marrs, Fosdick, and McCormick (2017) <arXiv:1701.05530>. / MIT  | noarch                         |
| <a href="#">r-nets</a>       | 0.9     | Sparse VAR estimation based on LASSO. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                            | Version | Summary/License   | Platforms   |
|---------------------------------|---------|---|---|
| <a href="#">r-netsimr</a>       | 0.1.0   | Assists actuaries and other insurance modellers in pricing, reserving and capital modelling for non-life insurance and reinsurance modelling. Provides functions that help model excess levels, capping and pure Incurred but not reported claims (pure IBNR). Includes capped mean, exposure curves and increased limit factor curves (ILFs) for LogNormal, Gamma, Pareto, Sliced LogNormal-Pareto and Sliced Gamma-Pareto distributions. Includes mean, probability density function (pdf), cumulative probability function (cdf) and inverse cumulative probability function for Sliced LogNormal-Pareto and Sliced Gamma-Pareto distributions. Includes calculating pure IBNR exposure with LogNormal and Gamma distribution for reporting delay. / GPL-3 | noarch  |
| <a href="#">r-netswan</a>       | 0.1     | A set of functions for studying network robustness, resilience and vulnerability. / GPL-2   | noarch  |
| <a href="#">r-netweaver</a>     | 0.0.6   | Implements various simple function utilities and flexible pipelines to generate circular images for visualizing complex genomic and network data analysis features. / GPL-3   | noarch  |
| <a href="#">r-networkd3</a>     | 0.4     | Creates 'D3' 'JavaScript' network, tree, dendrogram, and Sankey graphs from 'R'. / GPL (>= 3)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-networkgen</a>    | 0.1.1   | A network Maze generator that creates different types of network mazes. / GPL-3   | noarch  |
| <a href="#">r-neural</a>        | 1.4.2   | RBF and MLP neural networks with graphical user interface / GPL-2   | noarch  |
| <a href="#">r-neuralnet</a>     | 1.44.2  | Training of neural networks using backpropagation, resilient backpropagation with (Riedmiller, 1994) or without weight backtracking (Riedmiller and Braun, 1993) or the modified globally convergent version by Anastasiadis et al. (2005). The package allows flexible settings through custom-choice of error and activation function. Furthermore, the calculation of generalized weights (Intrator O & Intrator N, 1993) is implemented. / GPL-2  | noarch  |
| <a href="#">r-neuroblastoma</a> | 1.0     | Annotated neuroblastoma copy number profiles, a benchmark data set for change-point detection algorithms. / GPL-3   | noarch  |
| <a href="#">r-neurohcp</a>      | 0.8.1   | Downloads and reads data from Human 'Connectome' Project < <a href="https://db.humanconnectome.org">https://db.humanconnectome.org</a> > using Amazon Web Services ('AWS') 'S3' buckets. / GPL-2  | noarch  |
| <a href="#">r-neurosims</a>     | 0.2.1   | The package allows users to generate fMRI time series or 4D data. Some high-level functions are created for fast data generation with only a few arguments and a diversity of functions to define activation and noise. For more advanced users it is possible to use the low-level functions and manipulate the arguments. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-neverhpfiler</a>  | 0.2.0   | In the working paper titled Why You Should Never Use the Hodrick-Prescott Filter, James D. Hamilton proposes an interesting new alternative to economic time series filtering. The neverhpfiler package provides functions for implementing his solution. Hamilton (2017) <doi:10.3386/w23429>. / GPL-3   | noarch  |

Table 51 – continued from previous page

| Name                             | Version | Summary/License   | Platforms                      |
|----------------------------------|---------|---|--------------------------------|
| <a href="#">r-newdistns</a>      | 2.1     | Computes the probability density function, cumulative distribution function, quantile function, random numbers and measures of inference for the following general families of distributions (each family defined in terms of an arbitrary cdf G): Marshall Olkin G distributions, exponentiated G distributions, beta G distributions, gamma G distributions, Kumaraswamy G distributions, generalized beta G distributions, beta extended G distributions, gamma G distributions, gamma uniform G distributions, beta exponential G distributions, Weibull G distributions, log gamma G I distributions, log gamma G II distributions, exponentiated generalized G distributions, exponentiated Kumaraswamy G distributions, geometric exponential Poisson G distributions, truncated-exponential skew-symmetric G distributions, modified beta G distributions, and exponentiated exponential Poisson G distributions. / GPL-2 | noarch                         |
| <a href="#">r-newtestsurvrec</a> | 1.0.2   | Implements the routines to compare the survival curves with recurrent events, including the estimations of survival curves. The first model is a model for recurrent event, when the data are correlated or not correlated. It was proposed by Wang and Chang (1999) <doi:10.2307/2669690>. In the independent case, the survival function can be estimated by the generalization of the limit product model of Pena (2001) <doi:10.1198/016214501753381922>. / GPL-2   | noarch                         |
| <a href="#">r-nfactors</a>       | 2.3.3   | Indices, heuristics and strategies to help determine the number of factors/components to retain: 1. Acceleration factor (af with or without Parallel Analysis); 2. Optimal Coordinates (noc with or without Parallel Analysis); 3. Parallel analysis (components, factors and bootstrap); 4. lambda > mean(lambda) (Kaiser, CFA and related); 5. Cattell-Nelson-Gorsuch (CNG); 6. Zoski and Jurs multiple regression (b, t and p); 7. Zoski and Jurs standard error of the regression coefficient (sescree); 8. Nelson R2; 9. Bartlett khi-2; 10. Anderson khi-2; 11. Lawley khi-2 and 12. Bentler-Yuan khi-2. / GPL-2  | noarch                         |
| <a href="#">r-nfca</a>           | 0.3     | Numerical Formal Concept Analysis (nFCA) is a modern unsupervised learning tool for analyzing general numerical data. Given input data, this R package nFCA outputs two nFCA graphs: a H-graph and an I-graph that reveal systematic, hierarchical clustering and inherent structure of the data. / GPL-2   | noarch                         |
| <a href="#">r-nfwdist</a>        | 0.1.0   | Density, distribution function, quantile function and random generation for the 3D Navarro, Frenk & White (NFW) profile. For details see Robotham & Howlett (2018) <arXiv:1805.09550>. / GPL-3  | noarch                         |
| <a href="#">r-ngram</a>          | 3.0.4   | An n-gram is a sequence of n words taken, in order, from a body of text. This is a collection of utilities for creating, displaying, summarizing, and babbling n-grams. The ‘tokenization’ and babbling are handled by very efficient C code, which can even be built as its own standalone library. The babbler is a simple Markov chain. The package also offers a vignette with complete example ‘workflows’ and information about the utilities offered in the package. / BSD_2_clause  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ngspatial</a>      | 1.2.1   | Provides tools for analyzing spatial data, especially non- Gaussian areal data. The current version supports the sparse restricted spatial regression model of Hughes and Haran (2013) <DOI:10.1111/j.1467-9868.2012.01041.x>, the centered autologistic model of Caragea and Kaiser (2009) <DOI:10.1198/jabes.2009.07032>, and the Bayesian spatial filtering model of Hughes (2017) <arXiv:1706.04651>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-nhanes</a>         | 2.1.0   | Body Shape and related measurements from the US National Health and Nutrition Examination Survey (NHANES, 1999-2004). See <a href="http://www.cdc.gov/nchs/nhanes.htm">http://www.cdc.gov/nchs/nhanes.htm</a> for details. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name                           | Version | Summary/License  | Platforms           |
|--------------------------------|---------|--|---------------------|
| <a href="#">r-nhds</a>         | 1.0.3   | The National Hospital Discharge Survey (2010) summarizes the state of patients at the end of their hospital admissions. The US CDC publishes the data in the public domain, and describes it as follows: The National Hospital Discharge Survey (NHDS) is a continuing nationwide sample survey of short-stay hospitals in the United States. The scope of NHDS encompasses patients discharged from noninstitutional hospitals, exclusive of military and Department of Veterans Affairs hospitals, located in the 50 States and the District of Columbia. Only hospitals having six or more beds for in-patient use are included in the survey. See < <a href="https://www.cdc.gov/nchs/nhds">https://www.cdc.gov/nchs/nhds</a> > for more information. / GPL-3  | noarch              |
| <a href="#">r-nhldata</a>      | 1.0.0   | Each dataset contains scores for every game during a specific season of the NHL. / CC0   | noarch              |
| <a href="#">r-nhsrdatasets</a> | 0.1.1   | Free United Kingdom National Health Service (NHS) and other healthcare, or population health-related data for education and training purposes. This package currently contains a single simulated hospital dataset for teaching regression methods, with the addition of more datasets planned for future releases. This package exists to support skills development in the NHS-R community: < <a href="https://nhsrcommunity.com/">https://nhsrcommunity.com/</a> >. / CC0   | noarch              |
| <a href="#">r-nice</a>         | 0.4_1   | Get or set UNIX priority (niceness) of running R process. / MIT  | linux-64,<br>osx-64 |
| <a href="#">r-nicherover</a>   | 1.0     | This package uses a probabilistic method to calculate niche regions and pairwise niche overlap using multidimensional niche indicator data (e.g., stable isotopes, environmental variables, etc.). The niche region is defined as the joint probability density function of the multidimensional niche indicators at a user-defined probability alpha (e.g., 95%). Uncertainty is accounted for in a Bayesian framework, and the method can be extended to three or more indicator dimensions. It provides directional estimates of niche overlap, accounts for species-specific distributions in multivariate niche space, and produces unique and consistent bivariate projections of the multivariate niche region. A forthcoming article by Swanson et al. (Ecology, 2014) provides a detailed description of the methodology. See the package vignette for a worked example using fish stable isotope data. / GPL-2 | noarch              |
| <a href="#">r-nightday</a>     | 1.0.1   | Computes and plots the boundary between night and day. / GPL-3   | noarch              |
| <a href="#">r-nilde</a>        | 1.1_3   | Routines for enumerating all existing nonnegative integer solutions of a linear Diophantine equation. The package provides routines for solving 0-1, bounded and unbounded knapsack problems; 0-1, bounded and unbounded subset sum problems; additive partitioning of natural numbers; and one-dimensional bin-packing problem. / GPL-2   | noarch              |

|------------------------------|---------|--|--------------------------------|
| <a href="#">r-nimble</a>     | 0.8.0   | A system for writing hierarchical statistical models largely compatible with ‘BUGS’ and ‘JAGS’, writing nimbleFunctions to operate models and do basic R-style math, and compiling both models and nimbleFunctions via custom-generated C. ‘NIMBLE’ includes default methods for MCMC, particle filtering, Monte Carlo Expectation Maximization, and some other tools. The nimbleFunction system makes it easy to do things like implement new MCMC samplers from R, customize the assignment of samplers to different parts of a model from R, and compile the new samplers automatically via C alongside the samplers ‘NIMBLE’ provides. ‘NIMBLE’ extends the ‘BUGS’/‘JAGS’ language by making it extensible: New distributions and functions can be added, including as calls to external compiled code. Although most people think of MCMC as the main goal of the ‘BUGS’/‘JAGS’ language for writing models, one can use ‘NIMBLE’ for writing arbitrary other kinds of model-generic algorithms as well. A full User Manual is available at < <a href="https://r-nimble.org">https://r-nimble.org</a> >. / BSD_3_clause   GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-nipals</a>     | 0.5     | Principal Components Analysis of a matrix using Non-linear Iterative Partial Least Squares with Gram-Schmidt orthogonalization of the scores and loadings. Optimized for speed. See Andrecut (2009) <doi:10.1089/cmb.2008.0221>. / GPL-3   | noarch                         |
| <a href="#">r-nistnls</a>    | 0.9_1   | Datasets for testing nonlinear regression routines. / GPL-2  | noarch                         |
| <a href="#">r-nistunits</a>  | 1.0.1   | Fundamental physical constants (Quantity, Value, Uncertainty, Unit) for SI (International System of Units) and non-SI units, plus unit conversions Based on the data from NIST (National Institute of Standards and Technology, USA) / GPL-3   | noarch                         |
| <a href="#">r-nlar</a>       | 0.4.0   | Client for programmatic access to the 2007 and 2012 National Lakes Assessment database < <a href="https://www.epa.gov/national-aquatic-resource-surveys/nla">https://www.epa.gov/national-aquatic-resource-surveys/nla</a> > containing data for hundreds of lakes in the lower 48 states of the contiguous US. / GPL-3  | noarch                         |
| <a href="#">r-nlcoptim</a>   | 0.6     | Optimization for nonlinear objective and constraint functions. Linear or nonlinear equality and inequality constraints are allowed. It accepts the input parameters as a constrained matrix. / GPL-3   | noarch                         |
| <a href="#">r-nleqslv</a>    | 3.3.2   | Solve a system of nonlinear equations using a Broyden or a Newton method with a choice of global strategies such as line search and trust region. There are options for using a numerical or user supplied Jacobian, for specifying a banded numerical Jacobian and for allowing a singular or ill-conditioned Jacobian. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-nlgeocoder</a> | 0.1.3   | R interface to the open location server API of ‘Publieke Diensten Op de Kaart’ (< <a href="http://www.pdok.nl">http://www.pdok.nl</a> >). It offers geocoding, address suggestions and lookup of geographical objects. Included is an utility function for displaying leaflet tiles restricted to the Netherlands. / GPL-2   | noarch                         |
| <a href="#">r-nlirms</a>     | 3.4.4   | Design of non-life insurance rate-making system with a frequency and a severity component based on the a posteriori criteria. The rate-making system is a general form of bonus-malus system introduced by Lemaire (1995), <doi:10.1007/978-94-011-0631-3> and Frangos and Vrontos (2001), <doi:10.2143/AST.31.1.991>. / MIT   | noarch                         |

Table 51 – continued from previous page

| Name      | Version | Summary/License   | Platforms   |
|-----------|---------|---|---|
| r-nlme    | 3.1_1   | Fit and compare Gaussian linear and nonlinear mixed-effects models. / GPL (>= 2)   file LICENCE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| r-nlmeode | 1.1     | This package combines the odesolve and nlme packages for mixed-effects modelling using differential equations. / LGPL-2.1   | noarch  |
| r-nlmeu   | 0.70_3  | nlmeU: Datasets and utility functions enhancing functionality of nlme package. Datasets, functions and scripts are described in book titled 'Linear Mixed-Effects Models: A Step-by-Step Approach' by Galecki and Burzykowski (2013). Package is under development. / GPL-2   | noarch  |
| r-nlmrt   | 2016.32 | Replacement for nls() tools for working with nonlinear least squares problems. The calling structure is similar to, but much simpler than, that of the nls() function. Moreover, where nls() specifically does NOT deal with small or zero residual problems, nlmrt is quite happy to solve them. It also attempts to be more robust in finding solutions, thereby avoiding 'singular gradient' messages that arise in the Gauss-Newton method within nls(). The Marquardt-Nash approach in nlmrt generally works more reliably to get a solution, though this may be one of a set of possibilities, and may also be statistically unsatisfactory. Added print and summary as of August 28, 2012. / GPL-2 | noarch  |
| r-nlms    | 1.1     | Package to select best model among several linear and nonlinear models. The main function uses the gnls() function from the 'nlme' package to fit the data to nine regression models, named: linear, quadratic, cubic, logistic, exponential, power, monod, haldane, logit. / GPL-3   | noarch  |
| r-nloptr  | 1.2.1   | nloptr is an R interface to NLOpt. NLOpt is a free/open-source library for nonlinear optimization, providing a common interface for a number of different free optimization routines available online as well as original implementations of various other algorithms. See <a href="http://ab-initio.mit.edu/wiki/index.php/NLOpt_Introduction">http://ab-initio.mit.edu/wiki/index.php/NLOpt_Introduction</a> for more information on the available algorithms. During installation on Unix the NLOpt code is downloaded and compiled from the NLOpt website. / LGPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| r-nlp     | 0.2_0   | Basic classes and methods for Natural Language Processing. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-nlroot  | 1.0     | This is a package which can help you search for the root of a equation. / GPL-2   | noarch  |

Table 51 – continued from previous page

| Name                         | Version | Summary/License   | Platforms  |
|------------------------------|---------|---|--|
| <a href="#">r-nls2</a>       | 0.2     | Adds brute force and multiple starting values to nls. / GPL-2   | noarch   |
| <a href="#">r-nlshrink</a>   | 1.0.1   | Non-linear shrinkage estimation of population eigenvalues and covariance matrices, based on publications by Ledoit and Wolf (2004, 2015, 2016). / GPL-3   | noarch   |
| <a href="#">r-nlsmns</a>     | 0.0_4   | Fit univariate non-linear scale mixture of skew-normal(NL-SMSN) regression. / GPL (>= 3.0)  | noarch   |
| <a href="#">r-nlsr</a>       | 2019.9  | Provides tools for working with nonlinear least squares problems. It is intended to eventually supersede the 'nls()' function in the R distribution. For example, 'nls()' specifically does NOT deal with small or zero residual problems as its Gauss-Newton method frequently stops with 'singular gradient' messages. 'nlsr' is based on the now-deprecated package 'nlmrt', and has refactored functions and R-language symbolic derivative features. / GPL-2 | noarch   |
| <a href="#">r-nlsrk</a>      | 1.1     | Performs univariate or multivariate computation of a single ODE or of a set of ODE (ordinary differential equations). / GPL-2   | noarch   |
| <a href="#">r-nlstools</a>   | 1.0_2   | Several tools for assessing the quality of fit of a gaussian nonlinear model are provided. / GPL-2  | noarch   |
| <a href="#">r-nlsylinks</a>  | 2.0.6   | Utilities and kinship information for behavior genetics and developmental research using the National Longitudinal Survey of Youth (NLSY; < <a href="http://www.bls.gov/nls/">http://www.bls.gov/nls/</a> >). / GPL-3   | noarch   |
| <a href="#">r-nltm</a>       | 1.4.2   | Fits a non-linear transformation model ('nltm') for analyzing survival data, see Tsodikov (2003) <doi:10.1111/1467-9868.00414>. The class of 'nltm' includes the following currently supported models: Cox proportional hazard, proportional hazard cure, proportional odds, proportional hazard - proportional hazard cure, proportional hazard - proportional odds cure, Gamma frailty, and proportional hazard - proportional odds. / GPL-2                    | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-nlitt</a>      | 1.4.1   | Provides functions to calculate the normalised Lineage-Through- Time (nLTT) statistic, given two phylogenetic trees. The nLTT statistic measures the difference between two Lineage-Through-Time curves, where each curve is normalised both in time and in number of lineages. / GPL-2   | noarch   |
| <a href="#">r-nlwaldtest</a> | 1.1.3   | Wald Test for nonlinear restrictions on model parameters and confidence intervals for nonlinear functions of parameters using delta-method. Applicable after ANY model, provided parameters estimates and their covariance matrix are available. / GPL-2  | noarch   |
| <a href="#">r-nmainla</a>    | 0.1.2   | Performs network meta-analysis using integrated nested Laplace approximations ('INLA'). Includes methods to assess the heterogeneity and inconsistency in the network. Contains more than ten different network meta-analysis data. 'INLA' package can be obtained from < <a href="http://www.r-inla.org">http://www.r-inla.org</a> >. We recommend the testing version. / GPL-2  | noarch   |
| <a href="#">r-nmf</a>        | 0.21.0  | Provides a framework to perform Non-negative Matrix Factorization (NMF). The package implements a set of already published algorithms and seeding methods, and provides a framework to test, develop and plug new/custom algorithms. Most of the built-in algorithms have been optimized in C, and the main interface function provides an easy way of performing parallel computations on multicore machines. / GPL (>= 2)                                       | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                    | Version | Summary/License  | Platforms  |
|-------------------------|---------|--|--|
| <code>r-nmfgpu4r</code> | 0.2.5.2 | Wrapper package for the nmfgpu library, which implements several Non-negative Matrix Factorization (NMF) algorithms for CUDA platforms. By using the acceleration of GPGPU computing, the NMF can be used for real-world problems inside the R environment. All CUDA devices starting with Kepler architecture are supported by the library. / GPL-3   | linux-64,<br>osx-64,<br>win-64                         |
| <code>r-nmfn</code>     | 2.0     | Non-negative Matrix Factorization / GPL-3  | noarch   |
| <code>r-nmi</code>      | 2.0     | Calculates the normalized mutual information (NMI) of two community structures in network analysis. / GNU General Public License version 2   | noarch   |
| <code>r-nmof</code>     | 1.6_0   | Functions, examples and data from the book Numerical Methods and Optimization in Finance by M. Gilli, D. Maringer and E. Schumann (2011), ISBN 978-0123756626. The package provides implementations of several optimisation heuristics, such as Differential Evolution, Genetic Algorithms and Threshold Accepting. There are also functions for the valuation of financial instruments, such as bonds and options, and functions that help with stochastic simulations. / GPL-3                           | noarch   |
| <code>r-nmw</code>      | 0.1.4   | This shows how NONMEM(R) < <a href="http://www.iconplc.com/innovation/nonmem/">http://www.iconplc.com/innovation/nonmem/</a> > software works. NONMEM's classical estimation methods like 'First Order(FO) approximation', 'First Order Conditional Estimation(FOCE)', and 'Laplacian approximation' are explained. / GPL-3  | noarch   |
| <code>r-nna</code>      | 0.0.2   | Calculates spatial pattern analysis using a T-square sample procedure. This method is based on two measures x and y. x - Distance from the random point to the nearest individual. y - Distance from individual to its nearest neighbor. This is a methodology commonly used in phytosociology or marine benthos ecology to analyze the species' distribution (random, uniform or clumped patterns). Ludwig & Reynolds (1988, ISBN:0471832359). / GPL-2  | noarch   |
| <code>r-nnet</code>     | 7.3_1   | Software for feed-forward neural networks with a single hidden layer, and for multinomial log-linear models. / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-nnlasso</code>  | 0.3     | Estimates of coefficients of lasso penalized linear regression and generalized linear models subject to non-negativity constraints on the parameters using multiplicative iterative algorithm. Entire regularization path for a sequence of lambda values can be obtained. Functions are available for creating plots of regularization path, cross validation and estimating coefficients at a given lambda value. There is also provision for obtaining standard error of coefficient estimates. / GPL-2 | noarch   |
| <code>r-nnlm</code>     | 0.4.3   | This is a package for Non-Negative Linear Models (NNLM). It implements fast sequential coordinate descent algorithms for non-negative linear regression and non-negative matrix factorization (NMF). It supports mean square error and Kullback-Leibler divergence loss. Many other features are also implemented, including missing value imputation, domain knowledge integration, designable W and H matrices and multiple forms of regularizations. / BSD_2_clause                                     | linux-64,<br>osx-64,<br>win-64                         |

Table 51 – continued from previous page

| Name                              | Version | Summary/License   | Platforms                      |
|-----------------------------------|---------|---|--------------------------------|
| <code>r-nnls</code>               | 1.4     | An R interface to the Lawson-Hanson implementation of an algorithm for non-negative least squares (NNLS). Also allows the combination of non-negative and non-positive constraints. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-nnmmis</code>             | 1.0.1   | Imputation for both missing covariates and censored observations (optional) for survival data with missing covariates by the nearest neighbor based multiple imputation algorithm as described in Hsu et al. (2006) <doi:10.1002/sim.2452>, and Hsu and Yu (2018) <doi:10.1177/0962280218772592>. Note that the current version can only impute for a situation with one missing covariate. / LGPL-2  | noarch                         |
| <code>r-noaa oceans</code>        | 0.1.0   | Provides a small set of tools for collecting data from National Oceanic and Atmospheric Administration (NOAA) data sources. The functions provided in the package are wrappers around NOAA's existing APIs which is found at < <a href="https://tidesandcurrents.noaa.gov/api/">https://tidesandcurrents.noaa.gov/api/</a> >. / MIT   | noarch                         |
| <code>r-nodbi</code>              | 0.2.0   | Simplified document database manipulation and analysis, including support for many 'NoSQL' databases, including document databases ('Elasticsearch', 'CouchDB', 'MongoDB'), 'key-value' databases ('Redis'), and other 'NoSQL' types ('etcd'). / MIT  | noarch                         |
| <code>r-nodeharvest</code>        | 0.7_3   | Node harvest is a simple interpretable tree-like estimator for high-dimensional regression and classification. A few nodes are selected from an initially large ensemble of nodes, each associated with a positive weight. New observations can fall into one or several nodes and predictions are the weighted average response across all these groups. The package offers visualization of the estimator. Predictions can return the nodes a new observation fell into, along with the mean response of training observations in each node, offering a simple explanation of the prediction. / GPL-3 | noarch                         |
| <code>r-nofrills</code>           | 0.3.0   | Provides a compact variation of the usual syntax of function declaration, in order to support tidyverse-style quasiquotation of a function's arguments and body. / MIT  | noarch                         |
| <code>r-noncompliance</code>      | 0.2.2   | A finite-population significance test of the 'sharp' causal null hypothesis that treatment exposure X has no effect on final outcome Y, within the principal stratum of Compliers. A generalized likelihood ratio test statistic is used, and the resulting p-value is exact. Currently, it is assumed that there are only Compliers and Never Takers in the population. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-nonneg.cg</code>          | 0.1.6   | Minimize a differentiable function subject to all the variables being non-negative (i.e. $\geq 0$ ), using a Conjugate-Gradient algorithm based on a modified Polak-Ribiere-Polyak formula as described in (Li, Can, 2013, < <a href="https://www.hindawi.com/journals/jam/2013/986317/abs/">https://www.hindawi.com/journals/jam/2013/986317/abs/</a> >). / BSD_2_clause   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-nonparammodelcheck</code> | 3.0     | Provides tests of significance for covariates (or groups of covariates) in a fully nonparametric regression model and a variable (or group) selection procedure based on False Discovery Rate. In addition, it provides a function for local polynomial regression for any number of dimensions, using a bandwidth specified by the user or automatically chosen by cross validation or an adaptive procedure. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

| Name                          | Version | Summary/License   | Platforms                      |
|-------------------------------|---------|---|--------------------------------|
| <a href="#">r-nopaco</a>      | 1.0.6   | A non-parametric test for multi-observer concordance and differences between concordances in (un)balanced data. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-norm</a>        | 1.0_9   | Analysis of multivariate normal datasets with missing values / file LICENSE   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-norm2</a>       | 2.0.2   | Functions for parameter estimation, Bayesian posterior simulation and multiple imputation from incomplete multivariate data under a normal model. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-normt3</a>      | 1.0_3   | Evaluates the probability density function of the sum of the Gaussian and Student's t density on 3 degrees of freedom. Evaluates the p.d.f. of the sphered Student's t density function. Also evaluates the erf, and erfc functions on complex-valued arguments. Thanks to Krishna Myneni the function is calculates the Faddeeva function also! / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-nortestarma</a> | 1.0.2   | Tests the goodness-of-fit to the Normal distribution for the errors of an ARMA model. / GPL (> 2)   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-not</a>         | 1.2     | Provides efficient implementation of the Narrowest-Over-Threshold methodology for detecting an unknown number of change-points occurring at unknown locations in one-dimensional data following deterministic signal noise model, see R. Baranowski, Y. Chen and P. Fryzlewicz (2019) <doi:10.1111/rssb.12322>. Currently implemented scenarios are: piecewise-constant signal, piecewise-constant signal with a heavy-tailed noise, piecewise-linear signal, piecewise-quadratic signal, piecewise-constant signal and with piecewise-constant variance of the noise. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-np</a>          | 0.60_9  | Nonparametric (and semiparametric) kernel methods that seamlessly handle a mix of continuous, unordered, and ordered factor data types. We would like to gratefully acknowledge support from the Natural Sciences and Engineering Research Council of Canada (NSERC, < <a href="http://www.nserc-crsng.gc.ca">http://www.nserc-crsng.gc.ca</a> >), the Social Sciences and Humanities Research Council of Canada (SSHRC, < <a href="http://www.sshrc-crsh.gc.ca">http://www.sshrc-crsh.gc.ca</a> >), and the Shared Hierarchical Academic Research Computing Network (SHARCNET, < <a href="http://www.sharcnet.ca">http://www.sharcnet.ca</a> >). / GPL-3 | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                            | Version | Summary/License   | Platforms                      |
|---------------------------------|---------|---|--------------------------------|
| <code>r-npbayesimputecat</code> | 0.1     | These routines create multiple imputations of missing at random categorical data, and create multiply imputed synthesis of categorical data, with or without structural zeros. Imputations and syntheses are based on Dirichlet process mixtures of multinomial distributions, which is a non-parametric Bayesian modeling approach that allows for flexible joint modeling. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-npcoptest</code>        | 1.03    | A non parametric test for change points detection in the dependence between the components of multivariate data, with or without (multiple) changes in the marginal distributions. The full details, justification and examples are published in Rohmer (2016) <doi:10.1016/j.spl.2016.06.026>. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-npcp</code>             | 0.1_1   | Provides nonparametric CUSUM tests for detecting changes in possibly serially dependent univariate or multivariate observations. Tests sensitive to changes in the expectation, the variance, the covariance, the autocovariance, the distribution function, Spearman's rho, Kendall's tau, Gini's mean difference, and the copula are provided, as well as a test for detecting changes in the distribution of independent block maxima (with environmental studies in mind). The latest additions are a test sensitive to changes in the autocopula and a combined test of stationarity sensitive to changes in the distribution function and the autocopula. / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| <code>r-nprocregression</code>  | 1.0_5   | Implements several nonparametric regression approaches for the inclusion of covariate information on the receiver operating characteristic (ROC) framework. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-npsimex</code>          | 0.2_1   | This package contains a collection of functions to to perform nonparametric deconvolution using simulation extrapolation (SIMEX). We propose an estimator that adopts the SIMEX idea but bypasses the simulation step in the original SIMEX algorithm. There is no bandwidth parameter and the estimate is determined by appropriately selecting design points. See details in: Wang, X.F., Sun, J. and Fan, Z. (2011). Deconvolution density estimation with heteroscedastic errors using SIMEX. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <code>r-npst</code>             | 2.0     | Package 'npst' generalizes Hewitt's (1971) test for seasonality and Rogerson's (1996) extension based on Monte-Carlo simulation. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-nscluster</code>        | 1.3.1   | Simulation and estimation for Neyman-Scott spatial cluster point process models and their extensions, based on the methodology in Tanaka, Ogata, and Stoyan (2008) <doi:10.1002/bimj.200610339>. To estimate parameters by the simplex method, parallel computation using 'OpenMP' application programming interface is available. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                       | Version | Summary/License  | Platforms   |
|----------------------------|---------|--|---|
| <a href="#">r-nseval</a>   | 0.4     | Facilities to capture, inspect, manipulate, and create lazy values (promises), ... lists, and active calls. / GPL (>= 2.0)   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-nsrfa</a>    | 0.7_1   | A collection of statistical tools for objective (non-supervised) applications of the Regional Frequency Analysis methods in hydrology. The package refers to the index-value method and, more precisely, helps the hydrologist to: (1) regionalize the index-value; (2) form homogeneous regions with similar growth curves; (3) fit distribution functions to the empirical regional growth curves. Most of the methods are those described in the Flood Estimation Handbook (Centre for Ecology & Hydrology, 1999, ISBN:9781906698003). Homogeneity tests from Hosking and Wallis (1993) <doi:10.1029/92WR01980> and Viglione et al. (2007) <doi:10.1029/2006WR005095> are available. / GPL-2                      | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-numderiv</a> | 2016.8  | Methods for calculating (usually) accurate numerical first and second order derivatives. Accurate calculations are done using ‘Richardson’s’ extrapolation or, when applicable, a complex step derivative is available. A simple difference method is also provided. Simple difference is (usually) less accurate but is much quicker than ‘Richardson’s’ extrapolation and provides a useful cross-check. Methods are provided for real scalar and vector valued functions. / GPL-2   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-numero</a>   | 1.2.0   | High-dimensional datasets that do not exhibit a clear intrinsic clustered structure pose a challenge to conventional clustering algorithms. For this reason, we developed an unsupervised framework that helps scientists to better subgroup their datasets based on visual cues, please see Gao S, Mutter S, Casey A, Makinen V-P (2018) Numero: a statistical framework to define multivariable subgroups in complex population-based datasets, Int J Epidemiology, dyy113, <doi:10.1093/ije/dyy113>. The framework includes the necessary functions to construct a self-organizing map of the data, to evaluate the statistical significance of the observed data patterns, and to visualize the results. / GPL-2 | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-numosl</a>   | 2.6     | Package for optimizing regular numeric problems in optically stimulated luminescence dating, such as: equivalent dose calculation, dose rate determination, growth curve fitting, decay curve decomposition, statistical age model optimization, and statistical plot visualization. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-nvennr</a>   | 0.2.1   | Provides an interface for the nVenn algorithm (Perez-Silva et al. 2018) <DOI:10.1093/bioinformatics/bty109>. This algorithm works for any number of sets, and usually yields pleasing and informative Venn diagrams with proportionality information. However, representing more than six sets takes a long time and is hard to interpret, unless many of the regions are empty. If you cannot make sense of the result, you may want to consider ‘UpSetR’ <https://cran.r-project.org/package=UpSetR/README.html>. / MIT  | linux-64,<br>osx-64,<br>win-64                                    |

Table 51 – continued from previous page

| Name                           | Version | Summary/License   | Platforms   |
|--------------------------------|---------|---|---|
| <a href="#">r-nycflights13</a> | 1.0.0   | Airline on-time data for all flights departing NYC in 2013. Also includes useful ‘metadata’ on airlines, airports, weather, and planes. / CC0   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-oaqc</a>         | 1.0     | Implements the efficient algorithm by Ortmann and Brandes (2017) <doi:10.1007/s41109-017-0027-2> to compute the orbit-aware frequency distribution of induced and non-induced quads, i.e. subgraphs of size four. Given an edge matrix, data frame, or a graph object (e.g., ‘igraph’), the orbit-aware counts are computed respective each of the edges and nodes. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-obliclus</a>     | 0.9     | This package conducts factor rotation techniques which intend to identify a simple and well-clustered structure in a factor loading matrix. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-obsmd</a>        | 5.0     | Implements the objective Bayesian methodology proposed in Consonni and Deldossi in order to choose the optimal experiment that better discriminate between competing models. G.Consonni, L. Deldossi (2014) Objective Bayesian Model Discrimination in Follow-up Experimental Designs, Test. <DOI:10.1007/s11749-015-0461-3>. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-oce</a>          | 1.0_1   | Supports the analysis of Oceanographic data, including ‘ADCP’ measurements, measurements made with ‘argo’ floats, ‘CTD’ measurements, sectional data, sea-level time series, coastline and topographic data, etc. Provides specialized functions for calculating seawater properties such as potential temperature in either the ‘UNESCO’ or ‘TEOS-10’ equation of state. Produces graphical displays that conform to the conventions of the Oceanographic literature. / GPL (>= 2) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-odbc</a>         | 1.1.5   | A DBI-compatible interface to ODBC databases. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                                  | Version | Summary/License   | Platforms                      |
|---------------------------------------|---------|---|--------------------------------|
| <a href="#">r-odeintr</a>             | 1.7.1   | Wraps the Boost odeint library for integration of differential equations. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-oem</a>                 | 2.0.9   | Solves penalized least squares problems for big tall data using the orthogonalizing EM algorithm of Xiong et al. (2016) <doi:10.1080/00401706.2015.1054436>. The main fitting function is oem() and the functions cv.oem() and xval.oem() are for cross validation, the latter being an accelerated cross validation function for linear models. The big.oem() function allows for out of memory fitting. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-officer</a>             | 0.3.5   | Access and manipulate ‘Microsoft Word’ and ‘Microsoft PowerPoint’ documents from R. The package focuses on tabular and graphical reporting from R; it also provides two functions that let users get document content into data objects. A set of functions lets add and remove images, tables and paragraphs of text in new or existing documents. When working with ‘PowerPoint’ presentations, slides can be added or removed; shapes inside slides can also be added or removed. When working with ‘Word’ documents, a cursor can be used to help insert or delete content at a specific location in the document. The package does not require any installation of Microsoft products to be able to write Microsoft files. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-offlinechange</a>       | 0.0.2   | Detect the number and locations of change points. The locations can be either exact or in terms of ranges, depending on the available computational resource. The method is based on Jie Ding, Yu Xiang, Lu Shen, Vahid Tarokh (2016) <arXiv:1605.00346v2>. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-olctools</a>            | 0.3.0   | ‘Open Location Codes’ < <a href="http://openlocationcode.com/">http://openlocationcode.com/</a> > are a Google-created standard for identifying geographic locations. ‘olctools’ provides utilities for validating, encoding and decoding entries that follow this standard. / MIT  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-onearmphasetwostudy</a> | 1.0.3   | Purpose of this package is it to plan, monitor and evaluate oncological phase II studies. In general this kind of studies are single-arm trials with planned interim analysis and binary endpoint. To meet the resulting requirements, the package provides functions to calculate and evaluate ‘Simon’s two-stage designs’ and ‘so-called’ ‘subset designs’. If you are unfamiliar with this package a good starting point is to take a closer look at the functions getSolutions() and getSolutionsSub1().The web-based tool (< <a href="https://imbi.shinyapps.io/phaseII-app/">https://imbi.shinyapps.io/phaseII-app/</a> >) extends the functionality of our R package by means of a proper dealing with over- and underrunning. The R function binom.test of the ‘stats’ R package and the package ‘binom’ might be helpful to assess the performance of the corresponding one-stage design as a reference. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-onehot</a>              | 0.1.1   | Quickly create numeric matrices for machine learning algorithms that require them. It converts factor columns into onehot vectors. / MIT  | linux-64,<br>osx-64,<br>win-64 |

| Name                               | Version | Summary/License   | Platforms  |
|------------------------------------|---------|---|--|
| <a href="#">r-onion</a>            | 1.2.7   | Quaternions and Octonions are four- and eight- dimensional extensions of the complex numbers. They are normed division algebras over the real numbers and find applications in spatial rotations (quaternions) and string theory and relativity (octonions). The quaternions are noncommutative and the octonions nonassociative. See RKS Hankin 2006, Rnews Volume 6/2: 49-51, and the package vignette, for more details. / GPL-3   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-onlinevar</a>        | 0.1.1   | Functions for recursive online fitting of time-adaptive lasso vector auto regression. A recursive coordinate descent algorithm is used to estimate sparse vector auto regressive models and exponential forgetting is applied to allow model changes. Details can be found in Jakob W. Messner and Pierre Pinson (2018). Online adaptive LASSO estimation in Vector Auto Regressive models for wind power forecasting in high dimension. International Journal of Forecasting, in press. <doi:10.1016/j.ijforecast.2018.02.001>. / GPL-2   GPL-3  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-opart</a>            | 2019.10 | AO reference implementation of standard optimal partitioning algorithm in C using square-error loss and Poisson loss functions as described by Robert Maidstone (2016) <doi:10.1007/s11222-016-9636-3>, Toby Hocking (2016) <doi:10.1007/s11222-016-9636-3>, Guillem Rigaill (2016) <doi:10.1007/s11222-016-9636-3>, Paul Fearnhead (2016) <doi:10.1007/s11222-016-9636-3>. It scales quadratically with number of data points in terms of time-complexity. / GPL-3   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-opencv</a>           | 0.1     | Experimenting with computer vision and machine learning in R. This package exposes some of the available ‘OpenCV’ vision algorithms, such as edge, body or face detection. These can either be applied to analyze static images, or to filter live video footage from a camera device. / MIT  | linux-64,<br>osx-64                                    |
| <a href="#">r-openmpcontroller</a> | 0.2.5   | The OpenMPController package provides a function <code>omp_set_num_threads()</code> to set the number of OpenMP threads to be used. This may be useful, for example, when linking against a vendor optimised BLAS/LAPACK library (e.g. the AMD Core Math Library), since the defaults used by those libraries may not be highly performant. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-openssl</a>          | 1.3     | Bindings to OpenSSL libssl and libcrypto, plus custom SSH pubkey parsers. Supports RSA, DSA and EC curves P-256, P-384 and P-521. Cryptographic signatures can either be created and verified manually or via x509 certificates. AES can be used in cbc, ctr or gcm mode for symmetric encryption; RSA for asymmetric (public key) encryption or EC for Diffie Hellman. High-level envelope functions combine RSA and AES for encrypting arbitrary sized data. Other utilities include key generators, hash functions (md5, sha1, sha256, etc), base64 encoder, a secure random number generator, and ‘bignum’ math methods for manually performing crypto calculations on large multibyte integers. / MIT file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-openxlsx</a>         | 4.1.0   | Simplifies the creation of Excel .xlsx files by providing a high level interface to writing, styling and editing worksheets. Through the use of ‘Rcpp’, read/write times are comparable to the ‘xlsx’ and ‘XLConnect’ packages with the added benefit of removing the dependency on Java. / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                           | Version | Summary/License  | Platforms                      |
|--------------------------------|---------|--|--------------------------------|
| <a href="#">r-optgs</a>        | 1.1.1   | Functions to find near-optimal multi-stage designs for continuous outcomes. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-opthedging</a>   | 1.0     | Estimation of value and hedging strategy of call and put options, based on optimal hedging and Monte Carlo method, from Chapter 3 of ‘Statistical Methods for Financial Engineering’, by Bruno Remillard, CRC Press, (2013). / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-optimization</a> | 1.0.7   | Flexible optimizer with numerous input specifications for detailed parameterisation. Designed for complex loss functions with state and parameter space constraints. Visualization tools for validation and analysis of the convergence are included. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-opusminer</a>    | 0.1.0   | Provides a simple R interface to the OPUS Miner algorithm (implemented in C) for finding the top-k productive, non-redundant itemsets from transaction data. The OPUS Miner algorithm uses the OPUS search algorithm to efficiently discover the key associations in transaction data, in the form of self-sufficient itemsets, using either leverage or lift. See < <a href="http://i.giwebb.com/index.php/research/association-discovery/">http://i.giwebb.com/index.php/research/association-discovery/</a> > for more information in relation to the OPUS Miner algorithm. / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-orca</a>         | 1.1.1   | Implements orbit counting using a fast combinatorial approach. Counts orbits of nodes and edges from edge matrix or data frame, or a graph object from the graph package. / LGPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ordinalclust</a> | 1.3.4   | Ordinal data classification, clustering and co-clustering using model-based approach with the Bos distribution for ordinal data (Christophe Biernacki and Julien Jacques (2016) <doi:10.1007/s11222-015-9585-2>). / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ordinalgmifs</a> | 1.0.6   | Provides a function for fitting cumulative link, adjacent category, forward and backward continuation ratio, and stereotype ordinal response models when the number of parameters exceeds the sample size, using the the generalized monotone incremental forward stagewise method. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-ore</a>          | 1.6.2   | Provides an alternative to R’s built-in functionality for handling regular expressions, based on the Onigmo library. Offers first-class compiled regex objects, partial matching and function-based substitutions, amongst other features. / BSD_3_clause  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name          | Version | Summary/License   | Platforms                      |
|---------------|---------|---|--------------------------------|
| r-orndr       | 1.3.2   | Odds ratio based multifactor-dimensionality reduction method for detecting gene-gene interactions / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-orisk       | 1.0.5   | Convert odds ratio to relative risk in cohort studies with partial data information (Wang (2013) <doi:10.18637/jss.v055.i05>). / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-osc         | 1.0.4   | Allows distance based spatial clustering of georeferenced data by implementing the City Clustering Algorithm - CCA. Multiple versions allow clustering for matrix, raster and single coordinates on a plain (euclidean distance) or on a sphere (great-circle or orthodromic distance). / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-osdesign    | 1.7     | The osDesign serves for planning an observational study. Currently, functionality is focused on the two-phase and case-control designs. Functions in this packages provides Monte Carlo based evaluation of operating characteristics such as powers for estimators of the components of a logistic regression model. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-osqp        | 0.6.0   | Provides bindings to the ‘OSQP’ solver. The ‘OSQP’ solver is a numerical optimization package or solving convex quadratic programs written in ‘C’ and based on the alternating direction method of multipliers. See <arXiv:1711.08013> for details. / Apache License 2.0   file LICENSE   | linux-64,<br>osx-64,<br>win-64 |
| r-overlap     | 0.3.2   | Provides functions to fit kernel density functions to data on temporal activity patterns of animals; estimate coefficients of overlapping of densities for two species; and calculate bootstrap estimates of confidence intervals. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-pacbo       | 0.1.0   | A function for clustering online datasets. The number of cells is data-driven which need not to be chosen in advance by the user. The method is introduced and fully described in Le Li, Benjamin Guedj and Sebastien Loustau (2016), PAC-Bayesian Online Clustering (arXiv preprint: < <a href="https://arxiv.org/abs/1602.00522">https://arxiv.org/abs/1602.00522</a> >). / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-packcircles | 0.3.3   | Simple algorithms for circle packing. / MIT   | linux-64,<br>osx-64,<br>win-64 |

| Name                        | Version | Summary/License  | Platforms   |
|-----------------------------|---------|--|---|
| <a href="#">r-packrat</a>   | 0.5.0   | Manage the R packages your project depends on in an isolated, portable, and reproducible way. / GPL-2  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-pamr</a>      | 1.56.1  | Some functions for sample classification in microarrays. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-pan</a>       | 1.6     | It provides functions and examples for maximum likelihood estimation for generalized linear mixed models and Gibbs sampler for multivariate linear mixed models with incomplete data, as described in Schafer JL (1997) Imputation of missing covariates under a multivariate linear mixed model. Technical report 97-04, Dept. of Statistics, The Pennsylvania State University. / GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-pander</a>    | 0.6.3   | Contains some functions catching all messages, 'stdout' and other useful information while evaluating R code and other helpers to return user specified text elements (like: header, paragraph, table, image, lists etc.) in 'pandoc' markdown or several type of R objects similarly automatically transformed to markdown format. Also capable of exporting/converting (the resulting) complex 'pandoc' documents to e.g. HTML, 'PDF', 'docx' or 'odt'. This latter reporting feature is supported in brew syntax or with a custom reference class with a smarty caching 'backend'. / AGPL-3 | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-parglm</a>    | 0.1.3   | Provides a parallel estimation method for generalized linear models without compiling with a multithreaded LAPACK or BLAS. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-parmigene</a> | 1.0.2   | The package provides a parallel estimation of the mutual information based on entropy estimates from k-nearest neighbors distances and algorithms for the reconstruction of gene regulatory networks. / AGPL-3   | linux-64,<br>osx-64,<br>win-64                                    |

|---------------|---------|--|--------------------------------|
| r-party       | 1.3_3   | A computational toolbox for recursive partitioning. The core of the package is <code>ctree()</code> , an implementation of conditional inference trees which embed tree-structured regression models into a well defined theory of conditional inference procedures. This non-parametric class of regression trees is applicable to all kinds of regression problems, including nominal, ordinal, numeric, censored as well as multivariate response variables and arbitrary measurement scales of the covariates. Based on conditional inference trees, <code>cforest()</code> provides an implementation of Breiman's random forests. The function <code>mob()</code> implements an algorithm for recursive partitioning based on parametric models (e.g. linear models, GLMs or survival regression) employing parameter instability tests for split selection. Extensible functionality for visualizing tree-structured regression models is available. The methods are described in Hothorn et al. (2006) <doi:10.1198/106186006X133933>, Zeileis et al. (2008) <doi:10.1198/106186008X319331> and Strobl et al. (2007) <doi:10.1186/1471-2105-8-25>. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-patchdvi    | 1.9.16  | Functions to patch specials in .dvi files, or entries in .synctex files. Works with concordance=TRUE in Sweave or knitr to link sources to previews. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-pathmapping | 1.0.2   | Functions to compute and display the area-based deviation between spatial paths and to compute a mapping based on minimizing area and distance-based cost. For details, see: Mueller, S. T., Perelman, B. S., & Veinott, E. S. (2016) <DOI:10.3758/s13428-015-0562-7>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-pawls       | 1.0.0   | Efficient algorithms for fitting weighted least squares regression with $\text{eqn}\{L_{\{1\}}\{L1\}$ regularization on both the coefficients and weight vectors, which is able to perform simultaneous variable selection and outliers detection efficiently. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-pbdncdf4    | 0.1_4   | This package adds collective parallel read and write capability to the R package ncdf4 version 1.8. Typical use is as a parallel NetCDF4 file reader in SPMD style programming. Each R process reads and writes its own data in a synchronized collective mode, resulting in faster parallel performance. Performance improvement is conditional on a parallel file system. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-pbdprof     | 0.3_1   | MPI profiling tools. / Mozilla Public License 2.0  | osx-64,<br>win-64              |
| r-pbdrpc      | 0.2_1   | A very light implementation yet secure for remote procedure calls with unified interface via ssh (OpenSSH) or plink/plink.exe (PuTTY). / Mozilla Public License 2.0  | linux-64,<br>osx-64,<br>win-64 |

|-------------------------------|---------|--|---|
| <a href="#">r-pbdzmq</a>      | 0.3.3   | 'ZeroMQ' is a well-known library for high-performance asynchronous messaging in scalable, distributed applications. This package provides high level R wrapper functions to easily utilize 'ZeroMQ'. We mainly focus on interactive client/server programming frameworks. For convenience, a minimal 'ZeroMQ' library (4.2.2) is shipped with 'pbdZMQ', which can be used if no system installation of 'ZeroMQ' is available. A few wrapper functions compatible with 'rzmq' are also provided. / GPL-3                              | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-pbivnorm</a>    | 0.6.0   | Provides a vectorized R function for calculating probabilities from a standard bivariate normal CDF. / GPL (>= 2)  | linux-64,<br>osx-64,<br>win-32,<br>win-64                         |
| <a href="#">r-pbkrtest</a>    | 0.4.7   | Test in mixed effects models. Attention is on mixed effects models as implemented in the 'lme4' package. This package implements a parametric bootstrap test and a Kenward Roger modification of F-tests for linear mixed effects models and a parametric bootstrap test for generalized linear mixed models. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-pbmcapply</a>   | 1.5.0   | A light-weight package helps you track and visualize the progress of parallel version of vectorized R functions (mc*apply). Parallelization (mc.core > 1) works only on *nix (Linux, Unix such as macOS) system due to the lack of fork() functionality, which is essential for mc*apply, on Windows. / MIT  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-pbrf</a>        | 1.0.0   | Provides three ways to estimate the probability of being in response function (PBRF) The estimates are presented in Tsai, Luo and Crowley (2017) <doi: 10.1007/978-981-10-0126-0_10>. / GPL-2  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-pbsddesolve</a> | 1.12.4  | Routines for solving systems of delay differential equations by interfacing numerical routines written by Simon N. Wood , with contributions by Benjamin J. Cairns. These numerical routines first appeared in Simon Wood's 'solv95' program. This package includes a vignette and a complete user's guide. 'PB-Sddesolve' originally appeared on CRAN under the name 'ddesolve'. That version is no longer supported. The current name emphasizes a close association with other PBS packages, particularly 'PBSmodelling'. / GPL-2 | linux-64,<br>osx-64,<br>win-64                                    |

|--------------------------------|---------|--|--|
| <a href="#">r-pbsmapping</a>   | 2.72.1  | This software has evolved from fisheries research conducted at the Pacific Biological Station (PBS) in ‘Nanaimo’, British Columbia, Canada. It extends the R language to include two-dimensional plotting features similar to those commonly available in a Geographic Information System (GIS). Embedded C code speeds algorithms from computational geometry, such as finding polygons that contain specified point events or converting between longitude-latitude and Universal Transverse Mercator (UTM) coordinates. Additionally, we include ‘C’ code developed by Angus Johnson for the ‘Clipper’ library, data for a global shoreline, and other data sets in the public domain. Under the user’s R library directory ‘.libPaths()’, specifically in ‘./PBSmapping/doc’, a complete user’s guide is offered and should be consulted to use package functions effectively. / GPL-2 | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-pbsmodelling</a> | 2.68.8  | Provides software to facilitate the design, testing, and operation of computer models. It focuses particularly on tools that make it easy to construct and edit a customized graphical user interface (‘GUI’). Although our simplified ‘GUI’ language depends heavily on the R interface to the ‘Tcl/Tk’ package, a user does not need to know ‘Tcl/Tk’. Examples illustrate models built with other R packages, including ‘PBSmapping’, ‘PBSddesolve’, and ‘BRugs’. A complete user’s guide ‘PBSmodelling-UG.pdf’ shows how to use this package effectively. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-pbv</a>          | 0.2_1   | Computes probabilities of the bivariate normal distribution in a vectorized R function (Drezner & Wesolowsky, 1990, <doi:10.1080/00949659008811236>). / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-pca4ts</a>       | 0.1     | To seek for a contemporaneous linear transformation for a multivariate time series such that the transformed series is segmented into several lower-dimensional subseries, and those subseries are uncorrelated with each other both contemporaneously and serially. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-pcapp</a>        | 1.9_7   | Provides functions for robust PCA by projection pursuit. The methods are described in Croux et al. (2006) <doi:10.2139/ssrn.968376>, Croux et al. (2013) <doi:10.1080/00401706.2012.727746>, Todorov and Filzmoser (2013) <doi:10.1007/978-3-642-33042-1_31>. / GPL (>= 3)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-pcict</a>        | 0.5_4   | Provides a work-alike to R’s POSIXct class which implements 360- and 365-day calendars in addition to the gregorian calendar. / GPL-2  | linux-64,<br>osx-64,<br>win-64                         |

Table 51 – continued from previous page

| Name           | Version | Summary/License   | Platforms                                 |
|----------------|---------|---|---|
| r-pcirt        | 0.2.4   | Estimates the multidimensional polytomous Rasch model (Rasch, 1961) with conditional maximum likelihood estimation. / GPL-3   | linux-64,<br>osx-64,<br>win-64            |
| r-pcit         | 1.5_3   | Apply Partial Correlation coefficient with Information Theory (PCIT) to a correlation matrix. The PCIT algorithm identifies meaningful correlations to define edges in a weighted network. The algorithm can be applied to any correlation-based network including but not limited to gene co-expression networks. To reduce compute time by making use of multiple compute cores, simply run PCIT on a computer with has multiple cores and also has the Rmpi package installed. PCIT will then auto-detect the multicore environment and run in parallel mode without the need to rewrite your scripts. This makes scripts, using PCIT, portable across single core (or no Rmpi package installed) computers which will run in serial mode and multicore (with Rmpi package installed) computers which will run in parallel mode. / GPL-3 | linux-64,<br>osx-64,<br>win-64            |
| r-pdc          | 1.0.3   | Permutation Distribution Clustering is a clustering method for time series. Dissimilarity of time series is formalized as the divergence between their permutation distributions. The permutation distribution was proposed as measure of the complexity of a time series. / GPL-3  | linux-64,<br>osx-64,<br>win-64            |
| r-pdfestimator | 0.1_3   | Farmer, J., D. Jacobs (2108) <DOI:10.1371/journal.pone.0196937>. A non-parametric density estimator based on the maximum-entropy method. Accurately predicts a probability density function (PDF) for random data using a novel iterative scoring function to determine the best fit without overfitting to the sample. / GPL-2   | linux-64,<br>osx-64,<br>win-64            |
| r-pdftools     | 2.2     | Utilities based on 'libpoppler' for extracting text, fonts, attachments and meta-data from a PDF file. Also supports high quality rendering of PDF documents into PNG, JPEG, TIFF format, or into raw bitmap vectors for further processing in R. / MIT file LICENSE  | linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-pdist        | 1.2     | Computes the euclidean distance between rows of a matrix X and rows of another matrix Y. Previously, this could be done by binding the two matrices together and calling 'dist', but this creates unnecessary computation by computing the distances between a row of X and another row of X, and likewise for Y. pdist strictly computes distances across the two matrices, not within the same matrix, making computations significantly faster for certain use cases. / GPL-3  | linux-64,<br>osx-64,<br>win-64            |
| r-pdsce        | 1.2     | A package to compute and tune some positive definite and sparse covariance estimators / GPL-2   | linux-64,<br>osx-64,<br>win-64            |

| Name            | Version    | Summary/License  | Platforms                      |
|-----------------|------------|--|--------------------------------|
| r-peakerror     | 2017.06.10 | Chromatin immunoprecipitation DNA sequencing results in genomic tracks that show enriched regions or peaks where proteins are bound. This package implements fast C code that computes the true and false positives with respect to a database of annotated regions. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-peaksegdisk   | 2019.01.15 | Disk-based implementation of Functional Pruning Optimal Partitioning with up-down constraints <arXiv:1810.00117> for single-sample peak calling (independently for each sample and genomic problem), can handle huge data sets ( $10^7$ or more). / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-peaksegdp     | 2017.08.15 | Quadratic time dynamic programming algorithm can be used to compute an approximate solution to the problem of finding the most likely changepoints with respect to the Poisson likelihood, subject to a constraint on the number of segments, and the changes which must alternate: up, down, up, down, etc. For more info read < <a href="http://proceedings.mlr.press/v37/hocking15.html">http://proceedings.mlr.press/v37/hocking15.html</a> > PeakSeg: constrained optimal segmentation and supervised penalty learning for peak detection in count data by TD Hocking et al, proceedings of ICML2015. / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| r-pearsonds     | 1.1        | Implementation of the Pearson distribution system, including full support for the (d,p,q,r)-family of functions for probability distributions and fitting via method of moments and maximum likelihood method. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-pedigreeemm   | 0.3_3      | Fit pedigree-based mixed-effects models. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-pedigreetools | 0.1        | Tools to sort, edit and prune pedigrees and to extract the inbreeding coefficients and the relationship matrix (includes code for pedigrees from self-pollinated species). The use of pedigree data is central to genetics research within the animal and plant breeding communities to predict breeding values. The relationship matrix between the individuals can be derived from pedigree structure following the algorithms described for example in Vazquez et al., 2010 <doi:10.2527/jas.2009-1952>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-pedometrics   | 0.6_6      | Functions to employ many of the tools and techniques used in the field of pedometrics. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-penalized     | 0.9_5      | Fitting possibly high dimensional penalized regression models. The penalty structure can be any combination of an L1 penalty (lasso and fused lasso), an L2 penalty (ridge) and a positivity constraint on the regression coefficients. The supported regression models are linear, logistic and Poisson regression and the Cox Proportional Hazards model. Cross-validation routines allow optimization of the tuning parameters. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

|------------------------|---------|---|---|
| r-pencoxfrail          | 1.0.1   | A regularization approach for Cox Frailty Models by penalization methods is provided. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-penmsm               | 0.99    | Structured fusion Lasso penalized estimation of multi-state models with the penalty applied to absolute effects and absolute effect differences (i.e., effects on transition-type specific hazard rates). / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-pense                | 1.2.5   | Robust penalized elastic net S and MM estimator for linear regression. The method is described in detail in Cohen Freue, G. V., Kepplinger, D., Salibian-Barrera, M., and Smucler, E. (2017) < <a href="https://gcohenfr.github.io/pdfs/PENSE_manuscript.pdf">https://gcohenfr.github.io/pdfs/PENSE_manuscript.pdf</a> >. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-peptides             | 2.4.1   | Includes functions to calculate several physicochemical properties and indices for amino-acid sequences as well as to read and plot 'XVG' output files from the 'GROMACS' molecular dynamics package. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-perccal              | 1.0     | Contains functions which allow the user to compute confidence intervals quickly using the double bootstrap-based percentile calibrated ('perc-cal') method for linear regression coefficients. 'perccal_interval()' is the primary user-facing function within this package. / GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| r-performanceanalytics | 1.5.3   | Collection of econometric functions for performance and risk analysis. In addition to standard risk and performance metrics, this package aims to aid practitioners and researchers in utilizing the latest research in analysis of non-normal return streams. In general, it is most tested on return (rather than price) data on a regular scale, but most functions will work with irregular return data as well, and increasing numbers of functions will work with P&L or price data where possible. / GPL-2   GPL-3 | linux-64,<br>osx-64,<br>win-64                                    |
| r-perm                 | 1.0_0   | Perform Exact or Asymptotic permutation tests / GPL   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

|------------------------------|---------|--|--------------------------------|
| <a href="#">r-permallows</a> | 1.13    | Includes functions to work with the Mallows and Generalized Mallows Models. The considered distances are Kendall's-tau, Cayley, Hamming and Ulam and it includes functions for making inference, sampling and learning such distributions, some of which are novel in the literature. As a by-product, PerMallows also includes operations for permutations, paying special attention to those related with the Kendall's-tau, Cayley, Ulam and Hamming distances. It is also possible to generate random permutations at a given distance, or with a given number of inversions, or cycles, or fixed points or even with a given length on LIS (longest increasing subsequence). / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-permdep</a>    | 1.0.2   | Implementations of permutation approach to hypothesis testing for quasi-independence of truncation time and failure time. The implemented approaches are powerful against non-monotone alternatives and thereby offer protection against erroneous assumptions of quasi-independence. The proposed tests use either a conditional or an unconditional method to evaluate the permutation p-value. The conditional method was first developed in Tsai (1980) <doi:10.2307/2336059> and Efron and Petrosian (1992) <doi:10.1086/171931>. The unconditional method provides a valid approximation to the conditional method, yet computationally simpler and does not hold fixed the size of each risk sets. Users also have an option to carry out the proposed permutation tests in a parallel computing fashion. / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-pet</a>        | 0.5.1   | Implementation of different analytic/direct and iterative reconstruction methods of radon transformed data such as PET data. It also offer the possibility to simulate PET data. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-pgam</a>       | 0.4.15  | This work is an extension of the state space model for Poisson count data, Poisson-Gamma model, towards a semiparametric specification. Just like the generalized additive models (GAM), cubic splines are used for covariate smoothing. The semiparametric models are fitted by an iterative process that combines maximization of likelihood and backfitting algorithm. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-pgbart</a>     | 0.6.16  | The Particle Gibbs sampler and Gibbs/Metropolis-Hastings sampler were implemented to fit Bayesian additive regression tree model. Construction of the model (training) and prediction for a new data set (testing) can be separated. Our reference papers are: Lakshminarayanan B, Roy D, Teh Y W. Particle Gibbs for Bayesian additive regression trees[C], Artificial Intelligence and Statistics. 2015: 553-561, < <a href="http://proceedings.mlr.press/v38/lakshminarayanan15.pdf">http://proceedings.mlr.press/v38/lakshminarayanan15.pdf</a> > and Chipman, H., George, E., and McCulloch R. (2010) Bayesian Additive Regression Trees. The Annals of Applied Statistics, 4,1, 266-298, <doi:10.1214/09-aoas285>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-pgdraw</a>     | 1.1     | Generates random samples from the Polya-Gamma distribution using an implementation of the algorithm described in J. Windle's PhD thesis (2013) < <a href="https://repositories.lib.utexas.edu/bitstream/handle/2152/21842/WINDLE-DISSERTATION-2013.pdf">https://repositories.lib.utexas.edu/bitstream/handle/2152/21842/WINDLE-DISSERTATION-2013.pdf</a> >. The underlying implementation is in C. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |

| Name         | Version | Summary/License  | Platforms                      |
|--------------|---------|--|--------------------------------|
| r-pgee.mixed | 0.1.0   | Perform simultaneous estimation and variable selection for correlated bivariate mixed outcomes (one continuous outcome and one binary outcome per cluster) using penalized generalized estimating equations. In addition, clustered Gaussian and binary outcomes can also be modeled. The SCAD, MCP, and LASSO penalties are supported. Cross-validation can be performed to find the optimal regularization parameter(s). / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-pgmm       | 1.2.3   | Carries out model-based clustering or classification using parsimonious Gaussian mixture models. McNicholas and Murphy (2008) <doi:10.1007/s11222-008-9056-0>, McNicholas (2010) <doi:10.1016/j.jsps.2009.11.006>, McNicholas and Murphy (2010) <doi:10.1093/bioinformatics/btq498>, McNicholas et al. (2010) <doi:10.1016/j.csda.2009.02.011>. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-pgsc       | 1.0.0   | Computes the generalized synthetic control estimator described in Powell (2017) <doi:10.7249/WR1142>. Provides both point estimates, and hypothesis testing. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-ph2bayes   | 0.0.2   | An implementation of Bayesian single-arm phase II design methods for binary outcome based on posterior probability (Thall and Simon (1994) <doi:10.2307/2533377>) and predictive probability (Lee and Liu (2008) <doi:10.1177/1740774508089279>). / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-ph2hetero  | 1.0.2   | Implementation of Jones (2007) <doi:10.1016/j.cct.2007.02.008>, Tournoux-Facon (2011) <doi:10.1002/sim.4148> and Parashar (2016) <doi:10.1002/pst.1742> designs. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-phase123   | 2.1     | Contains three simulation functions for implementing the entire Phase 123 trial and the separate Eff-Tox and Phase 3 portions of the trial, which may be beneficial for use on clusters. The functions AssignEffTox() and RandomizeEffTox() assign doses to patient cohorts during phase 12 and Reoptimize() determines the optimal dose to continue with during Phase 3. The functions ReturnMeansAgent() and ReturnMeanControl() gives the true mean survival for the agent doses and control and ReturnOCS() gives the operating characteristics of the design. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-phenex     | 1.4_5   | Provides some easy-to-use functions for spatial analyses of (plant-) phenological data sets and satellite observations of vegetation. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-pheno      | 1.6     | Provides some easy-to-use functions for time series analyses of (plant-) phenological data sets. These functions mainly deal with the estimation of combined phenological time series and are usually wrappers for functions that are already implemented in other R packages adapted to the special structure of phenological data and the needs of phenologists. Some date conversion functions to handle Julian dates are also provided. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name        | Version | Summary/License  | Platforms                      |
|-------------|---------|--|--------------------------------|
| r-phmm      | 0.7_1   | Fits proportional hazards model incorporating random effects using an EM algorithm using Markov Chain Monte Carlo at E-step. Vaida and Xu (2000) <DOI:10.1002/1097-0258(20001230)19:24%3C3309::AID-SIM825%3E3.0.CO;2-9>. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-phonics   | 1.3.2   | Provides a collection of phonetic algorithms including Soundex, Metaphone, NYSIS, Caverphone, and others. / BSD_2_clause   | linux-64,<br>osx-64,<br>win-64 |
| r-phreeqc   | 3.4.10  | A geochemical modeling program developed by the US Geological Survey that is designed to perform a wide variety of aqueous geochemical calculations, including speciation, batch-reaction, one-dimensional reactive-transport, and inverse geochemical calculations. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-phyclust  | 0.1_2   | Phylogenetic clustering (phyloclustering) is an evolutionary Continuous Time Markov Chain model-based approach to identify population structure from molecular data without assuming linkage equilibrium. The package phyclust (Chen 2011) provides a convenient implementation of phyloclustering for DNA and SNP data, capable of clustering individuals into subpopulations and identifying molecular sequences representative of those subpopulations. It is designed in C for performance, interfaced with R for visualization, and incorporates other popular open source programs including ms (Hudson 2002) <doi:10.1093/bioinformatics/18.2.337>, seq-gen (Rambaut and Grassly 1997) <doi:10.1093/bioinformatics/13.3.235>, Hap-Clustering (Tzeng 2005) <doi:10.1002/gepi.20063> and PAML baseml (Yang 1997, 2007) <doi:10.1093/bioinformatics/13.5.555>, <doi:10.1093/molbev/msm088>, for simulating data, additional analyses, and searching the best tree. See the phyclust website for more information, documentations and examples. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-phyloland | 1.3     | Phyloland package models a space colonization process mapped onto a phylogeny, it aims at estimating limited dispersal and ecological competitive exclusion in a Bayesian MCMC statistical phylogeographic framework (please refer to phyloland-package help for details.) / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

Table 51 – continued from previous page

| Name                | Version | Summary/License  | Platforms                      |
|---------------------|---------|--|--------------------------------|
| r-phylomeasures     | 2.1     | Given a phylogenetic tree T and an assemblage S of species represented as a subset of tips in T, we want to compute a measure of the diversity of the species in S with respect to T. The current package offers efficient algorithms that can process large phylogenetic data for several such measures. Most importantly, the package includes algorithms for computing efficiently the standardized versions of phylogenetic measures and their p-values, which are essential for null model comparisons. Among other functions, the package provides efficient computation of richness-standardized versions for indices such as the net relatedness index (NRI), nearest taxon index (NTI), phylogenetic diversity index (PDI), and the corresponding indices of two-sample measures. The package also introduces a new single-sample measure, the Core Ancestor Cost (CAC); the package provides functions for computing the value and the standardised index of the CAC and, more than that, there is an extra function available that can compute exactly any statistical moment of the measure. The package supports computations under different null models, including abundance-weighted models. / GPL-3 | linux-64,<br>osx-64,<br>win-64 |
| r-physiology        | 1.2.1   | A variety of formulae are provided for estimation of physiologic characteristics of infants, children, and adults. Calculations include: body surface area, ideal weight, airway dead-space, the alveolar gas equation, and GFR. Each formula is referenced to the original publication. Future functions will cover more material with a focus on anaesthesia, critical care and peri-operative medicine. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-picasso           | 1.3.1   | Computationally efficient tools for fitting generalized linear model with convex or non-convex penalty. Users can enjoy the superior statistical property of non-convex penalty such as SCAD and MCP which has significantly less estimation error and overfitting compared to convex penalty such as lasso and ridge. Computation is handled by multi-stage convex relaxation and the Pathwise CALibrated Sparse Shooting algorithm (PICASSO) which exploits warm start initialization, active set updating, and strong rule for coordinate preselection to boost computation, and attains a linear convergence to a unique sparse local optimum with optimal statistical properties. The computation is memory-optimized using the sparse matrix output. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-pieceexpintensity | 1.0.4   | This function fits a reversible jump Bayesian piecewise exponential model that also includes the intensity of each event considered along with the rate of events. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-pijavski          | 1.0     | Global univariate minimization of Lipschitz functions is performed by using Pijavski method, which was published in Pijavski (1972) <DOI:10.1016/0041-5553(72)90115-2>. / LGPL-3   | linux-64,<br>osx-64,<br>win-64 |

| Name                        | Version | Summary/License  | Platforms   |
|-----------------------------|---------|--|---|
| <a href="#">r-pillar</a>    | 1.3.1   | Provides a ‘pillar’ generic designed for formatting columns of data using the full range of colours provided by modern terminals. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-pingr</a>     | 1.1.2   | Check if a remote computer is up. It can either just call the system ping command, or check a specified TCP port. / MIT  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-piton</a>     | 0.1.1   | A wrapper around the ‘Parsing Expression Grammar Template Library’, a C11 library for generating Parsing Expression Grammars, that makes it accessible within Rcpp. With this, developers can implement their own grammars and easily expose them in R packages. / MIT   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-pivotalr</a>  | 0.1.18  | Provides an R interface for the Pivotal Data stack running on ‘PostgreSQL’, ‘Greenplum’ or ‘Apache HAWQ (incubating)’ databases with parallel and distributed computation ability for big data processing. ‘PivotalR’ provides an R interface to various database operations on tables or views. These operations are almost the same as the corresponding native R operations. Thus users of R do not need to learn ‘SQL’ when they operate on objects in the database. It also provides a wrapper for ‘Apache MADlib (incubating)’, which is an open-source library for parallel and scalable in-database analytics. / GPL-2 | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-pkgbuild</a>  | 1.0.3   | Provides functions used to build R packages. Locates compilers needed to build R packages on various platforms and ensures the PATH is configured appropriately so R can use them. / GPL-3   | linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64              |
| <a href="#">r-pkgconfig</a> | 2.0.2   | Set configuration options on a per-package basis. Options set by a given package only apply to that package, other packages are unaffected. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| <a href="#">r-plfm</a>      | 2.2.2   | Functions for estimating probabilistic latent feature models with a disjunctive, conjunctive or additive mapping rule on (aggregated) binary three-way data. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-pliable</a>   | 1.1     | Fits a pliable lasso model. For details see Tibshirani and Friedman (2018) <arXiv:1712.00484>. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-plm</a>       | 1.7_0   | A set of estimators and tests for panel data econometrics. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-pln</a>       | 0.2_1   | Performs bivariate composite likelihood and full information maximum likelihood estimation for polytomous logit-normit (graded logistic) item response theory (IRT) models. / GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-plogr</a>     | 0.2.0   | A simple header-only logging library for C. Add 'LinkingTo: plogr' to 'DESCRIPTION', and '#include <plogr.h>' in your C modules to use it. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-plordprob</a> | 1.1     | Multivariate ordered probit model, i.e. the extension of the scalar ordered probit model where the observed variables have dimension greater than one. Estimation of the parameters is done via maximization of the pairwise likelihood, a special case of the composite likelihood obtained as product of bivariate marginal distributions. The package uses the Fortran 77 subroutine SADMVN by Alan Genz, with minor adaptations made by Adelchi Azzalini in his mvnormt package for evaluating the two-dimensional Gaussian integrals involved in the pairwise log-likelihood. Optimization of the latter objective function is performed via quasi-Newton box-constrained optimization algorithm, as implemented in nlminb. / GPL-2 | linux-64,<br>osx-64,<br>win-64                                    |

|--------------|---------|---|--------------------------------|
| r-polycclip  | 1.10.0  | R port of Angus Johnson's open source library Clipper. Performs polygon clipping operations (intersection, union, set minus, set difference) for polygonal regions of arbitrary complexity, including holes. Computes offset polygons (spatial buffer zones, morphological dilations, Minkowski dilations) for polygonal regions and polygonal lines. Computes Minkowski Sum of general polygons. There is a function for removing self-intersections from polygon data. / BSL  | linux-64,<br>osx-64,<br>win-64 |
| r-polycub    | 0.7.1   | Numerical integration of continuously differentiable functions $f(x,y)$ over simple closed polygonal domains. The following cubature methods are implemented: product Gauss cubature (Sommariva and Vianello, 2007, <doi:10.1007/s10543-007-0131-2>), the simple two-dimensional midpoint rule (wrapping 'spatstat' functions), adaptive cubature for radially symmetric functions via line integrate() along the polygon boundary (Meyer and Held, 2014, <doi:10.1214/14-AOAS743>, Supplement B), and integration of the bivariate Gaussian density based on polygon triangulation. For simple integration along the axes, the 'cubature' package is more appropriate. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-polyfreqs  | 1.0.2   | Implements a Gibbs sampling algorithm to perform Bayesian inference on biallelic SNP frequencies, genotypes and heterozygosity (observed and expected) in a population of autopolyploids. See the published paper in Molecular Ecology Resources: Blischak et al. (2016) <doi:10.1111/1755-0998.12493>. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |
| r-polylabelr | 0.1.0   | A wrapper around the C library 'polylabel' from 'Mapbox', providing an efficient routine for finding the approximate pole of inaccessibility of a polygon, which usually serves as an excellent candidate for labeling of a polygon. / MIT  | linux-64,<br>osx-64,<br>win-64 |
| r-polynomf   | 2.0_2   | Implements univariate polynomial operations in R, including polynomial arithmetic, finding zeros, plotting, and some operations on lists of polynomials. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

|-----------|---------|--|--------------------------------|
| r-polysat | 1.7.4   | A collection of tools to handle microsatellite data of any ploidy (and samples of mixed ploidy) where allele copy number is not known in partially heterozygous genotypes. It can import and export data in ABI ‘GeneMapper’, ‘Structure’, ‘ATetra’, ‘Tetrasat’/‘Tetra’, ‘GenoDive’, ‘SPAGeDi’, ‘POPDIST’, ‘STRand’, and binary presence/absence formats. It can calculate pairwise distances between individuals using a stepwise mutation model or infinite alleles model, with or without taking ploidies and allele frequencies into account. These distances can be used for the calculation of clonal diversity statistics or used for further analysis in R. Allelic diversity statistics and Polymorphic Information Content are also available. polysat can assist the user in estimating the ploidy of samples, and it can estimate allele frequencies in populations, calculate pairwise or global differentiation statistics based on those frequencies, and export allele frequencies to ‘SPAGeDi’ and ‘ade-genet’. Functions are also included for assigning alleles to isoloci in cases where one pair of microsatellite primers amplifies alleles from two or more independently segregating isoloci. polysat is described by Clark and Jasieniuk (2011) <doi:10.1111/j.1755-0998.2011.02985.x> and Clark and Schreier (2017) <doi:10.1111/1755-0998.12639>. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-pomaspu | 1.0.0   | POM-aSPU test evaluates an association between an ordinal response and multiple phenotypes, for details see Kim and Pan (2017) <DOI:10.1002/gepi.22033>. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-pomdp   | 0.9.1   | Provides an interface to pomdp-solve, a solver for Partially Observable Markov Decision Processes (POMDP). The package enables the user to simply define all components of a POMDP model and solve the problem using several methods. The package also contains functions to analyze and visualize the POMDP solutions (e.g., the optimal policy). / GPL-3   | linux-64,<br>osx-64            |
| r-pomp    | 2.3     | Tools for data analysis with partially observed Markov process (POMP) models (also known as stochastic dynamical systems, hidden Markov models, and nonlinear, non-Gaussian, state-space models). The package provides facilities for implementing POMP models, simulating them, and fitting them to time series data by a variety of frequentist and Bayesian methods. It is also a versatile platform for implementation of inference methods for general POMP models. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-pooh    | 0.3.2   | Finds equivalence classes corresponding to a symmetric relation or undirected graph. Finds total order consistent with partial order or directed graph (so-called topological sort). / MIT   | linux-64,<br>osx-64,<br>win-64 |

| Name         | Version | Summary/License  | Platforms   |
|--------------|---------|--|---|
| r-pool       | 0.1.4.2 | Enables the creation of object pools, which make it less computationally expensive to fetch a new object. Currently the only supported pooled objects are ‘DBI’ connections. / GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-pop.wolf   | 0.1     | Simulate the dynamic of wolf populations using a specific Individual-Based Model (IBM) compiled in C. / GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| r-popkin     | 1.2.2   | Provides functions to estimate the kinship matrix of individuals from a large set of biallelic SNPs, and extract inbreeding coefficients and the generalized FST (Wright’s fixation index). Method described in Ochoa and Storey (2016) <doi:10.1101/083923>. / GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| r-population | 0.2     | Run population simulations using an Individual-Based Model (IBM) compiled in C. / GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| r-pot        | 1.1_7   | Some functions useful to perform a Peak Over Threshold analysis in univariate and bivariate cases, see Beirlant et al. (2004) <doi:10.1002/0470012382>. A user’s guide is available. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-potts      | 0.5_8   | Do Markov chain Monte Carlo (MCMC) simulation of Potts models (Potts, 1952, <doi:10.1017/S0305004100027419>), which are the multi-color generalization of Ising models (so, as a special case, also simulates Ising models). Use the Swendsen-Wang algorithm (Swendsen and Wang, 1987, <doi:10.1103/PhysRevLett.58.86>) so MCMC is fast. Do maximum composite likelihood estimation of parameters (Besag, 1975, <doi:10.2307/2987782>, Lindsay, 1988, <doi:10.1090/conm/080>). / GPL-2 | linux-64,<br>osx-64,<br>win-64                                    |
| r-power      | 1.0.7   | Functions for the computation of power and level tables for hypothesis tests, in Latex format, functions to build explanatory graphs for studying power of test statistics. / GPL-2  | linux-64,<br>osx-64,<br>win-64                                    |

| Name     | Version | Summary/License   | Platforms                      |
|----------|---------|---|--------------------------------|
| r-pp     | 0.6.2   | The PP package includes estimation of (MLE, WLE, MAP, EAP, ROBUST) person parameters for the 1,2,3,4-PL model and the GPCM (generalized partial credit model). The parameters are estimated under the assumption that the item parameters are known and fixed. The package is useful e.g. in the case that items from an item pool / item bank with known item parameters are administered to a new population of test-takers and an ability estimation for every test-taker is needed. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-pp3    | 1.2     | Exploratory projection pursuit is a method to discovers structure in multivariate data. At heart this package uses a projection index to evaluate how interesting a specific three-dimensional projection of multivariate data (with more than three dimensions) is. Typically, the main structure finding algorithm starts at a random projection and then iteratively changes the projection direction to move to a more interesting one. In other words, the projection index is maximised over the projection direction to find the most interesting projection. This maximum is, though, a local maximum. So, this code has the ability to restart the algorithm from many different starting positions automatically. Routines exist to plot a density estimate of projection indices over the runs, this enables the user to obtain an idea of the distribution of the projection indices, and, hence, which ones might be interesting. Individual projection solutions, including those identified as interesting, can be extracted and plotted individually. The package can make use of the mclapply() function to execute multiple runs in parallel to speed up index discovery. Projection pursuit is similar to independent component analysis. This package uses a projection index that maximises an entropy measure to look for projections that exhibit non-normality, and operates on sphered data. Hence, information from this package is different from that obtained from principal components analysis, but the rationale behind both methods is similar. Nason, G. P. (1995) <doi:10.2307/2986135>. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| r-ppcc   | 1.1     | Calculates the Probability Plot Correlation Coefficient (PPCC) between a continuous variable X and a specified distribution. The corresponding composite hypothesis test that was first introduced by Filliben (1975) <doi: 10.1080/00401706.1975.10489279> can be performed to test whether the sample X is element of either the Normal, log-Normal, Exponential, Uniform, Cauchy, Logistic, Generalized Logistic, Gumbel (GEVI), Weibull, Generalized Extreme Value, Pearson III (Gamma 2), Mielke's Kappa, Rayleigh or Generalized Logistic Distribution. The PPCC test is performed with a fast Monte-Carlo simulation. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-ppmr   | 1.0     | Efficient statistical inference of two-sample MR (Mendelian Randomization) analysis. It can account for the correlated instruments and the horizontal pleiotropy, and can provide the accurate estimates of both causal effect and horizontal pleiotropy effect as well as the two corresponding p-values. There are two main functions in the 'PPMR' package. One is PMR_individual() for individual level data, the other is PMR_summary() for summary data. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| r-pqlseq | 1.1     | An efficient tool designed for differential analysis of large-scale RNA sequencing (RNAseq) data and Bisulfite sequencing (BSseq) data in the presence of individual relatedness and population structure. 'PQLseq' first fits a Generalized Linear Mixed Model (GLMM) with adjusted covariates, predictor of interest and random effects to account for population structure and individual relatedness, and then performs Wald tests for each gene in RNAseq or site in BSseq. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |

|-------------------------------|---------|--|---|
| <a href="#">r-praise</a>      | 1.0.0   | Build friendly R packages that praise their users if they have done something good, or they just need it to feel better. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-praznik</a>     | 6.0.0   | A collection of feature selection filters performing greedy optimisation of mutual information-based usefulness criteria, inspired by the overview by Brown, Pocock, Zhao and Lujan (2012) < <a href="http://www.jmlr.org/papers/v13/brown12a.html">http://www.jmlr.org/papers/v13/brown12a.html</a> >. Implements, among other, minimum redundancy maximal relevancy ('mRMR') method by Peng, Long and Ding (2005) <doi:10.1109/TPAMI.2005.159>; joint mutual information ('JMI') method by Yang and Moody (1999) < <a href="http://papers.nips.cc/paper/1779-data-visualization-and-feature-selection-new-algorithms-for-nongaussian-data">http://papers.nips.cc/paper/1779-data-visualization-and-feature-selection-new-algorithms-for-nongaussian-data</a> >; double input symmetrical relevance ('DISR') method by Meyer and Bontempi (2006) <doi:10.1007/11732242_9> as well as joint mutual information maximisation ('JMIM') method by Bennasar, Hicks and Setchi (2015) <doi:10.1016/j.eswa.2015.07.007>. / GPL-3 | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-prclust</a>     | 1.3     | Clustering is unsupervised and exploratory in nature. Yet, it can be performed through penalized regression with grouping pursuit. In this package, we provide two algorithms for fitting the penalized regression-based clustering (PRclust) with non-convex grouping penalties, such as group truncated lasso, MCP and SCAD. One algorithm is based on quadratic penalty and difference convex method. Another algorithm is based on difference convex and ADMM, called DC-ADD, which is more efficient. Generalized cross validation and stability based method were provided to select the tuning parameters. Rand index, adjusted Rand index and Jaccard index were provided to estimate the agreement between estimated cluster memberships and the truth. / GPL-2   GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-precisesums</a> | 0.3     | Most of the time floating point arithmetic does approximately the right thing. When adding sums or having products of numbers that greatly differ in magnitude, the floating point arithmetic may be incorrect. This package implements the Kahan (1965) sum <doi:10.1145/363707.363723>, Neumaier (1974) sum <doi:10.1002/zamm.19740540106>, pairwise-sum (adapted from 'NumPy', See Castaldo (2008) <doi:10.1137/070679946> for a discussion of accuracy), and arbitrary precision sum (adapted from the fsum in 'Python'; Shewchuk (1997) < <a href="http://www.cs.berkeley.edu/~jrs/papers/robustr.pdf">http://www.cs.berkeley.edu/~jrs/papers/robustr.pdf</a> >). In addition, products are changed to long double precision for accuracy, or changed into a log-sum for accuracy. / GPL-2  | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-predkmeans</a>  | 0.1.0   | Implements the predictive k-means method for clustering observations, using a mixture of experts model to allow covariates to influence cluster centers. Motivated by air pollution epidemiology settings, where cluster membership needs to be predicted across space. Includes functions for predicting cluster membership using spatial splines and principal component analysis (PCA) scores using either multinomial logistic regression or support vector machines (SVMs). For method details see Keller et al. (2017) <doi:10.1214/16-AOAS992>. / GPL-3   | linux-64,<br>osx-64,<br>win-64                                    |

| Name          | Version | Summary/License  | Platforms   |
|---------------|---------|--|---|
| r-psych       | 1.8.12  | A general purpose toolbox for personality, psychometric theory and experimental psychology. Functions are primarily for multivariate analysis and scale construction using factor analysis, principal component analysis, cluster analysis and reliability analysis, although others provide basic descriptive statistics. Item Response Theory is done using factor analysis of tetrachoric and polychoric correlations. Functions for analyzing data at multiple levels include within and between group statistics, including correlations and factor analysis. Functions for simulating and testing particular item and test structures are included. Several functions serve as a useful front end for structural equation modeling. Graphical displays of path diagrams, factor analysis and structural equation models are created using basic graphics. Some of the functions are written to support a book on psychometric theory as well as publications in personality research. For more information, see the < <a href="https://personality-project.org/r/">https://personality-project.org/r/</a> > web page. / GPL (>= 2) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-psychotools | 0.5.0   | Infrastructure for psychometric modeling such as data classes (for item response data and paired comparisons), basic model fitting functions (for Bradley-Terry, Rasch, parametric logistic IRT, generalized partial credit, rating scale, multinomial processing tree models), extractor functions for different types of parameters (item, person, threshold, discrimination, guessing, upper asymptotes), unified inference and visualizations, and various datasets for illustration. Intended as a common lightweight and efficient toolbox for psychometric modeling and a common building block for fitting psychometric mixture models in package psychomix and trees based on psychometric models in package psychotree. / GPL-2   GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |
| r-ptest       | 1.0.8   | Implements p-value computations using an approximation to the cumulative distribution function for a variety of tests for periodicity. These tests include harmonic regression tests with normal and double exponential errors as well as modifications of Fisher's g test. An accompanying vignette illustrates the application of these tests. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-pts2polys   | 0.1.1   | Various applications in invasive species biology, conservation biology, epidemiology and elsewhere involve sampling of sets of 2D points from a posterior distribution. The number of such point sets may be large, say 1000 or 10000. This package facilitates visualisation of such output by constructing seven nested polygons representing the location and variability of the point sets. This can be used, for example, to visualise the range boundary of a species, and uncertainty in the location of that boundary. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-ptsuite     | 1.0.0   | Various estimation methods for the shape parameter of Pareto distributed data. This package contains functions for various estimation methods such as maximum likelihood (Newman, 2005)<doi:10.1016/j.cities.2012.03.001>, Hill's estimator (Hill, 1975)<doi:10.1214/aos/1176343247>, least squares (Zaher et al., 2014)<doi:10.9734/BJMCS/2014/10890>, method of moments (Rytgaard, 1990)<doi:10.2143/AST.20.2.2005443>, percentiles (Bhatti et al., 2018)<doi:10.1371/journal.pone.0196456>, and weighted least squares (Nair et al., 2019) to estimate the shape parameter of Pareto distributed data. It also provides both a heuristic method (Hubert et al., 2013)<doi:10.1016/j.csda.2012.07.011> and a goodness of fit test (Gulati and Shapiro, 2008)<doi:10.1007/978-0-8176-4619-6> for testing for Pareto data as well as a method for generating Pareto distributed data. / GPL-3  | linux-64,<br>osx-64,<br>win-64                                    |

| Name       | Version | Summary/License  | Platforms  |
|------------|---------|--|--|
| r-ptw      | 1.9_1   | Parametric Time Warping aligns patterns, i.e. it aims to put corresponding features at the same locations. The algorithm searches for an optimal polynomial describing the warping. It is possible to align one sample to a reference, several samples to the same reference, or several samples to several references. One can choose between calculating individual warpings, or one global warping for a set of samples and one reference. Two optimization criteria are implemented: RMS (Root Mean Square error) and WCC (Weighted Cross Correlation). Both warping of peak profiles and of peak lists are supported. / GPL-2 | linux-64,<br>osx-64,<br>win-64                         |
| r-pullword | 0.2     | R Interface to Pullword Service for natural language processing in Chinese. It enables users to extract valuable words from text by deep learning models. For more details please visit the official site (in Chinese) <a href="http://pullword.com/">http://pullword.com/</a> . / LGPL-3  | linux-64,<br>osx-64,<br>win-64                         |
| r-purrr    | 0.3.2   | A complete and consistent functional programming toolkit for R. / GPL-3   file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-qpdf     | 1.1     | Content-preserving transformations of PDF files such as split, combine, and compress. This package interfaces directly to the ‘qpdf’ C API and does not require any command line utilities. Note that ‘qpdf’ does not read actual content from PDF files: to extract text and data you need the ‘pdftools’ package. / Apache License 2.0   | linux-64,<br>osx-64,<br>win-32,<br>win-64              |
| r-qrm      | 0.4_1   | Accompanying package to the book Quantitative Risk Management: Concepts, Techniques and Tools by Alexander J. McNeil, Rüdiger Frey, and Paul Embrechts. / GPL (>= 2)   | linux-64,<br>osx-64,<br>win-32,<br>win-64              |
| r-quadprog | 1.5_5   | This package contains routines and documentation for solving quadratic programming problems. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                          | Version | Summary/License  | Platforms   |
|-------------------------------|---------|--|---|
| <a href="#">r-quantmod</a>    | 0.4_14  | Specify, build, trade, and analyse quantitative financial trading strategies. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-quantreg</a>    | 5.38    | Estimation and inference methods for models of conditional quantiles: Linear and nonlinear parametric and non-parametric (total variation penalized) models for conditional quantiles of a univariate response and several methods for handling censored survival data. Portfolio selection methods based on expected shortfall risk are also included. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-qvcalc</a>      | 0.9_1   | Functions to compute quasi variances and associated measures of approximation error. / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-r.methodss3</a> | 1.7.1   | Methods that simplify the setup of S3 generic functions and S3 methods. Major effort has been made in making definition of methods as simple as possible with a minimum of maintenance for package developers. For example, generic functions are created automatically, if missing, and naming conflict are automatically solved, if possible. The method setMethodS3() is a good start for those who in the future may want to migrate to S4. This is a cross-platform package implemented in pure R that generates standard S3 methods. / LGPL (>= 2.1) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                        | Version | Summary/License  | Platforms   |
|-----------------------------|---------|--|---|
| <code>r-r.oo</code>         | 1.22.0  | Methods and classes for object-oriented programming in R with or without references. Large effort has been made on making definition of methods as simple as possible with a minimum of maintenance for package developers. The package has been developed since 2001 and is now considered very stable. This is a cross-platform package implemented in pure R that defines standard S3 classes without any tricks. / LGPL (>= 2.1) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-r.utils</code>      | 2.8.0   | Utility functions useful when programming and developing R packages. / LGPL (>= 2.1)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-r2d3</code>         | 0.2.3   | Suite of tools for using 'D3', a library for producing dynamic, interactive data visualizations. Supports translating objects into 'D3' friendly data structures, rendering 'D3' scripts, publishing 'D3' visualizations, incorporating 'D3' in R Markdown, creating interactive 'D3' applications with Shiny, and distributing 'D3' based 'htmlwidgets' in R packages. / BSD_3_clause file LICENSE                                  | noarch  |
| <code>r-r6</code>           | 2.4.0   | Creates classes with reference semantics, similar to R's built-in reference classes. Compared to reference classes, R6 classes are simpler and lighter-weight, and they are not built on S4 classes so they do not require the methods package. These classes allow public and private members, and they support inheritance, even when the classes are defined in different packages. / MIT file LICENSE                            | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-randomforest</code> | 4.6_14  | Classification and regression based on a forest of trees using random inputs, based on Breiman (2001) <DOI:10.1023/A:1010933404324>. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| Name                            | Version   | Summary/License  | Platforms   |
|---------------------------------|-----------|--|---|
| <a href="#">r-colorbrewer</a>   | 1.1_2     | Provides color schemes for maps (and other graphics) designed by Cynthia Brewer as described at <a href="http://colorbrewer2.org">http://colorbrewer2.org</a> / Apache License 2.0   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-rcpp</a>          | 1.0.1     | The ‘Rcpp’ package provides R functions as well as C classes which offer a seamless integration of R and C. Many R data types and objects can be mapped back and forth to C equivalents which facilitates both writing of new code as well as easier integration of third-party libraries. Documentation about ‘Rcpp’ is provided by several vignettes included in this package, via the ‘Rcpp Gallery’ site at <a href="http://gallery.rcpp.org">http://gallery.rcpp.org</a> , the paper by Eddelbuettel and Francois (2011, <doi:10.18637/jss.v040.i08>), the book by Eddelbuettel (2013, <doi:10.1007/978-1-4614-6868-4>) and the paper by Eddelbuettel and Balamuta (2017, <doi:10.7287/peerj.preprints.3188v1>); see ‘citation(Rcpp)’ for details. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-rcpparmadillo</a> | 0.9.3002  | ‘RcppArmadillo’ is a templated C linear algebra library (by Conrad Sanderson) that aims towards a good balance between speed and ease of use. Integer, floating point and complex numbers are supported, as well as a subset of trigonometric and statistics functions. Various matrix decompositions are provided through optional integration with LAPACK and ATLAS libraries. The ‘RcppArmadillo’ package includes the header files from the templated ‘Armadillo’ library. Thus users do not need to install ‘Armadillo’ itself in order to use ‘RcppArmadillo’. From release 7.800.0 on, ‘Armadillo’ is licensed under Apache License 2; previous releases were under licensed as MPL 2.0 from version 3.800.0 onwards and LGPL-3 prior to that; ‘RcppArmadillo’ (the ‘Rcpp’ bindings/bridge to Armadillo) is licensed under the GNU GPL version 2 or later, as is the rest of ‘Rcpp’. Note that Armadillo requires a fairly recent compiler; for the g family at least version 4.6.* is required. / GPL (>= 2) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-rcppeigen</a>     | 0.3.3.100 | ‘RcppEigen’ and ‘Eigen’ integration using ‘Rcpp’. ‘Eigen’ is a C template library for linear algebra: matrices, vectors, numerical solvers and related algorithms. It supports dense and sparse matrices on integer, floating point and complex numbers, decompositions of such matrices, and solutions of linear systems. Its performance on many algorithms is comparable with some of the best implementations based on ‘Lapack’ and level-3 ‘BLAS’. The ‘RcppEigen’ package includes the header files from the ‘Eigen’ C template library (currently version 3.3.4). Thus users do not need to install ‘Eigen’ itself in order to use ‘RcppEigen’. Since version 3.1.1, ‘Eigen’ is licensed under the Mozilla Public License (version 2); earlier version were licensed under the GNU LGPL version 3 or later. ‘RcppEigen’ (the ‘Rcpp’ bindings/bridge to ‘Eigen’) is licensed under the GNU GPL version 2 or later, as is the rest of ‘Rcpp’. / GPL (>= 2)   file LICENSE                                       | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-rcppprogress</a>  | 0.4.1     | Allows to display a progress bar in the R console for long running computations taking place in c code, and support for interrupting those computations even in multithreaded code, typically using OpenMP. / GPL (>= 3)   | noarch  |

| Name                       | Version | Summary/License   | Platforms   |
|----------------------------|---------|---|---|
| <a href="#">r-rcpproll</a> | 0.3.0   | Provides fast and efficient routines for common rolling / windowed operations. Routines for the efficient computation of windowed mean, median, sum, product, minimum, maximum, standard deviation and variance are provided. / GPL ( $\geq 2$ )  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-rcurl</a>    | 1.95    | Wrapper for 'libcurl' < <a href="http://curl.haxx.se/libcurl/">http://curl.haxx.se/libcurl/</a> > Provides functions to allow one to compose general HTTP requests and provides convenient functions to fetch URIs, get & post forms, etc. and process the results returned by the Web server. This provides a great deal of control over the HTTP/FTP... connection and the form of the request while providing a higher-level interface than is available just using R socket connections. Additionally, the underlying implementation is robust and extensive, supporting FTP/FTPS/TFTP (uploads and downloads), SSL/HTTPS, telnet, dict, ldap, and also supports cookies, redirects, authentication, etc. / BSD | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-readr</a>    | 1.3.1   | The goal of 'readr' is to provide a fast and friendly way to read rectangular data (like 'csv', 'tsv', and 'fwf'). It is designed to flexibly parse many types of data found in the wild, while still cleanly failing when data unexpectedly changes. / GPL ( $\geq 2$ )   file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-readxl</a>   | 1.3.1   | Import excel files into R. Supports 'xls' via the embedded 'libxls' C library < <a href="https://github.com/evanmiller/libxls">https://github.com/evanmiller/libxls</a> > and 'xlsx' via the embedded 'RapidXML' C library < <a href="https://rapidxml.sourceforge.net">https://rapidxml.sourceforge.net</a> >. Works on Windows, Mac and Linux without external dependencies. / GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-recipes</a>  | 0.1.5   | An extensible framework to create and preprocess design matrices. Recipes consist of one or more data manipulation and analysis steps. Statistical parameters for the steps can be estimated from an initial data set and then applied to other data sets. The resulting design matrices can then be used as inputs into statistical or machine learning models. / GPL-2  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name                      | Version | Summary/License   | Platforms   |
|---------------------------|---------|---|---|
| <a href="#">r-rjdbc</a>   | 0.2_7   | The RJDBC package is an implementation of R's DBI interface using JDBC as a back-end. This allows R to connect to any DBMS that has a JDBC driver. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-rjson</a>   | 0.2.20  | Converts R object into JSON objects and vice-versa / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-rjsonio</a> | 1.3_1   | This is a package that allows conversion to and from data in Javascript object notation (JSON) format. This allows R objects to be inserted into Javascript/ECMAScript/ActionScript code and allows R programmers to read and convert JSON content to R objects. This is an alternative to rjson package. Originally, that was too slow for converting large R objects to JSON and was not extensible. rjson's performance is now similar to this package, and perhaps slightly faster in some cases. This package uses methods and is readily extensible by defining methods for different classes, vectorized operations, and C code and callbacks to R functions for deserializing JSON objects to R. The two packages intentionally share the same basic interface. This package (RJSONIO) has many additional options to allow customizing the generation and processing of JSON content. This package uses libjson rather than implementing yet another JSON parser. The aim is to support other general projects by building on their work, providing feedback and benefit from their ongoing development. / BSD_3_clause file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-rlang</a>   | 0.3.4   | A toolbox for working with base types, core R features like the condition system, and core 'Tidyverse' features like tidy evaluation. / GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| <a href="#">r-rocr</a>     | 1.0.7   | ROC graphs, sensitivity/specificity curves, lift charts, and precision/recall plots are popular examples of trade-off visualizations for specific pairs of performance measures. ROCR is a flexible tool for creating cutoff-parameterized 2D performance curves by freely combining two from over 25 performance measures (new performance measures can be added using a standard interface). Curves from different cross-validation or bootstrapping runs can be averaged by different methods, and standard deviations, standard errors or box plots can be used to visualize the variability across the runs. The parameterization can be visualized by printing cutoff values at the corresponding curve positions, or by coloring the curve according to cutoff. All components of a performance plot can be quickly adjusted using a flexible parameter dispatching mechanism. Despite its flexibility, ROCR is easy to use, with only three commands and reasonable default values for all optional parameters. / GPL (>= 2) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-rodbc</a>    | 1.3.1   | An ODBC database interface. / GPL-2   GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-rook</a>     | 1.1.1   | This package contains the Rook specification and convenience software for building and running Rook applications. To get started, be sure and read the ‘Rook’ help file first. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-roxygen2</a> | 6.1.1   | Generate your Rd documentation, ‘NAMESPACE’ file, and collation field using specially formatted comments. |------------|---------|--|-----------|
| r-sra      | 0.1.1   | This package (sra) provides a set of tools to analyse artificial-selection response datasets. The data typically feature for several generations the average value of a trait in a population, the variance of the trait, the population size and the average value of the parents that were chosen to breed. Sra implements two families of models aiming at describing the dynamics of the genetic architecture of the trait during the selection response. The first family relies on purely descriptive (phenomenological) models, based on an autoregressive framework. The second family provides different mechanistic models, accounting e.g. for inbreeding, mutations, genetic and environmental canalization, or epistasis. The parameters underlying the dynamics of the time series are estimated by maximum likelihood. The sra package thus provides (i) a wrapper for the R functions mle() and optim() aiming at fitting in a convenient way a predetermined set of models, and (ii) some functions to plot and analyze the output of the models. / GPL-2 | noarch    |
| r-srccs    | 1.1     | Implementation of the SRCS method for a color-based visualization of the results of multiple pairwise tests on a large number of problem configurations, proposed in: I.G. del Amo, D.A. Pelta. SRCS: a technique for comparing multiple algorithms under several factors in dynamic optimization problems. In: E. Alba, A. Nakib, P. Siarry (Eds.), Metaheuristics for Dynamic Optimization. Series: Studies in Computational Intelligence 433, Springer, Berlin/Heidelberg, 2012. / LGPL-3   | noarch    |
| r-srda     | 1.0.0   | Sparse redundancy analysis for high dimensional (biomedical) data. Directional multivariate analysis to express the maximum variance in the predicted data set by a linear combination of variables of the predictive data set. Implemented in a partial least squares framework, for more details see Csala et al. (2017) <doi:10.1093/bioinformatics/btx374>. / MIT  | noarch    |
| r-srttools | 1.2.0   | Srt file is a common subtitle format for videos, it contains subtitle and when the subtitle showed. This package is for align time of srt file, and also change color, style and position of subtitle in videos, the srt file will be read as a vector into R, and can be write into srt file after modified using this package. / GPL-2   | noarch    |
| r-ssanv    | 1.1     | A set of functions to calculate sample size for two-sample difference in means tests. Does adjustments for either nonadherence or variability that comes from using data to estimate parameters. / GPL-3   | noarch    |
| r-ssbtools | 0.4.0   | Functions used by other packages from Statistics Norway are gathered. General data manipulation functions, and functions for hierarchical computations are included. The hierarchy specification functions are useful within statistical disclosure control. / Apache License 2.0   file LICENSE   | noarch    |
| r-sscor    | 0.2     | Provides the spatial sign correlation and the two-stage spatial sign correlation as well as a one-sample test for the correlation coefficient. / GPL-2   GPL-3   | noarch    |
| r-ssd      | 0.3     | ssd calculates the sample size needed to detect the differences between two sets of unordered categorical data. / GPL-2  | noarch    |
| r-ssdr     | 1.2.0   | Performs structured OLS (sOLS) and structured SIR (sSIR). / GPL-2  | noarch    |
| r-sse      | 0.7.1   | Provides functions to evaluate user-defined power functions for a parameter range, and draws a sensitivity plot. It also provides a resampling procedure for semi-parametric sample size estimation and methods for adding information to a Sweave report. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name          | Version | Summary/License  | Platforms   |
|---------------|---------|--|---|
| r-ssh.utils   | 1.0     | This package provides utility functions for system command execution, both locally and remotely using ssh/scp. The command output is captured and provided to the caller. This functionality is intended to streamline calling shell commands from R, retrieving and using their output, while instrumenting the calls with appropriate error handling. NOTE: this first version is limited to unix with local and remote systems running bash as the default shell. / Apache License (== 2.0)   | linux-64  |
| r-ssize.fdr   | 1.2     | This package contains a set of functions that calculates appropriate sample sizes for one-sample t-tests, two-sample t-tests, and F-tests for microarray experiments based on desired power while controlling for false discovery rates. For all tests, the standard deviations (variances) among genes can be assumed fixed or random. This is also true for effect sizes among genes in one-sample and two sample experiments. Functions also output a chart of power versus sample size, a table of power at different sample sizes, and a table of critical test values at different sample sizes. / GPL-3 | noarch  |
| r-ssm         | 1.0.1   | Creates an S4 class SSM and defines functions for fitting smooth supersaturated models, a polynomial model with spline-like behaviour. Functions are defined for the computation of Sobol indices for sensitivity analysis and plotting the main effects using FANOVA methods. It also implements the estimation of the SSM metamodel error using a GP model with a variety of defined correlation functions. / GPL-3  | noarch  |
| r-sss         | 0.1_0   | Tools to import survey files in the .sss (triple-s) format. The package provides the function read.sss() that reads the .asc (or .csv) and .sss files of a triple-s survey data file. / GPL-2   GPL-3  | noarch  |
| r-sssimple    | 0.6.4   | Simulate, solve state space models / GPL-2   | noarch  |
| r-ssvd        | 1.0     | Fast iterative thresholding sparse SVD, together with an initialization algorithm / GPL-2  | noarch  |
| r-stabledist  | 0.7_1   | Density, Probability and Quantile functions, and random number generation for (skew) stable distributions, using the parametrizations of Nolan. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-stableestim | 2.1     | Estimate the four parameters of stable laws using maximum likelihood method, generalised method of moments with finite and continuum number of points, iterative Koutrouvelis regression and Kogon-McCulloch method. The asymptotic properties of the estimators (covariance matrix, confidence intervals) are also provided. / GPL-2  | noarch  |
| r-stabm       | 1.1.0   | An implementation of many measures for the assessment of the stability of feature selection. Both simple measures and measures which take into account the similarities between features are available, see Bommert et al. (2017) <doi:10.1155/2017/7907163>. / LGPL-3   | noarch  |

Table 51 – continued from previous page

| Name                    | Version | Summary/License  | Platforms  |
|-------------------------|---------|--|--|
| r-stabs                 | 0.6.3   | Resampling procedures to assess the stability of selected variables with additional finite sample error control for high-dimensional variable selection procedures such as Lasso or boosting. Both, standard stability selection (Meinshausen & Bühlmann, 2010, <doi:10.1111/j.1467-9868.2010.00740.x>) and complementary pairs stability selection with improved error bounds (Shah & Samworth, 2013, <doi:10.1111/j.1467-9868.2011.01034.x>) are implemented. The package can be combined with arbitrary user specified variable selection approaches. / GPL-2   | noarch   |
| r-stackoverflow         | 0.3.0   | Helper functions collected from StackOverflow.com, a question and answer site for professional and enthusiast programmers. / CC BY-SA 4.0  | noarch   |
| r-stacomirtools         | 0.5.3   | S4 class wrappers for the ‘ODBC’ connection, also provides some utilities to paste small datasets to clipboard, rename columns. It is used by the package ‘stacomir’ for connections to the database. Development versions of ‘stacomir’ are available in R-forge. / GPL-2   | noarch   |
| r-stagedchoicesplinemix | 1.0.0   | Analyzing a mixture of two-stage logistic regressions with fixed candidate knots. See Bruch, E., F. Feinberg, K. Lee (in press)<DOI:10.1073/pnas.1522494113>. / GPL-2  | noarch   |
| r-stakeholderanalysis   | 1.2     | Proposes an original instrument for measuring stakeholder influence on the development of an infrastructure project that is carried through by a municipality, drawing on stakeholder classifications (Mitchell, Agle, & Wood, 1997) and input-output modelling (Hester & Adams, 2013). Mitchell R., Agle B.R., & Wood D.J. <doi:10.2307/259247> Hester, P.T., & Adams, K.M. (2013) <doi:10.1016/j.procs.2013.09.282>. / GPL-2   | noarch   |
| r-stand                 | 2.0     | Provides functions for the analysis of occupational and environmental data with non-detects. Maximum likelihood (ML) methods for censored log-normal data and non-parametric methods based on the product limit estimate (PLE) for left censored data are used to calculate all of the statistics recommended by the American Industrial Hygiene Association (AIHA) for the complete data case. Functions for the analysis of complete samples using exact methods are also provided for the lognormal model. Revised from 2007-11-05 ‘survfit~1’. / GPL-2   | noarch   |
| r-standardize           | 0.2.1   | Tools which allow regression variables to be placed on similar scales, offering computational benefits as well as easing interpretation of regression output. / GPL-3  | noarch   |
| r-standardizetext       | 1.0     | Standardizes text according to a template; particularly useful for country names. / GPL-3  | noarch   |
| r-stanheaders           | 2.18.1  | The C header files of the Stan project are provided by this package, but it contains no R code, vignettes, or function documentation. There is a shared object containing part of the ‘CVODES’ library, but it is not accessible from R. ‘StanHeaders’ is only useful for developers who want to utilize the ‘LinkingTo’ directive of their package’s DESCRIPTION file to build on the Stan library without incurring unnecessary dependencies. The Stan project develops a probabilistic programming language that implements full or approximate Bayesian statistical inference via Markov Chain Monte Carlo or ‘variational’ methods and implements (optionally penalized) maximum likelihood estimation via optimization. The Stan library includes an advanced automatic differentiation scheme, ‘templated’ statistical and linear algebra functions that can handle the automatically ‘differentiable’ scalar types (and doubles, ‘ints’, etc.), and a parser for the Stan language. The ‘rstan’ package provides user-facing R functions to parse, compile, test, estimate, and analyze Stan models. / BSD_3_clause file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                           | Version | Summary/License  | Platforms |
|--------------------------------|---------|--|-----------|
| <a href="#">r-staplr</a>       | 2.9.0   | Provides function to manipulate PDF files: fill out PDF forms; merge multiple PDF files into one; remove selected pages from a file; rename multiple files in a directory; rotate entire pdf document; rotate selected pages of a pdf file; Select pages from a file; splits single input PDF document into individual pages; splits single input PDF document into parts from given points. / GPL-3   | noarch    |
| <a href="#">r-stargazer</a>    | 5.2.2   | Produces LaTeX code, HTML/CSS code and ASCII text for well-formatted tables that hold regression analysis results from several models side-by-side, as well as summary statistics. / GPL-2   | noarch    |
| <a href="#">r-startup</a>      | 0.12.0  | Adds support for R startup configuration via ‘.Renvirom.d’ and ‘.Rprofile.d’ directories in addition to ‘.Renvirom’ and ‘.Rprofile’ files. This makes it possible to keep private / secret environment variables separate from other environment variables. It also makes it easier to share specific startup settings by simply copying a file to a directory. / LGPL-2.1   | noarch    |
| <a href="#">r-startupmsg</a>   | 0.9.6   | Provides utilities to create or suppress start-up messages. / LGPL-3   | noarch    |
| <a href="#">r-stat2data</a>    | 2.0.0   | Datasets for the textbook Stat2: Modeling with Regression and ANOVA (second edition). The package also includes data for the first edition, Stat2: Building Models for a World of Data and a few functions for plotting diagnostics. / GPL-3   | noarch    |
| <a href="#">r-statdataml</a>   | 1.0_26  | Support for reading and writing files in StatDataML—an XML-based data exchange format. / GPL-2   | noarch    |
| <a href="#">r-statgraph</a>    | 0.2.0   | Contains statistical methods to analyze graphs, such as graph parameter estimation, model selection based on the GIC (Graph Information Criterion), statistical tests to discriminate two or more populations of graphs (ANOGVA -Analysis of Graph Variability), correlation between graphs, and clustering of graphs. / GPL-3   | noarch    |
| <a href="#">r-statmeasures</a> | 1.0     | Offers useful functions to perform day-to-day data manipulation operations, data quality checks and post modelling statistical checks. One can effortlessly change class of a number of variables to factor, remove duplicate observations from the data, create deciles of a variable, perform data quality checks for continuous (integer or numeric), categorical (factor) and date variables, and compute goodness of fit measures such as auc for statistical models. The functions are consistent for objects of class ‘data.frame’ and ‘data.table’, which is an enhanced ‘data.frame’ implemented in the package ‘data.table’. / GPL-2   | noarch    |
| <a href="#">r-statpermeco</a>  | 0.1.0   | Statistical performance measures used in the econometric literature to evaluate conditional covariance/correlation matrix estimates (MSE, MAE, Euclidean distance, Frobenius distance, Stein distance, asymmetric loss function, eigenvalue loss function and the loss function defined in Eq. (4.6) of Engle et al. (2016) <doi:10.2139/ssrn.2814555>). Additionally, compute Eq. (3.1) and (4.2) of Li et al. (2016) <doi:10.1080/07350015.2015.1092975> to compare the factor loading matrix. The statistical performance measures implemented have been previously used in, for instance, Laurent et al. (2012) <doi:10.1002/jae.1248>, Amendola et al. (2015) <doi:10.1002/for.2322> and Becker et al. (2015) <doi:10.1016/j.ijforecast.2013.11.007>. / GPL-2 | noarch    |
| <a href="#">r-statprograms</a> | 0.2.0   | A small collection of data on graduate statistics programs from the United States. / MIT   | noarch    |
| <a href="#">r-stcov</a>        | 0.1.0   | Estimates a covariance matrix using Stein’s isotonized covariance estimator, or a related estimator suggested by Haff. / GPL-2   | noarch    |
| <a href="#">r-stddiff</a>      | 2.0     | Contains three main functions including stddiff.numeric(), stddiff.binary() and stddiff.category(). These are used to calculate the standardized difference between two groups. It is especially used to evaluate the balance between two groups before and after propensity score matching. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name           | Version | Summary/License   | Platforms |
|----------------|---------|---|-----------|
| r-steinernet   | 3.0.1   | A set of functions for finding and analysing Steiner trees. It has applications in biological pathway network analysis. Sadeghi (2013) <doi:10.1186/1471-2105-14-144>. / GPL-3  | noarch    |
| r-steiniv      | 0.1.1   | Routines for computing different types of linear estimators, based on instrumental variables (IVs), including the semi-parametric Stein-like (SPS) estimator, originally introduced by Judge and Mittelhammer (2004) <DOI:10.1198/016214504000000430>. / GPL-2  | noarch    |
| r-stellar      | 0.3.3   | A package to manage and display stellar tracks and isochrones from Pisa low-mass database. Includes tools for isochrones construction and tracks interpolation. / GPL-2   | noarch    |
| r-stem         | 1.0     | Estimation of the parameters of a spatio-temporal model using the EM algorithm, estimation of the parameter standard errors using a spatio-temporal parametric bootstrap, spatial mapping. / GPL-2  | noarch    |
| r-stemmatology | 0.3.2   | Explore and analyse the genealogy of textual or musical traditions, from their variants, with various stemmatological methods, mainly the disagreement-based algorithms suggested by Camps and Cafiero (2015) <doi:10.1484/M.LECTIO-EB.5.102565>. / GPL-3   | noarch    |
| r-stevedore    | 0.9.1   | Work with containers over the Docker API. Rather than using system calls to interact with a docker client, using the API directly means that we can receive richer information from docker. The interface in the package is automatically generated using the ‘OpenAPI’ (a.k.a., ‘swagger’) specification, and all return values are checked in order to make them type stable. / MIT   | noarch    |
| r-theoreme     | 1.2     | Functions implementing the procedure of entropy comparison between two data samples after the renormalization of respective probability distributions with the algorithm designed by Klimontovich (Zeitschrift fur Physik B Condensed Matter. 1987, Volume 66, Issue 1, pp 125-127) and extended by Anishchenko (Proc. SPIE 2098, Computer Simulation in Nonlinear Optics. 1994, pp.130-136). The package also includes data preparation tools which can also be used separately for various applications. / GPL-2  | noarch    |
| r-sticky       | 0.5.2   | In base R, object attributes are lost when objects are modified by common data operations such as subset, filter, slice, append, extract etc. This packages allows objects to be marked as ‘sticky’ and have attributes persisted during these operations or when inserted into or extracted from recursive (i.e. list- or table-like) objects. / GPL-2   | noarch    |
| r-stinepack    | 1.4     | A consistently well behaved method of interpolation based on piecewise rational functions using Stineman’s algorithm. / GPL-2   | noarch    |
| r-stmgrp       | 1.0.1   | Rapidly build accurate genetic prediction models for genome-wide association or whole-genome sequencing study data by smooth-threshold multivariate genetic prediction (STMGP) method. Variable selection is performed using marginal association test p-values with an optimal p-value cut-off selected by Cp-type criterion. Quantitative and binary traits are modeled respectively via linear and logistic regression models. A function that works through PLINK software (Purcell et al. 2007 <DOI:10.1086/519795>, Chang et al. 2015 <DOI:10.1186/s13742-015-0047-8>) <https://www.cog-genomics.org/plink2> is provided. Covariates can be included in regression model. / GPL-2 | noarch    |

Table 51 – continued from previous page

| Name                                  | Version | Summary/License   | Platforms   |
|---------------------------------------|---------|---|---|
| <a href="#">r-stochprofml</a>         | 1.2     | This is an R package accompanying the paper Parameterizing cell-to-cell regulatory heterogeneities via stochastic transcriptional profiles by Sameer S Bajikar, Christiane Fuchs, Andreas Roller, Fabian J Theis and Kevin A Janes (PNAS 2014, 111(5), E626-635). In this paper, we measure expression profiles from small heterogeneous populations of cells, where each cell is assumed to be from a mixture of lognormal distributions. We perform maximum likelihood estimation in order to infer the mixture ratio and the parameters of these lognormal distributions from the cumulated expression measurements. / GPL-2 | noarch  |
| <a href="#">r-stockchina</a>          | 0.3.1   | With this package, users can obtain the real-time price and volume information of stocks in China market, as well as the information of the stock index. This package adopted the API from Sina Finance ( <a href="http://finance.sina.com.cn/">http://finance.sina.com.cn/</a> ). / GPL-2  | noarch  |
| <a href="#">r-stoichcalc</a>          | 1.1_3   | Given a list of substance compositions, a list of substances involved in a process, and a list of constraints in addition to mass conservation of elementary constituents, the package contains functions to build the substance composition matrix, to analyze the uniqueness of process stoichiometry, and to calculate stoichiometric coefficients if process stoichiometry is unique. (See Reichert, P. and Schuwirth, N., A generic framework for deriving process stoichiometry in environmental models, Environmental Modelling and Software 25, 1241-1251, 2010 for more details.) / GPL-2                              | noarch  |
| <a href="#">r-stopes</a>              | 0.1     | A variable selection procedure for low to moderate size linear regressions models. This method repeatedly splits the data into two sets, one for estimation and one for validation, to obtain an empirically optimized threshold which is then used to screen for variables to include in the final model. / GPL-2  | noarch  |
| <a href="#">r-stopwords</a>           | 0.9.0   | Provides multiple sources of stopwords, for use in text analysis and natural language processing. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-storr</a>               | 1.2.1   | Creates and manages simple key-value stores. These can use a variety of approaches for storing the data. This package implements the base methods and support for file system, in-memory and DBI-based database stores. / MIT   | noarch  |
| <a href="#">r-strategy</a>            | 1.0.1   | Users can build and test customized quantitative trading strategies. Some quantitative trading strategies are already implemented, e.g. various moving-average filters with trend following approaches. The implemented class called Strategy allows users to access several methods to analyze performance figures, plots and backtest the strategies. Furthermore, custom strategies can be added, a generic template is available. The custom strategies require a certain input and output so they can be called from the Strategy-constructor. / GPL-3   | noarch  |
| <a href="#">r-stratifiedbalancing</a> | 0.3.0   | Performs Stratified Covariate Balancing with Markov blanket feature selection and use of synthetic cases. See Alemi et al. (2016) <DOI:10.1111/1475-6773.12628>. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name                               | Version | Summary/License  | Platforms  |
|------------------------------------|---------|--|--|
| <a href="#">r-streammetabolism</a> | 1.1.2   | I provide functions to calculate Gross Primary Productivity, Net Ecosystem Production, and Ecosystem Respiration from single station diurnal Oxygen curves. / GPL-3  | noarch   |
| <a href="#">r-stressr</a>          | 1.0.0   | Forms queries to submit to the Cleveland Federal Reserve Bank web site's financial stress index data site. Provides query functions for both the composite stress index and the components data. By default the download includes daily time series data starting September 25, 1991. The functions return a class of either type easing or cfsi which contain a list of items related to the query and its graphical presentation. The list includes the time series data as an xts object. The package provides four lattice time series plots to render the time series data in a manner similar to the bank's own presentation. / MIT  | noarch   |
| <a href="#">r-stressstrength</a>   | 1.0.2   | Reliability of (normal) stress-strength models and for building two-sided or one-sided confidence intervals according to different approximate procedures. / GPL-3   | noarch   |
| <a href="#">r-string2adjmatrix</a> | 0.1.0   | Takes a list of character strings and forms an adjacency matrix for the times the specified characters appear together in the strings provided. For use in social network analysis and data wrangling. Simple package, comprised of three functions. / GPL-3   | noarch   |
| <a href="#">r-stringb</a>          | 0.1.13  | Base R already ships with string handling capabilities 'out- of-the-box' but lacks streamlined function names and workflow. The 'stringi' ('stringr') package on the other hand has well named functions, extensive Unicode support and allows for a streamlined workflow. On the other hand it adds dependencies and regular expression interpretation between base R functions and 'stringi' functions might differ. This packages aims at providing a solution to the use case of unwanted dependencies on the one hand but the need for streamlined text processing on the other. The packages' functions are solely based on wrapping base R functions into 'stringr'/'stringi' like function names. Along the way it adds one or two extra functions and last but not least provides all functions as generics, therefore allowing for adding methods for other text structures besides plain character vectors. / MIT | noarch   |
| <a href="#">r-stringdist</a>       | 0.9.5   | Implements an approximate string matching version of R's native 'match' function. Can calculate various string distances based on edits (Damerau-Levenshtein, Hamming, Levenshtein, optimal sting alignment), qgrams (q-gram, cosine, jaccard distance) or heuristic metrics (Jaro, Jaro-Winkler). An implementation of soundex is provided as well. Distances can be computed between character vectors while taking proper care of encoding or between integer vectors representing generic sequences. / GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-stringformattr</a>   | 0.1.2   | Pass named and unnamed character vectors into specified positions in strings. This represents an attempt to replicate some of python's string formatting. / MIT  | noarch   |

Table 51 – continued from previous page

| Name                          | Version | Summary/License   | Platforms   |
|-------------------------------|---------|---|---|
| <a href="#">r-stringi</a>     | 1.4.3   | Allows for fast, correct, consistent, portable, as well as convenient character string/text processing in every locale and any native encoding. Owing to the use of the ICU library, the package provides R users with platform-independent functions known to Java, Perl, Python, PHP, and Ruby programmers. Available features include: pattern searching (e.g., with ICU Java-like regular expressions or the Unicode Collation Algorithm), random string generation, case mapping, string transliteration, concatenation, Unicode normalization, date-time formatting and parsing, etc. / file LICENSE (FOSS)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-stringr</a>     | 1.4.0   | A consistent, simple and easy to use set of wrappers around the fantastic ‘stringi’ package. All function and argument names (and positions) are consistent, all functions deal with NA’s and zero length vectors in the same way, and the output from one function is easy to feed into the input of another. / GPL-2   file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-strip</a>       | 1.0.0   | The strip function deletes components of R model outputs that are useless for specific purposes, such as predict[ing], print[ing], summary[izing], etc. / MIT   | noarch  |
| <a href="#">r-stripless</a>   | 1.0.3   | For making Trellis-type conditioning plots without strip labels. This is useful for displaying the structure of results from factorial designs and other studies when many conditioning variables would clutter the display with layers of redundant strip labels. Settings of the variables are encoded by layout and spacing in the trellis array and decoded by a separate legend. The functionality is implemented by a single S3 generic strucplot() function that is a wrapper for the Lattice package’s xyplot() function. This allows access to all Lattice graphics capabilities in the usual way. / GPL-2   GPL-3                                   | noarch  |
| <a href="#">r-strucchange</a> | 1.5.1   | Testing, monitoring and dating structural changes in (linear) regression models. strucchange features tests/methods from the generalized fluctuation test framework as well as from the F test (Chow test) framework. This includes methods to fit, plot and test fluctuation processes (e.g., CUSUM, MOSUM, recursive/moving estimates) and F statistics, respectively. It is possible to monitor incoming data online using fluctuation processes. Finally, the breakpoints in regression models with structural changes can be estimated together with confidence intervals. Emphasis is always given to methods for visualizing the data. / GPL-2   GPL-3 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-structfdr</a>   | 1.3     | Perform more powerful false discovery control (FDR) for microbiome data, taking into account the prior phylogenetic relationship among bacteria species. As a general methodology, it is applicable to any type of (genomic) data with prior structure information. / GPL-2   | noarch  |
| <a href="#">r-stsm.class</a>  | 1.3     | This package defines an S4 class for structural time series models and provides some basic methods to work with it. / GPL-2   | noarch  |
| <a href="#">r-stuart</a>      | 0.8.0   | Construct subtests from a pool of items by using ant-colony-optimization, genetic algorithms, brute force, or random sampling. Schultze (2017) <doi:10.17169/refubium-622>. / GPL-3   | noarch  |

Table 51 – continued from previous page

| Name                              | Version | Summary/License   | Platforms |
|-----------------------------------|---------|---|-----------|
| <code>r-stubthat</code>           | 1.2.1   | Create stubs of functions for use while testing. / MIT  | noarch    |
| <code>r-stv</code>                | 1.0.1   | Implementations of the Single Transferable Vote counting system. By default, it uses the Cambridge method for surplus allocation and Droop method for quota calculation. Fractional surplus allocation and the Hare quota are available as options. / LGPL-3  | noarch    |
| <code>r-stylest</code>            | 0.1.0   | Estimates distinctiveness in speakers' (authors') style. Fits models that can be used for predicting speakers of new texts. Methods developed in Spirling et al (2018) <doi:10.2139/ssrn.3235506> (working paper). / GPL-3  | noarch    |
| <code>r-subcopem2d</code>         | 1.3     | Calculate empirical subcopula and dependence measures from a given bivariate sample, and Bernstein copula approximations. / GPL-3   | noarch    |
| <code>r-subcultcon</code>         | 1.0     | The three functions in the package compute the maximum likelihood estimates of the informants' competence scores, tests for two answer keys with known groups, and finds best split of the informants into sub-culture groups. / GPL-2   GPL-3  | noarch    |
| <code>r-subdetect</code>          | 1.1     | A test for the existence of a subgroup with enhanced treatment effect. And, a sample size calculation procedure for the subgroup detection test. / GPL-3  | noarch    |
| <code>r-subgroup</code>           | 1.1     | Produces various measures of expected treatment effect heterogeneity under an assumption of homogeneity across subgroups. Graphical presentations are created to compare these expected differences with the observed differences. / GPL-2   GPL-3  | noarch    |
| <code>r-subgroup.discovery</code> | 0.2.1   | Developed to assist in discovering interesting subgroups in high-dimensional data. The PRIM implementation is based on the 1998 paper Bump hunting in high-dimensional data by Jerome H. Friedman and Nicholas I. Fisher. <doi:10.1023/A:1008894516817> PRIM involves finding a set of rules which combined imply unusually large (or small) values of some other target variable. Specifically one tries to find a set of sub regions in which the target variable is substantially larger than overall mean. The objective of bump hunting in general is to find regions in the input (attribute/feature) space with relatively high (low) values for the target variable. The regions are described by simple rules of the type if: condition-1 and ... and condition-n then: estimated target value. Given the data (or a subset of the data), the goal is to produce a box B within which the target mean is as large as possible. There are many problems where finding such regions is of considerable practical interest. Often these are problems where a decision maker can in a sense choose or select the values of the input variables so as to optimize the value of the target variable. In bump hunting it is customary to follow a so-called covering strategy. This means that the same box construction (rule induction) algorithm is applied sequentially to subsets of the data. / GPL-3 | noarch    |
| <code>r-subgxe</code>             | 0.9.0   | Classical methods for combining summary data from genome-wide association studies (GWAS) only use marginal genetic effects and power can be compromised in the presence of heterogeneity. 'subgxe' is a R package that implements p-value assisted subset testing for association (pASTA), a method developed by Yu et al. (2019) <doi:10.1159/000496867>. pASTA generalizes association analysis based on subsets by incorporating gene-environment interactions into the testing procedure. / GPL-3   | noarch    |
| <code>r-subniche</code>           | 0.9.7   | Complementary indexes calculation to the Outlying Mean Index analysis to explore niche shift of a community and biological constraint within an Euclidean space, with graphical displays. / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name                             | Version | Summary/License  | Platforms |
|----------------------------------|---------|--|-----------|
| <a href="#">r-subpathwaygmir</a> | 1.0     | Routines for identifying metabolic subpathways mediated by microRNAs (miRNAs) through topologically locating miRNAs and genes within reconstructed Kyoto Encyclopedia of Genes and Genomes (KEGG) metabolic pathway graphs embedded by miRNAs. (1) This package can obtain the reconstructed KEGG metabolic pathway graphs with genes and miRNAs as nodes, through converting KEGG metabolic pathways to graphs with genes as nodes and compounds as edges, and then integrating miRNA-target interactions verified by low-throughput experiments from four databases (TarBase, miRecords, mirTarBase and miR2Disease) into converted pathway graphs. (2) This package can locate metabolic subpathways mediated by miRNAs by topologically analyzing the lenient distance of miRNAs and genes within reconstructed KEGG metabolic pathway graphs. (3) This package can identify significantly enriched miRNA-mediated metabolic subpathways based on located subpathways by hypergenomic test. (4) This package can support six species for metabolic subpathway identification, such as caenorhabditis elegans, drosophila melanogaster, danio rerio, homo sapiens, mus musculus and rattus norvegicus, and user only need to update interested organism-specific environment variables. / GPL-2 | noarch    |
| <a href="#">r-subsamp</a>        | 0.1.0   | This subsample winner algorithm (SWA) for regression with a large-p data (X, Y) selects the important variables (or features) among the p features X in explaining the response Y. The SWA first uses a base procedure, here a linear regression, on each of subsamples randomly drawn from the p variables, and then computes the scores of all features, i.e., the p variables, according to the performance of these features collected in each of the subsample analyses. It then obtains the ‘semifinalist’ of the features based on the resulting scores and determines the ‘finalists’, i.e., the important features, from the ‘semifinalist’. Fan, Sun and Qiao (2017) < <a href="http://sr2c.case.edu/swa-reg/">http://sr2c.case.edu/swa-reg/</a> >. / GPL-2   GPL-3  | noarch    |
| <a href="#">r-sudoku</a>         | 2.6     | Generates, plays, and solves Sudoku puzzles. The GUI playSudoku() needs package tkrplot if you are not on Windows. / GPL-3   | noarch    |
| <a href="#">r-sudokualt</a>      | 0.2.0   | Tools for making, retrieving, displaying and solving sudoku games. This package is an alternative to the earlier sudoku-solver package, ‘sudoku’. The present package uses a slightly different algorithm, has a simpler coding and presents a few more sugar tools, such as plot and print methods. Solved sudoku games are of some interest in Experimental Design as examples of Latin Square designs with additional balance constraints. / GPL-2  | noarch    |
| <a href="#">r-sue</a>            | 1.0     | This is a package for the subsampling method of robust estimation of linear regression models / GPL-2  | noarch    |
| <a href="#">r-suncalc</a>        | 0.5.0   | Get sun position, sunlight phases (times for sunrise, sunset, dusk, etc.), moon position and lunar phase for the given location and time. Most calculations are based on the formulas given in Astronomy Answers articles about position of the sun and the planets : < <a href="https://www.aa.quae.nl/en/reken/zonpositie.html">https://www.aa.quae.nl/en/reken/zonpositie.html</a> >. / GPL-2   | noarch    |
| <a href="#">r-sunclarco</a>      | 1.0.0   | Survival analysis for unbalanced clusters using Archimedean copulas (Prenen et al. (2016) <DOI:10.1111/rssb.12174>). / GPL-3   | noarch    |
| <a href="#">r-suntersampling</a> | 1.0.1   | Functions for drawing samples according to Sunter’s sampling design, and for computing first and second order inclusion probabilities / GPL-3  | noarch    |

Table 51 – continued from previous page

| Name               | Version | Summary/License  | Platforms  |
|--------------------|---------|--|--|
| r-supcluster       | 1.0     | Clusters features under the assumption that each cluster has a random effect and there is an outcome variable that is related to the random effects by a linear regression. In this way the cluster analysis is “supervised” by the outcome variable. An alternate specification is that features in each cluster have the same compound symmetric normal distribution, and the conditional distribution of the outcome given the features has the same coefficient for each feature in a cluster. / GPL-2   | noarch   |
| r-superdiag        | 1.1     | A Comprehensive Test Suite for Markov Chain Nonconvergence. / GPL-3  | noarch   |
| r-supermds         | 1.0.2   | Witten and Tibshirani (2011) Supervised multidimensional scaling for visualization, classification, and bipartite ranking. Computational Statistics and Data Analysis 55(1): 789-801. / GPL-2  | noarch   |
| r-supernova        | 2.0.0   | Produces ANOVA tables in the format used by Judd, McClelland, and Ryan (2017, ISBN:978-1138819832) in their introductory textbook, Data Analysis. This includes proportional reduction in error and formatting to improve ease the transition between the book and R. / GPL-3  | noarch   |
| r-superpc          | 1.09    | Supervised principal components for regression and survival analysis. Especially useful for high-dimensional data, including microarray data. / GPL-2  | noarch   |
| r-suppdist         | 1.1_9.4 | Ten distributions supplementing those built into R. Inverse Gauss, Kruskal-Wallis, Kendall’s Tau, Friedman’s chi squared, Spearman’s rho, maximum F ratio, the Pearson product moment correlation coefficient, Johnson distributions, normal scores and generalized hypergeometric distributions. In addition two random number generators of George Marsaglia are included. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-support.bws      | 0.2_0   | Provides three basic functions that support an implementation of object case (Case 1) best-worst scaling: one for converting a two-level orthogonal main-effect design/balanced incomplete block design into questions; one for creating a data set suitable for analysis; and one for calculating count-based scores. / GPL-2   | noarch   |
| r-support.bws2     | 0.2_2   | Provides three basic functions that support an implementation of Case 2 (profile case) best-worst scaling. The first is to convert an orthogonal main-effect design into questions, the second is to create a dataset suitable for analysis, and the third is to calculate count-based scores. / GPL-2   | noarch   |
| r-surrogateoutcome | 1.0     | Provides functions to estimate the proportion of treatment effect on a censored primary outcome that is explained by the treatment effect on a censored surrogate outcome/event. All methods are described in detail in Assessing the Value of a Censored Surrogate Outcome by Parast L, Tian L, and Cai T which is currently in press at Lifetime Data Analysis. The main functions are (1) R.q.event() which calculates the proportion of the treatment effect (the difference in restricted mean survival time at time t) explained by surrogate outcome information observed up to a selected landmark time, (2) R.t.estimate() which calculates the proportion of the treatment effect explained by primary outcome information only observed up to a selected landmark time, and (3) IV.event() which calculates the incremental value of the surrogate outcome information. / GPL-3 | noarch   |

Table 51 – continued from previous page

| Name               | Version | Summary/License  | Platforms  |
|--------------------|---------|--|--|
| r-surrogatetest    | 1.1     | Provides functions to test for a treatment effect in terms of the difference in survival between a treatment group and a control group using surrogate marker information obtained at some early time point in a time-to-event outcome setting. Nonparametric kernel estimation is used to estimate the test statistic and perturbation resampling is used for variance estimation. More details will be available in the future in: Parast L, Cai T, Tian L (2019). Using a Surrogate Marker for Early Testing of a Treatment Effect. Biometrics, In press. / GPL-3 | noarch   |
| r-surrosurvroc     | 0.1.0   | Nonparametric and semiparametric estimations of the time-dependent ROC curve for an incomplete failure time data with surrogate failure time endpoints. / GPL-2  | noarch   |
| r-surtex           | 0.9     | suRtex was designed for easy descriptive statistic reporting of categorical survey data (e.g., Likert scales) in LaTeX. suRtex takes a matrix or data frame and produces the LaTeX code necessary for a sideways table creation. Mean, median, standard deviation, and sample size are optional. / GPL-3   | noarch   |
| r-survawkmt2       | 1.0.0   | Tests for equality of two survival functions based on integrated weighted differences of two Kaplan-Meier curves. / GPL-2  | noarch   |
| r-survbootoutliers | 1.0     | Three new methods to perform outlier detection in a survival context. In total there are six methods provided, the first three methods are traditional residual-based outlier detection methods, the second three are the concordance-based. Package developed during the work on the two following publications: Pinto J., Carvalho A. and Vinga S. (2015) <doi:10.5220/0005225300750082>; Pinto J.D., Carvalho A.M., Vinga S. (2015) <doi:10.1007/978-3-319-27926-8_22>. / GPL-2   | noarch   |
| r-survexp.fr       | 1.0     | Relative survival, AER and SMR based on French death rates / GPL-2   | noarch   |
| r-surveyeditor     | 1.0     | Help generate slides for surveys or experiments. The resulted slides allow the subject to respond with the use of the mouse (usual keyboard input is replaced with clicking on a virtual keyboard on the slide). Subjects' responses are saved to the user- specified location in the form of R-readable text file. To allow flexibility, each function in this package generates a particular type of slides thus general R function writing skills are required to compile these edited slides. / GPL-2  | noarch   |
| r-surveyoutliers   | 0.1     | At present, the only functionality is the calculation of optimal one-sided winsorizing cutoffs. The main function is optimal.onesided.cutoff.bygroup. It calculates the optimal tuning parameter for one-sided winsorisation, and so calculates winsorised values for a variable of interest. See the help file for this function for more details and an example. / GPL-2   GPL-3   | noarch   |
| r-survgini         | 1.0     | The Gini concentration test for survival data is a nonparametric test based on the Gini index for testing the equality of two survival distributions from the point of view of concentration. The package compares different nonparametric tests (asymptotic Gini test, permutation Gini test, log-rank test, Gray-Tsiatis test and Wilcoxon test) and computes their p-values. / GPL-2  | noarch   |
| r-survival         | 2.44    | Contains the core survival analysis routines, including definition of Surv objects, Kaplan-Meier and Aalen-Johansen (multi-state) curves, Cox models, and parametric accelerated failure time models. / LGPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name                             | Version | Summary/License  | Platforms |
|----------------------------------|---------|--|-----------|
| <a href="#">r-survjamda</a>      | 1.0.2   | Three breast cancer gene expression data sets that can be used for package ‘survJamda’. This package contains the gene expression and phenotype data of GSE1992, GSE3143 and GSE4335. / GPL-2  | noarch    |
| <a href="#">r-survlong</a>       | 1.0     | Kernel weighting methods for estimation of proportional hazards models with intermittently observed longitudinal covariates. / GPL-2   | noarch    |
| <a href="#">r-survregcenscov</a> | 1.4     | The main function of this package allows estimation of a Weibull Regression for a right-censored endpoint, one interval-censored covariate, and an arbitrary number of non-censored covariates. Additional functions allow to switch between different parametrizations of Weibull regression used by different R functions, inference for the mean difference of two arbitrarily censored Normal samples, and estimation of canonical parameters from censored samples for several distributional assumptions. / GPL-2  | noarch    |
| <a href="#">r-survrm2</a>        | 1.0.2   | Performs two-sample comparisons using the restricted mean survival time (RMST) as a summary measure of the survival time distribution. Three kinds of between-group contrast metrics (i.e., the difference in RMST, the ratio of RMST and the ratio of the restricted mean time lost (RMTL)) are computed. It performs an ANCOVA-type covariate adjustment as well as unadjusted analyses for those measures. / GPL-2  | noarch    |
| <a href="#">r-survrm2adapt</a>   | 1.0.1   | Performs the procedure proposed by Horiguchi et al. (2018) <doi:10.1002/sim.7661>. The method specifies a set of truncation time points tau’s for calculating restricted mean survival times (RMST), performs testing for equality, and estimates the difference in RMST between two groups at the specified tau’s. Multiplicity by specifying several tau’s is taken into account in this procedure. / GPL-2  | noarch    |
| <a href="#">r-survtrunc</a>      | 0.1.0   | Package performs Cox regression and survival distribution function estimation when the survival times are subject to double truncation. The estimation procedure for each method involves inverse probability weighting, where the weights correspond to the inverse of the selection probabilities and are estimated using the survival times and truncation times only. Both methods require that the survival and truncation times are quasi-independent. A test for checking this independence assumption is also included in this package. The functions available in this package for Cox regression, survival distribution function estimation, and testing independence under double truncation are based on the following methods, respectively: Rennert and Xie (2017) <doi:10.1111/biom.12809>, Shen (2010) <doi:10.1007/s10463-008-0192-2>, Martin and Betensky (2005) <doi:10.1198/016214504000001538>. / GPL-2 | noarch    |
| <a href="#">r-svapls</a>         | 1.4     | Accurate identification of genes that are truly differentially expressed over two sample varieties, after adjusting for hidden subject-specific effects of residual heterogeneity. / GPL-3   | noarch    |
| <a href="#">r-svdvisual</a>      | 1.1     | Some visualization tools based on Singular Value Decomposition / GPL-2   | noarch    |
| <a href="#">r-svenssonm</a>      | 0.1.0   | Obtain parameters of Svensson’s Method, including percentage agreement, systematic change and individual change. Also, the contingency table can be generated. Svensson’s Method is a rank-invariant nonparametric method for the analysis of ordered scales which measures the level of change both from systematic and individual aspects. For the details, please refer to Svensson E. Analysis of systematic and random differences between paired ordinal categorical data [dissertation]. Stockholm: Almqvist & Wiksell International; 1993. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name                       | Version | Summary/License  | Platforms |
|----------------------------|---------|--|-----------|
| <code>r-svgpanzoom</code>  | 0.3.3   | This ‘htmlwidget’ provides pan and zoom interactivity to R graphics, including ‘base’, ‘lattice’, and ‘ggplot2’. The interactivity is provided through the ‘svg-pan-zoom.js’ library. Various options to the widget can tailor the pan and zoom experience to nearly any user desire. / MIT  | noarch    |
| <code>r-svgui</code>       | 1.0.0   | The SciViews svGUI package eases the management of Graphical User Interfaces (GUI) in R. It is independent from any particular GUI widgets (Tk, Gtk2, native, ...). It centralizes info about GUI elements currently used, and it dispatches GUI calls to the particular toolkits in use in function of the context (is R run at the terminal, within a Tk application, a HTML page?). / GPL-2 | noarch    |
| <code>r-svmisc</code>      | 1.1.0   | Miscellaneous functions for SciViews or general use: manage a temporary environment attached to the search path for temporary variables you do not want to save() or load(), test if Aqua, Mac, Win, ... Show progress bar, etc. / GPL-2   | noarch    |
| <code>r-svmplus</code>     | 1.0.1   | Implementation of Support Vector Machines Plus (SVM) for classification problems. See (Vladimir et. al, 2009, <doi:10.1016/j.neunet.2009.06.042>) for theoretical details and see (Li et. al, 2016, <https://github.com/okbalefthanded/svmplus_matlab>) for implementation details in ‘MATLAB’. / GPL-3  | noarch    |
| <code>r-svn</code>         | 1.0     | Determines networks of significant synchronization between the discrete states of nodes; see Tumminello et al <doi:10.1371/journal.pone.0017994>. / GPL (>= 2.0)   | noarch    |
| <code>r-svs</code>         | 1.1.0   | Various tools for semantic vector spaces, such as correspondence analysis (simple, multiple and discriminant), latent semantic analysis, probabilistic latent semantic analysis, non-negative matrix factorization, latent class analysis and EM clustering. Furthermore, there are specialized distance measures, plotting functions and some helper functions. / GPL-3                       | noarch    |
| <code>r-svsweave</code>    | 0.9.8   | Supporting functions for the GUI API (Sweave functions) / GPL-2  | noarch    |
| <code>r-svunit</code>      | 0.7.1   | A complete unit test system and functions to implement its GUI part / GPL-2  | noarch    |
| <code>r-swagger</code>     | 3.9.2   | A collection of ‘HTML’, ‘JavaScript’, and ‘CSS’ assets that dynamically generate beautiful documentation from a ‘Swagger’ compliant API: <https://swagger.io/specification/>. / Apache License 2.0   file LICENSE  | noarch    |
| <code>r-swapclass</code>   | 1.0.1   | A null model randomizing semi-quantitative multi-classes (or ordinal) data by swapping sub-matrices while both the row and the column marginal sums are held constant. / GPL-3   | noarch    |
| <code>r-swcrtdesign</code> | 3.0     | A set of tools for examining the design and analysis aspects of stepped wedge cluster randomized trials (SW CRT) based on a repeated cross-sectional sampling scheme (Hussey MA and Hughes JP (2007) Contemporary Clinical Trials 28:182-191. <doi:10.1016/j.cct.2006.05.007>). / GPL-2  | noarch    |
| <code>r-swdft</code>       | 1.0.0   | Implements the Sliding Window Discrete Fourier Transform (SWDFT). Also provides statistical methods based on the SWDFT, and graphical tools to display the outputs. / MIT  | noarch    |
| <code>r-sweidnumbr</code>  | 1.4.1   | Structural handling of identity numbers used in the Swedish administration such as personal identity numbers (‘personnummer’) and organizational identity numbers (‘organisationsnummer’). / BSD_2_clause  | noarch    |
| <code>r-swirl</code>       | 2.4.4   | Use the R console as an interactive learning environment. Users receive immediate feedback as they are guided through self-paced lessons in data science and R programming. / MIT  | noarch    |

Table 51 – continued from previous page

| Name                           | Version | Summary/License  | Platforms |
|--------------------------------|---------|--|-----------|
| <a href="#">r-swissair</a>     | 1.1.5   | Ozone, NOx (= Sum of nitrogen monoxide and nitrogen dioxide), nitrogen monoxide, ambient temperature, dew point, wind speed and wind direction at 3 sites around lake of Lucerne in Central Switzerland in 30 min time resolution for year 2004. / GPL-3   | noarch    |
| <a href="#">r-swissmrp</a>     | 0.62    | Provides a number of useful functions to employ MrP for small area prediction in Switzerland. Based on a hierarchical model and survey data one can derive cantonal preference measures. The package allows to automatize the prediction and post-stratification steps. It further provides adequate print, summary, map, and plot functions for objects of its class. / GPL-2   | noarch    |
| <a href="#">r-switchr</a>      | 0.13.5  | Provides an abstraction for managing, installing, and switching between sets of installed R packages. This allows users to maintain multiple package libraries simultaneously, e.g. to maintain strict, package-version-specific reproducibility of many analyses, or work within a development/production release paradigm. Introduces a generalized package installation process which supports multiple repository and non-repository sources and tracks package provenance. / Artistic-2.0   | noarch    |
| <a href="#">r-sybil</a>        | 2.1.5   | This Systems Biology Package (Gelius-Dietrich et. al. (2012) <doi:10.1186/1752-0509-7-125>) implements algorithms for constraint based analyses of metabolic networks, e.g. flux-balance analysis (FBA), minimization of metabolic adjustment (MOMA), regulatory on/off minimization (ROOM), robustness analysis and flux variability analysis. The package is easily extendable for additional algorithms. Most of the current LP/MILP solvers are supported via additional packages. / GPL-3   | noarch    |
| <a href="#">r-syll</a>         | 0.1_5   | Provides the hyphenation algorithm used for ‘TeX’/‘LaTeX’ and similar software, as proposed by Liang (1983, < <a href="https://tug.org/docs/liang/">https://tug.org/docs/liang/</a> >). Mainly contains the function hyphen() to be used for hyphenation/syllable counting of text objects. It was originally developed for and part of the ‘koRpus’ package, but later released as a separate package so it’s lighter to have this particular functionality available for other packages. Support for various languages needs be added on-the-fly or by plugin packages (< <a href="https://undocumeantit.github.io/repos/">https://undocumeantit.github.io/repos/</a> >); this package does not include any language specific data. Due to some restrictions on CRAN, the full package sources are only available from the project homepage. To ask for help, report bugs, request features, or discuss the development of the package, please subscribe to the koRpus-dev mailing list (< <a href="http://korporusml.reaktanz.de">http://korporusml.reaktanz.de</a> >). / GPL-3 | noarch    |
| <a href="#">r-sym.arma</a>     | 1.0     | Functions for fitting the Autoregressive and Moving Average Symmetric Model for univariate time series introduced by Maior and Cysneiros (2018), <doi:10.1007/s00362-016-0753-z>. Fitting method: conditional maximum likelihood estimation. For details see: Wei (2006), Time Series Analysis: Univariate and Multivariate Methods, Section 7.2. / GPL-2  | noarch    |
| <a href="#">r-synbreeddata</a> | 1.5     | Data sets for the ‘synbreed’ package with three data sets from cattle, maize and mice to illustrate the functions in the ‘synbreed’ R package. All data sets are stored in the gpData format introduced in the ‘synbreed’ package. This research was funded by the German Federal Ministry of Education and Research (BMBF) within the AgroClustEr Synbreed - Synergistic plant and animal breeding (FKZ 0315528A). / GPL-2  | noarch    |
| <a href="#">r-synchrony</a>    | 0.3.7   | Methods for computing spatial, temporal, and spatiotemporal statistics including: empirical univariate, bivariate and multivariate variograms; fitting variogram models; phase locking and synchrony analysis; generating autocorrelated and cross-correlated matrices. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name            | Version | Summary/License  | Platforms                                 |
|-----------------|---------|--|---|
| r-syncmove      | 0.1_0   | The function 'syncSubsample' subsamples temporal data of different entities so that the result only contains synchronal events. The function 'mci' calculates the Movement Coordination Index (MCI, see reference on help page for function 'mci') of a data set created with the function 'syncSubsample'. / GPL-2  | noarch                                    |
| r-synet         | 2.0     | Infers sympatry matrices from distributional data and analyzes them in order to identify groups of species cohesively connected. / GPL-3   | noarch                                    |
| r-syntaxr       | 0.8.0   | A set of functions for generating 'SPSS' syntax files from the R environment. / MIT  | noarch                                    |
| r-sys           | 3.2     | Drop-in replacements for the base system2() function with fine control and consistent behavior across platforms. Supports clean interruption, timeout, background tasks, and streaming STDIN / STDOUT / STDERR over binary or text connections. Arguments on Windows automatically get encoded and quoted to work on different locales. / MIT file LICENSE   | linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-t2eq          | 1.1     | Contains functions for applying the T <sup>2</sup> -test for equivalence. The T <sup>2</sup> -test for equivalence is a multivariate two-sample equivalence test. Distance measure of the test is the Mahalanobis distance. For multivariate normally distributed data the T <sup>2</sup> -test for equivalence is exact and UMPI. The function T2EQ() implements the T <sup>2</sup> -test for equivalence according to Wellek (2010) <DOI:10.1201/ebk1439808184>. The function T2EQ.dissolution.profiles.hoffelder() implements a variant of the T <sup>2</sup> -test for equivalence according to Hoffelder (2016) < <a href="http://www.ecv.de/suse_item.php?suseId=Zlpil8430">http://www.ecv.de/suse_item.php?suseId=Zlpil8430</a> > for the equivalence comparison of highly variable dissolution profiles. / GPL-3 | noarch                                    |
| r-tablaxlsx     | 1.2.2   | Some functions are included in this package for writing tables in Excel format suitable for distribution. / GPL-3  | noarch                                    |
| r-table1        | 1.1     | Create HTML tables of descriptive statistics, as one would expect to see as the first table (i.e. Table 1) in a medical/epidemiological journal article. / GPL-3   | noarch                                    |
| r-table1heatmap | 1.1     | Table 1 is the classical way to describe the patients in a clinical study. The amount of splits in the data in such a table is limited. Table1Heatmap draws a heatmap of all crosstables that can be generated with the data. Users can choose between showing the actual crosstables or direction of effect of associations, and highlight associations by number of patients or p-values. / LGPL-3   | noarch                                    |
| r-tablehtml     | 2.0.0   | A tool to create and style HTML tables with CSS. These can be exported and used in any application that accepts HTML (e.g. 'shiny', 'rmarkdown', 'PowerPoint'). It also provides functions to create CSS files (which also work with shiny). / MIT   | noarch                                    |
| r-tablematrix   | 0.82.0  | Provides two classes extending 'data.table' class. Simple 'tableList' class wraps 'data.table' and any additional structures together. More complex 'tableMatrix' class combines 'data.table' and 'matrix'. See < <a href="http://github.com/InferenceTechnologies/tableMatrix">http://github.com/InferenceTechnologies/tableMatrix</a> > for more information and examples. / GPL-2   | noarch                                    |
| r-tablemonster  | 1.7     | Provides a user friendly interface to generation of booktab style tables using 'xtable'. / GPL-2   | noarch                                    |
| r-tableplot     | 0.3_5   | Description: / GPL-3   | noarch                                    |

Continued on next page

Table 51 – continued from previous page

| Name                              | Version | Summary/License  | Platforms |
|-----------------------------------|---------|--|-----------|
| <a href="#">r-tablerdash</a>      | 0.1.0   | 'R' interface to the 'Tabler' HTML template. See more here < <a href="https://tabler.io">https://tabler.io</a> >. 'tablerDash' is a light 'Bootstrap 4' dashboard template. There are different layouts available such as a one page dashboard or a multi page template, where the navigation menu is contained in the navigation bar. A fancy example is available at < <a href="https://dgranjon.shinyapps.io/shinyMons/">https://dgranjon.shinyapps.io/shinyMons/</a> >. / GPL-2  | noarch    |
| <a href="#">r-tabletolongform</a> | 1.3.2   | A wrapper to a set of algorithms designed to recognise positional cues present in hierarchical for-human Tables (which would normally be interpreted visually by the human brain) to decompose, then reconstruct the data into machine-readable LongForm Dataframes. / GPL-3   | noarch    |
| <a href="#">r-tabulizerjars</a>   | 1.0.1   | 'Java' .jar files for the 'Tabula' < <a href="http://tabula.technology/">http://tabula.technology/</a> > 'Java' library, which are required by the 'tabulizer' R package. The version numbering of this package corresponds to versions of 'tabula-java' library releases < <a href="https://github.com/tabulapdf/tabula-java/releases/">https://github.com/tabulapdf/tabula-java/releases/</a> >. / MIT   | noarch    |
| <a href="#">r-tabulog</a>         | 0.1.1   | Convert semi-structured log files (such as 'Apache' access.log files) into a tabular format (data.frame) using a standard template system. / MIT   | noarch    |
| <a href="#">r-tabusearch</a>      | 1.1.1   | Tabu search algorithm for binary configurations. A basic version of the algorithm as described by Fouskakis and Draper (2007) <doi:10.1111/j.1751-5823.2002.tb00174.x>. / GPL-2  | noarch    |
| <a href="#">r-tactile</a>         | 0.2.0   | Extensions to 'lattice', providing new high-level functions, methods for existing functions, panel functions, and a theme. / GPL-3   | noarch    |
| <a href="#">r-tailloss</a>        | 1.0     | Set of tools to estimate the probability in the upper tail of the aggregate loss distribution using different methods: Panjer recursion, Monte Carlo simulations, Markov bound, Cantelli bound, Moment bound, and Chernoff bound. / GPL-2   GPL-3  | noarch    |
| <a href="#">r-taipan</a>          | 0.1.2   | A tool to help create shiny apps for selecting and annotating elements of images. Users must supply images, questions, and answer choices. The user interface is a dynamic shiny app, that displays the images and questions and answer choices. The data generated can be saved to a file that can be used for subsequent analysis. The original purpose was to annotate still images from tennis video for face recognition and emotion detection purposes. / GPL-3  | noarch    |
| <a href="#">r-tandem</a>          | 1.0.2   | A two-stage regression method that can be used when various input data types are correlated, for example gene expression and methylation in drug response prediction. In the first stage it uses the upstream features (such as methylation) to predict the response variable (such as drug response), and in the second stage it uses the downstream features (such as gene expression) to predict the residuals of the first stage. In our manuscript (Aben et al., 2016, <doi:10.1093/bioinformatics/btw449>), we show that using TANDEM prevents the model from being dominated by gene expression and that the features selected by TANDEM are more interpretable. / GPL-2  | noarch    |
| <a href="#">r-tangram</a>         | 0.4     | Provides an extensible formula system to quickly and easily create production quality tables. The steps of the process are formula parser, statistical content generation from data, to rendering. Each step of the process is separate and user definable thus creating a set of building blocks for highly extensible table generation. A user is not limited by any of the choices of the package creator other than the formula grammar. For example, one could chose to add a different S3 rendering function and output a format not provided in the default package. Or possibly one would rather have Gini coefficients for their statistical content. Routines to achieve New England Journal of Medicine style, Lancet style and Hmisc::summaryM() statistics are provided. The package contains rendering for HTML5, Rmarkdown and an indexing format for use in tracing and tracking are provided. / GPL-3 | noarch    |

Table 51 – continued from previous page

| Name               | Version | Summary/License   | Platforms |
|--------------------|---------|---|-----------|
| r-taoteprogramming | 1.0     | Art-like behavior based on randomness / Unlimited   | noarch    |
| r-tapkee           | 1.0     | Wrapper for using ‘tapkee’ command line utility, it allows to run it from inside R and catch the results for further analysis and plotting. ‘Tapkee’ is a program for fast dimension reduction (see < <a href="http://tapkee.lisitsyn.me/">http://tapkee.lisitsyn.me/</a> > for more details). / GPL-2  | noarch    |
| r-tar              | 1.0     | Identification and estimation of the autoregressive threshold models with Gaussian noise, as well as positive-valued time series. The package provides the identification of the number of regimes, the thresholds and the autoregressive orders, as well as the estimation of remain parameters. The package implements the methodology from the 2005 paper: Modeling Bivariate Threshold Autoregressive Processes in the Presence of Missing Data <DOI:10.1081/STA-200054435>. / GPL-2  | noarch    |
| r-tariff           | 1.0.5   | Implement the Tariff algorithm for coding cause-of-death from verbal autopsies. The Tariff method was originally proposed in James et al (2011) <DOI:10.1186/1478-7954-9-31> and later refined as Tariff 2.0 in Serina, et al. (2015) <DOI:10.1186/s12916-015-0527-9>. Note that this package was not developed by authors affiliated with the Institute for Health Metrics and Evaluation and thus unintentional discrepancies may exist between the this implementation and the implementation available from IHME. / GPL-2   | noarch    |
| r-tarifix          | 1.0.6   | A collection of various utility and convenience functions. / GPL-2  | noarch    |
| r-tatest           | 1.0     | The ta-test is a modified two-sample or two-group t-test of Gosset (1908). In small samples with less than 15 replicates, the ta-test significantly reduces type I error rate but has almost the same power with the t-test and hence can greatly enhance reliability or reproducibility of discoveries in biology and medicine. The ta-test can test single null hypothesis or multiple null hypotheses without needing to correct p-values. / GPL-3   | noarch    |
| r-tatoo            | 1.1.1   | Functions to combine data.frames in ways that require additional effort in base R, and to add metadata (id, title, ...) that can be used for printing and xlsx export. The ‘Tatoo_report’ class is provided as a convenient helper to write several such tables to a workbook, one table per worksheet. Tatoo is built on top of ‘openxlsx’, but intimate knowledge of that package is not required to use tatoo. / MIT   | noarch    |
| r-taup.r           | 1.5     | Evaluates traveltimes and ray paths using predefined Earth (or other planet) models. Includes phase plotting routines. The IASP91 (Kennett and Engdahl, 1991 <doi:10.1111/j.1365-246X.1991.tb06724.x>) and AK135 (Kennett et al., 1995 <doi:10.1111/j.1365-246X.1995.tb03540.x>) Earth models are included, and most important arrival phases can be evaluated. / GPL-3   | noarch    |
| r-taxicabca        | 0.1.0   | Computation and visualization of Taxicab Correspondence Analysis, Choulakian (2006) <doi:10.1007/s11336-004-1231-4>. Classical correspondence analysis (CA) is a statistical method to analyse 2-dimensional tables of positive numbers and is typically applied to contingency tables (Benzecri, J.-P. (1973). L’Analyse des Donnees. Volume II. L’Analyse des Correspondances. Paris, France: Dunod). Classical CA is based on the Euclidean distance. Taxicab CA is like classical CA but is based on the Taxicab or Manhattan distance. For some tables, Taxicab CA gives more informative results than classical CA. / GPL-2 | noarch    |
| r-tbd              | 0.1.0   | Estimation of the survivor average causal effect under outcomes truncated by death, which requires the existence of a substitution variable. It can be applied to both experimental and observational data. / GPL-2   | noarch    |

Continued on next page

Table 51 – continued from previous page

| Name                             | Version | Summary/License  | Platforms |
|----------------------------------|---------|--|-----------|
| <a href="#">r-tbdiag</a>         | 0.1     | This package provides functions to assist researchers working in the field of tuberculosis diagnostics. Functions for the interpretation of two popular interferon-gamma release assays are provided, and additional functionality is planned. / MIT   | noarch    |
| <a href="#">r-tcgaretriever</a>  | 1.3     | The Cancer Genome Atlas (TCGA) is a program aimed at improving our understanding of Cancer Biology. Several TCGA Datasets are available online. 'TCGAretriever' helps accessing and downloading TCGA data hosted on 'cBioPortal' via its Web Interface (see < <a href="http://www.cbioportal.org/web_api.jsp">http://www.cbioportal.org/web_api.jsp</a> > for more information). Features of 'TCGAretriever' include: 1) it is very simple to use (get all the TCGA data you need with a few lines of code); 2) performance (smooth and reliable data download via 'httr'); 3) it is tailored for downloading large volumes of data. / GPL-2 | noarch    |
| <a href="#">r-tciapathfinder</a> | 1.0.5   | A wrapper for The Cancer Imaging Archive's REST API. The Cancer Imaging Archive (TCIA) hosts de-identified medical images of cancer available for public download, as well as rich metadata for each image series. TCIA provides a REST API for programmatic access to the data. This package provides simple functions to access each API endpoint. For more information, see < <a href="https://github.com/pamelarussell/TCIApathfinder">https://github.com/pamelarussell/TCIApathfinder</a> > and TCIA's website. / MIT   | noarch    |
| <a href="#">r-tcltk2</a>         | 1.2_1   | A series of additional Tcl commands and Tk widgets with style and various functions (under Windows: DDE exchange, access to the registry and icon manipulation) to supplement the tcltk package / LGPL-3   | noarch    |
| <a href="#">r-tdamapper</a>      | 1.0     | Topological Data Analysis using Mapper (discrete Morse theory). Generate a 1-dimensional simplicial complex from a filter function defined on the data: 1. Define a filter function (lens) on the data. 2. Perform clustering within each level set and generate one node (vertex) for each cluster. 3. For each pair of clusters in adjacent level sets with a nonempty intersection, generate one edge between vertices. The function mapper1D uses a filter function with codomain R, while the the function mapper2D uses a filter function with codomain R^2. / GPL-3   | noarch    |
| <a href="#">r-tdcor</a>          | 0.1_2   | The Time-Delay Correlation algorithm (TDCor) reconstructs the topology of a gene regulatory network (GRN) from time-series transcriptomic data. The algorithm is described in details in Lavenus et al., Plant Cell, 2015. It was initially developed to infer the topology of the GRN controlling lateral root formation in Arabidopsis thaliana. The time-series transcriptomic dataset which was used in this study is included in the package to illustrate how to use it. / GPL-2   | noarch    |
| <a href="#">r-tdpanalysis</a>    | 0.99    | Set of functions designed to help in the analysis of TDP sensors. Features includes dates and time conversion, weather data interpolation, daily maximum of tension analysis and calculations required to convert sap flow density data to sap flow rates at the tree and plot scale (For more information see : Granier (1985) <DOI:10.1051/forest:19850204> & Granier (1987) <DOI:10.1093/treephys/3.4.309>). / GPL-2  | noarch    |
| <a href="#">r-tdroc</a>          | 1.0     | Compute time-dependent ROC curve from censored survival data using non-parametric weight adjustments. / GPL-2  | noarch    |
| <a href="#">r-tdsc</a>           | 1.0.0   | Functions for performing time domain signal coding as used in Chesmore (2001) <doi:10.1016/S0003-682X(01)00009-3>, and related tasks. This package creates the standard S-matrix and A-matrix (with variable lag), has tools to convert coding matrices into distributed matrices, provides published code-books and allows for extraction of code sequences. / GPL-3  | noarch    |

Table 51 – continued from previous page

| Name                               | Version | Summary/License  | Platforms |
|------------------------------------|---------|--|-----------|
| <a href="#">r-teachingdemos</a>    | 2.10    | Demonstration functions that can be used in a classroom to demonstrate statistical concepts, or on your own to better understand the concepts or the programming. / Artistic-2.0   | noarch    |
| <a href="#">r-teachingsampling</a> | 3.4.2   | Allows the user to draw probabilistic samples and make inferences from a finite population based on several sampling designs. / GPL-2  | noarch    |
| <a href="#">r-teachnet</a>         | 0.7.1   | Can fit neural networks with up to two hidden layer and two different error functions. Also able to handle a weight decay. But just able to compute one output neuron and very slow. / GPL-2   | noarch    |
| <a href="#">r-teamr</a>            | 0.0.1   | Package of wrapper functions using R6 class to send requests to Microsoft ‘Teams’ < <a href="https://products.office.com/en-us/microsoft-teams/group-chat-software">https://products.office.com/en-us/microsoft-teams/group-chat-software</a> > through webhooks. When you need to share information or data from R to ‘Teams’, rather than copying/pasting, you can use this package to send well-formatted output from multiple R objects. / MIT   | noarch    |
| <a href="#">r-teda</a>             | 0.1.1   | The typicality and eccentricity data analysis (TEDA) framework was put forward by Angelov (2013) <DOI:10.14313/JAMRIS_2-2014/16>. It has been further developed into multiple different techniques since, and provides a non-parametric way of determining how similar an observation, from a process that is not purely random, is to other observations generated by the process. This package provides code to use the batch and recursive TEDA methods that have been published. / GPL-3 | noarch    |
| <a href="#">r-teereg</a>           | 1.1     | For fitting multiple linear regressions, the ordinary least squares approach is sensitive to outliers and/or violations of model assumptions. The trimmed elemental estimators are more robust to such situations. This package contains functions for computing the trimmed elemental estimates, as well as for creating the bias-corrected and accelerated bootstrap confidence intervals based on elemental regressions. / GPL-2  | noarch    |
| <a href="#">r-tejapi</a>           | 1.0.1   | Functions for interacting directly with the Taiwan Economic Journal API to offer data in R. For more information go to < <a href="https://api.tej.com.tw">https://api.tej.com.tw</a> >. / MIT  | noarch    |
| <a href="#">r-telegram</a>         | 0.6.0   | R wrapper around the Telegram Bot API ( <a href="http://core.telegram.org/bots/api">http://core.telegram.org/bots/api</a> ) to access Telegram’s messaging facilities with ease (e.g. you send messages, images, files from R to your smartphone). / GPL-3   | noarch    |
| <a href="#">r-telegram.bot</a>     | 2.3.1   | Provides a pure interface for the ‘Telegram Bot API’ < <a href="http://core.telegram.org/bots/api">http://core.telegram.org/bots/api</a> >. In addition to the pure API implementation, it features a number of tools to make the development of ‘Telegram’ bots with R easy and straightforward, providing an easy-to-use interface that takes some work off the programmer. / GPL-3  | noarch    |
| <a href="#">r-tempcont</a>         | 0.1.0   | Method to estimate the effect of the trend in predictor variables on the observed trend of the response variable using mixed models with temporal autocorrelation. See Fernández-Martínez et al. (2017 and 2019) <doi:10.1038/s41598-017-08755-8> <doi:10.1038/s41558-018-0367-7>. / GPL-2   | noarch    |
| <a href="#">r-tempcyclesdata</a>   | 1.0.1   | This is the data companion package to the package tempcycles. This package includes the metadata, linear, and cycling parameters from Recent geographic convergence in diurnal and annual temperature cycling flattens global thermal profiles, Wang & Dillon, Nature Climate Change, 4, 988-992 (2014). doi:10.1038/nclimate2378. / GPL-2   | noarch    |

Continued on next page

Table 51 – continued from previous page

| Name         | Version | Summary/License  | Platforms   |
|--------------|---------|--|---|
| r-tempdisagg | 0.25.0  | Temporal disaggregation methods are used to disaggregate and interpolate a low frequency time series to a higher frequency series, where either the sum, the average, the first or the last value of the resulting high frequency series is consistent with the low frequency series. Temporal disaggregation can be performed with or without one or more high frequency indicator series. Contains the methods of Chow-Lin, Santos-Silva-Cardoso, Fernandez, Litterman, Denton and Denton-Cholette. / GPL-3  | noarch  |
| r-tempor     | 1.0.4   | TEMPO (TEMPoral Modeling of Pathway Outliers) is a pathway-based outlier detection approach for finding pathways showing significant changes in temporal expression patterns across conditions. Given a gene expression data set where each sample is characterized by an age or time point as well as a phenotype (e.g. control or disease), and a collection of gene sets or pathways, TEMPO ranks each pathway by a score that characterizes how well a partial least squares regression (PLSR) model can predict age as a function of gene expression in the controls and how poorly that same model performs in the disease. TEMPO v1.0.3 is described in Pietras (2018) <doi:10.1145/3233547.3233559>. / GPL-3   | noarch  |
| r-temp       | 0.9.9   | Analysis and visualization of data from temporal sensory methods, including for temporal check-all-that-apply (TCATA) and temporal dominance of sensations (TDS). / GPL-2  | noarch  |
| r-tenispolar | 0.1.4   | Implementation of ZENIT-POLAR substitution cipher method of encryption using by default the TENIS-POLAR cipher. This last cipher of encryption became famous through the collection of Brazilian books Os Karas by the author Pedro Bandeira. For more details, see A Cryptographic Dictionary (GC&CS, 1944). / GPL-3  | noarch  |
| r-tensor     | 1.5     | The tensor product of two arrays is notionally an outer product of the arrays collapsed in specific extents by summing along the appropriate diagonals. / GPL-2  | noarch  |
| r-tensorflow | 1.13    | Interface to ‘TensorFlow’ < <a href="https://www.tensorflow.org/">https://www.tensorflow.org/</a> >, an open source software library for numerical computation using data flow graphs. Nodes in the graph represent mathematical operations, while the graph edges represent the multidimensional data arrays (tensors) communicated between them. The flexible architecture allows you to deploy computation to one or more ‘CPUs’ or ‘GPUs’ in a desktop, server, or mobile device with a single ‘API’. ‘TensorFlow’ was originally developed by researchers and engineers working on the Google Brain Team within Google’s Machine Intelligence research organization for the purposes of conducting machine learning and deep neural networks research, but the system is general enough to be applicable in a wide variety of other domains as well. / Apache License 2.0 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-tensort    | 0.1.1   | Provides methods to manipulate and store sparse tensors. Tensors are multidimensional generalizations of matrices (two dimensional) and vectors (one dimensional). / GPL-3   | noarch  |
| r-tensr      | 1.0.1   | A collection of functions for Kronecker structured covariance estimation and testing under the array normal model. For estimation, maximum likelihood and Bayesian equivariant estimation procedures are implemented. For testing, a likelihood ratio testing procedure is available. This package also contains additional functions for manipulating and decomposing tensor data sets. This work was partially supported by NSF grant DMS-1505136. Details of the methods are described in Gerard and Hoff (2015) <doi:10.1016/j.jmva.2015.01.020> and Gerard and Hoff (2016) <doi:10.1016/j.laa.2016.04.033>. / GPL-3   | noarch  |

Table 51 – continued from previous page

| Name                | Version | Summary/License   | Platforms |
|---------------------|---------|---|-----------|
| r-teqr              | 6.0.0   | The TEQR package contains software to calculate the operating characteristics for the TEQR and the ACT designs. The TEQR (toxicity equivalence range) design is a toxicity based cumulative cohort design with added safety rules. The ACT (Activity constrained for toxicity) design is also a cumulative cohort design with additional safety rules. The unique feature of this design is that dose is escalated based on lack of activity rather than on lack of toxicity and is de-escalated only if an unacceptable level of toxicity is experienced. / GPL-2  | noarch    |
| r-terapplusb        | 1.0     | This package is for the comparison of various types of AB escalation rules for dose finding trials. / LGPL-2.1  | noarch    |
| r-ternary           | 1.1.1   | Plots ternary diagrams using the standard graphics functions. An alternative to 'ggtern', which uses the 'ggplot2' family of plotting functions. / GPL-2  | noarch    |
| r-ternvis           | 1.2     | A suite of functions for visualising ternary probabilistic forecasts, as discussed in the paper by Jupp (2012) <doi:10.1098/rsta.2011.0350>. / GPL-2  | noarch    |
| r-testassay         | 0.1.0   | A common way of validating a biological assay for is through a procedure, where m levels of an analyte are measured with n replicates at each level, and if all m estimates of the coefficient of variation (CV) are less than some pre-specified level, then the assay is declared validated for precision within the range of the m analyte levels. Two limitations of this procedure are: there is no clear statistical statement of precision upon passing, and it is unclear how to modify the procedure for assays with constant standard deviation. We provide tools to convert such a procedure into a set of m hypothesis tests. This reframing motivates the m:n:q procedure, which upon completion delivers a 100q% upper confidence limit on the CV. Additionally, for a post-validation assay output of y, the method gives an “effective standard deviation interval” of log(y) plus or minus r, which is a 68% confidence interval on log(mu), where mu is the expected value of the assay output for that sample. Further, the m:n:q procedure can be straightforwardly applied to constant standard deviation assays. We illustrate these tools by applying them to a growth inhibition assay. / MIT | noarch    |
| r-testdriver        | 0.5.1   | Provides data sets for teaching statistics and data science courses. It includes a sample of data from John Edmund Kerrich's famous coinflip experiment. These are data that I use for teaching SOC 4015 / SOC 5050 at Saint Louis University (SLU). The package also contains an R Markdown template with the required formatting for assignments in my courses SOC 4015, SOC 4650, SOC 5050, and SOC 5650 at SLU. / GPL-3   | noarch    |
| r-testequavar       | 0.1.2   | Tests the hypothesis that variances are homogeneous or not using bootstrap. The procedure uses a variance-based statistic, and is derived from a normal-theory test. The test equivalently expressed the hypothesis as a function of the log contrasts of the population variances. A box-type acceptance region is constructed to test the hypothesis. See Cahoy (2010) <doi:10.1016/j.csda.2010.04.012>. / GPL-3  | noarch    |
| r-tester            | 0.1.7   | tester allows you to test characteristics of common R objects. / GPL-3  | noarch    |
| r-testfunctions     | 0.2.0   | Test functions are often used to test computer code. They are used in optimization to test algorithms and in metamodeling to evaluate model predictions. This package provides test functions that can be used for any purpose. Some functions are taken from < <a href="https://www.sfu.ca/~ssurjano">https://www.sfu.ca/~ssurjano</a> >, but their R code is not used. / GPL-3  | noarch    |
| r-testingsimilarity | 1.1     | Provides a bootstrap test which decides whether two dose response curves can be assumed as equal concerning their maximum absolute deviation. A plenty of choices for the model types are available, which can be found in the 'DoseFinding' package, which is used for the fitting of the models. See <doi:10.1080/01621459.2017.1281813> for details. / GPL-3   | noarch    |

Continued on next page

Table 51 – continued from previous page

| Name         | Version | Summary/License   | Platforms   |
|--------------|---------|---|---|
| r-testit     | 0.9     | Provides two convenience functions <code>assert()</code> and <code>test_pkg()</code> to facilitate testing R packages. / GPL  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-testscorer | 1.7.2   | GUI for entering test items and obtaining raw and transformed scores. The results are shown on the console and can be saved to a tabular text file for further statistical analysis. The user can define his own tests and scoring procedures through a GUI. / GPL-2  | noarch  |
| r-testthat   | 2.1.1   | Software testing is important, but, in part because it is frustrating and boring, many of us avoid it. ‘testthat’ is a testing framework for R that is easy learn and use, and integrates with your existing ‘workflow’. / MIT file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| r-texreg     | 1.36.2  | Converts coefficients, standard errors, significance stars, and goodness-of-fit statistics of statistical models into LaTeX tables or HTML tables/MS Word documents or to nicely formatted screen output for the R console for easy model comparison. A list of several models can be combined in a single table. The output is highly customizable. New model types can be easily implemented. / GPL-2   GPL-3   | noarch  |
| r-textgrid   | 1.0.1   | The software application Praat can be used to annotate waveform data (e.g., to mark intervals of interest or to label events). (See <a href="http://www.fon.hum.uva.nl/praat/">http://www.fon.hum.uva.nl/praat/</a> for more information about Praat.) These annotations are stored in a Praat TextGrid object, which consists of a number of interval tiers and point tiers. An interval tier consists of sequential (i.e., not overlapping) labeled intervals. A point tier consists of labeled events that have no duration. The ‘textgRid’ package provides S4 classes, generics, and methods for accessing information that is stored in Praat TextGrid objects. / GPL-3 | noarch  |
| r-textile    | 0.1.2   | Contains real images of the same textile material with/without local defects, which were used in Bui and Apley (2017) <doi:10.1080/00401706.2017.1302362>. / GPL-2  | noarch  |
| r-textometry | 0.1.4   | Statistical exploration of textual corpora using several methods from French ‘Textometrie’ (new name of ‘Lexicometrie’) and French ‘Data Analysis’ schools. It includes methods for exploring irregularity of distribution of lexicon features across text sets or parts of texts (Specificity analysis); multi-dimensional exploration (Factorial analysis), etc. Those methods are used in the TXM software. / GPL-3  | noarch  |

| Name                         | Version   | Summary/License   | Platforms   |
|------------------------------|-----------|---|---|
| <a href="#">r-texttrank</a>  | 0.3.0     | The ‘texttrank’ algorithm is an extension of the ‘Pagerank’ algorithm for text. The algorithm allows to summarize text by calculating how sentences are related to one another. This is done by looking at overlapping terminology used in sentences in order to set up links between sentences. The resulting sentence network is next plugged into the ‘Pagerank’ algorithm which identifies the most important sentences in your text and ranks them. In a similar way ‘texttrank’ can also be used to extract keywords. A word network is constructed by looking if words are following one another. On top of that network the ‘Pagerank’ algorithm is applied to extract relevant words after which relevant words which are following one another are combined to get keywords. More information can be found in the paper from Mihalcea, Rada & Tarau, Paul (2004) < <a href="http://www.aclweb.org/anthology/W04-3252">http://www.aclweb.org/anthology/W04-3252</a> >. / MPL-2.0 | noarch  |
| <a href="#">r-textshape</a>  | 1.6.0     | Tools that can be used to reshape and restructure text data. / GPL-2  | noarch  |
| <a href="#">r-textutils</a>  | 0.1.1     | Utilities for handling character vectors that store human-readable text (either plain or with markup, such as HTML or LaTeX). The package provides, in particular, functions that help with the preparation of plain-text reports (e.g. for expanding and aligning strings that form the lines of such reports); the package also provides generic functions for transforming R objects to HTML and to plain text. / GPL-3  | noarch  |
| <a href="#">r-tfdatasets</a> | 1.13.1    | Interface to ‘TensorFlow’ Datasets, a high-level library for building complex input pipelines from simple, re-usable pieces. See < <a href="https://www.tensorflow.org/programmers_guide/datasets">https://www.tensorflow.org/programmers_guide/datasets</a> > for additional details. / Apache License 2.0   | noarch  |
| <a href="#">r-tfer</a>       | 1.1       | Statistical interpretation of forensic glass transfer (Simulation of the probability distribution of recovered glass fragments). / GPL-2  | noarch  |
| <a href="#">r-tframe</a>     | 2015.12.1 | A kernel of functions for programming time series methods in a way that is relatively independently of the representation of time. Also provides plotting, time windowing, and some other utility functions which are specifically intended for time series. See the Guide distributed as a vignette, or ?tframe.Intro for more details. (User utilities are in package tfplot.) / GPL-2  | noarch  |
| <a href="#">r-tfruns</a>     | 1.4       | Create and manage unique directories for each ‘TensorFlow’ training run. Provides a unique, time stamped directory for each run along with functions to retrieve the directory of the latest run or latest several runs. / Apache License 2.0   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-tfse</a>       | 0.5.0     | A collection of useful tools for programming and writing-scripts. Several functions are simple wrappers around base R functions that extend their functionality while also providing some convenient properties—regular expression functions that automatically detect look-ahead and look-behind statements, a read-line function that suppresses incomplete-final-line warnings and automatically opens and closes connections, a version of substrings that starts from the end of strings, etc. Other functions are useful for checking whether packages are installed, omitting missing data, and showing in-use connections. / MIT  | noarch  |
| <a href="#">r-tfx</a>        | 0.1.0     | Connects R to TrueFX(tm) for free streaming real-time and historical tick-by-tick market data for dealable interbank foreign exchange rates with millisecond detail. / GPL-3  | noarch  |

Table 51 – continued from previous page

| Name            | Version | Summary/License  | Platforms   |
|-----------------|---------|--|---|
| r-tgkd          | 0.1.1   | Density, distribution function, quantile function and random generation for the Truncated Generalised Gamma Distribution (also in $\log_{10}(x)$ and $\ln(x)$ space). / GPL-3  | noarch  |
| r-tgram         | 0.2.3   | Functions to compute and plot tracheidograms, as in De Soto et al. (2011) <doi:10.1139/x11-045>. / GPL-2   | noarch  |
| r-th.data       | 1.0.1   | Contains data sets used in other packages Torsten Hothorn maintains. / GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-thankr        | 1.0.0   | Find out who maintains the packages you use in your current session or in your package library and maybe say ‘thank you’. / MIT  | noarch  |
| r-thankyoustars | 0.2.0   | A tool for starring GitHub repositories. / MIT   | noarch  |
| r-thermindex    | 0.2.0   | Calculates several thermal comfort indexes using temperature, wind speed and relative humidity values, calculating indexes such as Humidex, windchill, Discomfort Index and others. / GPL-2  | noarch  |
| r-thermocouple  | 1.0.2   | Temperature measurement data, equations and methods for thermocouples, wire RTD, thermistors, IC thermometers, bimetallic strips and the ITS-90. / GPL-3   | noarch  |
| r-thinknum      | 1.3.0   | This package interacts directly with the Thinknum API to offer data in a number of formats usable in R / GPL-2   | noarch  |
| r-threeboost    | 1.1     | This package implements a thresholded version of the EEBoost algorithm described in [Wolfson (2011, JASA)]. EEBoost is a general-purpose method for variable selection which can be applied whenever inference would be based on an estimating equation. The package currently implements variable selection based on the Generalized Estimating Equations, but can also accommodate user-provided estimating functions. Thresholded EEBoost is a generalization which allows multiple variables to enter the model at each boosting step. / GPL-3 | noarch  |
| r-threegroups   | 0.21    | Implements the Maximum Likelihood estimator for baseline, placebo, and treatment groups (three-group) experiments with non-compliance proposed by Gerber, Green, Kaplan, and Kern (2010). / GPL-2  | noarch  |
| r-threejs       | 0.3.1   | Create interactive 3D scatter plots, network plots, and globes using the ‘three.js’ visualization library (< <a href="https://threejs.org">https://threejs.org</a> >). / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-threeway      | 1.1.3   | Component analysis for three-way data arrays by means of Candecomp/Parafac, Tucker3, Tucker2 and Tucker1 models. / GPL-2   | noarch  |

Continued on next page

Table 51 – continued from previous page

| Name             | Version | Summary/License  | Platforms  |
|------------------|---------|--|--|
| r-threewords     | 0.1.0   | A connector to the ‘What3Words’ ( <a href="http://what3words.com/">http://what3words.com/</a> ) service, which represents each 3m by 3m square on earth with a unique trio of English-language words. / MIT  | noarch   |
| r-threg          | 1.0.3   | Fit a threshold regression model based on the first-hitting-time of a boundary by the sample path of a Wiener diffusion process. The threshold regression methodology is well suited to applications involving survival and time-to-event data. / GPL-2  | noarch   |
| r-thregi         | 1.0.4   | Fit a threshold regression model for Interval Censored Data based on the first-hitting-time of a boundary by the sample path of a Wiener diffusion process. The threshold regression methodology is well suited to applications involving survival and time-to-event data. / GPL-2   | noarch   |
| r-thresholdroc   | 2.7     | Functions that provide point and interval estimations of optimum thresholds for continuous diagnostic tests. The methodology used is based on minimizing an overall cost function in the two- and three-state settings. The package also provides functions for sample size determination and estimation of diagnostic accuracy measures. It also includes graphical tools. / GPL-2  | noarch   |
| r-thsls          | 0.1     | Fit the Simultaneous Systems of Linear Equations using Three-stage Least Squares. / GPL-3  | noarch   |
| r-tibble         | 2.1.1   | Provides a ‘tbl_df’ class (the ‘tibble’) that provides stricter checking and better formatting than the traditional data frame. / MIT file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-tibbrconnector | 1.5.1   | Post messages to tibbr from within R. / BSD_3_clause   | noarch   |
| r-tickexec       | 1.1     | Functions to execute orders in backtesting using tick data. A testing platform was established by the four major execution functions, namely ‘LimitBuy’, ‘LimitSell’, ‘MarketBuy’ and ‘MarketSell’, which enclosed all tedious aspects (such as queueing for order executions and calculate actual executed volumes) for order execution using tick data. Such that one can focus on the logic of strategies, rather than its execution. / GPL-3   | noarch   |
| r-tictoc         | 1.0     | This package provides the timing functions ‘tic’ and ‘toc’ that can be nested. One can record all timings while a complex script is running, and examine the values later. It is also possible to instrument the timing calls with custom callbacks. In addition, this package provides class ‘Stack’, implemented as a vector, and class ‘List’, implemented as a list, both of which support operations ‘push’, ‘pop’, ‘first’, ‘last’ and ‘clear’. / Apache License (== 2.0)   file LICENSE | noarch   |
| r-tiddlywikir    | 1.0.1   | Utilities to generate wiki reports in TiddlyWiki format. / GPL-2   | noarch   |
| r-tideharmonics  | 0.1_1   | Implements harmonic analysis of tidal and sea-level data. Over 400 harmonic tidal constituents can be estimated, all with daily nodal corrections. Time-varying mean sea-levels can also be used. / BSD_3_clause   | noarch   |
| r-tides          | 2.1     | Calculate Characteristics of Quasi-Periodic Time Series, e.g. Estuarine Water Levels. / GPL-3  | noarch   |

Table 51 – continued from previous page

| Name                         | Version | Summary/License  | Platforms   |
|------------------------------|---------|--|---|
| <a href="#">r-tidetable</a>  | 0.0.2   | Tide analysis and prediction of predominantly semi-diurnal tides with two high waters and two low waters during one lunar day (~24.842 hours, ~1.035 days). The analysis should preferably cover an observation period of at least 19 years. For shorter periods, for example, the nodal cycle can not be taken into account, which particularly affects the height calculation. The main objective of this package is to produce tide tables. / GPL-3 | noarch  |
| <a href="#">r-tidyr</a>      | 0.8.3   | An evolution of 'reshape2'. It's designed specifically for data tidying (not general reshaping or aggregating) and works well with 'dplyr' data pipelines. / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-tidyselct</a>  | 0.2.5   | A backend for the selecting functions of the 'tidyverse'. It makes it easy to implement select-like functions in your own packages in a way that is consistent with other 'tidyverse' interfaces for selection. / GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-tidytext</a>   | 0.2.0   | Text mining for word processing and sentiment analysis using 'dplyr', 'ggplot2', and other tidy tools. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-tidyverse</a>  | 1.2.1   | The 'tidyverse' is a set of packages that work in harmony because they share common data representations and 'API' design. This package is designed to make it easy to install and load multiple 'tidyverse' packages in a single step. Learn more about the 'tidyverse' at < <a href="https://tidyverse.org">https://tidyverse.org</a> >. / GPL-3   file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-tightclust</a> | 1.1     | The functions needed to perform tight clustering Algorithm. / GPL-2  | noarch  |

Continued on next page

Table 51 – continued from previous page

| Name                             | Version  | Summary/License   | Platforms   |
|----------------------------------|----------|---|---|
| <a href="#">r-tilegrams</a>      | 0.2.0    | R spatial objects for Tilegrams. Tilegrams are tiled maps where the region size is proportional to the certain characteristics of the dataset. / MIT file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">r-tilting</a>        | 1.1.1    | Implements an algorithm for variable selection in high-dimensional linear regression using the tilted correlation, a new way of measuring the contribution of each variable to the response which takes into account high correlations among the variables in a data-driven way. / GPL-2  | noarch  |
| <a href="#">r-timedate</a>       | 3043.102 | The 'timeDate' class fulfils the conventions of the ISO 8601 standard as well as of the ANSI C and POSIX standards. Beyond these standards it provides the Financial Center concept which allows to handle data records collected in different time zones and mix them up to have always the proper time stamps with respect to your personal financial center, or alternatively to the GMT reference time. It can thus also handle time stamps from historical data records from the same time zone, even if the financial centers changed day light saving times at different calendar dates. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-timedelay</a>      | 1.0.8    | We provide a toolbox to estimate the time delay between the brightness time series of gravitationally lensed quasar images via Bayesian and profile likelihood approaches. The model is based on a state-space representation for irregularly observed time series data generated from a latent continuous-time Ornstein-Uhlenbeck process. Our Bayesian method adopts scientifically motivated hyper-prior distributions and a Metropolis-Hastings within Gibbs sampler, producing posterior samples of the model parameters that include the time delay. A profile likelihood of the time delay is a simple approximation to the marginal posterior distribution of the time delay. Both Bayesian and profile likelihood approaches complement each other, producing almost identical results; the Bayesian way is more principled but the profile likelihood is easier to implement. / GPL-2 | noarch  |
| <a href="#">r-timeordered</a>    | 0.9.9    | Approaches for incorporating time into network analysis. Methods include: construction of time-ordered networks (temporal graphs); shortest-time and shortest-path-length analyses; resource spread calculations; data resampling and rarefaction for null model construction; reduction to time-aggregated networks with variable window sizes; application of common descriptive statistics to these networks; vector clock latencies; and plotting functionalities. The package supports <doi:10.1371/journal.pone.0020298>. / GPL-3   | noarch  |
| <a href="#">r-timeprojection</a> | 0.2.0    | Extract useful time components of a date object, such as day of week, weekend, holiday, day of month, etc, and put it in a data frame. This can be used to create many predictor variables out of a single time variable, which can then be used in a regression or decision tree. Also includes function plotCalendarHeatmap which draws a calendar and overlays a heatmap based on values. / GPL-3  | noarch  |

Table 51 – continued from previous page

| Name          | Version  | Summary/License   | Platforms   |
|---------------|----------|---|---|
| r-timer       | 1.1.0    | Provides a ‘timeR’ class that makes timing codes easier. One can create ‘timeR’ objects and use them to record all timings, and extract recordings as data frame for later use. / Apache License (== 2.0)   file LICENSE  | noarch  |
| r-timesboot   | 1.0      | Computes bootstrap CI for the sample ACF and periodogram / GPL-2  | noarch  |
| r-timeseries  | 3042.002 | Provides a class and various tools for financial time series. This includes basic functions such as scaling and sorting, subsetting, mathematical operations and statistical functions. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-timevis     | 0.5      | Create rich and fully interactive timeline visualizations. Timelines can be included in Shiny apps and R markdown documents, or viewed from the R console and ‘RStudio’ Viewer. ‘timevis’ includes an extensive API to manipulate a timeline after creation, and supports getting data out of the visualization into R. Based on the ‘vis.js’ Timeline module and the ‘htmlwidgets’ R package. / MIT  | noarch  |
| r-timevtree   | 0.3.1    | Estimates time varying regression effects under Cox type models in survival data using classification and regression tree. The codes in this package were originally written in S-Plus for the paper Survival Analysis with Time-Varying Regression Effects Using a Tree-Based Approach, by Xu, R. and Adak, S. (2002) <doi:10.1111/j.0006-341X.2002.00305.x>, Biometrics, 58: 305-315. Development of this package was supported by NIH grants AG053983 and AG057707, and by the UCSD Altman Translational Research Institute, NIH grant UL1TR001442. The content is solely the responsibility of the authors and does not necessarily represent the official views of the NIH. The example data are from the Honolulu Heart Program/Honolulu Asia Aging Study (HHP/HAAS). / GPL-2 | noarch  |
| r-timewarp    | 1.0.15   | Date sequence, relative date calculations, and date manipulation with business days and holidays. Works with Date and POSIXt classes. / GPL-3   | noarch  |
| r-tinsel      | 0.0.1    | Instead of nesting function calls, annotate and transform functions using #. comments. / MIT  | noarch  |
| r-tint        | 0.1.2    | A ‘tufte’-alike style for ‘rmarkdown’. A modern take on the ‘Tufte’ design for pdf and html vignettes, building on the ‘tufte’ package with additional contributions from the ‘knitr’ and ‘ggtufte’ package, and also acknowledging the key influence of ‘envisioned css’. / GPL-3  | noarch  |
| r-tinyproject | 0.6.1    | Creates useful files and folders for data analysis projects and provides functions to manage data, scripts and output files. Also provides a project template for ‘Rstudio’. / GPL-2  | noarch  |
| r-tinytest    | 1.0.0    | Provides a lightweight (zero-dependency) and easy to use unit testing framework. Main features: install tests with the package. Test results are treated as data that can be stored and manipulated. Test files are R scripts interspersed with test commands, that can be programmed over. Fully automated build-install-test sequence for packages. Skip tests when not run locally (e.g. on CRAN). Flexible and configurable output printing. Compare computed output with output stored with the package. Run tests in parallel. Extensible by other packages. Report side effects. / GPL-3   | noarch  |

| Name                              | Version | Summary/License  | Platforms   |
|-----------------------------------|---------|--|---|
| <a href="#">r-tinytex</a>         | 0.12    | Helper functions to install and maintain the ‘LaTeX’ distribution named ‘TinyTeX’ ( <a href="https://yihui.name/tinytex/">https://yihui.name/tinytex/</a> ), a lightweight, cross-platform, portable, and easy-to-maintain version of ‘TeX Live’. This package also contains helper functions to compile ‘LaTeX’ documents, and install missing ‘LaTeX’ packages automatically. / MIT file LICENSE   | linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64              |
| <a href="#">r-tiobeindexr</a>     | 0.1.1   | Get latest ‘TIOBE’ Programming Index Tables. The ‘TIOBE’ Programming Community index is an indicator of the popularity of programming languages from <a href="https://www.tiobe.com/tiobe-index/">https://www.tiobe.com/tiobe-index/</a> . / AGPL-3  | noarch  |
| <a href="#">r-tipom</a>           | 1.0.2   | TIPOM is based on a methodology that was developed in the 1960s by Bernardino Bagolini. The basic idea is to use the three simple dimensions of length, width and thickness of each lithic artefact to classify them in discrete groups and infer their function. / GPL-3  | noarch  |
| <a href="#">r-tippy</a>           | 0.0.1   | ‘Htmlwidget’ of ‘Tippyjs’ to add tooltips to ‘Shiny’ apps and ‘R markdown’ documents. / MIT  | noarch  |
| <a href="#">r-titan</a>           | 1.0_1   | GUI to analyze mass spectrometric data on the relative abundance of two substances from a titration series. / GPL-2  | noarch  |
| <a href="#">r-titanic</a>         | 0.1.0   | This data set provides information on the fate of passengers on the fatal maiden voyage of the ocean liner Titanic, summarized according to economic status (class), sex, age and survival. Whereas the base R Titanic data found by calling <code>data(Titanic)</code> is an array resulting from cross-tabulating 2201 observations, these data sets are the individual non-aggregated observations and formatted in a machine learning context with a training sample, a testing sample, and two additional data sets that can be used for deeper machine learning analysis. These data sets are also the data sets downloaded from the Kaggle competition and thus lowers the barrier to entry for users new to R or machine learning. / CC0 | noarch  |
| <a href="#">r-titrationcurves</a> | 0.1.0   | A collection of functions to plot acid/base titration curves (pH vs. volume of titrant), complexation titration curves (pMetal vs. volume of EDTA), redox titration curves (potential vs. volume of titrant), and precipitation titration curves (either pAnalyte or pTitrant vs. volume of titrant). Options include the titration of mixtures, the ability to overlay two or more titration curves, and the ability to show equivalence points. / GPL-2  | noarch  |
| <a href="#">r-tkrgl</a>           | 0.8     | Provides ‘TK’ widget tools for the ‘rgl’ package. / GPL  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

|---|---------|---|--|
| r- <a href="#">tkrplot</a>              | 0.0_24  | Simple mechanism for placing R graphics in a Tk widget / GPL  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r- <a href="#">tkrplotr</a>             | 0.1.1   | Display a plot in a Tk canvas. / GPL-2  | noarch   |
| r- <a href="#">tlemix</a>               | 0.1.3   | TLE implements a general framework for robust fitting of finite mixture models. Parameter estimation is performed using the EM algorithm. / GPL-3   | noarch   |
| r- <a href="#">tlim</a>                 | 0.1.5   | Computation of effects under linear, logistic and Poisson regression models with transformed variables. Logarithm and power transformations are allowed. Effects can be displayed both numerically and graphically in both the original and the transformed space of the variables. / GPL-2   | noarch   |
| r- <a href="#">tlmec</a>                | 0.0_2   | Fit a linear mixed effects model for censored data with Student-t or normal distributions. The errors are assumed independent and identically distributed. / GPL (>= 3.0)   | noarch   |
| r- <a href="#">tls</a>                  | 0.1.0   | Functions for point and interval estimation in error-in-variables models via total least squares or generalized total least squares method. See Golub and Van Loan (1980) <doi:10.1137/0717073>, Gleser (1981) < <a href="https://www.jstor.org/stable/2240867">https://www.jstor.org/stable/2240867</a> >, Ivan Markovsky and Huffel (2007) <doi:10.1016/j.sigpro.2007.04.004> for more information. / GPL-3 | noarch   |
| r- <a href="#">tm</a>                   | 0.7_6   | A framework for text mining applications within R. / GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r- <a href="#">tm.plugin.alceste</a>    | 1.1     | This package provides a tm Source to create corpora from a corpus prepared in the format used by the Alceste application (i.e. a single text file with inline meta-data). It is able to import both text contents and meta-data (starred) variables. / GPL-2  | noarch   |
| r- <a href="#">tm.plugin.dc</a>         | 0.2_8   | A plug-in for the text mining framework tm to support text mining in a distributed way. The package provides a convenient interface for handling distributed corpus objects based on distributed list objects. / GPL-2  | noarch   |
| r- <a href="#">tm.plugin.europresse</a> | 1.4     | Provides a ‘tm’ Source to create corpora from articles exported from the ‘Europresse’ content provider as HTML files. It is able to read both text content and meta-data information (including source, date, title, author and pages). / GPL-2   | noarch   |
| r- <a href="#">tm.plugin.factiva</a>    | 1.7     | Provides a ‘tm’ Source to create corpora from articles exported from the Dow Jones ‘Factiva’ content provider as XML or HTML files. It is able to read both text content and meta-data information (including source, date, title, author, subject, geographical coverage, company, industry, and various provider-specific fields). / GPL-2  | noarch   |

Continued on next page

Table 51 – continued from previous page

| Name                                | Version | Summary/License   | Platforms |
|-------------------------------------|---------|---|-----------|
| <code>r-tm.plugin.lexisnexis</code> | 1.4.0   | Provides a ‘tm’ Source to create corpora from articles exported from the ‘LexisNexis’ content provider as HTML files. It is able to read both text content and meta-data information (including source, date, title, author and pages). Note that the file format is highly unstable: there is no warranty that this package will work for your corpus, and you may have to adjust the code to adapt it to your particular format. / GPL-2  | noarch    |
| <code>r-tm.plugin.mail</code>       | 0.2.1   | A plug-in for the tm text mining framework providing mail handling functionality. / GPL-3   | noarch    |
| <code>r-tm.plugin.webmining</code>  | 1.3     | Facilitate text retrieval from feed formats like XML (RSS, ATOM) and JSON. Also direct retrieval from HTML is supported. As most (news) feeds only incorporate small fractions of the original text tm.plugin.webmining even retrieves and extracts the text of the original text source. / GPL-3   | noarch    |
| <code>r-tmlr</code>                 | 1.1.2   | Useful functions to connect to ‘TM1’ < <a href="https://www.ibm.com/uk-en/marketplace/planning-and-analytics">https://www.ibm.com/uk-en/marketplace/planning-and-analytics</a> > instance from R via REST API. With the functions in the package, data can be imported from ‘TM1’ via mdx view or native view, data can be sent to ‘TM1’, processes and chores can be executed, and cube and dimension metadata information can be taken. / GPL-2   | noarch    |
| <code>r-tmcalculator</code>         | 1.0.0   | The melting temperature of nucleic acid sequences can be calculated in three method, the Wallace rule (Thein & Wallace (1986) <doi:10.1016/S0140-6736(86)90739-7>), empirical formulas based on G and C content (Marmur J. (1962) <doi:10.1016/S0022-2836(62)80066-7>, Schildkraut C. (2010) <doi:10.1002/bip.360030207>, Wetmur J G (1991) <10.3109/10409239109114069>, Untergasser,A. (2012) <doi:10.1093/nar/gks596>, von Ahsen N (2001) <PMID:11673362>) and nearest neighbor thermodynamics (Breslauer K J (1986) <doi:10.1073/pnas.83.11.3746>, Sugimoto N (1996) <doi:10.1093/nar/24.22.4501>, Allawi H (1998) <doi:10.1093/nar/26.11.2694>, SantaLucia J (2004) <doi:10.1146/annurev.biophys.32.110601.141800>, Freier S (1986) <doi:10.1073/pnas.83.24.9373>, Xia T (1998) <doi:10.1021/bi9809425>, Chen JL (2012) <doi:10.1021/bi3002709>, Bommarito S (2000) <doi:10.1093/nar/28.9.1929>, Turner D H (2010) <doi:10.1093/nar/gkp892>, Sugimoto N (1995) <doi:10.1016/S0048-9697(98)00088-6>, Allawi H T (1997) <doi:10.1021/bi962590c>, Santalucia N (2005) <doi:10.1093/nar/gki918>), and it can also be corrected with salt ions and chemical compound (SantaLucia J (1996) <doi:10.1021/bi951907q>, SantaLucia J(1998) <doi:10.1073/pnas.95.4.1460>, Owczarzy R (2004) <doi:10.1021/bi034621r>, Owczarzy R (2008) <doi:10.1021/bi702363u>). / GPL-2 | noarch    |
| <code>r-tmdb</code>                 | 1.0     | Provides an R-interface to the TMDb API (see TMDb API on < <a href="http://docs.themoviedb.apiary.io/#&gt;">http://docs.themoviedb.apiary.io/#&gt;</a> ). The Movie Database (TMDb) is a popular user editable database for movies and TV shows (see < <a href="https://www.themoviedb.org&gt;">https://www.themoviedb.org</a> >). / Artistic-2.0   | noarch    |
| <code>r-tmpm</code>                 | 1.0.3   | Trauma Mortality prediction for ICD-9, ICD-10, and AIS lexicons in long or wide format based on Dr. Alan Cook’s tmpm mortality model. / GPL-2   | noarch    |

Table 51 – continued from previous page

| Name          | Version | Summary/License   | Platforms  |
|---------------|---------|---|--|
| r-tmvnorm     | 1.0.2   | Efficient sampling of truncated multivariate (scale) mixtures of normals under linear inequality constraints is nontrivial due to the analytically intractable normalizing constant. Meanwhile, traditional methods may subject to numerical issues, especially when the dimension is high and dependence is strong. Algorithms proposed by Li and Ghosh (2015) <doi: 10.1080/15598608.2014.996690> are adopted for overcoming difficulties in simulating truncated distributions. Efficient rejection sampling for simulating truncated univariate normal distribution is included in the package, which shows superiority in terms of acceptance rate and numerical stability compared to existing methods and R packages. An efficient function for sampling from truncated multivariate normal distribution subject to convex polytope restriction regions based on Gibbs sampler for conditional truncated univariate distribution is provided. By extending the sampling method, a function for sampling truncated multivariate Student's t distribution is also developed. Moreover, the proposed method and computation remain valid for high dimensional and strong dependence scenarios. Empirical results in Li and Ghosh (2015) <doi: 10.1080/15598608.2014.996690> illustrated the superior performance in terms of various criteria (e.g. mixing and integrated auto-correlation time). / GPL-2 | noarch   |
| r-tnc         | 0.1.0   | Node centrality measures for temporal networks. Available measures are temporal degree centrality, temporal closeness centrality and temporal betweenness centrality defined by Kim and Anderson (2012) <doi:10.1103/PhysRevE.85.026107>. Applying the REN algorithm by Hanke and Foraita (2017) <doi:10.1186/s12859-017-1677-x> when calculating the centrality measures keeps the computational running time linear in the number of graph snapshots. Further, all methods can run in parallel up to the number of nodes in the network. / GPL-3  | noarch   |
| r-tnet        | 3.0.14  | R package for analyzing weighted, two-mode, and longitudinal networks. / GPL-3  | noarch   |
| r-todor       | 0.0.5   | This is a simple addin to 'RStudio' that finds all 'TODO', 'FIX ME', 'CHANGED' etc. comments in your project and shows them as a markers list. / MIT  | noarch   |
| r-tokenizers  | 0.2.1   | Convert natural language text into tokens. Includes tokenizers for shingled n-grams, skip n-grams, words, word stems, sentences, paragraphs, characters, shingled characters, lines, tweets, Penn Treebank, regular expressions, as well as functions for counting characters, words, and sentences, and a function for splitting longer texts into separate documents, each with the same number of words. The tokenizers have a consistent interface, and the package is built on the 'stringi' and 'Rcpp' packages for fast yet correct tokenization in 'UTF-8'. / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-toordinal   | 1.1_0   | Language specific cardinal to ordinal number conversion. / GPL-3  | noarch   |
| r-topsis      | 1.0     | Evaluation of alternatives based on multiple criteria using TOPSIS method. / GPL-2  | noarch   |
| r-tosls       | 1.0     | Fit an Instrumental Variables Two Stage Least Squares model / Artistic-2.0  | noarch   |
| r-totalcensus | 0.6.1   | Download summary files from Census Bureau < <a href="https://www2.census.gov/">https://www2.census.gov/</a> > and extract data, in particular high resolution data at block, block group, and tract level, from decennial census and American Community Survey 1-year and 5-year estimates. / MIT   | noarch   |

Table 51 – continued from previous page

| Name                   | Version | Summary/License   | Platforms |
|------------------------|---------|---|-----------|
| r-totalcopheneticindex | 1.0.1   | For a given phylogenetic tree, calculates the Total Cophenetic Index. Reference: A. Mir, F. Rossello, L. A. Rotger (2013). A new balance index for phylogenetic trees. Math. Biosci. 241, 125-136 <doi:10.1016/j.mbs.2012.10.005>. / Unlimited  | noarch    |
| r-tourr                | 0.5.6   | Implements geodesic interpolation and basis generation functions that allow you to create new tour methods from R. / MIT  | noarch    |
| r-toxtestd             | 2.0     | Calculates sample size and dose allocation for binary toxicity tests, using the Fish Embryo Toxicity Test as example. An optimal test design is obtained by running (i) spoD (calculate the number of individuals to test under control conditions), (ii) setD (estimate the minimal sample size per treatment given the users precision requirements) and (iii) doseD (construct an individual dose scheme). / GPL-2   | noarch    |
| r-tpauc                | 2.1.1   | Tools for estimating and inferring two-way partial area under receiver operating characteristic curves (two-way pAUC), partial area under receiver operating characteristic curves (pAUC), and partial area under ordinal dominance curves (pODC). Methods includes Mann-Whitney statistic and Jackknife, etc. / GPL-2  | noarch    |
| r-tpe                  | 1.0.1   | This package implements the greedy approximation for tree preserving embedding. / MIT   | noarch    |
| r-tpes                 | 1.0.0   | A bioinformatics tool for the estimation of the tumor purity from sequencing data. It uses the set of putative clonal somatic single nucleotide variants within copy number neutral segments to call tumor cellularity. / MIT   | noarch    |
| r-track                | 1.1.9   | Automatically stores objects in files on disk so that files are rewritten when objects are changed, and so that objects are accessible but do not occupy memory until they are accessed. Keeps track of times when objects are created and modified, and caches some basic characteristics of objects to allow for fast summaries of objects. Also provides a command history mechanism that saves the last command to a history file after each command completes. / GPL-3   | noarch    |
| r-trading              | 1.2     | Contains trades from the five major assets classes and also functionality to use pricing curves, rating tables, CSAs and add-on tables. The implementation follows an object oriented logic whereby each trade inherits from more abstract classes while also the curves/tables are objects. There is a lot of functionality focusing on the counterparty credit risk calculations however the package can be used for trading applications in general. / GPL-3   | noarch    |
| r-trampr               | 1.0_8   | Matching terminal restriction fragment length polymorphism ('TRFLP') profiles between unknown samples and a database of known samples. TRAMPR facilitates analysis of many unknown profiles at once, and provides tools for working directly with electrophoresis output through to generating summaries suitable for community analyses with R's rich set of statistical functions. TRAMPR also resolves the issues of multiple 'TRFLP' profiles within a species, and shared 'TRFLP' profiles across species. / GPL-2 | noarch    |
| r-transcriber          | 0.0.0   | Transcribes audio to text with the HP IDOL API. Includes functions to upload files, retrieve transcriptions, and monitor jobs. / GPL-3  | noarch    |

|------------------|---------|---|-----------|
| r-translation.ko | 0.0.1.3 | R2version 2.1.0 and later support Korean translations of program messages. The continuous efforts have been made by < <a href="http://developer.r-project.org/TranslationTeams.html">http://developer.r-project.org/TranslationTeams.html</a> > The R Documentation files are licensed under the General Public License, version 2 or 3. This means that the pilot project to translate them into Korean has permission to reproduce them and translate them. This work is done with GNU ‘gettext’ utilities. The portable object template is updated a weekly basis or whenever changes are necessary. Comments and corrections via email to the maintainer is of course most welcome. In order to voluntarily participate in or offer your help with this translation, please contact the maintainer. To check the change and progress of Korean translation, please visit < <a href="http://www.openstatistics.net">http://www.openstatistics.net</a> >. / GPL-2 | noarch    |
| r-transmodel     | 2.1     | A unified estimation procedure for the analysis of right censored data using linear transformation models. / GPL-2  | noarch    |
| r-transp         | 0.1     | Implementation of two transportation problem algorithms. 1. North West Corner Method 2. Minimum Cost Method or Least cost method. For more technical details about the algorithms please refer below URLs. < <a href="http://www.universalteacherpublications.com/univ/ebooks/or/Ch5/nw.htm">http://www.universalteacherpublications.com/univ/ebooks/or/Ch5/nw.htm</a> >. < <a href="http://personal.maths.surrey.ac.uk/st/J.F/chapter7.pdf">http://personal.maths.surrey.ac.uk/st/J.F/chapter7.pdf</a> >. / GPL-2  | noarch    |
| r-treebase       | 0.1.4   | Interface to the API for ‘TreeBASE’ < <a href="http://treebase.org">http://treebase.org</a> > from ‘R.’ ‘TreeBASE’ is a repository of user-submitted phylogenetic trees (of species, population, or genes) and the data used to create them. / CC0  | noarch    |
| r-treeclust      | 1.1.7   | Create a measure of inter-point dissimilarity useful for clustering mixed data, and, optionally, perform the clustering. / GPL-2  | noarch    |
| r-treecm         | 1.2.2   | The centre of mass is a crucial data for arborists in order to consolidate a tree using steel or dynamic cables. Given field-recorded data on branchiness of a tree, the package: (i) computes and plots the centre of mass of the tree itself, (ii) computes branches slenderness coefficient in order to aid the arborist identify potentially dangerous branches, and (iii) computes the force acting on a ground plinth and its best position relating to the tree centre of mass, should the tree need to be stabilized by a steel cable. / GPL-2  | noarch    |
| r-treelet        | 1.1     | Treelets provides a novel construction of multi-scale bases that extends wavelets to non-smooth signals. It returns a multi-scale orthonormal basis, where the final computed basis functions are supported on nested clusters in a hierarchical tree. Both the tree and the basis, which are constructed simultaneously, reflect the internal structure of the data. / GPL-2   | noarch    |
| r-trekfont       | 0.9.3   | Provides a collection of true type and open type Star Trek-themed fonts. / GPL-3  | noarch    |
| r-trendchange    | 0.1.0   | Innovative Trend Analysis is a graphical method to examine the trends in time series data. Sequential Mann-Kendall test uses the intersection of prograde and retrograde series to indicate the possible change point in time series data. Distribution free cumulative sum charts indicate location and significance of the change point in time series. Zekai, S. (2011). <doi:10.1061/(ASCE)HE.1943-5584.0000556>. Grayson, R. B. et al. (1996). Hydrological Recipes: Estimation Techniques in Australian Hydrology. Cooperative Research Centre for Catchment Hydrology, Australia, p. 125. Sneyers, S. (1990). On the statistical analysis of series of observations. Technical note no 5 143, WMO No 725 415. Secretariat of the World Meteorological Organization, Geneva, 192 pp. / GPL-3  | noarch    |

| Name                             | Version | Summary/License  | Platforms |
|----------------------------------|---------|--|-----------|
| <a href="#">r-trendsegmentr</a>  | 1.0.0   | Performs the detection of point anomalies and linear trend changes for univariate time series by implementing the bottom-up unbalanced wavelet transformation proposed by H. Maeng and P. Fryzlewicz (2019) < <a href="http://personal.lse.ac.uk/maeng/">http://personal.lse.ac.uk/maeng/</a> >. The estimated number and locations of the change-points are returned with the piecewise-linear estimator for signal. / GPL-3  | noarch    |
| <a href="#">r-triangle</a>       | 0.12    | Provides the r, q, p, and d distribution functions for the triangle distribution. / GPL-2  | noarch    |
| <a href="#">r-triangulation</a>  | 0.5.0   | Measuring angles between points in a landscape is much easier than measuring distances. When the location of three points is known the position of the observer can be determined based solely on the angles between these points as seen by the observer. This task (known as triangulation) however requires onerous calculations - these calculations are automated by this package. / LGPL-3   | noarch    |
| <a href="#">r-trimcluster</a>    | 0.1_2   | Trimmed k-means clustering. / GPL-3  | noarch    |
| <a href="#">r-trimr</a>          | 1.0.1   | Provides various commonly-used response time trimming methods, including the recursive / moving-criterion methods reported by Van Selst and Jolicoeur (1994). By passing trimming functions raw data files, the package will return trimmed data ready for inferential testing. / GPL-3  | noarch    |
| <a href="#">r-tripsanddipr</a>   | 0.1.0   | Uses read counts for biallelic single nucleotide polymorphisms (SNPs) to compare the likelihoods for the observed read counts given that a sample is either diploid or triploid. It allows parameters to be specified to account for sequencing error rates and allelic bias. For details of the algorithm, please see Delomas (2019) <doi:10.1111/1755-0998.13073>. / MIT   | noarch    |
| <a href="#">r-tropalgebra</a>    | 0.1.1   | It includes functions like tropical addition, tropical multiplication for vectors and matrices. In tropical algebra, the tropical sum of two numbers is their minimum and the tropical product of two numbers is their ordinary sum. For more information see also I. Simon (1988) Recognizable sets with multiplicities in the tropical semi ring: Volume 324 Lecture Notes I Computer Science, pages 107-120 <doi: 10.1007/BFb0017135>. / GPL-3  | noarch    |
| <a href="#">r-tropicalsparse</a> | 0.1.0   | Some of the basic tropical algebra functionality is provided for sparse matrices by applying sparse matrix storage techniques. Some of these are addition and multiplication of vectors and matrices, dot product of the vectors in tropical form and some general equations are also solved using tropical algebra. / GPL-3   | noarch    |
| <a href="#">r-trotter</a>        | 0.6     | Class definitions and constructors for pseudo-vectors containing all permutations, combinations and subsets of objects taken from a vector. Simplifies working with structures commonly encountered in combinatorics. / GPL-3  | noarch    |
| <a href="#">r-trueskill</a>      | 0.1     | An implementation of the TrueSkill algorithm (Herbrich, R., Minka, T. and Grapel, T) in R; a Bayesian skill rating system with inference by approximate message passing on a factor graph. Used by Xbox to rank gamers and identify appropriate matches. <a href="http://research.microsoft.com/en-us/projects/trueskill/default.aspx">http://research.microsoft.com/en-us/projects/trueskill/default.aspx</a> Current version allows for one player per team. Will update as time permits. Requires R version 3.0 as it is written with Reference Classes. URL: <a href="https://github.com/bhoung/trueskill-in-r">https://github.com/bhoung/trueskill-in-r</a> Acknowledgements to Doug Zongker and Heungsub Lee for their python implementations of the algorithm and for the liberal reuse of Doug's code comments (@dougz and @sublee on github). / GPL-3 | noarch    |
| <a href="#">r-truncreg</a>       | 0.2_5   | Estimation of models for truncated Gaussian variables by maximum likelihood. / GPL-2   | noarch    |
| <a href="#">r-trust</a>          | 0.1_7   | Does local optimization using two derivatives and trust regions. Guaranteed to converge to local minimum of objective function. / MIT  | noarch    |

Table 51 – continued from previous page

| Name                  | Version   | Summary/License  | Platforms  |
|-----------------------|-----------|--|--|
| r-trustedtimestamping | 0.2.6     | Trusted Timestamps (tts) are created by incorporating a hash of a file or dataset into a transaction on the decentralized blockchain (Stellar network). The package makes use of a free service provided by < <a href="https://stellarapi.io">https://stellarapi.io</a> >. / AGPL-3  | noarch   |
| r-trycatchlog         | 1.1.4     | Advanced tryCatch() and try() functions for better error handling (logging, stack trace with source code references and support for post-mortem analysis via dump files). / GPL-3  | noarch   |
| r-tsallisqexp         | 0.9_3     | Tsallis distribution also known as the q-exponential family distribution. Provide distribution d, p, q, r functions, fitting and testing functions. Project initiated by Paul Higbie and based on Cosma Shalizi's code. / GPL-2  | noarch   |
| r-tsbox               | 0.2.0     | Time series toolkit with identical behavior for all time series classes: 'ts', 'xts', 'data.frame', 'data.table', 'tibble', 'zoo', 'timeSeries', 'tsibble', 'tis' or 'irts'. Also converts reliably between these classes. / GPL-3   | noarch   |
| r-tsdata              | 2016.8.11 | Illustrates the various 'TSdbi' packages with a vignette using time series data from several sources. The vignette also illustrates some simple time series manipulation and plotting using packages 'tframe' and 'tfplot'. / GPL-2  | noarch   |
| r-tsdecomp            | 0.2       | ARIMA-model-based decomposition of quarterly and monthly time series data. The methodology is developed and described, among others, in Burman (1980) <DOI:10.2307/2982132> and Hillmer and Tiao (1982) <DOI:10.2307/2287770>. / GPL-2   | noarch   |
| r-tsdf                | 1.1_7     | Calculate optimal Zhong's two-/three-stage Phase II designs (see Zhong (2012) <doi:10.1016/j.cct.2012.07.006>). Generate Target Toxicity decision table for Phase I dose-finding (two-/three-stage). This package also allows users to run dose-finding simulations based on customized decision table. / GPL-2  | noarch   |
| r-tsdisagg2           | 0.1.0     | Disaggregates low frequency time series data to higher frequency series. Implements the following methods for temporal disaggregation: Boot, Feibes and Lisman (1967) <DOI:10.2307/2985238>, Chow and Lin (1971) <DOI:10.2307/1928739>, Fernandez (1981) <DOI:10.2307/1924371> and Litterman (1983) <DOI:10.2307/1391858>. / GPL-2   | noarch   |
| r-tse                 | 0.1.0     | Calculates total survey error (TSE) for one or more surveys, using common scale-dependent and/or scale-independent metrics. On TSE, see: Weisberg, Herbert (2005, ISBN:0-226-89128-3); Biemer, Paul (2010) <doi:10.1093/poq/nfq058>. / GPL-2   | noarch   |
| r-tseind              | 0.1.0     | Calculates total survey error (TSE) for one or more surveys, using both scale-dependent and scale-independent metrics. Package works directly from the data set, with no hand calculations required: just upload a properly structured data set (see TESTIND and its documentation), properly input column names (see functions documentation), and run your functions. For more on TSE, see: Weisberg, Herbert (2005, ISBN:0-226-89128-3); Biemer, Paul (2010) <doi:10.1093/poq/nfq058>; Biemer, Paul et.al. (2017, ISBN:9781119041672); etc. / GPL-2 | noarch   |
| r-tseries             | 0.10_46   | Time series analysis and computational finance. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

| Name         | Version | Summary/License  | Platforms |
|--------------|---------|--|-----------|
| r-tseriesmma | 0.1.1   | Multiscale multifractal analysis (MMA) (Gierałtowski et al., 2012) <DOI:10.1103/PhysRevE.85.021915> is a time series analysis method, designed to describe scaling properties of fluctuations within the signal analyzed. The main result of this procedure is the so called Hurst surface $h(q,s)$ , which is a dependence of the local Hurst exponent $h$ (fluctuation scaling exponent) on the multifractal parameter $q$ and the scale of observation $s$ (data window width). / GPL-2   | noarch    |
| r-tsetools   | 0.1.3   | Tools for downloading and organizing data from Tehran Stock Exchange (TSE) < <a href="http://new.tse.ir/en/">http://new.tse.ir/en/</a> >. It also performs some descriptive data analysis for assets. / BSD_2_clause   | noarch    |
| r-tsewgt     | 0.1.0   | Calculates total survey error (TSE) for a survey under multiple, different weighting schemes, using both scale-dependent and scale-independent metrics. Package works directly from the data set, with no hand calculations required: just upload a properly structured data set (see TESTWGT and its documentation), properly input column names (see functions documentation), and run your functions. For more on TSE, see: Weisberg, Herbert (2005, ISBN:0-226-89128-3); Biemer, Paul (2010) <doi:10.1093/poq/nfq058>; Biemer, Paul et.al. (2017, ISBN:9781119041672); etc. / GPL-2  | noarch    |
| r-tsgsis     | 0.1     | To provide a high dimensional grouped variable selection approach for detection of whole-genome SNP effects and SNP-SNP interactions, as described in Fang et al. (2017, under review). / GPL-2  | noarch    |
| r-tsmn       | 1.0.0   | Return the first four moments of the SMN distributions (Normal, Student-t, Pearson VII, Slash or Contaminated Normal). / GPL (>= 3.0)  | noarch    |
| r-tsmode     | 0.6     | Tools for specifying time series regression models / GPL-2   | noarch    |
| r-tsne       | 0.1_3   | A pure R implementation of the t-SNE algorithm. / GPL-3  | noarch    |
| r-tsqn       | 1.0.0   | Time Series Qn is a package with applications of the Qn estimator of Rousseeuw and Croux (1993) <doi:10.1080/01621459.1993.10476408> to univariate and multivariate Time Series in time and frequency domains. More specifically, the robust estimation of autocorrelation or autocovariance matrix functions from Ma and Genton (2000, 2001) <doi:10.1111/1467-9892.00203>, <doi:10.1006/jmva.2000.1942> and Cotta (2017) <doi:10.13140/RG.2.2.14092.10883> are provided. The robust pseudo-periodogram of Molinares et. al. (2009) <doi:10.1016/j.jspi.2008.12.014> is also given. This packages also provides the M-estimator of the long-memory parameter $d$ based on the robustification of the GPH estimator proposed by Reisen et al. (2017) <doi:10.1016/j.jspi.2017.02.008>. / GPL-2 | noarch    |
| r-tstools    | 0.3.8   | Plot official statistics' time series conveniently: automatic legends, highlight windows, stacked bar charts with positive and negative contributions, sum-as-line option, two y-axes with automatic horizontal grids that fit both axes and other popular chart types. 'tstools' comes with a plethora of defaults to let you plot without setting an abundance of parameters first, but gives you the flexibility to tweak the defaults. In addition to charts, 'tstools' provides a super fast, 'data.table' backed time series I/O that allows the user to export / import long format, wide format and transposed wide format data to various file types. / GPL-2   | noarch    |
| r-tstr       | 1.2     | A ternary search tree is a type of prefix tree with up to three children and the ability for incremental string search. The package uses this ability for word auto-completion and spell checking. Includes a dataset with the 10001 most frequent English words. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name                         | Version | Summary/License  | Platforms  |
|------------------------------|---------|--|--|
| <code>r-tstutorial</code>    | 1.2.3   | Interactive laboratory of Time Series based in Box-Jenkins methodology. / GPL ( $\geq 2.0$ )   | noarch   |
| <code>r-tsvr</code>          | 1.0.0   | Tools for timescale decomposition of the classic variance ratio of community ecology. Tools are as described in Zhao et al (in prep), extending commonly used methods introduced by Peterson et al (1975) <doi: 10.2307/1936306>. / GPL-3  | noarch   |
| <code>r-ttbbeer</code>       | 1.1.0   | U.S. Department of the Treasury, Alcohol and Tobacco Tax and Trade Bureau (TTB) collects data and reports on monthly beer industry production and operations. This data package includes a collection of 10 years (2006 - 2015) worth of data on materials used at U.S. breweries in pounds reported by the Brewer's Report of Operations and the Quarterly Brewer's Report of Operations forms, ready for data analysis. This package also includes historical tax rates on distilled spirits, wine, beer, champagne, and tobacco products as individual data sets. / CC0   | noarch   |
| <code>r-ttmoment</code>      | 1.0     | Computing the first two moments of the truncated multivariate t (TMVT) distribution under the double truncation. Applying the slice sampling algorithm to generate random variates from the TMVT distribution. / GPL-2   | noarch   |
| <code>r-ttr</code>           | 0.23    | Functions and data to construct technical trading rules with R. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <code>r-tts</code>           | 1.0     | Time-Temperature Superposition analysis is often applied to frequency modulated data obtained by Dynamic Mechanic Analysis (DMA) and Rheometry in the analytical chemistry and physics areas. These techniques provide estimates of material mechanical properties (such as moduli) at different temperatures in a wider range of time. This package provides the Time-Temperature superposition Master Curve at a referred temperature by the three methods: the two wider used methods, Arrhenius based methods and WLF, and the newer methodology based on derivatives procedure. The Master Curve is smoothed by B-splines basis. The package output is composed of plots of experimental data, horizontal and vertical shifts, TTS data, and TTS data fitted using B-splines with bootstrap confidence intervals. / GPL-2 | noarch   |
| <code>r-ttplot</code>        | 1.1.1   | Implementation of Time to Target plot based on the work of Ribeiro and Rosseti (2015) <DOI:10.1007/s11590-014-0760-8>, that describe a numerical method that gives the probability of an algorithm A finds a solution at least as good as a given target value in smaller computation time than algorithm B. / GPL-2   | noarch   |
| <code>r-ttutils</code>       | 1.0_1   | Contains some auxiliary functions. / GPL-2   | noarch   |
| <code>r-ttwa</code>          | 0.8.5   | This package makes Travel To Work Area from a commuting flow data frame. / GPL ( $\geq 2.0$ )  | noarch   |
| <code>r-tubern</code>        | 0.1.0   | Get statistics and reports from YouTube. To learn more about the YouTube Analytics and Reporting API, see < <a href="https://developers.google.com/youtube/reporting/">https://developers.google.com/youtube/reporting/</a> >. / MIT   | noarch   |
| <code>r-tuckerr.mmegg</code> | 1.5.1   | Performs Three-Mode Principal Components Analysis, which carries out Tucker Models. / GPL-3  | noarch   |

Table 51 – continued from previous page

| Name             | Version | Summary/License  | Platforms |
|------------------|---------|--|-----------|
| r-tufte          | 0.5     | Provides R Markdown output formats to use Tufte styles for PDF and HTML output. / GPL-3  | noarch    |
| r-tuftehandout   | 1.2.1   | Custom template and output formats for use with rmarkdown. Produce Edward Tufte-style handouts in html formats with full support for rmarkdown features / MIT  | noarch    |
| r-tukeytrend     | 0.6     | Provides wrapper functions to the multiple marginal model function mmm() of package 'multcomp' to implement the trend test of Tukey, Ciminera and Heyse (1985) <DOI:10.2307/2530666> for general parametric models. / GPL-2  | noarch    |
| r-tumblr         | 1.1     | Provides an R-interface to the Tumblr web API (see Tumblr v2 API on <a href="https://www.tumblr.com/docs/en/api/v2">https://www.tumblr.com/docs/en/api/v2</a> ). Tumblr is a microblogging platform and social networking website ( <a href="https://www.tumblr.com">https://www.tumblr.com</a> ). / Artistic-2.0  | noarch    |
| r-tuple          | 0.4_0   | Functions to find all matches or non-matches, orphans, and duplicate or other replicated elements. / LGPL-3  | noarch    |
| r-turboem        | 2018    | Algorithms for accelerating the convergence of slow, monotone sequences from smooth, contraction mapping such as the EM and MM algorithms. It can be used to accelerate any smooth, linearly convergent acceleration scheme. A tutorial style introduction to this package is available in a vignette on the CRAN download page or, when the package is loaded in an R session, with vignette(turboEM). / GPL-2  | noarch    |
| r-turtlegraphics | 1.0_8   | An implementation of turtle graphics < <a href="http://en.wikipedia.org/wiki/Turtle_graphics">http://en.wikipedia.org/wiki/Turtle_graphics</a> >. Turtle graphics comes from Papert's language Logo and has been used to teach concepts of computer programming. / GPL-3   | noarch    |
| r-tutorial       | 0.4.3   | DataCamp Light (< <a href="https://github.com/datacamp/datacamp-light">https://github.com/datacamp/datacamp-light</a> >) is a light-weight implementation of the DataCamp UI, that allows you to embed interactive exercises inside HTML documents. The tutorial package makes it easy to create these HTML files from R Markdown files. An extension to knitr, tutorial detects appropriately formatted code chunks and replaces them with DataCamp Light readable chunks in the resulting HTML file. / MIT | noarch    |
| r-twfy           | 0.1.0   | An R wrapper around the API of TheyWorkForYou, a parliamentary monitoring site that scrapes and repackages Hansard (the UK's parliamentary record) and augments it with information from the Register of Members' Interests, election results, and voting records to provide a unified source of information about UK legislators and their activities. See < <a href="http://www.theyworkforyou.com">http://www.theyworkforyou.com</a> > for details. / GPL-3   | noarch    |
| r-twiddler       | 0.5_0   | Twiddler is an interactive tool that automatically creates a Tcl/Tk GUI for manipulating variables in any R expression. See the documentation of the function twiddle to get started. / GPL-2  | noarch    |
| r-twilio         | 0.1.0   | The Twilio web service provides an API for computer programs to interact with telephony. The included functions wrap the SMS and MMS portions of Twilio's API, allowing users to send and receive text messages from R. See < <a href="https://www.twilio.com/docs/">https://www.twilio.com/docs/</a> > for more information. / MIT  | noarch    |
| r-twitter        | 1.1.9   | Provides an interface to the Twitter web API. / Artistic-2.0   | noarch    |
| r-twitterwidget  | 0.1.1   | Include the Twitter status widgets in HTML pages created using R markdown. The package uses the Twitter javascript APIs to embed in your document Twitter cards associated to specific statuses. The main targets are regular HTML pages or dashboards. / MIT  | noarch    |

Table 51 – continued from previous page

| Name  | Version | Summary/License   | Platforms |
|---|---------|---|-----------|
| <a href="#">r-twosampletest</a> .hd         | 1.0     | For high-dimensional data whose main feature is a large number, $p$ , of variables but a small sample size, the null hypothesis that the marginal distributions of $p$ variables are the same for two groups is tested. We propose a test statistic motivated by the simple idea of comparing, for each of the $p$ variables, the empirical characteristic functions computed from the two samples. If one rejects this global null hypothesis of no differences in distributions between the two groups, a set of permutation $p$ -values is reported to identify which variables are not equally distributed in both groups. / GPL-2  | noarch    |
| <a href="#">r-twostepclogit</a>             | 1.2.5   | Conditional logistic regression with longitudinal follow up and individual-level random coefficients: A stable and efficient two-step estimation method. / GPL-2  | noarch    |
| <a href="#">r-twoway</a>                    | 0.6.2   | Carries out analyses of two-way tables with one observation per cell, together with graphical displays for an additive fit and a diagnostic plot for removable ‘non-additivity’ via a power transformation of the response. It implements Tukey’s Exploratory Data Analysis methods, including a 1-degree-of-freedom test for row*column ‘non-additivity’, linear in the row and column effects. / GPL-3  | noarch    |
| <a href="#">r-txtplot</a>                   | 1.0.3   | Provides functions to produce rudimentary ascii graphics directly in the terminal window. Provides a basic plotting function (and equivalents of curve, density, acf and barplot) as well as a boxplot function. / LGPL-3   | noarch    |
| <a href="#">r-types</a>                     | 1.0.0   | Provides a simple type annotation for R that is usable in scripts, in the R console and in packages. It is intended as a convention to allow other packages to use the type information to provide error checking, automatic documentation or optimizations. / MIT  | noarch    |
| <a href="#">r-ubcrm</a>                     | 1.0.1   | Two Phase I designs are implemented in the package: the classical 33 and the Continual Reassessment Method. Simulations tools are also available to estimate the operating characteristics of the methods with several user-dependent options. / GPL-2  | noarch    |
| <a href="#">r-ucbthesis</a>                 | 1.0     | This package contains latex, knitr and R Markdown templates that adhere to the UC Berkeley Graduate Division’s thesis guidelines. The templates are located in the inst/ directory. / GPL-2   | noarch    |
| <a href="#">r-ucr.columnnames</a>           | 0.1.0   | Changes the column names of the inputted dataset to the correct names from the Uniform Crime Report codebook for the Offenses Known and Clearance by Arrest datasets from 1998-2014. / GPL-3  | noarch    |
| <a href="#">r-udapi</a>                     | 0.1.3   | A client for the Urban Dictionary < <a href="http://www.urbandictionary.com/">http://www.urbandictionary.com/</a> > API. / MIT  | noarch    |
| <a href="#">r-udderquarterinfectiondata</a> | 1.0.0   | The udder quarter infection data set contains infection times of individual cow udder quarters with <i>Corynebacterium bovis</i> (Laevens et al. 1997 <DOI:10.3168/jds.S0022-0302(97)76295-7>). Obviously, the four udder quarters are clustered within a cow, and udder quarters are sampled only approximately monthly, generating interval-censored data. The data set contains both covariates that change within a cow (e.g., front and rear udder quarters) and covariates that change between cows (e.g., parity [the number of previous calvings]). The correlation between udder infection times within a cow also is of interest, because this is a measure of the infectivity of the agent causing the disease. Various models have been applied to address the problem of interdependence for right-censored event times. These models, as applied to this data set, can be found back in the publications found in the reference list. / GPL-3 | noarch    |

Table 51 – continued from previous page

| Name                          | Version | Summary/License   | Platforms  |
|-------------------------------|---------|---|--|
| <a href="#">r-udunits2</a>    | 0.13    | Provides simple bindings to Unidata's udunits library. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-ui</a>          | 0.1.0   | Implements functions to derive uncertainty intervals for (i) regression (linear and probit) parameters when outcome is missing not at random (non-ignorable missingness) introduced in Genbaeck, M., Stanghellini, E., de Luna, X. (2015) <doi:10.1007/s00362-014-0610-x> and Genbaeck, M., Ng, N., Stanghellini, E., de Luna, X. (2018) <doi:10.1007/s10433-017-0448-x>; and (ii) double robust and outcome regression estimators of average causal effects (on the treated) with possibly unobserved confounding introduced in Genbaeck, M., de Luna, X. (2018) <doi:10.1111/biom.13001>. / GPL-2 | noarch   |
| <a href="#">r-uiuc themes</a> | 0.2.1   | A set of custom 'R' 'Markdown' templates for documents and presentations with the University of Illinois at Urbana-Champaign (UIUC) color scheme and identity standards. / MIT  | noarch   |
| <a href="#">r-ukbabynames</a> | 0.1.1   | Full listing of UK baby names occurring more than three times per year between 1996 and 2015, and rankings of baby name popularity by decade from 1904 to 1994. / CC0   | noarch   |
| <a href="#">r-ukgasapi</a>    | 0.16    | Allows users to access live UK gas market information via National Grid's API. / GPL-2  | noarch   |
| <a href="#">r-ultimixt</a>    | 2.1     | A generic reference Bayesian analysis of unidimensional mixture distributions obtained by a location-scale parameterisation of the model is implemented. The including functions simulate and summarize posterior samples for location-scale mixture models using a weakly informative prior. There is no need to define priors for scale-location parameters except two hyperparameters in which are associated with a Dirichlet prior for weights and a simplex. / GPL (>= 2.0)   | noarch   |
| <a href="#">r-umoments</a>    | 0.1.0   | Calculates one-sample unbiased central moment estimates and two-sample pooled estimates up to 6th order, including unbiased estimates of powers and products of central moments. Provides the machinery for obtaining unbiased central moment estimators beyond 6th order. / GPL-2  | noarch   |
| <a href="#">r-umpire</a>      | 1.3.7   | The Ultimate Microrray Prediction, Reality and Inference Engine (UMPIRE) is a package to facilitate the simulation of realistic microarray data sets with link to associate outcomes. See Zhang and Coombes (2012) <doi:10.1186/1471-2105-13-S13-S1>. / Apache License (== 2.0)   | noarch   |
| <a href="#">r-unbalhaar</a>   | 2.0     | The package implements top-down and bottom-up algorithms for nonparametric function estimation in Gaussian noise using Unbalanced Haar wavelets. / GPL-2  | noarch   |

| Name         | Version | Summary/License  | Platforms  |
|--------------|---------|--|--|
| r-uncdecomp  | 0.0.4   | If a procedure consists of several stages and there are several scenarios that can be selected for each stage, uncertainty of the procedure can be decomposed by stages or scenarios. cum_uncertainty() is used to decompose uncertainty based on the cumulative uncertainty. stage_uncertainty() and scenario_uncertainty() is used to decompose uncertainty based on the second order interaction ANOVA model. In stage_uncertainty() and scenario_uncertainty(), the uncertainty from interaction effect from two stages is distributed equally to each stage. / GPL-2                        | noarch   |
| r-unf        | 2.0.6   | Computes a universal numeric fingerprint (UNF) for an R data object. UNF is a cryptographic hash or signature that can be used to uniquely identify (a version of) a rectangular dataset, or a subset thereof. UNF can be used, in tandem with a DOI, to form a persistent citation to a versioned dataset. / GPL-2  | noarch   |
| r-unicode    | 12.0.0  | Data from Unicode 12.0.0 and related utilities. / GPL-2  | noarch   |
| r-unikn      | 0.1.0   | Define and use graphical elements of corporate design manuals in R. The ‘unikn’ package provides color functions (by defining dedicated colors and color palettes, and commands for changing, viewing, and using them) and styled text elements (e.g., for marking, underlining, or plotting colored titles). The pre-defined range of colors and text functions is based on the corporate design of the University of Konstanz < <a href="https://www.uni-konstanz.de/">https://www.uni-konstanz.de/</a> >, but can be adapted and extended for other institutions and purposes. / CC BY-SA 4.0 | noarch   |
| r-uniqtag    | 1.0     | For each string in a set of strings, determine a unique tag that is a substring of fixed size k unique to that string, if it has one. If no such unique substring exists, the least frequent substring is used. If multiple unique substrings exist, the lexicographically smallest substring is used. This lexicographically smallest substring of size k is called the UniqTag of that string. / MIT   | noarch   |
| r-unitcircle | 0.1.3   | The uc.check() function checks whether the roots of a given polynomial lie outside the Unit circle. You can also easily draw an unit circle. / GPL-3   | noarch   |
| r-unitedr    | 0.3.1   | United is a software tool which can be downloaded at the following website < <a href="http://www.schroepf.net/pbm/software/united/">http://www.schroepf.net/pbm/software/united/</a> >. In general, it is a virtual manager game for football teams. This package contains helpful functions for determining an optimal formation for a virtual match in United. E.g. knowing that the opponent has a strong defensive it is advisable to beat him in the mid-field. Furthermore, this package contains functions for computing the optimal usage of hardness in a game. / GPL-2                 | noarch   |
| r-unitizer   | 1.4.8   | Simplifies regression tests by comparing objects produced by test code with earlier versions of those same objects. If objects are unchanged the tests pass, otherwise execution stops with error details. If in interactive mode, tests can be reviewed through the provided interactive environment. / GPL-2   | noarch   |
| r-units      | 0.6_2   | Support for measurement units in R vectors, matrices and arrays: automatic propagation, conversion, derivation and simplification of units; raising errors in case of unit incompatibility. Compatible with the POSIXct, Date and diff-time classes. Uses the UNIDATA udunits library and unit database for unit compatibility checking and conversion. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name           | Version | Summary/License   | Platforms  |
|----------------|---------|---|--|
| r-unittest     | 1.3.0   | Concise TAP < <a href="http://testanything.org/">http://testanything.org/</a> > compliant unit testing package. Authored tests can be run using CMD check with minimal implementation overhead. / GPL-3   | noarch   |
| r-univrng      | 1.2     | Pseudo-random number generation of 17 univariate distributions. / GPL-2   GPL-3   | noarch   |
| r-unrepx       | 1.0     | Provides half-normal plots, reference plots, and Pareto plots of effects from an unreplicated experiment, along with various pseudo-standard-error measures, simulated reference distributions, and other tools. Many of these methods are described in Daniel C. (1959) <doi:10.1080/00401706.1959.10489866> and/or Lenth R.V. (1989) <doi:10.1080/00401706.1989.10488595>, but some new approaches are added and integrated in one package. / GPL-2   | noarch   |
| r-unvotes      | 0.2.0   | Historical voting data of the United Nations General Assembly. This includes votes for each country in each roll call, as well as descriptions and topic classifications for each vote. / MIT   | noarch   |
| r-upsvarapprox | 0.1.1   | Variance approximations for the Horvitz-Thompson total estimator in Unequal Probability Sampling using only first-order inclusion probabilities. See Matei and Tillä (2005) and Haziza, Mecatti and Rao (2008) for details. / GPL-3   | noarch   |
| r-uptimerobot  | 1.0.0   | Provide a set of wrappers to call all the endpoints of UptimeRobot API which includes various kind of ping, keep-alive and speed tests. See < <a href="https://uptimerobot.com/">https://uptimerobot.com/</a> > for more information. / MIT   | noarch   |
| r-urbin        | 0.1.8   | Calculate unified measures that quantify the effect of a covariate on a binary dependent variable (e.g., for meta-analyses). This can be particularly important if the estimation results are obtained with different models/estimators (e.g., linear probability model, logit, probit, ...) and/or with different transformations of the explanatory variable of interest (e.g., linear, quadratic, interval-coded, ...). The calculated unified measures are: (a) semi-elasticities of linear, quadratic, or interval-coded covariates and (b) effects of linear, quadratic, interval-coded, or categorical covariates when a linear or quadratic covariate changes between distinct intervals, the reference category of a categorical variable or the reference interval of an interval-coded variable needs to be changed, or some categories of a categorical covariate or some intervals of an interval-coded covariate need to be grouped together. Approximate standard errors of the unified measures are also calculated. All methods that are implemented in this package are described in the 'vignette' Extracting and Unifying Semi-Elasticities and Effect Sizes from Studies with Binary Dependent Variables that is included in this package. / GPL-2 | noarch   |
| r-urca         | 1.3.0   | Unit root and cointegration tests encountered in applied econometric analysis are implemented. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

| Name                | Version | Summary/License  | Platforms  |
|---------------------|---------|--|--|
| r-uroot             | 2.0_9   | Seasonal unit roots and seasonal stability tests. P-values based on response surface regressions are available for both tests. P-values based on bootstrap are available for seasonal unit root tests. A parallel implementation of the bootstrap method requires a CUDA capable GPU with compute capability >= 3.0, otherwise a debugging version fully coded in R is used. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-usaboundaries     | 0.3.1   | The boundaries for geographical units in the United States of America contained in this package include state, county, congressional district, and zip code tabulation area. Contemporary boundaries are provided by the U.S. Census Bureau (public domain). Historical boundaries for the years from 1629 to 2000 are provided from the Newberry Library's 'Atlas of Historical County Boundaries' (licensed CC BY-NC-SA). Additional data is provided in the 'US-AboundariesData' package; this package provides an interface to access that data. / MIT | noarch   |
| r-uscensus2000cdp   | 0.03    | US Census 2000 Designated Places shapefiles and additional demographic data from the SF1 100 percent files. This data set contains polygon files in lat/lon coordinates and the corresponding demographic data for a number of different variables. / GPL-2  | noarch   |
| r-uscensus2000tract | 0.03    | US 2000 Census Tract shapefiles and additional demographic data from the SF1 100 percent files. This data set contains polygon files in lat/lon coordinates and the corresponding demographic data for a number of different variables. / GPL-2  | noarch   |
| r-uscensus2010      | 0.11    | US Census 2010 shape files and additional demographic data from the SF1 100 percent files. This package contains a number of helper functions for the US-census2010blk, UScensus2010blkgrp, UScensus2010tract, UScensus2010cdp packages. / GPL-2   | noarch   |
| r-usdm              | 1.1_1   | This is a framework that aims to provide methods and tools for assessing the impact of different sources of uncertainties (e.g. positional uncertainty) on performance of species distribution models (SDMs.) / GPL-3  | noarch   |
| r-usedist           | 0.1.0   | Functions to re-arrange, extract, and work with distances. / GPL-3   | noarch   |
| r-usethis           | 1.5.0   | Automate package and project setup tasks that are otherwise performed manually. This includes setting up unit testing, test coverage, continuous integration, Git, 'GitHub', licenses, 'Rcpp', 'RStudio' projects, and more. / GPL-3   | noarch   |
| r-usgsstates2k      | 1.0.1   | A map of the USA from the United States Geological Survey (USGS). Irucka worked with this data set while a Cherokee Nation Technology Solutions (CNTS) USGS Contractor and/or USGS employee. It is replaced by 'states2k'. / CC0   | noarch   |
| r-usmap             | 0.4.0   | Obtain United States map data frames of varying region types (e.g. county, state). The map data frames include Alaska and Hawaii conveniently placed to the bottom left, as they appear in most maps of the US. Convenience functions for plotting choropleths and working with FIPS codes are also provided. / GPL-3  | noarch   |

| Name                            | Version | Summary/License  | Platforms  |
|---------------------------------|---------|--|--|
| <a href="#">r-ustatbookabsc</a> | 1.0.0   | A set of functions leading to multivariate response L1 regression. This includes functions on computing Euclidean inner products and norms, weighted least squares estimates on multivariate responses, function to compute fitted values and residuals. This package is a companion to the book U-Statistics, M-estimation and Resampling, by Arup Bose and Snigdhanu Chatterjee, to appear in 2017 as part of the Texts and Readings in Mathematics (TRIM) series of Hindustan Book Agency and Springer-Verlag. / GPL-3  | noarch   |
| <a href="#">r-ustyc</a>         | 1.0.0   | Forms a query to submit for US Treasury yield curve data, posting this query to the US Treasury web site's data feed service. By default the download includes data yield data for 12 products from January 1, 1990, some of which are NA during this span. The caller can pass parameters to limit the query to a certain year or year and month, but the full download is not especially large. The download data from the service is in XML format. The package's main function transforms that XML data into a numeric data frame with treasury product items (constant maturity yields for 12 kinds of bills, notes, and bonds) as columns and dates as row names. The function returns a list which includes an item for this data frame as well as query-related values for reference and the update date from the service. / MIT | noarch   |
| <a href="#">r-utc</a>           | 0.1.5   | Three functions are provided: first function changes time from local to UTC, other changes from UTC to local and third returns difference between local and UTC. %h% operator is also provided it adds hours to a time. / GPL-2  | noarch   |
| <a href="#">r-utf8</a>          | 1.1.4   | Process and print 'UTF-8' encoded international text (Unicode). Input, validate, normalize, encode, format, and display. / Apache License (== 2.0)   file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-utility</a>       | 1.4.3   | Construct and plot objective hierarchies and associated value and utility functions. Evaluate the values and utilities and visualize the results as colored objective hierarchies or tables. Visualize uncertainty by plotting median and quantile intervals within the nodes of objective hierarchies. Get numerical results of the evaluations in standard R data types for further processing. / GPL-3  | noarch   |
| <a href="#">r-uuid</a>          | 0.1_2   | Tools for generating and handling of UUIDs (Universally Unique Identifiers). / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

| Name         | Version | Summary/License   | Platforms |
|--------------|---------|---|-----------|
| r-vaersndvax | 1.0.4   | Non-Domestic VAERS vaccine data for 01/01/2016 - 06/14/2016. If you want to explore the full VAERS data for 1990 - Present (data, symptoms, and vaccines), then check out the 'vaersND' package from the URL below. The URL and BugReports below correspond to the 'vaersND' package, of which 'vaersNDvax' is a small subset (2016 only). 'vaersND' is not hosted on CRAN due to the large size of the data set. To install the Suggested 'vaers' and 'vaersND' packages, use the following R code: 'devtools::install_git( <a href="https://gitlab.com/iembry/vaers.git">https://gitlab.com/iembry/vaers.git</a> , build_vignettes = TRUE)' and 'devtools::install_git( <a href="https://gitlab.com/iembry/vaersND.git">https://gitlab.com/iembry/vaersND.git</a> , build_vignettes = TRUE)'. VAERS is a national vaccine safety surveillance program co-sponsored by the US Centers for Disease Control and Prevention (CDC) and the US Food and Drug Administration (FDA). VAERS is a post-marketing safety surveillance program, collecting information about adverse events (possible side effects) that occur after the administration of vaccines licensed for use in the United States. For more information about the data, visit < <a href="https://vaers.hhs.gov/index">https://vaers.hhs.gov/index</a> >. For information about vaccination/immunization hazards, visit < <a href="http://www.questionuniverse.com/rethink.html#vaccine">http://www.questionuniverse.com/rethink.html#vaccine</a> >. / CC0 | noarch    |
| r-vaersvax   | 1.0.5   | US VAERS vaccine data for 01/01/2018 - 06/14/2018. If you want to explore the full VAERS data for 1990 - Present (data, symptoms, and vaccines), then check out the 'vaers' package from the URL below. The URL and BugReports below correspond to the 'vaers' package, of which 'vaersvax' is a small subset (2018 only). 'vaers' is not hosted on CRAN due to the large size of the data set. To install the Suggested 'vaers' and 'vaersND' packages, use the following R code: 'devtools::install_git(< <a href="https://gitlab.com/iembry/vaers.git">https://gitlab.com/iembry/vaers.git</a> >, build_vignettes = TRUE)' and 'devtools::install_git(< <a href="https://gitlab.com/iembry/vaersND.git">https://gitlab.com/iembry/vaersND.git</a> >, build_vignettes = TRUE)'. The Vaccine Adverse Event Reporting System (VAERS) is a national early warning system to detect possible safety problems in U.S.-licensed vaccines. VAERS is co-managed by the Centers for Disease Control and Prevention (CDC) and the U.S. Food and Drug Administration (FDA). For more information about the data, visit < <a href="https://vaers.hhs.gov/">https://vaers.hhs.gov/</a> >. For information about vaccination/immunization hazards, visit < <a href="http://www.questionuniverse.com/rethink.html#vaccine">http://www.questionuniverse.com/rethink.html#vaccine</a> >. / CC0   | noarch    |
| r-valaddin   | 1.0.0   | A set of basic tools to transform functions into functions with input validation checks, in a manner suitable for both programmatic and interactive use. / MIT  | noarch    |
| r-valection  | 1.0.0   | A binding for the 'valection' program which offers various ways to sample the outputs of competing algorithms or parameterizations, and fairly assess their performance against each other. The 'valection' C library is required to use this package and can be downloaded from: < <a href="http://labs.oicr.on.ca/boutros-lab/software/valection">http://labs.oicr.on.ca/boutros-lab/software/valection</a> >. Cooper CI, et al; Valection: Design Optimization for Validation and Verification Studies; Biorxiv 2018; <doi:10.1101/254839>. / GPL-3  | noarch    |
| r-valetr     | 0.1.0   | Interface to Bank of Canada's 'Valet' API (< <a href="https://www.bankofcanada.ca/valet/docs">https://www.bankofcanada.ca/valet/docs</a> >). Please read the API terms and conditions: < <a href="https://www.bankofcanada.ca/terms">https://www.bankofcanada.ca/terms</a> >. / GPL-3   | noarch    |
| r-valottery  | 0.0.1   | Historical results for the state of Virginia lottery draw games. Data were downloaded from <a href="https://www.valottery.com/">https://www.valottery.com/</a> . / CC0  | noarch    |
| r-var.etp    | 0.7     | Estimation, Hypothesis Testing, Prediction for Stationary Vector Autoregressive Models / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name                        | Version | Summary/License   | Platforms   |
|-----------------------------|---------|---|---|
| <a href="#">r-varbin</a>    | 0.2.1   | Tool for easy and efficient discretization of continuous and categorical data. The package calculates the most optimal binning of a given explanatory variable with respect to a user-specified target variable. The purpose is to assign a unique Weight-of-Evidence value to each of the calculated binpoints in order to recode the original variable. The package allows users to impose certain restrictions on the functional form on the resulting binning while maximizing the overall information value in the original data. The package is well suited for logistic scoring models where input variables may be subject to restrictions such as linearity by e.g. regulatory authorities. An excellent source describing in detail the development of scorecards, and the role of Weight-of-Evidence coding in credit scoring is (Siddiqi 2006, ISBN: 978-0-471-75451-0). The package utilizes the discrete nature of decision trees and Isotonic Regression to accommodate the trade-off between flexible functional forms and maximum information value. / GPL-2 | noarch  |
| <a href="#">r-variag</a>    | 0.2_1   | Interactive variogram diagnostics. / GPL-2  | noarch  |
| <a href="#">r-vared</a>     | 1.0.0   | Generating functions for both optimal and ordinary difference sequences, and the difference-based estimation functions. / GPL-2   | noarch  |
| <a href="#">r-vares</a>     | 1.0     | Computes Value at risk and expected shortfall, two most popular measures of financial risk, for over one hundred parametric distributions, including all commonly known distributions. Also computed are the corresponding probability density function and cumulative distribution function. / GPL-2   | noarch  |
| <a href="#">r-varhandle</a> | 2.0.3   | Variables are the fundamental parts of each programming language but handling them might be frustrating for programmers from time to time. This package contains some functions to help user (especially data explorers) to make more sense of their variables and take the most out of variables and hardware resources. These functions are written, collected and crafted over 5 years of experience in statistical data analysis on high-dimensional data and for each of them there was a need. Functions in this package are suppose to be efficient and easy to use, hence they will be frequently updated to make them more convenient. / GPL-2   | noarch  |
| <a href="#">r-variables</a> | 1.0_2   | Abstract descriptions of (yet) unobserved variables. / GPL-2  | noarch  |
| <a href="#">r-vars</a>      | 1.5_3   | Estimation, lag selection, diagnostic testing, forecasting, causality analysis, forecast error variance decomposition and impulse response functions of VAR models and estimation of SVAR and SVEC models. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-varsedig</a>  | 1.9     | An algorithm which identifies the morphometric features that significantly discriminate two taxa and validates the morphological distinctness between them via a Monte-Carlo test, polar coordinates and overlap of the area under the density curve. / GPL-2   | noarch  |

Table 51 – continued from previous page

| Name              | Version | Summary/License   | Platforms |
|-------------------|---------|---|-----------|
| r-varsel          | 0.1     | Feature selection using Sequential Forward Floating feature Selection and Jeffries-Matusita distance. It returns a suboptimal set of features to use for image classification. Reference: Dalponte, M., Oerka, H.O., Gobakken, T., Gianelle, D. & Naeset, E. (2013). Tree Species Classification in Boreal Forests With Hyperspectral Data. IEEE Transactions on Geoscience and Remote Sensing, 51, 2632-2645, <DOI:10.1109/TGRS.2012.2216272>. / GPL-3 | noarch    |
| r-varselrf        | 0.7.8   | Variable selection from random forests using both backwards variable elimination (for the selection of small sets of non-redundant variables) and selection based on the importance spectrum (somewhat similar to scree plots; for the selection of large, potentially highly-correlated variables). Main applications in high-dimensional data (e.g., microarray data, and other genomics and proteomics applications). / GPL-2                        | noarch    |
| r-varswapprice    | 1.0     | Computes a portfolio of European options that replicates the cost of capturing the realised variance of an equity index. / GPL-3  | noarch    |
| r-vcd             | 1.4.4   | Visualization techniques, data sets, summary and inference procedures aimed particularly at categorical data. Special emphasis is given to highly extensible grid graphics. The package was originally inspired by the book Visualizing Categorical Data by Michael Friendly and is now the main support package for a new book, Discrete Data Analysis with R by Michael Friendly and David Meyer (2015). / GPL-2                                      | noarch    |
| r-vcov            | 0.0.1   | Methods for faster extraction (about 5x faster in a few test cases) of variance-covariance matrices and standard errors from models. Methods in the 'stats' package tend to rely on the summary method, which may waste time computing other summary statistics which are summarily ignored. / GPL-2  | noarch    |
| r-vcvcomp         | 1.0.1   | Comparison of variance - covariance patterns using relative principal component analysis (relative eigenanalysis). Also provides functions to compute group covariance matrices, distance matrices, and perform proportionality tests. A working sample on the body shape of cichlid fishes is included. / GPL-3  | noarch    |
| r-vdjgermlines    | 0.1     | Contains variable, diversity, and joining sequences and accompanying functions that enable both the extraction of and comparison between immune V-D-J genomic segments from a variety of species. Sources include IMGT from MP Lefranc (2009) <doi:10.1093/nar/gkn838> and Vgenerepertoire from publication DN Olivieri (2014) <doi:10.1007/s00251-014-0784-3>. / GPL-2   | noarch    |
| r-vdspcalibration | 1.0     | Provides statistical methods for the design and analysis of a calibration study, which aims for calibrating measurements using two different methods. The package includes sample size calculation, sample selection, regression analysis with error-in measurements and change-point regression. The method is described in Tian, Durazo-Arvizu, Myers, et al. (2014) <DOI:10.1002/sim.6235>. / GPL-3  | noarch    |
| r-vec2dtransf     | 1.1     | A package for applying affine and similarity transformations on vector spatial data (sp objects). Transformations can be defined from control points or directly from parameters. If redundant control points are provided Least Squares is applied allowing to obtain residuals and RMSE. / GPL-2  | noarch    |
| r-vecsets         | 1.2.1   | The base 'sets' tools follow the algebraic definition that each element of a set must be unique. Since it's often helpful to compare all elements of two vectors, this toolset treats every element as unique for counting purposes. For ease of use, all functions in vecsets have an argument 'multiple' which, when set to FALSE, reverts them to the base::set tools functionality. / LGPL-3  | noarch    |

Table 51 – continued from previous page

| Name              | Version | Summary/License   | Platforms |
|-------------------|---------|---|-----------|
| r-vecstatgraphs2d | 1.8     | A 2D statistical analysis is performed, both numerical and graphical, of a set of vectors. Since a vector has two components (module and azimuth) vector analysis is performed in three stages: modules are analyzed by means of linear statistics, azimuths are analyzed by circular statistics, and the joint analysis of modules and azimuths is done using density maps that allow detecting another distribution properties (i.e. anisotropy) and outliers. Tests and circular statistic parameters have associated a full range of graphing: histograms, maps of distributions, point maps, vector maps, density maps, distribution modules and azimuths. / GPL-3   | noarch    |
| r-vegalite        | 0.6.1   | The ‘Vega-Lite’ ‘JavaScript’ framework provides a higher-level grammar for visual analysis, akin to ‘ggplot’ or ‘Tableau’, that generates complete ‘Vega’ specifications. Functions exist which enable building a valid ‘spec’ from scratch or importing a previously created ‘spec’ file. Functions also exist to export ‘spec’ files and to generate code which will enable plots to be embedded in properly configured web pages. The default behavior is to generate an ‘htmlwidget’. / AGPL-3  | noarch    |
| r-vegawidget      | 0.2.1   | ‘Vega’ and ‘Vega-Lite’ parse text in ‘JSON’ notation to render chart-specifications into ‘HTML’. This package is used to facilitate the rendering. It also provides a means to interact with signals, events, and datasets in a ‘Vega’ chart using ‘JavaScript’ or ‘Shiny’. / MIT   | noarch    |
| r-vegdata         | 0.9.5   | Handling of vegetation data from different sources ( Turboveg < <a href="http://www.synbiosys.alterra.nl/turboveg/">http://www.synbiosys.alterra.nl/turboveg/</a> >; the German national repository < <a href="http://www.vegetweb.de">http://www.vegetweb.de</a> > and others. Taxonomic harmonization (given appropriate taxonomic lists, e.g. the German taxonomic standard list GermanSL, < <a href="http://germansl.infinitemature.org">http://germansl.infinitemature.org</a> >). / GPL-2   | noarch    |
| r-vegetarian      | 1.2     | This package computes diversity for community data sets using the methods outlined by Jost (2006, 2007). While there are differing opinions on the ideal way to calculate diversity (e.g. Magurran 2004), this method offers the advantage of providing diversity numbers equivalents, independent alpha and beta diversities, and the ability to incorporate ‘order’ (q) as a continuous measure of the importance of rare species in the metrics. The functions provided in this package largely correspond with the equations offered by Jost in the cited papers. The package computes alpha diversities, beta diversities, gamma diversities, and similarity indices. Confidence intervals for diversity measures are calculated using a bootstrap method described by Chao et al. (2008). For datasets with many samples (sites, plots), sim.table creates tables of all pairwise comparisons possible, and for grouped samples sim.groups calculates pairwise combinations of within- and between-group comparisons. / GPL-2 | noarch    |
| r-vegperiod       | 0.2.6   | Collection of common methods to determine growing season length in a simple manner. Start and end dates of the vegetation periods are calculated solely based on daily mean temperatures and the day of the year. / GPL-3   | noarch    |
| r-vembedr         | 0.1.3   | A set of functions for generating HTML to embed hosted video in your R Markdown documents or Shiny applications. / MIT  | noarch    |
| r-venn            | 1.7     | Draws and displays Venn diagrams up to 7 sets, and any Boolean union of set intersections. / GPL-2  | noarch    |
| r-venneuler       | 1.1_0   | Calculates and displays Venn and Euler Diagrams / MPL-1.1   | noarch    |

| Name                               | Version | Summary/License   | Platforms  |
|------------------------------------|---------|---|--|
| <a href="#">r-versions</a>         | 0.3     | Installs specified versions of R packages hosted on CRAN and provides functions to list available versions and the versions of currently installed packages. These tools can be used to help make R projects and packages more reproducible. ‘versions’ fits in the narrow gap between the ‘devtools’ <code>install_version()</code> function and the ‘checkpoint’ package. <code>devtools::install_version()</code> installs a stated package version from source files stored on the CRAN archives. However CRAN does not store binary versions of packages so Windows users need to have RTools installed and Windows and OSX users get longer installation times. ‘checkpoint’ uses the Revolution Analytics MRAN server to install packages (from source or binary) as they were available on a given date. It also provides a helpful interface to detect the packages in use in a directory and install all of those packages for a given date. ‘checkpoint’ doesn’t provide <code>install.packages</code> -like functionality however, and that’s what ‘versions’ aims to do, by querying MRAN. As MRAN only goes back to 2014-09-17, ‘versions’ can’t install packages archived before this date. / BSD_3_clause | noarch   |
| <a href="#">r-vertexsimilarity</a> | 0.1     | Creates Vertex Similarity matrix of an undirected graph based on the method stated by E. A. Leicht, Petter Holme, AND M. E. J. Newman in their paper <DOI:10.1103/PhysRevE.73.026120>. / GPL-2  | noarch   |
| <a href="#">r-vfprogression</a>    | 0.7.1   | Realization of published methods to analyze visual field (VF) progression. Introduction to the plotting methods (designed by author TE) for VF output visualization. A sample dataset for two eyes, each with 10 follow-ups is included. The VF analysis methods could be found in – Musch et al. (1999) <doi:10.1016/S0161-6420(99)90147-1>, Nouri-Mahdavi et al. (2012) <doi:10.1167/iovs.11-9021>, Schell et al. (2014) <doi:10.1016/j.ophtha.2014.02.021>, Aptel et al. (2015) <doi:10.1111/aos.12788>. / GPL-2   | noarch   |
| <a href="#">r-vgam</a>             | 1.1_1   | An implementation of about 6 major classes of statistical regression models. At the heart of it are the vector generalized linear and additive model (VGLM/VGAM) classes, and the book Vector Generalized Linear and Additive Models: With an Implementation in R (Yee, 2015) <DOI:10.1007/978-1-4939-2818-7> gives details of the statistical framework and VGAM package. Currently only fixed-effects models are implemented, i.e., no random-effects models. Many (150) models and distributions are estimated by maximum likelihood estimation (MLE) or penalized MLE, using Fisher scoring. VGLMs can be loosely thought of as multivariate GLMs. VGAMs are data-driven VGLMs (i.e., with smoothing). The other classes are RR-VGLMs (reduced-rank VGLMs), quadratic RR-VGLMs, reduced-rank VGAMs, RCIMs (row-column interaction models)—these classes perform constrained and unconstrained quadratic ordination (CQO/UQO) models in ecology, as well as constrained additive ordination (CAO). Note that these functions are subject to change; see the NEWS and ChangeLog files for latest changes. / GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-vgamdata</a>         | 1.0_3   | Data sets to accompany the VGAM package and the book Vector Generalized Linear and Additive Models: With an Implementation in R (Yee, 2015) <DOI:10.1007/978-1-4939-2818-7>. These are used to illustrate vector generalized linear and additive models (VGLMs/VGAMs), and associated models (Reduced-Rank VGLMs, Quadratic RR-VGLMs, Row-Column Interaction Models, and constrained and unconstrained ordination models in ecology). / GPL-2   | noarch   |

| Name                | Version | Summary/License  | Platforms   |
|---------------------|---------|--|---|
| r-vhdclassification | 0.3     | This package provides an implementation of Linear discriminant analysis and quadratic discriminant analysis that works fine in very high dimension (when there are many more variables than observations). / GPL-2   | noarch  |
| r-vhica             | 0.2.4   | The Vertical and Horizontal Inheritance Consistence Analysis method is described in the following publication: VHICA: a new method to discriminate between vertical and horizontal transposon transfer: application to the mariner family within Drosophila by G. Wallau. et al. (2016) <DOI:10.1093/molbev/msv341>. The purpose of the method is to detect horizontal transfers of transposable elements, by contrasting the divergence of transposable element sequences with that of regular genes. / GPL-2   | noarch  |
| r-vietnamcode       | 0.1.1   | Converts Vietnam's provinces' names and ID across different formats. Handles diacritics and different spellings. / GPL-3   | noarch  |
| r-vif               | 1.0     | This package implements a fast regression algorithm for building linear model for large data as defined in the paper VIF-Regression: A Fast Regression Algorithm for Large Data (2011), Journal of the American Statistical Association, Vol. 106, No. 493: 232-247 by Dongyu Lin, Dean P. Foster, and Lyle H. Ungar. / GPL-2  | noarch  |
| r-violinmplot       | 0.2.1   | A lattice violin-plot is overlayed with the arithmetic mean and standard deviation. / GPL-2  | noarch  |
| r-viopoints         | 0.2.1   | viopoints draws one dimensional scatter plots with jitter using kernel density estimates in a similar way to violin plots. / GPL-2   | noarch  |
| r-vipor             | 0.4.5   | Generate a violin point plot, a combination of a violin/histogram plot and a scatter plot by offsetting points within a category based on their density using quasirandom noise. / GPL-2   | noarch  |
| r- viridis          | 0.5.1   | Implementation of the 'viridis' - the default -, 'magma', 'plasma', 'inferno', and 'cividis' color maps for 'R'. 'viridis', 'magma', 'plasma', and 'inferno' are ported from 'matplotlib' < <a href="http://matplotlib.org/">http://matplotlib.org/</a> >, a popular plotting library for 'python'. 'cividis', was developed by Jamie R. Nuñez and Sean M. Colby. These color maps are designed in such a way that they will analytically be perfectly perceptually-uniform, both in regular form and also when converted to black-and-white. They are also designed to be perceived by readers with the most common form of color blindness (all color maps in this package) and color vision deficiency ('cividis' only). / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r- viridislite      | 0.3.0   | Implementation of the 'viridis' - the default -, 'magma', 'plasma', 'inferno', and 'cividis' color maps for 'R'. 'viridis', 'magma', 'plasma', and 'inferno' are ported from 'matplotlib' < <a href="http://matplotlib.org/">http://matplotlib.org/</a> >, a popular plotting library for 'python'. 'cividis', was developed by Jamie R. Nuñez and Sean M. Colby. These color maps are designed in such a way that they will analytically be perfectly perceptually-uniform, both in regular form and also when converted to black-and-white. They are also designed to be perceived by readers with the most common form of color blindness (all color maps in this package) and color vision deficiency ('cividis' only). This is the 'lite' version of the more complete 'viridis' package that can be found at < <a href="https://cran.r-project.org/package=viridis">https://cran.r-project.org/package=viridis</a> >. / MIT file LICENSE | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-virustotal        | 0.2.1   | Use VirusTotal, a Google service that analyzes files and URLs for viruses, worms, trojans etc., provides category of the content hosted by a domain from a variety of prominent services, provides passive DNS information, among other things. See < <a href="http://www.virustotal.com">http://www.virustotal.com</a> > for more information. / MIT  | noarch  |

| Name                         | Version | Summary/License   | Platforms   |
|------------------------------|---------|---|---|
| <a href="#">r-visielse</a>   | 1.2.1   | A graphical tool designed to visualize and to give an overview of behavioral observations realized on individuals or groups. Visualization of raw data during experimental observations of the realization of a procedure. It graphically presents an overview of individuals and group actions usually acquired from timestamps during video recorded sessions. Options of the package allow adding graphical information as statistical indicators (mean, standard deviation, quantile or statistical test) but also for each action green or black zones providing visual information about the accuracy of the realized actions. / AGPL-3 | noarch  |
| <a href="#">r-visnetwork</a> | 2.0.6   | Provides an R interface to the 'vis.js' JavaScript charting library. It allows an interactive visualization of networks. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-visreg</a>     | 2.5.1   | Provides a convenient interface for constructing plots to visualize the fit of regression models arising from a wide variety of models in R ('lm', 'glm', 'coxph', 'rlm', 'gam', 'locfit', 'lmer', 'randomForest', etc.) / GPL-3  | noarch  |
| <a href="#">r-visualize</a>  | 4.3.0   | Graphs the pdf or pmf and highlights what area or probability is present in user defined locations. Visualize is able to provide lower tail, bounded, upper tail, and two tail calculations. Supports strict and equal to inequalities. Also provided on the graph is the mean and variance of the distribution. / MIT  | noarch  |
| <a href="#">r-vitality</a>   | 1.3     | Provides fitting routines for four versions of the Vitality family of mortality models. / GPL-2   | noarch  |
| <a href="#">r-vkr</a>        | 0.1     | Provides an interface to the VK API < <a href="https://vk.com/dev/methods">https://vk.com/dev/methods</a> >. VK < <a href="https://vk.com/">https://vk.com/</a> > is the largest European online social networking service, based in Russia. / GPL-3  | noarch  |
| <a href="#">r-vlf</a>        | 1.0     | Using frequency matrices, very low frequency variants (VLFs) are assessed for amino acid and nucleotide sequences. The VLFs are then compared to see if they occur in only one member of a species, singleton VLFs, or if they occur in multiple members of a species, shared VLFs. The amino acid and nucleotide VLFs are then compared to see if they are concordant with one another. Amino acid VLFs are also assessed to determine if they lead to a change in amino acid residue type, and potential changes to protein structures. / GPL-3   | noarch  |

| Name                          | Version | Summary/License  | Platforms |
|-------------------------------|---------|--|-----------|
| <a href="#">r-vmask</a>       | 1.0     | The cumulative sum (CUSUM) control chart is considered to be an alternative or complementary to Shewhart control charts in statistical process control (SPC) applications, owing to its higher sensitivity to small shifts in the process mean. It utilizes all the available data rather than the last few ones used in Shewhart control charts for quick decision making. V-mask is a traditional technique for separating meaningful data from unusual circumstances in a Cumulative Sum (CUSUM) control chart; for see details about v-mask see Montgomery (1985, ISBN:978-0471656319). The mask is a V-shaped overlay placed on the CUSUM chart so that one arm of the V lines up with the slope of data points, making it easy to see data points that lie outside the slope and to determine whether these points should be discarded as random events, or treated as a performance trend that should be addressed. But, complex computations is one disadvantage V-mask method for detect small changes in mean using CUSUM control chart. Package ‘vMask’ can help to the applied users to overcome this challenge by considering six different methods which each of them are based on different information. / LGPL-3 | noarch    |
| <a href="#">r-vocaldia</a>    | 0.8.2   | Create adjacency matrices of vocalisation graphs from dataframes containing sequences of speech and silence intervals, transforming these matrices into Markov diagrams, and generating datasets for classification of these diagrams by ‘flattening’ them and adding global properties (functionals) etc. Vocalisation diagrams date back to early work in psychiatry (Jaffe and Feldstein, 1970) and social psychology (Dabbs and Ruback, 1987) but have only recently been employed as a data representation method for machine learning tasks including meeting segmentation (Luz, 2012) <doi:10.1145/2328967.2328970> and classification (Luz, 2013) <doi:10.1145/2522848.2533788>. / GPL-3   | noarch    |
| <a href="#">r-volleystat</a>  | 0.2.0   | Volleyball match statistics of the German volleyball first division league (seasons 2013/2014 to 2018/2019). The data has been collected from the official volleyball first division homepage (<www.volleyball-bundesliga.de>) and contains information on teams, staff, sets, matches, and player-in-match statistics (extracted automatically from the official match reports). / CC0  | noarch    |
| <a href="#">r-vortexrdata</a> | 1.0.5   | Contains selected data from two publications, Campbell ‘et’ ‘al’. (2016) <DOI:10.1080/14486563.2015.1028486> and ‘Pacioni’ ‘et’ ‘al’. (2017) <DOI:10.1071/PC17002>. The data is provided both as raw outputs from the population viability analysis software ‘Vortex’ and packaged as R objects. The R package ‘vortexR’ uses the raw data provided here to illustrate its functionality of parsing raw ‘Vortex’ output into R objects. / GPL-3  | noarch    |
| <a href="#">r-vote</a>        | 1.1_0   | Counting election votes and determining election results by different methods, including the single transferable vote, approval, score and plurality methods. / GPL-2  | noarch    |
| <a href="#">r-votesys</a>     | 0.1.1   | Various methods to count ballots in voting systems are provided. Functions to check validity of ballots are also provided to ensure flexibility. / GPL-3   | noarch    |
| <a href="#">r-vottrans</a>    | 1.0     | Calculates voter transitions comparing two elections, using the function solve.QP() in package ‘quadprog’. / GPL-3   | noarch    |
| <a href="#">r-vowels</a>      | 1.2_2   | Procedures for the manipulation, normalization, and plotting of phonetic and sociophonetic vowel formant data. vowels is the backend for the NORM website. / GPL-3   | noarch    |
| <a href="#">r-voxf</a>        | 0.5.1   | Tools for tree crown structure description based on T-LiDAR data voxelisation / GPL (>= 2.0)   | noarch    |

Continued on next page

Table 51 – continued from previous page

| Name                 | Version | Summary/License  | Platforms |
|----------------------|---------|--|-----------|
| r-vrmlgen            | 1.4.9   | vrmlgen creates 3D scatter and bar plots, visualizations of 3D meshes, parametric functions and height maps in web-formats like the Virtual Reality Markup Language (VRML, filetype .wrl) and the LiveGraphics3D format. / GPL-2   | noarch    |
| r-vrtest             | 0.97    | A collection of statistical tests for martingale difference hypothesis / GPL-2   | noarch    |
| r-vstsr              | 1.0.0   | Implementation of Visual Studio Team Services < <a href="https://www.visualstudio.com/team-services/">https://www.visualstudio.com/team-services/</a> > API calls. It enables the extraction of information about repositories, build and release definitions and individual releases. It also helps create repositories and work items within a project without logging into Visual Studio. There is the ability to use any API service with a shell for any non-predefined call. / GPL-2   | noarch    |
| r-vudc               | 1.1     | Contains functions for visualization univariate data: ccdplot and qddplot. / GPL-2   | noarch    |
| r-vwr                | 0.3.0   | Functions and data for use in visual word recognition research: Computation of neighbors (Hamming and Levenshtein distances), average distances to neighbors (e.g., OLD20), and Coltheart's N. Also includes the LD1NN algorithm to detect bias in the composition of a lexical decision task. Most of the functions support parallel execution. Supplies wordlists for several languages. Uses the string distance functions from the stringdist package by Mark van der Loo. / GPL-3   | noarch    |
| r-w3cmarkupvalidator | 0.1_6   | R interface to a W3C Markup Validation service. See < <a href="http://validator.w3.org/">http://validator.w3.org/</a> > for more information. / GPL-2  | noarch    |
| r-wahc               | 1.0     | Fit the fixed effect panel data model with heteroskedasticity and autocorrelation correction. / GPL-3  | noarch    |
| r-waiter             | 0.0.1   | Full screen splash loading screens for 'Shiny'. / MIT  | noarch    |
| r-walkscoreapi       | 1.2     | A collection of functions to perform the Application Programming Interface (API) calls associated with the Walk Score website (www.walkscore.com) within the R environment. These functions can be used to query the Walk Score and Transit Score database for a wide variety of information using R scripts. This package includes the simple Walk Score and Transit Score API calls, which return the scores associated with an input location, as well as calls which return some data used to calculate the scores. These functions are especially useful for mass data collection and gathering Walk Score and Transit Score values for large lists of locations. / GPL-2 | noarch    |
| r-wamasim            | 1.0.0   | The outcome of various rehabilitation strategies for water distribution systems can be modeled with the Water Management Simulator (WaMaSim). Pipe breaks and the corresponding damage and rehabilitation costs are simulated. It is mainly intended to be used as educational tool for the Water Infrastructure Experimental and Computer Laboratory at ETH Zurich, Switzerland. / GPL-3  | noarch    |
| r-wand               | 0.5.0   | 'MIME' types are shorthand descriptors for file contents and can be determined from magic bytes in file headers, file contents or intuited from file extensions. Tools are provided to perform curated magic tests as well as mapping 'MIME' types from a database of over 1,500 extension mappings. / MIT   | noarch    |
| r-warn               | 1.2_3   | This estimates precise weaning ages for a given skeletal population by analyzing the stable nitrogen isotope ratios of them. Bone collagen turnover rates estimated anew and the approximate Bayesian computation (ABC) were adopted in this package. / GPL-3  | noarch    |

Table 51 – continued from previous page

| Name                           | Version | Summary/License   | Platforms |
|--------------------------------|---------|---|-----------|
| <a href="#">r-washdata</a>     | 0.1.2   | Urban water and sanitation survey dataset collected by Water and Sanitation for the Urban Poor (WSUP) with technical support from Valid International. These citywide surveys have been collecting data allowing water and sanitation service levels across the entire city to be characterised, while also allowing more detailed data to be collected in areas of the city of particular interest. These surveys are intended to generate useful information for others working in the water and sanitation sector. Current release version includes datasets collected from a survey conducted in Dhaka, Bangladesh in March 2017. This survey in Dhaka is one of a series of surveys to be conducted by WSUP in various cities in which they operate including Accra, Ghana; Nakuru, Kenya; Antananarivo, Madagascar; Maputo, Mozambique; and, Lusaka, Zambia. This package will be updated once the surveys in other cities are completed and datasets have been made available. / CC0 | noarch    |
| <a href="#">r-washer</a>       | 0.1.2   | Time series outlier detection by mean of non parametric test. Outlier detection regarding two methodologies: single time series variability (a vector) and grouped similar time series (a data frame). Andrea Venturini(2011) Statistica-Universita' Bologna, Vol.71, pp.329-344. / GPL-2   | noarch    |
| <a href="#">r-waterfall</a>    | 1.0.2   | Provides support for creating waterfall charts in R using both traditional base and lattice graphics. / BSD_2_clause  | noarch    |
| <a href="#">r-wateryear</a>    | 1.0.1   | Provides Water Year Hydrologic Classification Indices based on measured unimpaired runoff (in million acre-feet). Data is provided by California Department of Water Resources and subject to revision. / MIT   | noarch    |
| <a href="#">r-waved</a>        | 1.2     | Makes available code necessary to reproduce figures and tables in papers on the WaveD method for wavelet deconvolution of noisy signals as presented in The WaveD Transform in R, Journal of Statistical Software Volume 21, No. 3, 2007. / GPL-3   | noarch    |
| <a href="#">r-wavefunction</a> | 1.0.0   | Real probability distributions can be represented as the square of an orthogonal sum in the Hermite basis. This representation is formally similar to the representation of quantum mechanical states as wave functions, whose squared modulus is a probability density. This is described in more detail in Wave function representation of probability distributions, by Madeleine B. Thompson <arXiv:1712.07764>. This package provides a reference implementation of the technique. / Apache License (== 2.0)   | noarch    |
| <a href="#">r-waveletcomp</a>  | 1.1     | Wavelet analysis and reconstruction of time series, cross-wavelets and phase-difference (with filtering options), significance with simulation algorithms. / GPL-2  | noarch    |
| <a href="#">r-wce</a>          | 1.0.2   | A flexible method for modeling cumulative effects of time-varying exposures, weighted according to their relative proximity in time, and represented by time-dependent covariates. The current implementation estimates the weight function in the Cox proportional hazards model. The function that assigns weights to doses taken in the past is estimated using cubic regression splines. / GPL-2  | noarch    |
| <a href="#">r-wcq</a>          | 0.2     | The package contains the WCQ method for detection of QTL effects in a small mapping population. It also contains implementation of the Chen-Qin two-sample and one-sample test of means. / GPL-3  | noarch    |
| <a href="#">r-wdi</a>          | 2.6.0   | Search, extract and format data from the World Bank's World Development Indicators. / GPL-3   | noarch    |

Table 51 – continued from previous page

| Name                             | Version | Summary/License  | Platforms  |
|----------------------------------|---------|--|--|
| <a href="#">r-weatherdata</a>    | 0.5.0   | Functions that help in fetching weather data from websites. Given a location and a date range, these functions help fetch weather data (temperature, pressure etc.) for any weather related analysis. / GPL  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-weathermetrics</a> | 1.2.2   | Functions to convert between weather metrics, including conversions for metrics of temperature, air moisture, wind speed, and precipitation. This package also includes functions to calculate the heat index from air temperature and air moisture. / GPL-2   | noarch   |
| <a href="#">r-webchem</a>        | 0.4.0   | Chemical information from around the web. This package interacts with a suite of web APIs for chemical information. / MIT  | noarch   |
| <a href="#">r-webddx</a>         | 0.1.0   | Freely available online differential-diagnosis generating tools are changing clinical medicine and biomedical research. With webddx, useRs can generate differential diagnosis lists given a set of symptoms. The web tools would likely be directly used in clinical practice, but programmatic interaction and data manipulation can sharply increase efficiency and reproducibility of research in clinical informatics. Relevant visualizations can also be created with webddx. / GPL-3   | noarch   |
| <a href="#">r-webex</a>          | 0.9.1   | Functions for easily creating interactive web pages using ‘R Markdown’ that students can use in self-guided learning. / CC BY-SA 4.0   | noarch   |
| <a href="#">r-websearchr</a>     | 0.0.3   | Functions that allow for accessing domains and a number of search engines. / MIT   | noarch   |
| <a href="#">r-webshot</a>        | 0.5.1   | Takes screenshots of web pages, including Shiny applications and R Markdown documents. / GPL-2   | linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64   |
| <a href="#">r-wee</a>            | 1.0     | Secondary analysis of case-control studies using a weighted estimating equation (WEE) approach: logistic regression for binary secondary outcomes, linear regression and quantile regression for continuous secondary outcomes. / GPL-2  | noarch   |
| <a href="#">r-weibullness</a>    | 1.19.8  | Performs a goodness-of-fit test of Weibull distribution (weibullness test) and provides the maximum likelihood estimates of the three-parameter Weibull distribution. Note that the threshold parameter is estimated based on the correlation from the Weibull plot. For more details, see Park (2018) <doi:10.1155/2018/6056975>. This work was supported by the National Research Foundation of Korea (NRF) grant funded by the Korea government (No. NRF-2017R1A2B4004169). / GPL-2   GPL-3 | noarch   |

| Name                              | Version | Summary/License   | Platforms                      |
|-----------------------------------|---------|---|--------------------------------|
| <code>r-weibullr</code>           | 1.0.10  | Life data analysis in the graphical tradition of Waloddi Weibull. Methods derived from Robert B. Abernethy (2008, ISBN 0-965306-3-2), Wayne Nelson (1982, ISBN: 9780471094586) <DOI:10.1002/0471725234>, William Q. Meeker and Lois A. Escobar (1998, ISBN: 1-471-14328-6), John I. McCool, (2012, ISBN: 9781118217986) <DOI:10.1002/9781118351994>. / GPL-3  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-weighted.desc.stat</code> | 1.0     | Weighted descriptive statistics is the discipline of quantitatively describing the main features of real-valued fuzzy data which usually given from a fuzzy population. One can summarize this special kind of fuzzy data numerically or graphically using this package. To interpret some of the properties of one or several sets of real-valued fuzzy data, numerically summarize is possible by some weighted statistics which are designed in this package such as mean, variance, covariance and correlation coefficient. Also, graphically interpretation can be given by weighted histogram and weighted scatter plot using this package to describe properties of real-valued fuzzy data set. / LGPL-3   | noarch                         |
| <code>r-weightedporttest</code>   | 1.0     | This packages contains the Weighted Portmanteau Tests as described in New Weighted Portmanteau Statistics for Time Series Goodness-of-Fit Testing' accepted for publication by the Journal of the American Statistical Association. / GPL-3   | noarch                         |
| <code>r-weightedroc</code>        | 2018.1  | Fast computation of Receiver Operating Characteristic (ROC) curves and Area Under the Curve (AUC) for weighted binary classification problems (weights are example-specific cost values). / GPL-3   | noarch                         |
| <code>r-weightquant</code>        | 1.0     | Estimation of observation-specific weights for incomplete longitudinal data and bootstrap procedure for weighted quantile regressions. / GPL (>= 2.0)   | noarch                         |
| <code>r-weirs</code>              | 0.25    | Provides computational support for flow over weirs, such as sharp-crested, broad-crested, and embankments. Initially, the package supports broad- and sharp-crested weirs. / GPL-2  | noarch                         |
| <code>r-welchadf</code>           | 0.3.2   | Implementation of Johansen's general formulation of Welch-James's statistic with Approximate Degrees of Freedom, which makes it suitable for testing any linear hypothesis concerning cell means in univariate and multivariate mixed model designs when the data pose non-normality and non-homogeneous variance. Some improvements, namely trimmed means and Winsorized variances, and bootstrapping for calculating an empirical critical value, have been added to the classical formulation. The code departs from a previous SAS implementation by L.M. Lix and H.J. Keselman, available at < <a href="http://supp.apa.org/psycarticles/supplemental/met_13_2_110/SAS_Program.pdf">http://supp.apa.org/psycarticles/supplemental/met_13_2_110/SAS_Program.pdf</a> > and published in Keselman, H.J., Wilcox, R.R., and Lix, L.M. (2003) <DOI:10.1111/1469-8986.00060>. / LGPL-3 | noarch                         |
| <code>r-wesanderson</code>        | 0.3.6   | Palettes generated mostly from 'Wes Anderson' movies. / MIT   | noarch                         |
| <code>r-wfe</code>                | 1.9.1   | Provides a computationally efficient way of fitting weighted linear fixed effects estimators for causal inference with various weighting schemes. Weighted linear fixed effects estimators can be used to estimate the average treatment effects under different identification strategies. This includes stratified randomized experiments, matching and stratification for observational studies, first differencing, and difference-in-differences. The package implements methods described in Imai and Kim (2017) When should We Use Linear Fixed Effects Regression Models for Causal Inference with Longitudinal Data?, available at < <a href="https://imai.fas.harvard.edu/research/FEmatch.html">https://imai.fas.harvard.edu/research/FEmatch.html</a> >. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| <code>r-wfg</code>                | 0.1     | Implementation of Weighted Fast Greedy algorithm for community detection in networks with mixed types of attributes. / GPL-2  | noarch                         |

Table 51 – continued from previous page

| Name              | Version | Summary/License   | Platforms   |
|-------------------|---------|---|---|
| r-wgteff          | 0.1.2   | Functions for determining the effect of data weights on the variance of survey data: users will load a data set which has a weights column, and the package will calculate the design effect (DEFF), weighting loss, root design effect (DEFT), effective sample size (ESS), and/or weighted margin of error. / GPL-2   | noarch  |
| r-wheatmap        | 0.1.0   | Builds complex plots, heatmaps in particular, using natural semantics. Bigger plots can be assembled using directives such as ‘LeftOf’, ‘RightOf’, ‘TopOf’, and ‘Beneath’ and more. Other features include clustering, dendrograms and integration with ‘ggplot2’ generated grid objects. This package is particularly designed for bioinformaticians to assemble complex plots for publication. / GPL-3  | noarch  |
| r-whereami        | 0.1.8   | Robust and reliable functions to return informative outputs to console with the run or source location of a command. This can be from the ‘RScript’/R terminal commands or ‘RStudio’ console, source editor, ‘Rmarkdown’ document and a Shiny application. / MIT  | noarch  |
| r-whiboclustering | 0.1.2   | White Box Cluster Algorithm Design allows you to create Representative based cluster algorithm by using reusable components. This way one can recreate already available cluster algorithms (i.e. K-Means, K-Means, PAM) but also create new cluster algorithms not available in the literature or any other software. For more information see papers <doi:10.1007/s10462-009-9133-6> and <doi:10.1016/j.datak.2012.03.005>. / GPL-3   | noarch  |
| r-whisker         | 0.3.2   | logicless templating, reuse templates in many programming languages including R / GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-whitechapelr    | 0.3.0   | Provides a set of functions to make tracking the hidden movements of the ‘Jack’ player easier. By tracking every possible path Jack might have traveled from the point of the initial murder including special movement such as through alleyways and via carriages, the police can more accurately narrow the field of their search. Additionally, by tracking all possible hideouts from round to round, rounds 3 and 4 should have a vastly reduced field of search. / MIT                         | noarch  |
| r-whitening       | 1.1.1   | Implements the whitening methods (ZCA, PCA, Cholesky, ZCA-cor, and PCA-cor) discussed in Kessy, Lewin, and Strimmer (2018) Optimal whitening and decorrelation, <doi:10.1080/00031305.2016.1277159>, as well as the whitening approach to canonical correlation analysis allowing negative canonical correlations described in Jendoubi and Strimmer (2019) A whitening approach to probabilistic canonical correlation analysis for omics data integration, <doi:10.1186/s12859-018-2572-9>. / GPL-3 | noarch  |
| r-whoami          | 1.3.0   | Look up the username and full name of the current user, the current user’s email address and ‘GitHub’ username, using various sources of system and configuration information. / MIT  | noarch  |
| r-whoapi          | 0.1.2   | Retrieve data from the ‘Whoapi’ ( <a href="https://whoapi.com">https://whoapi.com</a> ) store of domain information, including a domain’s geographic location, registration status and search prominence. / MIT   | noarch  |

Table 51 – continued from previous page

| Name          | Version | Summary/License   | Platforms                      |
|---------------|---------|---|--------------------------------|
| r-whopgenome  | 0.9.7   | Provides very fast access to whole genome, population scale variation data from VCF files and sequence data from FASTA-formatted files. It also reads in alignments from FASTA, Phylip, MAF and other file formats. Provides easy-to-use interfaces to genome annotation from UCSC and Bioconductor and gene ontology data from AmiGO and is capable to read, modify and write PLINK .PED-format pedigree files. / GPL-2  | linux-64,<br>osx-64,<br>win-64 |
| r-wicket      | 0.4.0   | Utilities to generate bounding boxes from ‘WKT’ (Well-Known Text) objects and R data types, validate ‘WKT’ objects and convert object types from the ‘sp’ package into ‘WKT’ representations. / MIT   | linux-64,<br>osx-64,<br>win-64 |
| r-widgetframe | 0.3.1   | Provides two functions ‘frameableWidget()’, and ‘frameWidget()’. The ‘frameableWidget()’ is used to add extra code to a ‘htmlwidget’ which allows is to be rendered correctly inside a responsive ‘iframe’. The ‘frameWidget()’ is a ‘htmlwidget’ which displays content of another ‘htmlwidget’ inside a responsive ‘iframe’. These functions allow for easier embedding of ‘htmlwidgets’ in content management systems such as ‘wordpress’, ‘blogger’ etc. They also allow for separation of widget content from main HTML content where CSS of the main HTML could interfere with the widget. / MIT  | noarch                         |
| r-wikibooks   | 0.2     | The german Wikibook GNU R introduces R to new users. This package is a collection of functions and datas used in the german WikiBook GNU R / GPL-2  | noarch                         |
| r-wikifacts   | 0.1.0   | Creates messages containing random facts from the Wikipedia homepage. Intended to keep users interested during long waiting periods. / CC0  | noarch                         |
| r-wikipediar  | 1.1     | Provides an interface to the Wikipedia web application programming interface (API), using internet connexion. Three functions provide details for a specific Wikipedia page : all links that are present, all pages that link to, all the contributions (revisions for main pages, and discussions for talk pages). Two functions provide details for a specific user : all contributions, and general information (as name, gender, rights or groups). It provides additional information compared to others packages, as WikipediR. It does not need login. The multiplex network that can be constructed from the results of the functions of WikipediAR can be modeled as Stochastic Block Model as in Barbillon P., Donnet, S., Lazega E., and Bar-Hen A. : Stochastic Block Models for Multiplex networks: an application to networks of researchers, ArXiv 1501.06444, <a href="http://arxiv.org/abs/1501.06444">http://arxiv.org/abs/1501.06444</a> . / GPL (> 2) | noarch                         |
| r-wikipedir   | 1.5.0   | A wrapper for the MediaWiki API, aimed particularly at the Wikimedia ‘production’ wikis, such as Wikipedia. It can be used to retrieve page text, information about users or the history of pages, and elements of the category tree. / MIT   | noarch                         |
| r-wilcoxcv    | 1.0_2   | This package provides functions to perform fast variable selection based on the Wilcoxon rank sum test in the cross-validation or Monte-Carlo cross-validation settings, for use in microarray-based binary classification. / GPL-2   | noarch                         |
| r-wildcard    | 1.1.0   | Generate data frames from templates. / GPL-3  | noarch                         |
| r-wildpoker   | 1.1     | Provides insight into how the best hand for a poker game changes based on the game dealt, players who stay in until the showdown and wildcards added to the base game. At this time the package does not support player tactics, so draw poker variants are not included. / GPL-3   | noarch                         |

Table 51 – continued from previous page

| Name                     | Version | Summary/License   | Platforms   |
|--------------------------|---------|---|---|
| <a href="#">r-wingui</a> | 0.2     | Helps for interfacing with the operating system particularly for Windows. / GPL-2   GPL-3   MIT   | linux-64,<br>osx-64,<br>win-64                                    |
| <a href="#">r-wisam</a>  | 0.2.8   | In the course of a genome-wide association study, the situation often arises that some phenotypes are known with greater precision than others. It could be that some individuals are known to harbor more micro-environmental variance than others. In the case of inbred strains of model organisms, it could be the case that more organisms were observed from some strains than others, so the strains with more organisms have better-estimated means. Package 'wisAM' handles this situation by allowing for weighting of each observation according to residual variance. Specifically, the 'weight' parameter to the function <code>conduct_scan()</code> takes the precision of each observation (one over the variance). / GPL-3 | noarch  |
| <a href="#">r-withr</a>  | 2.1.2   | A set of functions to run code 'with' safely and temporarily modified global state. Many of these functions were originally a part of the 'devtools' package, this provides a simple package with limited dependencies to provide access to these functions. / GPL (>= 2)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-wkb</a>    | 0.3_0   | Utility functions to convert between the 'Spatial' classes specified by the package 'sp', and the well-known binary '(WKB)' representation for geometry specified by the Open Geospatial Consortium. Supports 'Spatial' objects of class 'SpatialPoints', 'SpatialPointsDataFrame', 'SpatialLines', 'SpatialLinesDataFrame', 'SpatialPolygons', and 'SpatialPolygonsDataFrame'. Supports 'WKB' geometry types 'Point', 'LineString', 'Polygon', 'MultiPoint', 'MultiLineString', and 'MultiPolygon'. Includes extensions to enable creation of maps with 'TIBCO Spotfire'. / BSD_3_clause   | noarch  |
| <a href="#">r-wktmo</a>  | 1.0.5   | Converts weekly data to monthly data. Users can use three types of week formats: ISO week, epidemiology week (epi week) and calendar date. / GPL-2  | noarch  |
| <a href="#">r-wlreg</a>  | 1.0.0   | Use various regression models for the analysis of win loss endpoints adjusting for non-binary and multivariate covariates. / GPL-2  | linux-64,<br>osx-64,<br>win-64                                    |

|------------------------------|---------|--|-----------|
| <a href="#">r-wmdb</a>       | 1.0     | Distance discriminant analysis method is one of classification methods according to multiindex performance parameters. However, the traditional Mahalanobis distance discriminant method treats with the importance of all parameters equally, and exaggerates the role of parameters which changes a little. The weighted Mahalanobis distance is used in discriminant analysis method to distinguish the importance of each parameter. In the concrete application, firstly based on the principal component analysis scheme, a new group of parameters and their corresponding percent contributions of the parameters are calculated, and the weighted matrix is regarded as the diagonal matrix of the contributions rates. Setting data to standardization, then the weighted Mahalanobis distance can be calculated. Besides the methods mentioned above, bayes method is also given. / GPL-2 | noarch    |
| <a href="#">r-wmwssp</a>     | 0.4.0   | Calculates the minimal sample size for the Wilcoxon-Mann-Whitney test that is needed for a given power and two sided type I error rate. The method works for metric data with and without ties, count data, ordered categorical data, and even dichotomous data. But data is needed for the reference group to generate synthetic data for the treatment group based on a relevant effect. For details, see Brunner, E., Bathke A. C. and Konietzschke, F: Rank- and Pseudo-Rank Procedures in Factorial Designs - Using R and SAS, Springer Verlag, to appear. / GPL-3  | noarch    |
| <a href="#">r-wnl</a>        | 0.5.1   | This is a set of minimization tools (maximum likelihood estimation and least square fitting) to solve examples in the Johan Gabrielsson and Dan Weiner's book Pharmacokinetic and Pharmacodynamic Data Analysis - Concepts and Applications 5th ed. (ISBN:9198299107). Examples include linear and non-linear compartmental model, turn-over model, single or multiple dosing bolus/infusion/oral models, allometry, toxicokinetics, reversible metabolism, in-vitro/in-vivo extrapolation, enterohepatic circulation, metabolite modeling, Emax model, inhibitory model, tolerance model, oscillating response model, enantiomer interaction model, effect compartment model, drug-drug interaction model, receptor occupancy model, and rebound phenomena model. / GPL-3   | noarch    |
| <a href="#">r-wnnse1</a>     | 0.1     | New tools for the imputation of missing values in high-dimensional data are introduced using the non-parametric nearest neighbor methods. It includes weighted nearest neighbor imputation methods that use specific distances for selected variables. It includes an automatic procedure of cross validation and does not require prespecified values of the tuning parameters. It can be used to impute missing values in high-dimensional data when the sample size is smaller than the number of predictors. For more information see Faisal and Tutz (2017) <doi:10.1515/sagmb-2015-0098>. / GPL-2  | noarch    |
| <a href="#">r-woe</a>        | 0.2     | Shows the relationship between an independent and dependent variable through Weight of Evidence and Information Value. / GPL-2   | noarch    |
| <a href="#">r-woebinning</a> | 0.1.6   | Implements an automated binning of numeric variables and factors with respect to a dichotomous target variable. Two approaches are provided: An implementation of fine and coarse classing that merges granular classes and levels step by step. And a tree-like approach that iteratively segments the initial bins via binary splits. Both procedures merge, respectively split, bins based on similar weight of evidence (WOE) values and stop via an information value (IV) based criteria. The package can be used with single variables or an entire data frame. It provides flexible tools for exploring different binning solutions and for deploying them to (new) data. / GPL-2  | noarch    |

Table 51 – continued from previous page

| Name             | Version | Summary/License  | Platforms                      |
|------------------|---------|--|--------------------------------|
| r-wooldridge     | 1.3.1   | Students learning both econometrics and R may find the introduction to both challenging. However, if the text is Introductory Econometrics: A Modern Approach by Jeffrey M. Wooldridge, they are in luck! The wooldridge data package aims to lighten the task by efficiently loading any data set found in the text with a single command. Data sets have all been compressed to a fraction of their original size and are well documented. Documentation files contain the page numbers of the text where each set is used, the original source, time of publication, and notes suggesting ideas for further exploratory data analysis and research. If one need's to brush-up on model syntax, a vignette contains R solutions to examples from each chapter of the text. Data sets are from the 6th edition (Wooldridge 2016, ISBN-13: 978-1-305-27010-7), and are backwards compatible with all versions of the text. / GPL-3                 | noarch                         |
| r-word.alignment | 1.1     | For a given Sentence-Aligned Parallel Corpus, it aligns words for each sentence pair. It considers one-to-many and symmetrization alignments. Moreover, it evaluates the quality of word alignment based on this package and some other software. It also builds an automatic dictionary of two languages based on given parallel corpus. / GPL-2  | noarch                         |
| r-wordcloud      | 2.6     | Functionality to create pretty word clouds, visualize differences and similarity between documents, and avoid over-plotting in scatter plots with text. / LGPL-2.1   | linux-64,<br>osx-64,<br>win-64 |
| r-wordcloud2     | 0.2.1   | A fast visualization tool for creating wordcloud by using 'wordcloud2.js'. 'wordcloud2.js' is a JavaScript library to create wordle presentation on 2D canvas or HTML < <a href="https://timdream.org/wordcloud2.js/">https://timdream.org/wordcloud2.js/</a> >. / GPL-2   | noarch                         |
| r-wordmatch      | 1.0     | Matches words in one file with words in another file and shows index(row number) for the matches / GPL-2   | noarch                         |
| r-wordnet        | 0.1_1   | An interface to WordNet using the Jawbone Java API to WordNet. WordNet (< <a href="http://wordnet.princeton.edu/">http://wordnet.princeton.edu/</a> >) is a large lexical database of English. Nouns, verbs, adjectives and adverbs are grouped into sets of cognitive synonyms (synsets), each expressing a distinct concept. Synsets are interlinked by means of conceptual-semantic and lexical relations. Please note that WordNet(R) is a registered tradename. Princeton University makes WordNet available to research and commercial users free of charge provided the terms of their license (< <a href="http://wordnet.princeton.edu/wordnet/license/">http://wordnet.princeton.edu/wordnet/license/</a> >) are followed, and proper reference is made to the project using an appropriate citation (< <a href="http://wordnet.princeton.edu/wordnet/citing-wordnet/">http://wordnet.princeton.edu/wordnet/citing-wordnet/</a> >). / MIT | noarch                         |
| r-wordpools      | 1.1_1   | Collects several classical word pools used most often to provide lists of words in psychological studies of learning and memory. It provides a simple function, 'pickList' for selecting random samples of words within given ranges. / GPL-2  | noarch                         |
| r-worms          | 0.2.2   | Retrieves taxonomic information from < <a href="http://www.marinespecies.org">http://www.marinespecies.org</a> > using WoRMS' RESTful Webservice. Utility functions aim at taxonomic consistency. / AGPL-3   | noarch                         |
| r-wperm          | 1.0.1   | Supplies permutation-test alternatives to traditional hypothesis-test procedures such as two-sample tests for means, medians, and standard deviations; correlation tests; tests for homogeneity and independence; and more. Suitable for general audiences, including individual and group users, introductory statistics courses, and more advanced statistics courses that desire an introduction to permutation tests. / GPL-2  | noarch                         |

| r-wpkde      | 0.1     | Weighted Piecewise Kernel Density Estimation for large data. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-wpp2008    | 1.0_1   | Data from the United Nation's World Population Prospects 2008 / GPL-2  | noarch                         |
| r-wpp2010    | 1.2_0   | Data from the United Nation's World Population Prospects 2010 / GPL-2  | noarch                         |
| r-wpp2012    | 2.2_1   | Data from the United Nation's World Population Prospects 2012 / GPL-2  | noarch                         |
| r-wpp2015    | 1.1_2   | Provides data from the United Nation's World Population Prospects 2015. / GPL-2  | noarch                         |
| r-wpp2017    | 1.2_1   | Provides data from the United Nation's World Population Prospects 2017. / GPL-2  | noarch                         |
| r-wpp2019    | 1.0_0   | Provides data from the United Nation's World Population Prospects 2019. / file LICENSE   | noarch                         |
| r-wrapr      | 1.8.9   | Tools for writing and debugging R code. Provides: '%>%' dot-pipe (an 'S3' configurable pipe), 'let()' (converts non-standard evaluation interfaces to parametric standard evaluation interfaces, inspired by 'gttools:strmacro()' and 'base::bquote()'), 'build_frame()'/'draw_frame()' ('data.frame' example tools), 'qc()' (quoting concatenate), ':= ' (named map builder), and more. / GPL-2   GPL-3   | noarch                         |
| r-wrassp     | 0.1.8   | A wrapper around Michel Scheffers's 'libassp' (< <a href="http://libassp.sourceforge.net/">http://libassp.sourceforge.net/</a> >). The 'libassp' (Advanced Speech Signal Processor) library aims at providing functionality for handling speech signal files in most common audio formats and for performing analyses common in phonetic science/speech science. This includes the calculation of formants, fundamental frequency, root mean square, auto correlation, a variety of spectral analyses, zero crossing rate, filtering etc. This wrapper provides R with a large subset of 'libassp's signal processing functions and provides them to the user in a (hopefully) user-friendly manner. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| r-wrightmap  | 1.2.1   | A powerful yet simple graphical tool available in the field of psychometrics is the Wright Map (also known as item maps or item-person maps), which presents the location of both respondents and items on the same scale. Wright Maps are commonly used to present the results of dichotomous or polytomous item response models. The 'WrightMap' package provides functions to create these plots from item parameters and person estimates stored as R objects. Although the package can be used in conjunction with any software used to estimate the IRT model (e.g. 'TAM', 'mirt', 'eRm' or 'IRTtoys' in 'R', or 'Stata', 'Mplus', etc.), 'WrightMap' features special integration with 'ConQuest' to facilitate reading and plotting its output directly. The 'wrightMap' function creates Wright Maps based on person estimates and item parameters produced by an item response analysis. The 'CQmodel' function reads output files created using 'ConQuest' software and creates a set of data frames for easy data manipulation, bundled in a 'CQmodel' object. The 'wrightMap' function can take a 'CQmodel' object as input or it can be used to create Wright Maps directly from data frames of person and item parameters. / BSD_2_clause | noarch                         |
| r-write.snns | 0.0_4   | Function for writing a SNNS pattern file from a data.frame or matrix. / GPL-2  | noarch                         |

| Name                               | Version | Summary/License  | Platforms                      |
|------------------------------------|---------|--|--------------------------------|
| <a href="#">r-writexl</a>          | 1.1     | Zero-dependency data frame to xlsx exporter based on 'libxlsxwriter'. Fast and no Java or Excel required. / BSD_2_clause   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-writexls</a>         | 5.0.0   | Cross-platform Perl based R function to create Excel 2003 (XLS) and Excel 2007 (XLSX) files from one or more data frames. Each data frame will be written to a separate named worksheet in the Excel spreadsheet. The worksheet name will be the name of the data frame it contains or can be specified by the user. / GPL-2   | noarch                         |
| <a href="#">r-wrswor</a>           | 1.1     | A collection of implementations of classical and novel algorithms for weighted sampling without replacement. / GPL-3   | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-wrswor.benchmark</a> | 0.2     | Includes performance measurements and results of repeated experiment runs (for correctness checks) for code in the 'wrswor' package. / GPL-3   | noarch                         |
| <a href="#">r-wskm</a>             | 1.4.28  | Entropy weighted k-means (ewkm) is a weighted subspace clustering algorithm that is well suited to very high dimensional data. Weights are calculated as the importance of a variable with regard to cluster membership. The two-level variable weighting clustering algorithm tw-k-means (twkm) introduces two types of weights, the weights on individual variables and the weights on variable groups, and they are calculated during the clustering process. The feature group weighted k-means (fgkm) extends this concept by grouping features and weighting the group in addition to weighting individual features. / GPL-3               | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-wsrf</a>             | 1.7.17  | A parallel implementation of Weighted Subspace Random Forest. The Weighted Subspace Random Forest algorithm was proposed in the International Journal of Data Warehousing and Mining by Baoxun Xu, Joshua Zhexue Huang, Graham Williams, Qiang Wang, and Yunming Ye (2012) <DOI:10.4018/jdwm.2012040103>. The algorithm can classify very high-dimensional data with random forests built using small subspaces. A novel variable weighting method is used for variable subspace selection in place of the traditional random variable sampling. This new approach is particularly useful in building models from high-dimensional data. / GPL-2 | linux-64,<br>osx-64,<br>win-64 |
| <a href="#">r-wsvm</a>             | 0.1_7   | We propose weighted SVM methods with penalization form. By adding weights to loss term, we can build up weighted SVM easily and examine classification algorithm properties under weighted SVM. Through comparing each of test error rates, we conclude that our Weighted SVM with boosting has predominant properties than the standard SVM have, as a whole. / GPL-2   | noarch                         |
| <a href="#">r-wtest</a>            | 3.2     | Perform the calculation of W-test, diagnostic checking, calculate minor allele frequency (MAF) and odds ratio. / GPL-2   | linux-64,<br>osx-64,<br>win-64 |

| Name        | Version | Summary/License   | Platforms  |
|-------------|---------|---|--|
| r-wtss      | 1.1.0   | An R client that provides remote access to satellite image time series. The client allows Earth observation users to obtain time series from data sets available in a Web Time Series Server. The functions include: (a) listing the data sets available in the server; (b) describing the contents of a data set; (c) retrieving a time series based on spatial location and temporal filters. / GPL-3   | noarch   |
| r-wvtool    | 1.0     | This tool, wood vision tool, is intended to facilitate preprocessing and analyzing 2-dimensional wood images toward automated recognition. The former includes some basics such as functions to RGB to grayscale, gray to binary, cropping, rotation(bilinear), median/mean/Gaussian filter, and Canny/Sobel edge detection. The latter includes gray level co-occurrence matrix (GLCM), Haralick parameters, local binary pattern (LBP), higher order local autocorrelation (HLAC), Fourier transform (radial and azimuthal integration), and Gabor filtering. The functions are intended to read data using 'readTIFF(x,info=T)' from 'tiff' package. The functions in this packages basically assumes the grayscale images as input data, thus the color images should be subjected to the function rgb2gray() before used for some other functions. / GPL-2 | noarch   |
| r-wwgbook   | 1.0.1   | Book is Linear Mixed Models: A Practical Guide Using Statistical Software published in 2006 by Chapman Hall / CRC Press / GPL-2   | noarch   |
| r-wwr       | 1.2.2   | Calculate the (weighted) win loss statistics including the win ratio, win difference and win product and their variances, with which the p-values are also calculated. The variance estimation is based on Luo et al. (2015) <doi:10.1111/biom.12225> and Luo et al. (2017) <doi:10.1002/sim.7284>. This package also calculates general win loss statistics with user-specified win loss function with variance estimation based on Bebu and Lachin (2016) <doi:10.1093/biostatistics/kxv032>. This version corrected an error when outputting confidence interval for win difference. / GPL-2   | linux-64,<br>osx-64,<br>win-64                       |
| r-x12       | 1.9.0   | The 'X13-ARIMA-SEATS' < <a href="https://www.census.gov/srd/www/x13as/">https://www.census.gov/srd/www/x13as/</a> > methodology and software is a widely used software and developed by the US Census Bureau. It can be accessed from 'R' with this package and 'X13-ARIMA-SEATS' binaries are provided by the 'R' package 'x13binary'. / GPL-2   | noarch   |
| r-x13binary | 1.1.39  | The US Census Bureau provides a seasonal adjustment program now called 'X-13ARIMA-SEATS' building on both earlier programs called X-11 and X-12 as well as the SEATS program by the Bank of Spain. The US Census Bureau offers both source and binary versions – which this package integrates for use by other R packages. / file LICENSE  | linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-xbrl      | 0.99.1  | Functions to extract business financial information from an Extensible Business Reporting Language ('XBRL') instance file and the associated collection of files that defines its 'Discoverable' Taxonomy Set ('DTS'). / GPL-2  | linux-64,<br>osx-64,<br>win-64                       |

|-----------------|---------|--|--|
| r-xfun          | 0.6     | Miscellaneous functions commonly used in other packages maintained by ‘Yihui Xie’. / MIT file LICENSE  | linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64   |
| r-xgboost       | 0.90.0  | Extreme Gradient Boosting, which is an efficient implementation of the gradient boosting framework from Chen & Guestrin (2016) <doi:10.1145/2939672.2939785>. This package is its R interface. The package includes efficient linear model solver and tree learning algorithms. The package can automatically do parallel computation on a single machine which could be more than 10 times faster than existing gradient boosting packages. It supports various objective functions, including regression, classification and ranking. The package is made to be extensible, so that users are also allowed to define their own objectives easily. / Apache License (== 2.0)   file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-xgboost-cpu   | 0.80    | None / None  | linux-64,<br>osx-64,<br>win-64                         |
| r-xgboost-gpu   | 0.80    | None / None  | linux-64   |
| r-xgobi         | 1.2_1   | Interface to the XGobi and XGvis programs for graphical data analysis. / file LICENSE  | noarch   |
| r-xhwe          | 1.0     | Conduct the likelihood ratio tests for Hardy-Weinberg equilibrium at marker loci on the X chromosome. / GPL-2  | noarch   |
| r-ximple        | 0.10    | Provides a simple XML tree parser/generator. It includes functions to read XML files into R objects, get information out of and into nodes, and write R objects back to XML code. It's not as powerful as the 'XML' package and doesn't aim to be, but for simple XML handling it could be useful. It was originally developed for the R GUI and IDE 'RKward' < <a href="https://rkward.kde.org">https://rkward.kde.org</a> >, to make plugin development easier. / GPL-3  | noarch   |
| r-xlconnectjars | 0.2_1   | Provides external JAR dependencies for the XLConnect package. / GPL-3  | noarch   |
| r-xlink         | 1.0.1   | The expression of X-chromosome undergoes three possible biological processes: X-chromosome inactivation (XCI), escape of the X-chromosome inactivation (XCI-E), and skewed X-chromosome inactivation (XCI-S). To analyze the X-linked genetic association for phenotype such as continuous, binary, and time-to-event outcomes with the actual process unknown, we propose a unified approach of maximizing the likelihood or partial likelihood over all of the potential biological processes. The methods are described in Wei Xu, Meiling Hao (2017) <doi:10.1002/gepi.22097>. And also see Dongxiao Han, Meiling Hao, Lianqiang Qu, Wei Xu (2019) <doi:10.1177/0962280219859037>. / GPL-2 | noarch   |

|----------------------------|---------|---|---|
| <a href="#">r-xllim</a>    | 2.1     | Provides a tool for non linear mapping (non linear regression) using a mixture of regression model and an inverse regression strategy. The methods include the GLLiM model (see Deleforge et al (2015) <DOI:10.1007/s11222-014-9461-5>) based on Gaussian mixtures and a robust version of GLLiM, named SLLiM (see Perthame et al (2016) < <a href="https://hal.archives-ouvertes.fr/hal-01347455">https://hal.archives-ouvertes.fr/hal-01347455</a> >) based on a mixture of Generalized Student distributions. The methods also include BLLiM (see Devijver et al (2017) < <a href="https://arxiv.org/abs/1701.07899">https://arxiv.org/abs/1701.07899</a> >) which is an extension of GLLiM with a sparse block diagonal structure for large covariance matrices (particularly interesting for transcriptomic data). / GPL-2 | noarch  |
| <a href="#">r-xlsimple</a> | 0.0.1   | Provides a simple wrapper for some ‘XLConnect’ functions. ‘XLConnect’ is a package that allows for reading, writing, and manipulating Microsoft Excel files. This package, ‘xlsimple’, adds some documentation and pre-defined formatting to the outputted Excel file. Individual sheets can include a description on the first row to remind user what is in the data set. Auto filters and freeze rows are turned on. A brief readme file is created that provides a summary listing of the created sheets and, where provided, the description. / GPL-3  | noarch  |
| <a href="#">r-xlsx</a>     | 0.6.1   | Provide R functions to read/write/format Excel 2007 and Excel 97/2000/XP/2003 file formats. / GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-xlsxjars</a> | 0.6.1   | The xlsxjars package collects all the external jars required for the xlsx package. This release corresponds to POI 3.10.1. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r-xltabr</a>   | 0.1.2   | Writes beautifully formatted cross tabulations to Excel using ‘openxlsx’. It has been developed to help automate the process of publishing Official Statistics. The user provides a dataframe, which is outputted to Excel with various types of rich formatting which are automatically detected from the structure of the cross tabulation. Documentation can be found at the following url < <a href="https://github.com/moj-analytical-services/xltabr">https://github.com/moj-analytical-services/xltabr</a> >. / GPL-3  | noarch  |
| <a href="#">r-xmisc</a>    | 0.2.1   | This is Xiaobei’s miscellaneous classes and functions useful when developing R packages, particularly for OOP using R Reference Class. / GPL-2  | noarch  |

Table 51 – continued from previous page

| Name           | Version | Summary/License  | Platforms  |
|----------------|---------|--|--|
| r-xml          | 3.98    | Many approaches for both reading and creating XML (and HTML) documents (including DTDs), both local and accessible via HTTP or FTP. Also offers access to an 'XPath' interpreter. / BSD_2_clause file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-xml2         | 1.2.0   | Work with XML files using a simple, consistent interface. Built on top of the 'libxml2' C library. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-xml2r        | 0.0.6   | XML2R is a framework that reduces the effort required to transform XML content into number of tables while preserving parent to child relationships. / GPL-2   | noarch   |
| r-xmlparsedata | 1.0.2   | Convert the output of 'utils::getParseData()' to an 'XML' tree, that one can search via 'XPath', and easier to manipulate in general. / MIT  | noarch   |
| r-xmlrpc2      | 1.1     | The 'XML-RPC' is a remote procedure call protocol based on 'XML'. The 'xmlrpc2' package is inspired by the 'XMLRPC' package but uses the 'curl' and 'xml2' packages instead 'RCurl' and 'XML'. / GPL-3   | noarch   |
| r-xnomial      | 1.0.4   | Tests whether a set of counts fit a given expected ratio. For example, a genetic cross might be expected to produce four types in the relative frequencies of 9:3:3:1. To see whether a set of observed counts fits this expectation, one can examine all possible outcomes with xmulti() or a random sample of them with xmonte() and find the probability of an observation deviating from the expectation by at least as much as the observed. As a measure of deviation from the expected, one can use the log-likelihood ratio, the multinomial probability, or the classic chi-square statistic. A histogram of the test statistic can also be plotted and compared with the asymptotic curve. / GPL-3 | linux-64,<br>osx-64,<br>win-64                         |
| r-xopen        | 1.0.0   | Cross platform solution to open files, directories or 'URLs' with their associated programs. / MIT file LICENSE  | noarch   |
| r-xplorerr     | 0.1.1   | Tools for interactive data exploration built using 'shiny'. Includes apps for descriptive statistics, visualizing probability distributions, inferential statistics, linear regression, logistic regression and RFM analysis. / MIT  | noarch   |
| r-xptr         | 1.1.1   | There is limited native support for external pointers in the R interface. This package provides some basic tools to verify, create and modify 'externalptr' objects. / MIT   | linux-64,<br>osx-64,<br>win-64                         |

Table 51 – continued from previous page

| Name         | Version | Summary/License   | Platforms   |
|--------------|---------|---|---|
| r-xr         | 0.7.2   | Support for interfaces from R to other languages, built around a class for evaluators and a combination of functions, classes and methods for communication. Will be used through a specific language interface package. Described in the book Extending R. / GPL-2   | noarch  |
| r-xrscc      | 0.1     | This is a set of statistical quality control functions, that allows plotting control charts and its iterations, process capability for variable and attribute control, highlighting the xrs_gr() function, like a first iteration for variable chart, meanwhile the we_rules() function detects non random patterns in sample. / GPL-2            | noarch  |
| r-xslt       | 1.3     | An extension for the 'xml2' package to transform XML documents by applying an 'xslt' style-sheet. / GPL-2   | linux-64,<br>osx-64,<br>win-64                                    |
| r-xtable     | 1.8_4   | Coerce data to LaTeX and HTML tables. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| r-xtal       | 1.15    | This is the tool set for crystallographer to design and analyze crystallization experiments, especially for ribosome from Mycobacterium tuberculosis. / GPL-2   GPL-3   | noarch  |
| r-xtensor    | 0.11.1  | The 'xtensor' C library for numerical analysis with multi-dimensional array expressions is provided as a header-only C14 library. It offers an extensible expression system enabling lazy broadcasting; an API following the idioms of the C standard library; and tools to manipulate array expressions and build upon 'xtensor'. / BSD_3_clause | linux-64,<br>osx-64,<br>win-64                                    |
| r-xtermstyle | 3.0.5   | Can be used for coloring output in terminals. It was developed for the standard Ubuntu terminal but should be compatible with any terminal using xterm or ANSI escape sequences. If run in windows, RStudio, or any other platform not supporting such escape sequences it gracefully passes on any output without modifying it. / GPL-2          | noarch  |
| r-xts        | 0.11    | Provide for uniform handling of R's different time-based data classes by extending zoo, maximizing native format information preservation and allowing for user level customization and extension, while simplifying cross-class interoperability. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| Name          | Version | Summary/License  | Platforms  |
|---------------|---------|--|--|
| r-xwf         | 0.2.2   | Extrema-weighted feature extraction for varying length functional data. Functional data analysis method that performs dimensionality reduction based on predefined features and allows for quantile weighting. Method implemented as presented in Van den Boom et al. (2018) <doi:10.1093/bioinformatics/bty120>. / MIT  | noarch   |
| r-xyloplot    | 1.6     | A method for creating vertical histograms sharing a y-axis using base graphics. / GPL-2  | noarch   |
| r-xyz         | 0.2     | High dimensional interaction search by brute force requires a quadratic computational cost in the number of variables. The xyz algorithm provably finds strong interactions in almost linear time. For details of the algorithm see: G. Thanei, N. Meinshausen and R. Shah (2016). The xyz algorithm for fast interaction search in high-dimensional data < <a href="https://arxiv.org/pdf/1610.05108v1.pdf">https://arxiv.org/pdf/1610.05108v1.pdf</a> >. / GPL-3   | linux-64,<br>osx-64,<br>win-64                         |
| r-yacca       | 1.1.1   | Provides an alternative canonical correlation/redundancy analysis function, with associated print, plot, and summary methods. A method for generating helio plots is also included. / GPL-3  | noarch   |
| r-yaimpute    | 1.0.3   | Performs nearest neighbor-based imputation using one or more alternative approaches to processing multivariate data. These include methods based on canonical correlation analysis, canonical correspondence analysis, and a multivariate adaptation of the random forest classification and regression techniques of Leo Breiman and Adele Cutler. Additional methods are also offered. The package includes functions for comparing the results from running alternative techniques, detecting imputation targets that are notably distant from reference observations, detecting and correcting for bias, bootstrapping and building ensemble imputations, and mapping results. / GPL-2 | linux-64,<br>osx-64,<br>win-64                         |
| r-yakmor      | 0.1.1   | This is a simple wrapper for the yakmo K-Means library (developed by Naoki Yoshinaga, see <a href="http://www.tkl.iis.u-tokyo.ac.jp/~ynaga/yakmo/">http://www.tkl.iis.u-tokyo.ac.jp/~ynaga/yakmo/</a> ). It performs fast and robust (orthogonal) K-Means. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| r-yaletoolkit | 4.2.2   | This collection of data exploration tools was developed at Yale University for the graphical exploration of complex multivariate data; barcode and gpairs now have their own packages. The new big.read.table() provided here may be useful for large files when only a subset is needed. / LGPL-3   | noarch   |
| r-yaml        | 2.2.0   | Implements the ‘libyaml’ ‘YAML’ 1.1 parser and emitter (< <a href="http://pyyaml.org/wiki/LibYAML">http://pyyaml.org/wiki/LibYAML</a> >) for R. / BSD_3_clause file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 51 – continued from previous page

| Name               | Version | Summary/License   | Platforms                      |
|--------------------|---------|---|--------------------------------|
| r-yarr             | 0.1.2   | A parser and a writer for ‘WEKA’ Attribute-Relation File Format < <a href="https://waikato.github.io/weka-wiki/arff_stable/">https://waikato.github.io/weka-wiki/arff_stable/</a> > in pure R, with no dependencies. As opposed to other R implementations, this package can read standard (dense) as well as sparse files, i.e. those where each row does only contain nonzero components. Unlike ‘RWeka’, ‘yarr’ does not require any ‘Java’ installation nor is dependent on external software. This implementation is generalized from those in packages ‘mldr’ and ‘mldr.datasets’. / GPL-3  | noarch                         |
| r-yasp             | 0.2.0   | A collection of string functions designed for writing compact and expressive R code. ‘yasp’ (Yet Another String Package) is simple, fast, dependency-free, and written in pure R. The package provides: a coherent set of abbreviations for paste() from package ‘base’ with a variety of defaults, such as p() for paste and pcc() for paste and collapse with commas; wrap(), bracket(), and others for wrapping a string in flanking characters; unwrap() for removing pairs of characters (at any position in a string); and sentence() for cleaning whitespace around punctuation and capitalization appropriate for prose sentences. / MIT  | noarch                         |
| r-yatah            | 0.0.1   | Provides functions to manage taxonomy when lineages are described with strings and ranks separated with special patterns like !*__ or ;*__. / GPL-3   | noarch                         |
| r-yesno            | 0.1.0   | Asks Yes-No questions with variable or custom responses. / GPL-2  | noarch                         |
| r-yhatr            | 0.15.1  | Deploy, maintain, and invoke models via the Yhat REST API. / FreeBSD  | noarch                         |
| r-yieldcurve       | 4.1     | Modelling the yield curve with some parametric models. The models implemented are: Nelson-Siegel, Diebold-Li and Svensson. The package also includes the data of the term structure of interest rate of Federal Reserve Bank and European Central Bank. / GPL-2   | noarch                         |
| r-ykmeans          | 1.0     | The clustering by k-means of using the target variable. To determine the number of clusters with the variance of the target variable in the cluster. / GPL-3  | noarch                         |
| r-yll              | 1.0.0   | Compute the standard expected years of life lost (YLL), as developed by the Global Burden of Disease Study (Murray, C.J., Lopez, A.D. and World Health Organization, 1996). The YLL is based on comparing the age of death to an external standard life expectancy curve. It also computes the average YLL, which highlights premature causes of death and brings attention to preventable deaths (Aragon et al., 2008). / GPL-2  | noarch                         |
| r-yonder           | 0.1.1   | Build ‘shiny’ applications with the latest Bootstrap components and design utilities. Includes refreshed reactive inputs and outputs. Use responsive layouts to design and construct applications for devices of all sizes. / GPL-3   | noarch                         |
| r-ypinterimtesting | 1.0.3   | For any spending function specified by the user, this package provides corresponding boundaries for interim testing using the adaptively weighted log-rank test developed by Yang and Prentice (2010 <doi:10.1111/j.1541-0420.2009.01243.x>). The package uses a re-sampling method to obtain stopping boundaries at the interim looks. The output consists of stopping boundaries and observed values of the test statistics at the interim looks, along with nominal p-values defined as the probability of the test exceeding the specific observed test statistic value or critical value, regardless of the test behavior at other looks. The asymptotic validity of the stopping boundaries is established in Yang (2018 <doi:10.1002/sim.7958>). / GPL-3 | linux-64,<br>osx-64,<br>win-64 |

| Name                      | Version | Summary/License  | Platforms  |
|---------------------------|---------|--|--|
| <a href="#">r-ypmodel</a> | 1.3     | Inference procedures accommodate a flexible range of hazard ratio patterns with a two-sample semi-parametric model. This model contains the proportional hazards model and the proportional odds model as sub-models, and accommodates non-proportional hazards situations to the extreme of having crossing hazards and crossing survivor functions. Overall, this package has four major functions: 1) the parameter estimation, namely short-term and long-term hazard ratio parameters; 2) 95 percent and 90 percent point-wise confidence intervals and simultaneous confidence bands for the hazard ratio function; 3) p-value of the adaptive weighted log-rank test; 4) p-values of two lack-of-fit tests for the model. See the included read_me_first.pdf for brief instructions. In this version (1.1), there is no need to sort the data before applying this package. / GPL-3 | noarch   |
| <a href="#">r-yum</a>     | 0.0.1   | Provides a number of functions to facilitate extracting information in ‘YAML’ fragments from one or multiple files, optionally structuring the information in a ‘data.tree’. ‘YAML’ (recursive acronym for YAML ain’t Markup Language) is a convention for specifying structured data in a format that is both machine- and human-readable. ‘YAML’ therefore lends itself well for embedding (meta)data in plain text files, such as Markdown files. This principle is implemented in ‘yum’ with minimal dependencies (i.e. only the ‘yaml’ packages, and the ‘data.tree’ package can be used to enable additional functionality). / GPL-3   | noarch   |
| <a href="#">r-yummlyr</a> | 0.1.1   | Yummly.com is one of the world’s largest and most powerful recipe search sites and this package aims to provide R bindings for publicly available Yummly.com Recipe API ( <a href="https://developer.yummly.com/">https://developer.yummly.com/</a> ). / GPL-2   | noarch   |
| <a href="#">r-zeallot</a> | 0.1.0   | Provides a %<-% operator to perform multiple, unpacking, and destructuring assignment in R. The operator unpacks the right-hand side of an assignment into multiple values and assigns these values to variables on the left-hand side of the assignment. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-64 |
| <a href="#">r-zen4r</a>   | 0.3     | Provides an Interface to ‘Zenodo’ (< <a href="https://zenodo.org">https://zenodo.org</a> >) REST API, including management of depositions, attribution of DOIs by ‘Zenodo’ and upload of files. / MIT  | noarch   |
| <a href="#">r-zendesk</a> | 0.4     | This package provides an R wrapper for the Zendesk API / GPL-2   | noarch   |
| <a href="#">r-zic</a>     | 0.9.1   | Provides MCMC algorithms for the analysis of zero-inflated count models. The case of stochastic search variable selection (SVS) is also considered. All MCMC samplers are coded in C for improved efficiency. A data set considering the demand for health care is provided. / GPL-2   | linux-64,<br>osx-64,<br>win-64                         |
| <a href="#">r-zillowr</a> | 0.1.0   | Zillow, an online real estate company, provides real estate and mortgage data for the United States through a REST API. The ZillowR package provides an R function for each API service, making it easy to make API calls and process the response into convenient, R-friendly data structures. See < <a href="http://www.zillow.com/howto/api/APIOverview.htm">http://www.zillow.com/howto/api/APIOverview.htm</a> > for the Zillow API Documentation. / GPL-3  | noarch   |

| Name        | Version | Summary/License  | Platforms  |
|-------------|---------|--|--|
| r-zim       | 1.1.0   | Analyze count time series with excess zeros. Two types of statistical models are supported: Markov regression by Yang et al. (2013) <doi:10.1016/j.stamet.2013.02.001> and state-space models by Yang et al. (2015) <doi:10.1177/1471082X14535530>. They are also known as observation-driven and parameter-driven models respectively in the time series literature. The functions used for Markov regression or observation-driven models can also be used to fit ordinary regression models with independent data under the zero-inflated Poisson (ZIP) or zero-inflated negative binomial (ZINB) assumption. Besides, the package contains some miscellaneous functions to compute density, distribution, quantile, and generate random numbers from ZIP and ZINB distributions. / GPL-3 | noarch   |
| r-zip       | 2.0.1   | Cross-Platform ‘zip’ Compression Library. A replacement for the ‘zip’ function, that does not require any additional external tools on any platform. / CC0   | linux-64,<br>osx-64,<br>win-32,<br>win-64              |
| r-zipcode   | 1.0     | This package contains a database of city, state, latitude, and longitude information for U.S. ZIP codes from the CivicSpace Database (August 2004) augmented by Daniel Coven’s federalgovernmentzipcodes.us web site (updated January 22, 2012). Previous versions of this package (before 1.0) were based solely on the CivicSpace data, so an original version of the CivicSpace database is also included. / CC BY-SA 2.0 file LICENSE  | noarch   |
| r-zipfr     | 0.6_1   | Statistical models and utilities for the analysis of word frequency distributions. The utilities include functions for loading, manipulating and visualizing word frequency data and vocabulary growth curves. The package also implements several statistical models for the distribution of word frequencies in a population. (The name of this package derives from the most famous word frequency distribution, Zipf’s law.) / GPL-3   | noarch   |
| r-zipr      | 0.1.1   | Implements Python-style zip for R. Is a more flexible version of cbind. / GPL-3  | noarch   |
| r-zoeppritz | 1.0_7   | Calculate and plot scattering matrix coefficients for plane waves at interface. / GPL-2  | noarch   |
| r-zoo       | 1.8_6   | An S3 class with methods for totally ordered indexed observations. It is particularly aimed at irregular time series of numeric vectors/matrices and factors. zoo’s key design goals are independence of a particular index/date/time class and consistency with ts and base R by providing methods to extend standard generics. / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| r-zoocat    | 0.2.0   | Tools for manipulating multivariate time series data by extending ‘zoo’ class. / GPL-3   | noarch   |
| r-zoom      | 2.0.4   | zm(), called with any active plot allow to enter an interactive session to zoom/navigate any plot. The development version, as well as binary releases can be found at <a href="https://github.com/cbarbu/R-package-zoom">https://github.com/cbarbu/R-package-zoom</a> / GPL-3   | noarch   |

| Name                        | Version | Summary/License  | Platforms   |
|-----------------------------|---------|--|---|
| <a href="#">r-zoomgrid</a>  | 1.0.0   | Provides the grid search algorithm with a zoom. The grid search algorithm with a zoom aims to help solving difficult optimization problem where there are many local optima inside the domain of the target function. It offers suitable initial or starting value for the following optimization procedure, provided that the global optimum exists in the neighbourhood of the initial or starting value. The grid search algorithm with a zoom saves time tremendously in cases with high-dimensional arguments. / GPL-3                                | noarch  |
| <a href="#">r-zseq</a>      | 0.2.0   | Generates well-known integer sequences. ‘gmp’ package is adopted for computing with arbitrarily large numbers. Every function has hyperlink to its corresponding item in OEIS (The On-Line Encyclopedia of Integer Sequences) in the function help page. For interested readers, see Sloane and Plouffe (1995, ISBN:978-0125586306). / GPL-3   | noarch  |
| <a href="#">r-ztree</a>     | 1.0.6   | Read ‘.xls’ and ‘.sbj’ files which are written by the Microsoft Windows program ‘z-Tree’. The latter is a software for developing and carrying out economic experiments (see < <a href="http://www.ztree.uzh.ch/">http://www.ztree.uzh.ch/</a> > for more information). / GPL-3  | noarch  |
| <a href="#">r.methodss3</a> | 1.7.1   | Methods that simplify the setup of S3 generic functions and S3 methods. Major effort has been made in making definition of methods as simple as possible with a minimum of maintenance for package developers. For example, generic functions are created automatically, if missing, and naming conflict are automatically solved, if possible. The method setMethodS3() is a good start for those who in the future may want to migrate to S4. This is a cross-platform package implemented in pure R that generates standard S3 methods. / LGPL (>= 2.1) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r.oo</a>        | 1.22.0  | Methods and classes for object-oriented programming in R with or without references. Large effort has been made on making definition of methods as simple as possible with a minimum of maintenance for package developers. The package has been developed since 2001 and is now considered very stable. This is a cross-platform package implemented in pure R that defines standard S3 classes without any tricks. / LGPL (>= 2.1)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">r.utils</a>     | 2.8.0   | Utility functions useful when programming and developing R packages. / LGPL (>= 2.1)   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name         | Version | Summary/License  | Platforms   |
|--------------|---------|--|---|
| r2d3         | 0.2.3   | Suite of tools for using ‘D3’, a library for producing dynamic, interactive data visualizations. Supports translating objects into ‘D3’ friendly data structures, rendering ‘D3’ scripts, publishing ‘D3’ visualizations, incorporating ‘D3’ in R Markdown, creating interactive ‘D3’ applications with Shiny, and distributing ‘D3’ based ‘htmlwidgets’ in R packages. / BSD_3_clause file LICENSE                    | noarch  |
| r6           | 2.4.0   | Creates classes with reference semantics, similar to R’s built-in reference classes. Compared to reference classes, R6 classes are simpler and lighter-weight, and they are not built on S4 classes so they do not require the methods package. These classes allow public and private members, and they support inheritance, even when the classes are defined in different packages. / MIT file LICENSE              | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| randomforest | 4.6_14  | Classification and regression based on a forest of trees using random inputs, based on Breiman (2001) <DOI:10.1023/A:1010933404324>. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| ranger       | 0.11.2  | A fast implementation of Random Forests, particularly suited for high dimensional data. Ensembles of classification, regression, survival and probability prediction trees are supported. Data from genome-wide association studies can be analyzed efficiently. In addition to data frames, datasets of class ‘gwaa.data’ (R package ‘GenABEL’) and ‘dgCMatrx’ (R package ‘Matrix’) can be directly analyzed. / GPL-3 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| rappdirs     | 0.3.1   | An easy way to determine which directories on the users computer you should use to save data, caches and logs. A port of Python’s ‘Appdirs’ ( <a href="https://github.com/ActiveState/appdirs">url{https://github.com/ActiveState/appdirs}</a> ) to R. / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| Name                          | Version  | Summary/License  | Platforms  |
|-------------------------------|----------|--|--|
| <a href="#">rcpparmadillo</a> | 0.9.3002 | 'Armadillo' is a templated C linear algebra library (by Conrad Sanderson) that aims towards a good balance between speed and ease of use. Integer, floating point and complex numbers are supported, as well as a subset of trigonometric and statistics functions. Various matrix decompositions are provided through optional integration with LAPACK and ATLAS libraries. The 'RcppArmadillo' package includes the header files from the templated 'Armadillo' library. Thus users do not need to install 'Armadillo' itself in order to use 'RcppArmadillo'. From release 7.800.0 on, 'Armadillo' is licensed under Apache License 2; previous releases were under licensed as MPL 2.0 from version 3.800.0 onwards and LGPL-3 prior to that; 'RcppArmadillo' (the 'Rcpp' bindings/bridge to Armadillo) is licensed under the GNU GPL version 2 or later, as is the rest of 'Rcpp'. Note that Armadillo requires a fairly recent compiler; for the g family at least version 4.6.* is required. / GPL (>= 2) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">rcppeigen</a>     | 0.3.3.50 | and 'Eigen' integration using 'Rcpp'. 'Eigen' is a C template library for linear algebra: matrices, vectors, numerical solvers and related algorithms. It supports dense and sparse matrices on integer, floating point and complex numbers, decompositions of such matrices, and solutions of linear systems. Its performance on many algorithms is comparable with some of the best implementations based on 'Lapack' and level-3 'BLAS'. The 'RcppEigen' package includes the header files from the 'Eigen' C template library (currently version 3.3.4). Thus users do not need to install 'Eigen' itself in order to use 'RcppEigen'. Since version 3.1.1, 'Eigen' is licensed under the Mozilla Public License (version 2); earlier version were licensed under the GNU LGPL version 3 or later. 'RcppEigen' (the 'Rcpp' bindings/bridge to 'Eigen') is licensed under the GNU GPL version 2 or later, as is the rest of 'Rcpp'. / GPL (>= 2)   file LICENSE   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">rcppprogress</a>  | 0.4.1    | Allows to display a progress bar in the R console for long running computations taking place in c code, and support for interrupting those computations even in multithreaded code, typically using OpenMP. / GPL (>= 3)   | noarch   |
| <a href="#">rcpproll</a>      | 0.3.0    | Provides fast and efficient routines for common rolling / windowed operations. Routines for the efficient computation of windowed mean, median, sum, product, minimum, maximum, standard deviation and variance are provided. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">rcurl</a>         | 1.95     | Wrapper for 'libcurl' < <a href="http://curl.haxx.se/libcurl/">http://curl.haxx.se/libcurl/</a> > Provides functions to allow one to compose general HTTP requests and provides convenient functions to fetch URIs, get & post forms, etc. and process the results returned by the Web server. This provides a great deal of control over the HTTP/FTP/... connection and the form of the request while providing a higher-level interface than is available just using R socket connections. Additionally, the underlying implementation is robust and extensive, supporting FTP/FTPS/TFTP (uploads and downloads), SSL/HTTPS, telnet, dict, ldap, and also supports cookies, redirects, authentication, etc. / BSD   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

|--------------------------|---------|---|---|
| <a href="#">rjsonio</a>  | 1.3_1   | This is a package that allows conversion to and from data in Javascript object notation (JSON) format. This allows R objects to be inserted into Javascript/ECMAScript/ActionScript code and allows R programmers to read and convert JSON content to R objects. This is an alternative to rjson package. Originally, that was too slow for converting large R objects to JSON and was not extensible. rjson's performance is now similar to this package, and perhaps slightly faster in some cases. This package uses methods and is readily extensible by defining methods for different classes, vectorized operations, and C code and callbacks to R functions for deserializing JSON objects to R. The two packages intentionally share the same basic interface. This package (RJSONIO) has many additional options to allow customizing the generation and processing of JSON content. This package uses libjson rather than implementing yet another JSON parser. The aim is to support other general projects by building on their work, providing feedback and benefit from their ongoing development. / BSD_3_clause file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">rlang</a>    | 0.3.4   | A toolbox for working with base types, core R features like the condition system, and core 'Tidyverse' features like tidy evaluation. / GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">rlist</a>    | 0.4.6   | Provides a set of functions for data manipulation with list objects, including mapping, filtering, grouping, sorting, updating, searching, and other useful functions. Most functions are designed to be pipeline friendly so that data processing with lists can be chained. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">rmariadb</a> | 1.0.6   | Implements a 'DBI'-compliant interface to 'MariaDB' (< <a href="https://mariadb.org/">https://mariadb.org/</a> >) and 'MySQL' (< <a href="https://www.mysql.com/">https://www.mysql.com/</a> >) databases. / GPL-2  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

|----------------------------|---------|--|---|
| <a href="#">rngtools</a>   | 1.3.1   | Provides a set of functions for working with Random Number Generators (RNGs). In particular, a generic S4 framework is defined for getting/setting the current RNG, or RNG data that are embedded into objects for reproducibility. Notably, convenient default methods greatly facilitate the way current RNG settings can be changed. / GPL-3  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">robustbase</a> | 0.93    | Essential Robust Statistics. Tools allowing to analyze data with robust methods. This includes regression methodology including model selections and multivariate statistics where we strive to cover the book Robust Statistics, Theory and Methods by 'Maronna, Martin and Yohai'; Wiley 2006. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">rocr</a>       | 1.0_7   | ROC graphs, sensitivity/specificity curves, lift charts, and precision/recall plots are popular examples of trade-off visualizations for specific pairs of performance measures. ROCR is a flexible tool for creating cutoff-parameterized 2D performance curves by freely combining two from over 25 performance measures (new performance measures can be added using a standard interface). Curves from different cross-validation or bootstrapping runs can be averaged by different methods, and standard deviations, standard errors or box plots can be used to visualize the variability across the runs. The parameterization can be visualized by printing cutoff values at the corresponding curve positions, or by coloring the curve according to cutoff. All components of a performance plot can be quickly adjusted using a flexible parameter dispatching mechanism. Despite its flexibility, ROCR is easy to use, with only three commands and reasonable default values for all optional parameters. / GPL (>= 2) | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">rodbc</a>      | 1.3_15  | An ODBC database interface. / GPL-2   GPL-3  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| <code>snowballc</code>   | 0.6.0   | An R interface to the C ‘libstemmer’ library that implements Porter’s word stemming algorithm for collapsing words to a common root to aid comparison of vocabulary. Currently supported languages are Danish, Dutch, English, Finnish, French, German, Hungarian, Italian, Norwegian, Portuguese, Romanian, Russian, Spanish, Swedish and Turkish. / BSD_3_clause file LICENSE           | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <code>sourcetools</code> | 0.1.7   | Tools for the reading and tokenization of R code. The ‘sourcetools’ package provides both an R and C interface for the tokenization of R code, and helpers for interacting with the tokenized representation of R code. / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <code>sp</code>          | 1.3_1   | Classes and methods for spatial data; the classes document where the spatial location information resides, for 2D or 3D data. Utility functions are provided, e.g. for plotting data as maps, spatial selection, as well as methods for retrieving coordinates, for subsetting, print, summary, etc. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <code>sparklyr</code>    | 1.0.0   | R interface to Apache Spark, a fast and general engine for big data processing, see < <a href="http://spark.apache.org">http://spark.apache.org</a> >. This package supports connecting to local and remote Apache Spark clusters, provides a ‘dplyr’ compatible back-end, and provides an interface to Spark’s built-in machine learning algorithms. / Apache License 2.0   file LICENSE | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Continued on next page

Table 52 – continued from previous page

| Name                    | Version | Summary/License   | Platforms   |
|-------------------------|---------|---|---|
| <a href="#">sparsem</a> | 1.77    | Some basic linear algebra functionality for sparse matrices is provided: including Cholesky decomposition and backsolving as well as standard R subsetting and Kronecker products. / GPL ( $\geq 2$ )   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">spatial</a> | 7.3_1   | Functions for kriging and point pattern analysis. / GPL-2   GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">spdata</a>  | 0.3.0   | Diverse spatial datasets for demonstrating, benchmarking and teaching spatial data analysis. It includes R data of class sf (defined by the package ‘sf’), Spatial (‘sp’), and nb (‘spdep’). Unlike other spatial data packages such as ‘rnat-uralearth’ and ‘maps’, it also contains data stored in a range of file formats including GeoJSON, ESRI Shapefile and GeoPackage. Some of the datasets are designed to illustrate specific analysis techniques. cycle_hire() and cycle_hire_osm(), for example, is designed to illustrate point pattern analysis techniques. / CC0 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">squarem</a> | 2017.10 | Algorithms for accelerating the convergence of slow, monotone sequences from smooth, contraction mapping such as the EM algorithm. It can be used to accelerate any smooth, linearly convergent acceleration scheme. A tutorial style introduction to this package is available in a vignette on the CRAN download page or, when the package is loaded in an R session, with vignette(SQUAREM). / GPL ( $\geq 2$ )  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

Table 52 – continued from previous page

| Name                        | Version | Summary/License  | Platforms   |
|-----------------------------|---------|--|---|
| <a href="#">stabledist</a>  | 0.7.1   | Density, Probability and Quantile functions, and random number generation for (skew) stable distributions, using the parametrizations of Nolan. / GPL ( $\geq 2$ )   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">stanheaders</a> | 2.18.1  | The C header files of the Stan project are provided by this package, but it contains no R code or function documentation. There is a shared object containing part of the 'CVODES' library, but it is not accessible from R. 'StanHeaders' is only useful for developers who want to utilize the 'LinkingTo' directive of their package's DESCRIPTION file to build on the Stan library without incurring unnecessary dependencies. The Stan project develops a probabilistic programming language that implements full or approximate Bayesian statistical inference via Markov Chain Monte Carlo or 'variational' methods and implements (optionally penalized) maximum likelihood estimation via optimization. The Stan library includes an advanced automatic differentiation scheme, 'templated' statistical and linear algebra functions that can handle the automatically 'differentiable' scalar types (and doubles, 'ints', etc.), and a parser for the Stan language. The 'rstan' package provides user-facing R functions to parse, compile, test, estimate, and analyze Stan models. / BSD_3_clause file LICENSE | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">stopwords</a>   | 0.9.0   | Provides multiple sources of stopwords, for use in text analysis and natural language processing. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">stringdist</a>  | 0.9.5   | Implements an approximate string matching version of R's native 'match' function. Can calculate various string distances based on edits (Damerau-Levenshtein, Hamming, Levenshtein, optimal sting alignment), qgrams (q-gram, cosine, jaccard distance) or heuristic metrics (Jaro, Jaro-Winkler). An implementation of soundex is provided as well. Distances can be computed between character vectors while taking proper care of encoding or between integer vectors representing generic sequences. This package is built for speed and runs in parallel by using 'openMP'. An API for C or C++ is exposed as well. / GPL-3   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

Table 52 – continued from previous page

| Name                        | Version | Summary/License   | Platforms   |
|-----------------------------|---------|---|---|
| <a href="#">stringi</a>     | 1.4.3   | Fast, correct, consistent, portable, as well as convenient character string/text processing in every locale and any native encoding. Owing to the use of the ‘ICU’ (International Components for Unicode) library, the package provides ‘R’ users with platform-independent functions known to ‘Java’, ‘Perl’, ‘Python’, ‘PHP’, and ‘Ruby’ programmers. Available features include: pattern searching (e.g., with ‘Java’-like regular expressions or the ‘Unicode’ collation algorithm), random string generation, case mapping, string transliteration, concatenation, Unicode normalization, date-time formatting and parsing, and many more. / file LICENSE (FOSS) | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">stringr</a>     | 1.4.0   | A consistent, simple and easy to use set of wrappers around the fantastic ‘stringi’ package. All function and argument names (and positions) are consistent, all functions deal with NA’s and zero length vectors in the same way, and the output from one function is easy to feed into the input of another. / GPL-2   file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">strucchange</a> | 1.5_1   | Testing, monitoring and dating structural changes in (linear) regression models. strucchange features tests/methods from the generalized fluctuation test framework as well as from the F test (Chow test) framework. This includes methods to fit, plot and test fluctuation processes (e.g., CUSUM, MOSUM, recursive/moving estimates) and F statistics, respectively. It is possible to monitor incoming data online using fluctuation processes. Finally, the breakpoints in regression models with structural changes can be estimated together with confidence intervals. Emphasis is always given to methods for visualizing the data. / GPL-2   GPL-3         | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">suppdists</a>   | 1.1_9.4 | Ten distributions supplementing those built into R. Inverse Gauss, Kruskal-Wallis, Kendall’s Tau, Friedman’s chi squared, Spearman’s rho, maximum F ratio, the Pearson product moment correlation coefficient, Johnson distributions, normal scores and generalized hypergeometric distributions. In addition two random number generators of George Marsaglia are included. / GPL (>= 2)   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |

| <a href="#">tensorflow</a>        | 1.13.1  | Interface to ‘TensorFlow’ < <a href="https://www.tensorflow.org/">https://www.tensorflow.org/</a> >, an open source software library for numerical computation using data flow graphs. Nodes in the graph represent mathematical operations, while the graph edges represent the multidimensional data arrays (tensors) communicated between them. The flexible architecture allows you to deploy computation to one or more ‘CPUs’ or ‘GPUs’ in a desktop, server, or mobile device with a single ‘API’. ‘TensorFlow’ was originally developed by researchers and engineers working on the Google Brain Team within Google’s Machine Intelligence research organization for the purposes of conducting machine learning and deep neural networks research, but the system is general enough to be applicable in a wide variety of other domains as well. / Apache License 2.0 | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">testit</a>            | 0.9     | Provides two convenience functions <code>assert()</code> and <code>test_pkg()</code> to facilitate testing R packages. / GPL   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">testthat</a>          | 2.1.1   | Software testing is important, but, in part because it is frustrating and boring, many of us avoid it. ‘testthat’ is a testing framework for R that is easy learn and use, and integrates with your existing ‘workflow’. / MIT file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">tfruns</a>            | 1.4     | Create and manage unique directories for each ‘TensorFlow’ training run. Provides a unique, time stamped directory for each run along with functions to retrieve the directory of the latest run or latest several runs. / Apache License 2.0  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">th.data</a>           | 1.0_1   | Contains data sets used in other packages Torsten Hothorn maintains. / GPL-3   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <b>3.2. Anaconda Distribution</b> |         |  | <b>2139</b>   |
| <a href="#">threejs</a>           | 0.3.1   | Create interactive 3D scatter plots, network plots, and globes using the ‘three.js’ visualization library (< <a href="https://threejs.org/">https://threejs.org/</a> >). / MIT file LICENSE  | linux-32,<br>linux-   |

Table 54: U

| Name     | Version | Summary/License  | Platforms  |
|----------|---------|--|--|
| udunits2 | 0.13    | Provides simple bindings to Unidata's udunits library. / GPL-2   | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| units    | 0.6_2   | Support for measurement units in R vectors, matrices and arrays: automatic propagation, conversion, derivation and simplification of units; raising errors in case of unit incompatibility. Compatible with the POSIXct, Date and diff-time classes. Uses the UNIDATA udunits library and unit database for unit compatibility checking and conversion. / GPL-2                      | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| urca     | 1.3_0   | Unit root and cointegration tests encountered in applied econometric analysis are implemented. / GPL (>= 2)  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| uroot    | 2.0_9   | Seasonal unit roots and seasonal stability tests. P-values based on response surface regressions are available for both tests. P-values based on bootstrap are available for seasonal unit root tests. A parallel implementation of the bootstrap method requires a CUDA capable GPU with compute capability >= 3.0, otherwise a debugging version fully coded in R is used. / GPL-2 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |
| usethis  | 1.5.0   | Automate package and project setup tasks that are otherwise performed manually. This includes setting up unit testing, test coverage, continuous integration, Git, 'GitHub', licenses, 'Rcpp', 'RStudio' projects, and more. / GPL-3   | noarch   |
| utf8     | 1.1.4   | Process and print 'UTF-8' encoded international text (Unicode). Input, validate, normalize, encode, format, and display. / Apache License (== 2.0)   file LICENSE  | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

Table 55: V

| Name                              | Version | Summary/License  | Platforms   |
|-----------------------------------|---------|--|---|
| <a href="#">vars</a>              | 1.5_3   | Estimation, lag selection, diagnostic testing, forecasting, causality analysis, forecast error variance decomposition and impulse response functions of VAR models and estimation of SVAR and SVEC models. / GPL (>= 2)  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">vgam</a>              | 1.1_1   | An implementation of about 6 major classes of statistical regression models. The central algorithm is Fisher scoring and iterative reweighted least squares. At the heart of this package are the vector generalized linear and additive model (VGLM/VGAM) classes. VGLMs can be loosely thought of as multivariate GLMs. VGAMs are data-driven VGLMs that use smoothing. The book Vector Generalized Linear and Additive Models: With an Implementation in R (Yee, 2015) <DOI:10.1007/978-1-4939-2818-7> gives details of the statistical framework and the package. Currently only fixed-effects models are implemented. Many (150) models and distributions are estimated by maximum likelihood estimation (MLE) or penalized MLE. The other classes are RR-VGLMs (reduced-rank VGLMs), quadratic RR-VGLMs, reduced-rank VGAMs, RCIMs (row-column interaction models)—these classes perform constrained and unconstrained quadratic ordination (CQO/UQO) models in ecology, as well as constrained additive ordination (CAO). Note that these functions are subject to change; see the NEWS and ChangeLog files for latest changes. / GPL-3 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64            |
| <a href="#">viridis</a>           | 0.5.1   | Implementation of the ‘viridis’ - the default -, ‘magma’, ‘plasma’, ‘inferno’, and ‘cividis’ color maps for ‘R’. ‘viridis’, ‘magma’, ‘plasma’, and ‘inferno’ are ported from ‘matplotlib’ < <a href="http://matplotlib.org/">http://matplotlib.org/</a> >, a popular plotting library for ‘python’. ‘cividis’, was developed by Jamie R. Nuñez and Sean M. Colby. These color maps are designed in such a way that they will analytically be perfectly perceptually-uniform, both in regular form and also when converted to black-and-white. They are also designed to be perceived by readers with the most common form of color blindness (all color maps in this package) and color vision deficiency (‘cividis’ only). / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">viridislite</a>       | 0.3.0   | Implementation of the ‘viridis’ - the default -, ‘magma’, ‘plasma’, ‘inferno’, and ‘cividis’ color maps for ‘R’. ‘viridis’, ‘magma’, ‘plasma’, and ‘inferno’ are ported from ‘matplotlib’ < <a href="http://matplotlib.org/">http://matplotlib.org/</a> >, a popular plotting library for ‘python’. ‘cividis’, was developed by Jamie R. Nuñez and Sean M. Colby. These color maps are designed in such a way that they will analytically be perfectly perceptually-uniform, both in regular form and also when converted to black-and-white. They are also designed to be perceived by readers with the most common form of color blindness (all color maps in this package) and color vision deficiency (‘cividis’ only). This is the ‘lite’ version of the more complete ‘viridis’ package that can be found at < <a href="https://cran.r-project.org/package=viridis">https://cran.r-project.org/package=viridis</a> >. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |
| <a href="#">visnetwork</a>        | 2.0.6   | Provides an R interface to the ‘vis.js’ JavaScript charting library. It allows an interactive visualization of networks. / MIT file LICENSE  | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-32,<br>win-64 |

| Name    | Version | Summary/License  | Platforms  |
|---------|---------|--|--|
| zeallot | 0.1.0   | Provides a %<-% operator to perform multiple, unpacking, and destructuring assignment in R. The operator unpacks the right-hand side of an assignment into multiple values and assigns these values to variables on the left-hand side of the assignment. / MIT file LICENSE   | linux-32,<br>linux-64,<br>noarch,<br>osx-64,<br>win-64 |
| zip     | 2.0.1   | Cross-Platform ‘zip’ Compression Library. A replacement for the ‘zip’ function, that does not require any additional external tools on any platform. / CC0   | linux-64,<br>osx-64,<br>win-32,<br>win-64              |
| zoo     | 1.8_5   | An S3 class with methods for totally ordered indexed observations. It is particularly aimed at irregular time series of numeric vectors/matrices and factors. zoo’s key design goals are independence of a particular index/date/time class and consistency with ts and base R by providing methods to extend standard generics. / GPL-2   GPL-3 | linux-32,<br>linux-64,<br>osx-64,<br>win-32,<br>win-64 |

## Documentation download packages

For users who wish to view documentation locally or when offline, Anaconda provides documentation downloads.

## Anaconda documentation downloads

[docs.anaconda.com](https://docs.anaconda.com) includes documentation for these products:

- [Anaconda Distribution](#)
- [Anaconda Navigator](#)
- [Anaconda Enterprise 4 Repository](#)
- [Anaconda Enterprise 4 Notebooks](#)
- [Anaconda Cloud](#)
- [MKL Optimizations](#)

[docs.anaconda.com](#) also includes archived documentation pages for these products that are no longer in production:

- [Anaconda Accelerate](#)
- [Anaconda Adam](#)
- [Anaconda for Cluster Management](#)
- [Anaconda Launcher](#)
- [Anaconda Scale](#)
- [NumbaPro](#)

You can download a PDF or zipped HTML copy of [docs.anaconda.com](#) by clicking the v: latest box in the lower right corner. Under the heading “Downloads” you will see the options “PDF” and “HTML”.

[enterprise-docs.anaconda.com](#) offers documentation for Anaconda Enterprise 5.

You can download a PDF or zipped HTML copy of [enterprise-docs.anaconda.com](#) by navigating to that site and clicking the v: latest box in the lower right corner. Under the heading “Downloads” you will see the options “PDF” and “HTML”.

You can install offline copies of both [docs.anaconda.com](#) and [enterprise-docs.anaconda.com](#) by installing the conda package `anaconda-docs`:

```
conda install anaconda-docs
```

This will install a PDF copy and a zipped HTML copy of each site into the directory `share/doc` for your currently active conda environment.

EXAMPLE: If your conda install directory is `~/miniconda3`, and your environment is named `my-env`, the documentation will be installed into `~/miniconda3/envs/my-env/share/doc/`.

## Open source package documentation downloads

You can download a package of documentation for many of Anaconda’s open source packages with this command:

```
conda install anaconda-oss-docs
```

This will install documentation for the open source packages into the directory `share/doc/anaconda-oss` for your currently active conda environment.

EXAMPLE: If your conda install directory is `~/miniconda3`, and your environment is named `my-env`, the documentation will be installed into `~/miniconda3/envs/my-env/share/doc/anaconda-oss`.

This bundle includes documentation for these packages:

- Python
- NumPy

- SciPy
- pandas
- Conda
- Blaze
- Bleach
- botocore
- Certifi
- cryptography
- CFFI

## Old package lists

You can download previous versions of Anaconda from the [Anaconda installer archive](#).

Older versions of packages can usually be downloaded from the [package repository](#) or from <https://anaconda.org/anaconda/PackageName>.

---

**Note:** Replace `PackageName` with the name of the desired package.

---

EXAMPLE: At <https://anaconda.org/anaconda/beautifulsoup4>, previous versions of beautifulsoup4 are shown on the **Files** tab.

You can also search for packages from the command line with `conda search PackageName`.

Packages included in previous versions of Anaconda:

## Packages included in Anaconda v.1.0

### 3.2.4 End User License Agreement

© 2015, Anaconda, Inc.

All rights reserved under the 3-clause BSD License:

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

Neither the name of Anaconda, Inc. (“Anaconda, Inc.”) nor the names of its contributors may be used to endorse or promote products derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE COPYRIGHT HOLDERS AND CONTRIBUTORS “AS IS” AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL ANACONDA, INC. BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

#### Notice of Third Party Software Licenses

Anaconda Distribution contains open source software packages from third parties. These are available on an “as is” basis and subject to their individual license agreements. These licenses are available in Anaconda Distribution or at <http://docs.anaconda.com/anaconda/pkg-docs>. Any binary packages of these third party tools you obtain via Anaconda Distribution are subject to their individual licenses as well as the Anaconda license. Anaconda, Inc. reserves the right to change which third party tools are provided in Anaconda Distribution.

In particular, Anaconda Distribution contains re-distributable, run-time, shared-library files from the Intel(TM) Math Kernel Library (“MKL binaries”). You are specifically authorized to use the MKL binaries with your installation of Anaconda Distribution. You are also authorized to redistribute the MKL binaries with Anaconda Distribution or in the conda package that contains them. Use and redistribution of the MKL binaries are subject to the licensing terms located at <https://software.intel.com/en-us/license/intel-simplified-software-license>. If needed, instructions for removing the MKL binaries after installation of Anaconda Distribution are available at <http://www.anaconda.com>.

Anaconda Distribution also contains cuDNN software binaries from NVIDIA® Corporation (“cuDNN binaries”). You are specifically authorized to use the cuDNN binaries with your installation of Anaconda Distribution. You are also authorized to redistribute the cuDNN binaries with an Anaconda Distribution package that contains them. If needed, instructions for removing the cuDNN binaries after installation of Anaconda Distribution are available at <http://www.anaconda.com>.

Anaconda Distribution also contains Visual Studio Code software binaries from Microsoft Corporation (“VS Code”). You are specifically authorized to use VS Code with your installation of Anaconda Distribution. Use of VS Code is subject to the licensing terms located at <https://code.visualstudio.com/License>.

#### Cryptography Notice

This distribution includes cryptographic software. The country in which you currently reside may have restrictions on the import, possession, use, and/or re-export to another country, of encryption software. BEFORE using any encryption software, please check your country’s laws, regulations and policies concerning the import, possession, or use, and re-export of encryption software, to see if this is permitted. See the Wassenaar Arrangement <http://www.wassenaar.org/> for more information.

Anaconda, Inc. has self-classified this software as Export Commodity Control Number (ECCN) 5D992b, which includes mass market information security software using or performing cryptographic functions with asymmetric algorithms. No license is required for export of this software to non-embargoed countries. The Intel(TM) Math Kernel Library contained in Anaconda, Inc.’s software is classified by Intel(TM) as ECCN 5D992b with no license required for export to non-embargoed countries and Microsoft’s Visual Studio Code software is classified by Microsoft as ECCN 5D992.c with no license required for export to non-embargoed countries.

The following packages are included in this distribution that relate to cryptography:

- `openssl` The OpenSSL Project is a collaborative effort to develop a robust, commercial-grade, full-featured, and Open Source toolkit implementing the Transport Layer Security (TLS) and Secure Sockets Layer (SSL) protocols as well as a full strength general purpose cryptography library.
- `pycrypto` A collection of both secure hash functions (such as SHA256 and RIPEMD160), and various encryption algorithms (AES, DES, RSA, ElGamal, etc.).
- `pyopenssl` A thin Python wrapper around (a subset of) the OpenSSL library.
- `kerberos` (krb5, non-Windows platforms) A network authentication protocol designed to provide strong authentication for client/server applications by using secret-key cryptography.
- `cryptography` A Python library which exposes cryptographic recipes and primitives.

## 3.3 Anaconda Cloud

### *What is Anaconda Cloud?*

**Anaconda Cloud** is a package management service by **Anaconda**. Cloud makes it easy to find, access, store and share public notebooks, environments, and conda and PyPI packages. Cloud also makes it easy to stay current with updates made to the packages and environments you are using. Cloud hosts hundreds of useful Python packages, notebooks and environments for a wide variety of applications. You do not need to log in, or even to have a Cloud account, to search for public packages, download and install them.

You can build new packages using the Anaconda Client command line interface (CLI), then manually or automatically upload the packages to Cloud to quickly share with others or access yourself from anywhere.

For developers, Cloud is designed to make software development, release and maintenance easy by providing broad package management support. Cloud allows for free public package hosting, as well as package channels, providing a flexible and scalable service for groups and organizations of all sizes.

Hosting of freely available packages always remains free for individuals and organizations hosting up to 3 GB of packages.

To use Cloud, you should first:

- [Download Anaconda](#).
- Become familiar with using conda. A good place to start is the [conda cheat sheet](#) and the [conda test drive](#).

### 3.3.1 User guide

Anaconda Cloud is a package management service that makes it easy to find, access, store and share public notebooks, environments, and conda and PyPI packages. Cloud also makes it easy to stay current with updates made to the packages and environments you are using.

To begin using Cloud, read [Getting started](#), then the remaining sections of the user guide.

#### Getting started

- [Installing Anaconda Client](#)
- [Finding, downloading and installing packages](#)
- [Building and uploading packages](#)
- [Sharing notebooks](#)
- [Sharing environments](#)

#### Installing Anaconda Client

You can use Anaconda Client command line interface (CLI) to:

- Connect to and manage your Anaconda Cloud account.
- Upload [packages](#) you have created.
- Generate access [tokens](#) to allow access to private packages.

NOTE: Client is not necessary to search for and download packages.

This tool can be installed using an Anaconda Prompt or the Terminal application in three ways: with [conda](#), with [pip](#) or with [pip](#) from source. We recommend using conda.

Option 1, conda:

```
conda install anaconda-client
```

Option 2, pip:

```
pip install anaconda-client
```

Option 3, installing with pip from source:

```
pip install git+https://github.com/Anaconda-Platform/anaconda-client
```

After installing, view the complete list of Client tasks with this command:

```
anaconda -h
```

## Finding, downloading and installing packages

### Searching for public packages

Cloud hosts hundreds of useful Python packages for a wide variety of applications. You do not need to be logged in, or even need a Cloud account, to search for public packages, download and install them. You need an account only to access *private packages* without a *token* or to share your packages with others.

To search for packages:

1. In the top Search box, type part or all of the name of a program you are searching for, and then press Enter.
2. Packages that match your search string are displayed. To see more information, click the package name.

The screenshot shows the Anaconda Cloud search interface. At the top, there is a search bar with the text 'quadratic' and a green search button. Below the search bar, there are filter controls for 'Type: All', 'Access: All', and 'Platform: All'. The search results are displayed in a table with columns: Favorites, Downloads, Package (owner / package), and Platforms. The table shows one result: 'superuser / quadratic\_equation' with 1 favorite and 0 downloads. The package is an 'IPython notebook' and is available as 'source' on the 'ipynb' platform. Navigation links '« Previous', 'showing 1 - 1 of 1', and 'Next »' are at the bottom.

| ⬆ Favorites | ⬇ Downloads | ⬆ Package (owner / package)                               | Platforms    |
|-------------|-------------|---|--------------|
| 1           | 0           | <b>superuser / quadratic_equation</b><br>IPython notebook | ipynb source |

« Previous   showing 1 - 1 of 1   Next »

For more information, see [Working with packages](#).

### Refining your search results

You can filter search results using 3 filter controls:

- **Type:** All, conda only or PyPI only.
- **Access:** All, Public and/or Private—only available if you are logged in.
- **Platform:** All, source, linux-32, linux-64, linux-armv61, linux-armv71, linux-ppc641e, noarch, osx-32, osx-64, win-32, win-64.

Source packages are source code only, not yet built for any specific platform.

Noarch packages are built to work on all platforms.

### Downloading and installing packages from Cloud

You can download and install packages using *Anaconda Navigator*, the graphical user interface for Anaconda. Advanced users may prefer a terminal window or command prompt.

#### Using Navigator

Navigator is automatically installed when you install Anaconda®.

To download and install a package into its own environment:

1. Start Navigator by clicking its program icon on your desktop or in your programs menu.
2. Sign Navigator into Cloud so you can search for packages marked as private. Click the top right Sign in to Anaconda Cloud button and type your Cloud username and password, then click the Login button.
3. On the **Environments** tab, in the far-right Search packages box, enter the name of the desired package.
4. In the list to the left of Channels, select either Not installed or All, then click the Search button.
5. Select the checkbox of the package you want to install, then click the Apply button.

For more information, see *Navigator*.

#### Using conda in a Terminal window or Anaconda Prompt

To download and install a package into its own environment:

1. Locate a package on Cloud that you want to download, then click on the package name.
2. A detail page displays specific installation instructions for the current operating system. Copy and paste the full command into your terminal window.

For example, the command could be structured as:

```
conda install -c username packagename
```

NOTE: For the following examples to work, you need to have [conda downloaded](#) and installed.

TIP: Conda expands `username` to a URL such as <https://anaconda.org/username>, based on the settings in the `.condarc` file.

### Building and uploading packages

*Open a Cloud account* to upload packages or to access private packages without a token.

To build and upload packages, install the Client command line interface (CLI). For more information, see *Installing Anaconda Client*.

Use the Terminal window or an Anaconda Prompt to perform the following steps.

1. Install Anaconda Client:

```
conda install anaconda-client
```

2. Log into your Cloud account:

```
anaconda login
```

At the prompt, enter your Cloud username and password.

3. Choose the package you would like to build. For this example, download our public test package:

```
git clone https://github.com/Anaconda-Platform/anaconda-client
cd anaconda-client/example-packages/conda/
```

4. To build your test package, first install `conda-build` and turn off automatic Client uploading, then run the `conda build` command:

```
conda install conda-build
conda config --set anaconda_upload no
conda build .
```

5. Find the path to where the newly-built file was placed so you can use it in the next step:

```
conda build . --output
```

6. Upload your newly-built test package to your Cloud account:

```
anaconda login
anaconda upload /your/path/conda-package.tar.bz2
```

NOTE: Replace `/your/path/` with the actual path that you found in the previous step.

For more information, see [conda packages](#).

## Sharing notebooks

To share a [Jupyter notebook](#)—formerly IPython notebook—on Cloud:

1. To Upload your notebook to Cloud, open the Terminal or an Anaconda Prompt and enter:

```
anaconda upload my-notebook.ipynb
```

NOTE: Replace `my-notebook` with the actual name of your notebook.

2. You can see an HTML version of your notebook stored at:

```
http://notebooks.anaconda.org/<USERNAME>/my-notebook
```

NOTE: Replace `<USERNAME>` with your username, and `my-notebook` with the actual name of your notebook.

3. Anyone who has access to Cloud can download your notebook. To download the notebook, open the Terminal or an Anaconda Prompt and enter:

```
anaconda download username/my-notebook
```

NOTE: Replace `username` with your username, and `my-notebook` with the actual name of your notebook.

## Sharing environments

To share an environment on Cloud:

1. See the [conda user guide](#) to create and save a conda environment. Open the Terminal or an Anaconda Prompt and enter:

```
conda env export -n my-environment -f my-environment.yml
```

NOTE: Replace `my-environment` with the actual name of your environment.

2. Upload it to Cloud either using the web interface or the `anaconda upload` command.

- Using the web interface:

Go to <https://anaconda.org/USERNAME/environments>.

NOTE: Replace `USERNAME` with your username.

In the top right corner use the Upload button to upload your environment.

- Using the `anaconda upload` command from the Terminal window or an Anaconda Prompt:

```
anaconda upload my-environment.yml
```

NOTE: Replace `my-environment` with the actual name of your environment.

3. You can see a list of your uploaded environments at:

```
http://envs.anaconda.org/<USERNAME>
```

NOTE: Replace `<USERNAME>` with your username.

4. Anyone can download and install your environment from Cloud.

- Using the web interface:

Go to <https://anaconda.org/USERNAME/environments>.

NOTE: Replace `USERNAME` with the username.

Select the environment, click the Files tab, and under the Names field click the file to download.

- Using the Terminal or an Anaconda Prompt:

```
conda env create user/my-environment
source activate my-environment
```

NOTE: Replace `my-environment` with the actual name of your environment.

### How to...

- *Use packages*
- *Use the Anaconda Client CLI*
- *Build packages*

### Use packages

## Finding a package

In your browser, you can search Anaconda Cloud for packages by package name. From the top navigation bar of any page, enter the package name in the search box. You can filter your searches to specify only conda or PyPI packages, and you can sort results by number of favorites or number of downloads by clicking the search results column heading.

## Downloading and installing a package from Cloud

To install a conda package, in your Terminal window or Anaconda Prompt run:

```
conda install -c username packagename
```

Conda expands `username` to a URL such as <https://anaconda.org/username> or <https://conda.anaconda.org/username> based on the settings in the `.condarc` file.

NOTE: Replace `username` with your username, and `packagename` with the actual name of the package.

## Downloading and installing a PyPI package from Cloud

To install a PyPI package, in your Terminal window or Anaconda Prompt run:

```
pip install --index-url pypi.anaconda.org/USERNAME/simple packagename
```

NOTE: Replace `USERNAME` with your username, and `packagename` with the actual name of the package.

## Use the Anaconda Client CLI

### Installing Client

For installation and setup instructions, see *[Install Anaconda Client](#)*.

### Finding my Client login credentials

Your credentials for Client are those you used to create an account on Cloud.

To get help:

1. Go to <https://anaconda.org>.
2. Select the **Sign In** tab.
3. Click either [I forgot my password](#) or [I forgot my username](#).

### Logging into Client

After you have downloaded and configured Client, open a Terminal window or an Anaconda Prompt and run:

```
anaconda login
```

### Displaying a list of Client commands

From a Terminal window or an Anaconda Prompt, run:

```
anaconda --help
```

### Finding out more about a Client command

From a Terminal window or an Anaconda Prompt, run:

```
anaconda COMMANDNAME -h
```

NOTE: Replace `COMMANDNAME` with the name of the command about which you want more information.

### Listing all available Client configuration files

From a Terminal window or an Anaconda Prompt, run:

```
anaconda config --files
```

### Listing all of your Client configuration variables

From a Terminal window or an Anaconda Prompt, run:

```
anaconda config --show
```

### Finding out more about Client

You can learn more about Client using the help command, documentation or community support email group.

### Build packages

#### Building and uploading a package

For a quick example, see *Building and uploading packages* in *Getting started*.

#### Testing a built package

In your Terminal window or Anaconda Prompt run:

```
conda create --use-local -n test PACKAGENAME
```

Specify the `--use-local` option.

NOTE: Replace `PACKAGENAME` with the actual name of the package.

## Uploading a package to Cloud

In a Terminal window or Anaconda Prompt, run:

```
anaconda upload PACKAGENAME
```

NOTE: Replace `PACKAGENAME` with the actual name of the package.

## Finding help for uploading packages

You can obtain a complete list of upload options, including:

- Package channel.
- Label.
- Availability to other users.
- Metadata.

To list the options, in a Terminal window or Anaconda Prompt run:

```
anaconda upload -h
```

## Tutorial

### Using labels in the development cycle

Anaconda Cloud *labels* can be used to facilitate a development cycle and organize the code that is in development, in testing and in production, without affecting non-development users. With labels you can upload a file to a specific label, so only users who put that label in the URL they search are able to find it.

Using Anaconda Client, *package* developers can create additional labels such as development `labels/dev`, test `labels/test` or other labels that are searched only if the user specifies the label. The following search examples use a *namespace* of `travis`:

- <https://anaconda.org/travis/labels/main> – the label searched by default.
- <https://anaconda.org/travis> – same as default label with `main` implicit.
- <https://anaconda.org/travis/labels/dev> – contains the packages in development.
- <https://anaconda.org/travis/labels/test> – contains packages ready to test.
- <https://anaconda.org/travis/labels/any-custom-label> – any label you want to use.

In this example, we show you how to use a `test` label, so that you can upload files without affecting your production-quality packages. Without a `--label` argument the default label is `main`.

Use the Terminal window or an Anaconda Prompt to perform the following steps:

1. Let us start with a conda package. If you do not have one, use our example conda package. Before you build the package, edit the version in the `meta.yaml` file in `anaconda-client/example-packages/conda/` to be `2.0`:

```
git clone https://github.com/Anaconda-Platform/anaconda-client/  
cd anaconda-client/example-packages/conda/  
nano meta.yaml # Bump version to 2.0
```

(continues on next page)

(continued from previous page)

```
conda config --set anaconda_upload no
conda build .
```

2. Upload your test package to Cloud using the Client *upload* command.

Adding the `--label` option tells Cloud to make the upload visible only to users who specify that label:

```
anaconda upload /path/to/conda-package-2.0.tar.bz2 --label test
```

NOTE: Replace `/path/to/` with the actual path where you stored the package.

3. You now can see that even when you search conda main, you do not see the 2.0 version of the test package. This is because you need to tell conda to look for your new test label.
4. The `--override` argument tells conda not to use any channels in your `~/.condarc` file.

No 2.0 results:

```
conda search --override -c USERNAME conda-package
```

NOTE: Replace USERNAME with your username.

Your 2.0 package is here:

```
conda search --override -c USERNAME/label/test conda-package
```

NOTE: Replace USERNAME with your username.

5. You can give the label `USERNAME/label/test` to your testers.

NOTE: Replace USERNAME with your username.

6. Once they finish testing, you may then want to copy the test packages back to your main label:

```
anaconda label --copy test main
```

You can also manage your package labels from your dashboard: <https://anaconda.org/USERNAME/conda-package>.

Your version 2.0 is now in main:

```
conda search --override -c USERNAME conda-package
```

NOTE: Replace USERNAME with your username.

If you use `anaconda-client` 1.7 or higher, you can use `anaconda move` to move packages from one label to another:

```
anaconda move --from-label OLD --to-label NEW SPEC
```

Replace OLD with the old label, NEW with the new label, and SPEC with the package to move. SPEC can be either “user/package/version/file”, or “user/package/version” in which case it moves all files in that version.

## Tasks

### Working with accounts

- *Personal accounts*
- *Organization accounts*

## Personal accounts

### Overview

This section explains how to create a free, personal account, log in and out, and access the settings and features of different types of accounts.

### Creating a free account

All Anaconda Cloud users can find, download and use packages without having a Cloud account.

However, you need to create a Cloud account to:

- Author packages.
- Upload packages, notebooks and environments.
- Access shared, private packages.
- Create organizations.

To sign up for a free Cloud account:

1. In a browser, go to [Anaconda Cloud](#).
2. Make sure the **Sign Up** tab is active.  
**NOTE:** There is also a **Sign In** tab for existing users.
3. Select a username.

4. Enter your email address.

NOTE: Users who register with an .edu email are granted some additional features.

5. Create a password.

NOTE: The password must be at least 7 characters long.

6. Enter the password again to confirm it.

7. Read and accept the Terms and Conditions.

8. Click the Sign up button.

The system creates your free account, logs you in and displays your personal dashboard.

TIP: Cloud displays your profile photo if the email address you used to register on Cloud is associated with a Gravatar account. To associate your email address or to change your Gravatar profile photo, go to [gravatar.com](https://gravatar.com).

When you are logged into Cloud, the Profile list appears at the top right of every page. This indicates the name of the currently active user or organization.

The View menu contains these options:

- Landscape: Your home page.
- Favorites: Packages from other users you have starred.
- Packages: Only packages you have created.
- Notebooks: Only notebooks you have created.
- Environments: Only environments you have created.
- Projects: Only projects you have uploaded.

Packages, notebooks and environments that you have created with this account appear on your dashboard. For more information, see [packages](#).

## Resetting your password

The **Sign In** tab provides two links to help regain access to your account:

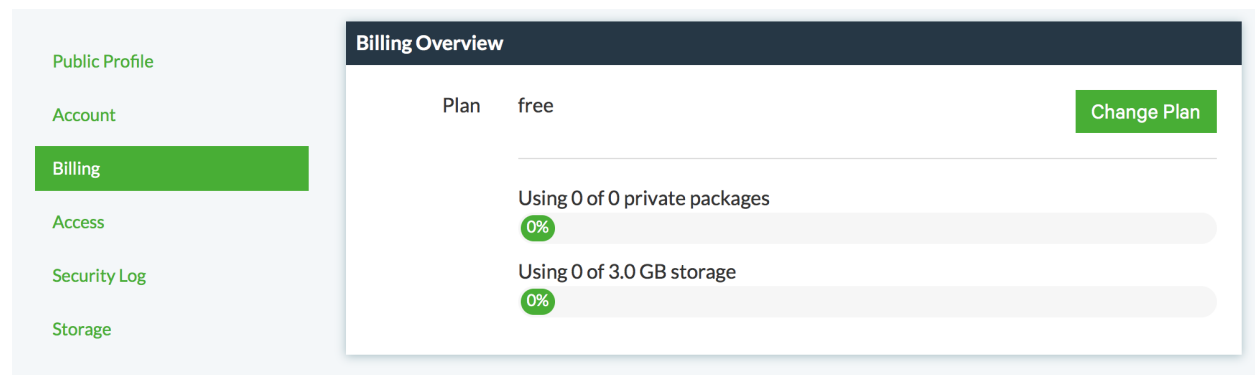

- **I forgot my username**. Click this link to have the username emailed to the email address of record.
- **I forgot my password**. Click this link to have a reset password link sent to the email address of record.

NOTE: The reset password link expires within 24 hours. If you no longer have access to the email account, you can create a new account or email [support@anaconda.com](mailto:support@anaconda.com) for assistance.

## Upgrading or downgrading your plan

To change a Cloud plan:

1. Log in to the Cloud account that you want to change.
2. At the top right of the Cloud interface, in the Profile list, select Settings.
3. Select the Billing option.

4. Click the Change Plan button.
5. Select the desired plan.

If you are moving from a free to a charged plan, enter your credit card information, and then click the OK button.

NOTE: If you need more private packages or storage space than is included in a personal plan, [contact Anaconda](#) so we can customize a plan for you.

NOTE: If you need assistance with billing questions, you can [contact Anaconda](#).

## Creating access tokens

The best way to manage access or make packages private is to create [organizations](#) or [groups](#), which allow you to set separate permissions per package, notebook or environment.

You can also control access with the *token* system. You can use tokens to control access to private repositories, collections or packages on Cloud. Additionally, the degree of access a token grants is completely configurable at the time of generation. You can generate multiple tokens to control which groups of users have access to certain features if they have the appropriate token.

### Generating tokens

You can generate tokens using the Web UI or Anaconda Client.

NOTE: By default, tokens expire after one year.

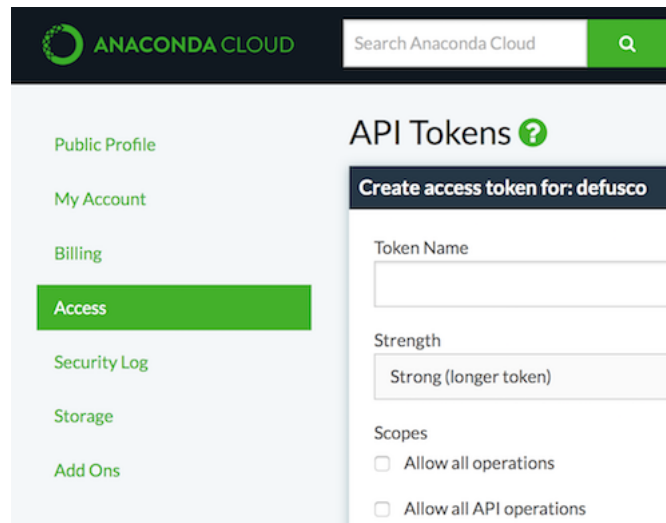

To generate a token using the Web UI:

1. Navigate to:

```
https://anaconda.org/<channel>/settings/access
```

NOTE: Replace `<channel>` with the actual channel name.

2. From here you can select a name for the token and set the required scopes.

To generate a token with Client:

1. In your Terminal window or Anaconda Prompt run:

```
anaconda auth --create --name YOUR-TOKEN-NAME --scopes 'repos conda:download'
```

NOTE: Replace `YOUR-TOKEN-NAME` with the token name you want.

2. This generates a random alphanumeric token string, which you can then distribute to fellow Cloud users to enable them to download a package that you have marked private. The token produced in this example provides access to download any of your private conda repositories.
3. It can be enabled with the `conda config` command. In your Terminal window or Anaconda Prompt run:

```
conda config --add channels https://conda.anaconda.org/t/<token>/<channel>
```

Add a channel with a token and a label::

```
conda config --add channels https://conda.anaconda.org/t/<token>/<channel>/
↳label/<labelname>
```

NOTE: Replace ``<token>`` with your token string, ``<channel>`` with the channel\_
↳name,
``<labelname>`` with the label name used in :ref:`cloud-accounts-generate`.

NOTE: If you lose the random alphanumeric string, you need to *revoke the token* and create a new one.

Scopes are provided as a space-separated, quoted list. The available scopes are:

- `all`: Allow all operations.
- `api`: Allow all API operations.
- `api:modify-group`: Allow addition and modification of groups.
- `api:read`: Allow read access to the API site.
- `api:write`: Allow write access to the API site.
- `conda`: Allow all operations on Conda repositories.
- `conda:download`: Allow private downloads from Conda repositories.
- `pypi`: Allow all operations on PyPI repositories.
- `pypi:download`: Allow private downloads from PyPI repositories.
- `pypi:upload`: Allow uploads to PyPI repositories.
- `repos`: Allow access to all package repositories.

NOTE: Tokens provide access to all packages within a specified channel. Separate permissions per package, notebook or environment may be better handled with *organizations* and *groups*.

## Revoking tokens

You can revoke tokens using the Web UI or Anaconda Client.

To revoke a token using the Web UI, navigate to the following URL:

```
https://anaconda.org/<channel>/settings/access
```

NOTE: Replace `<channel>` with the actual channel name.

To revoke a token using Client, in your Terminal window or Anaconda Prompt run:

```
anaconda auth -r YOUR-TOKEN-NAME
```

NOTE: Replace `YOUR-TOKEN-NAME` with the token name you want to revoke.

## Organization accounts

### Overview

You can create a *Cloud organization* to:

- Share packages, environments or notebooks under an organization's account rather than your personal account.
- Assign multiple account administrators.
- Assign different access permissions to groups of users and customize per-package access by group.
- Host more, larger packages.

### Working with organizations

- *Creating an organization*
- *Deleting an organization*
- *Customizing users and groups*
- *Uploading packages to an organization*
- *Creating groups for differing access levels*

Organizations enable you to maintain group-owned repositories and set access levels for various users in the group.

### Creating an organization

To create an organization:

1. Log in to Anaconda Cloud.
2. In the Tools list, select Organizations, and then scroll to the bottom of the page.
3. Supply an organization name.

NOTE: Organization names cannot include spaces or special characters.

4. Supply an email address, then click the Create Organization button.

The system displays the dashboard for the new organization.

As the creator and owner of an organization, you have automatic administrative access to this organization and any packages associated with the organization.

In the Tools list, the Group Membership option shows a list of all organizations to which you belong.

### Deleting an organization

To delete an organization you administer and erase all data associated with it:

1. At the top right of the Cloud interface, in the Profile list, select Switch To.
2. Select the organization you want to delete.
3. In the Profile list, select Settings.
4. Select the Account option. You may be asked to verify your password.

5. In the Delete Account section, click the Delete button.

A confirmation page then requests that you provide the full name of the organization.

## Customizing users and groups

To add, remove, or edit group and user access for an organization you administer:

1. At the top right of the Cloud interface, in the Profile list, select the desired organization profile.
2. In the Tools list, select Groups.
3. You can review and edit the current group and user access for an organization, as well as add new groups and users at this address: <https://anaconda.org/<OrgName>/groups/>

NOTE: Replace <OrgName> with the organization name.

NOTE: Users receive a dashboard notification when you add them to an organization.

## Uploading packages to an organization

To upload a package to an organization, use the `-u/--user` option and in the Terminal window or an Anaconda Prompt, run:

```
anaconda upload --user ORGANIZATION package.tar.bz2
```

NOTE: Replace `ORGANIZATION` with the organization name, and `package.tar.bz2` with the actual name of the package.

NOTE: Only the co-owners of an organization may upload packages to the organization.

## Creating groups for differing access levels

Within an organization, you can create a group to customize access for a group of users. There are four types of permissions you can grant:

- **Read:** Provides access only to the packages. Users in a read-only group can see the list of files within a package and can install them through conda.
- **Read-Write:** Provides access to upload new versions of an existing package, delete files of a package and manage the individual labels of files. Users in a read-write group cannot upload files for non-existing packages, cannot delete or transfer the package and cannot lock and unlock labels.
- **Admin:** Provides access do everything except uploading new packages (admin users can still upload to an existing package) and lock and unlock labels.
- **Owners:** The user has full control over the organization and group.

To create a group and set access levels:

1. Click the +New Group button.
2. Give the group a name, and assign the desired permissions— Read-Only, Read-Write or Administration.
3. Add the desired members by username in the Members box.
4. Add the packages which this group can access in the Packages box.
5. Click the Save Group button.

### Working with packages

- *Overview*
- *Using package managers*
- *Uploading packages*
- *Using private packages*
- *Removing a previous version of a package*
- *Adding a collaborator to a package*
- *Removing a collaborator from a package*
- *Transferring a package to a new owner*
- *Copying a package*
- *Deleting a package*

#### Overview

All files uploaded to Anaconda Cloud are stored in packages. Each Cloud package is visible at its own unique URL based on the name of the user who owns the package and the name of the package.

Users can create a Cloud package and then upload files into it.

For more information, see *package*.

---

**Note:** Throughout this task, replace placeholder text like `USERNAME` and `PACKAGENAME` with the text specific to your project.

---

#### Namespaces

A namespace is the part of Cloud where a user or organization may host packages. For example, the user namespace <https://anaconda.org/travis> contains packages that were uploaded and shared by a user named `travis`.

For more information, see *namespace*.

#### Labels

A label is part of the URLs on Cloud where conda looks for packages.

Each file within a package may be tagged with one or more labels, or not tagged at all to accept the default label of `main`.

For more information, see *label*.

## Using package managers

Cloud supports two package managers, *conda* and *PyPI*. To work with conda or PyPI packages, you must use their corresponding subdomains:

- To install conda packages from the user `travis`, use the repository URL `https://conda.anaconda.org/travis`
- To install PyPI packages from the user `travis`, use the repository URL `https://pypi.anaconda.org/travis`

## Conda packages

### Uploading conda packages

This example shows how to build and upload a *conda* package to Cloud using `conda build`.

Use the terminal window or an Anaconda Prompt to perform the following steps:

1. Before you start, install `anaconda-client` and `conda-build`:

```
conda install anaconda-client conda-build
```

2. Choose the repository for which you would like to build the package. In this example, we use a simple public *conda test package*:

```
git clone https://github.com/Anaconda-Platform/anaconda-client
cd anaconda-client/example-packages/conda/
```

In this directory, there are two required files, *meta.yaml* and *build.sh*.

macOS and Linux systems are Unix systems. Packages built for Unix systems require a *build.sh* file, packages built for Windows require a *bld.bat* file, and packages built for both Windows and Unix systems require both a *build.sh* file and a *bld.bat* file. All packages require a *meta.yaml* file.

3. To build the package, turn off automatic Client uploading and then run the `conda build` command:

```
conda config --set anaconda_upload no
conda build .
```

All packages built in this way are placed in a subdirectory of the *Anaconda* `conda-bld` directory.

4. You can check where the resulting file was placed with the `--output` option:

```
conda build . --output
```

5. You can upload the test package to Cloud with the Anaconda *upload* command:

```
anaconda login
anaconda upload /path/to/conda-package.tar.bz2
```

---

**Note:** Replace `/path/to/` with the actual path where you stored the package.

---

For more information on conda's overall build framework, you may also want to read the articles *Building conda packages*.

### Installing conda packages

You can install conda packages from Cloud by adding channels to your conda configuration.

Use the terminal window or an Anaconda Prompt to perform the following steps:

1. Because conda knows how to interact with Cloud, specifying the channel `sean` translates to <https://anaconda.org/sean>:

```
conda config --add channels sean
```

2. You can now install public conda packages from Sean's Cloud account. Try installing the `testci` package at <https://anaconda.org/sean/testci>:

```
conda install testci
```

3. You can install a package from a channel with a token and a label:

```
conda install -c https://conda.anaconda.org/t/token/channel/label/labelname_↵  
↵packagename
```

---

**Note:** Replace `token` with the provided token, `channel` with a user channel, `labelname` with the label name and `packagename` with the package name you want to install.

---

### PyPI packages

#### Uploading PyPI packages

We can test PyPI package uploading with a small public example package saved in the [anaconda-client repository](#).

Use the terminal window or an Anaconda Prompt to perform the following steps:

1. Begin by cloning the repository from the command line:

```
git clone git@github.com:Anaconda-Platform/anaconda-client.git  
cd anaconda-client/example-packages/pypi/
```

2. You can now create your PyPI package with the `setup.py` script:

```
python setup.py sdist
```

3. The package has now been built as a source tarball and is ready to be uploaded:

```
anaconda upload dist/*.tar.gz
```

Your package is now available at <http://anaconda.org/USERNAME/PACKAGE>.

### Installing PyPI packages

The best way to install a PyPI package is using `pip`. For the following command, we use the package we authored in the examples above. In your terminal window or an Anaconda Prompt, run:

```
pip install --extra-index-url https://pypi.anaconda.org/USERNAME/simple pypi-test-  
↪package
```

## Installing private PyPI packages

The best way to manage access or make PyPI and other packages private is to create *organizations* or *groups*, which allow you to set separate permissions per package, notebook or environment.

You can also control access with the token system. All Cloud URLs can be prefixed with `/t/$TOKEN` to access private packages.

In your terminal window or an Anaconda Prompt, run:

```
TOKEN=$(anaconda auth --create --name YOUR-TOKEN-NAME)  
pip install --index-url https://pypi.anaconda.org/t/$TOKEN/USERNAME/simple-test-  
↪package
```

**Note:** Replace `YOUR-TOKEN-NAME` with the name of the token you created, `USERNAME` with your username and `simple-test-package` with the actual test-package name.

## Uploading packages

1. To upload package files to Cloud, use the terminal window or an Anaconda Prompt and the *upload* command:

```
anaconda login  
anaconda upload PACKAGENAME
```

Cloud automatically detects packages and notebooks, package or notebook types, and their versions.

2. Your package is now available at:

```
https://anaconda.org/USERNAME/PACKAGENAME
```

3. Your package also can be downloaded by anyone using Client from the terminal window or an Anaconda Prompt:

```
anaconda download USERNAME/PACKAGENAME
```

## Using private packages

It is no longer possible to sign up for an individual paid plan with private packages. Anyone who had private packages in the past still has the ability to have those hosted privately.

By default, all packages, notebooks, and environments uploaded to Cloud are accessible to anyone who has access to the repository.

Packages uploaded to your user channel on Cloud can be marked as private using the Web UI:

1. Select the desired package.
2. Select the **Settings** tab.
3. Select Admin in the sidebar.

- Alternatively, you can reach this page with the following URL:

```
https://anaconda.org/username/packageName/settings/admin
```

---

**Note:** Jupyter notebooks and conda environments can also be marked private using this procedure and URL.

---

---

**Note:** Other Cloud users may access your private packages either with tokens or by logging in.

---

### Private packages with tokens

---

**Note:** Replace `token` with the provided token, `channel` with a user channel, `labelname` with the label name, and `packageName` with a package name you want to install.

---

To make your private packages available to be accessed with tokens:

- First create an access *token* that includes the following scope for Client:

```
conda:download
```

Or, in the Web UI with:

```
Allow private downloads from conda repositories
```

The token is a random alphanumeric string and this is used to install a package or add a channel from which you want to install private packages.

- Using the provided token, a user channel can be added to `config` from the terminal window or an Anaconda Prompt with:

```
conda config --add channels https://conda.anaconda.org/t/token/channel
```

- The token can also be used to install packages without first adding the channel. In the terminal window or an Anaconda Prompt, run:

```
conda install -c https://conda.anaconda.org/t/token/channel packageName
```

To install a package from a channel using token and label name:

```
conda install -c https://conda.anaconda.org/t/token/channel/label/labelname_↵  
↵packageName
```

- Private PyPI packages can also be installed in the Web UI:

```
https://pypi.anaconda.org/t/token/channel
```

### Private packages with login

To make your private packages available to users who have logged in:

- Create an *organization*.

2. Create a group in that organization, which may be a read-only group.
3. Add to the group the users that you want to grant access to.
4. Upload the package to the organization, or transfer an existing package to the organization.

After you grant them access, other users can download and install your package using the Web UI or Client.

To download a package:

1. In a browser, navigate to the desired channel.
2. If the organization name is `OrgName` and the package name is `conda-package`, use these commands in the terminal window or an Anaconda Prompt:

```
conda install anaconda-client
anaconda login
conda install -c OrgName conda-package
```

Or instead:

```
conda install anaconda-client
anaconda login
conda install -c https://conda.anaconda.org/OrgName conda-package
```

## Removing a previous version of a package

To remove a previous version of one of your packages from Cloud:

1. Select the package name.
2. Select the **Files** tab.
3. Select the checkbox to the left of the version you want to remove.
4. In the **Actions** menu, select Remove.

You may instead use the terminal window or an Anaconda Prompt:

1. Run:

```
anaconda remove USERNAME/PACKAGENAME/0.2
```

**Note:** Replace `USERNAME` with your username, `PACKAGENAME` with the package name and `0.2` with the desired version.

2. You can now see the change on your profile page:

```
https://anaconda.org/USERNAME/PACKAGE
```

### Adding a collaborator to a package

You can add other users that are not part of an organization to collaborate on your packages. You will need the usernames of the other users.

1. From your dashboard, select the package by clicking on its name.
2. To display the package settings, select the Settings option.
3. To display the current collaborators, select the Collaborators option.
4. Type the username of the person you want to add as a collaborator, and then click the Add button.

---

**Note:** All collaborators are given full read/write permissions to the package, even private packages.

---

### Removing a collaborator from a package

To revoke package access previously granted to a collaborator:

1. From your dashboard select the package by clicking on its name.
2. To display the package settings, select the Settings option.
3. To display the current collaborators, select the Collaborators option.
4. Click the red X button next to a collaborator to revoke their access.

### Transferring a package to a new owner

By default, when you create or add packages, they are attached to your individual profile. You can transfer ownership to another owner account you control, such as an organization profile you manage.

To transfer a package to a new owner:

1. From your dashboard—or the dashboard of an organization you administer—select the package for which you want to transfer ownership.  
The system displays options for that package.
2. To display the package settings, select the Settings option.
3. Select the Admin option.
4. Under Transfer this package to a new owner, click the Transfer button.
5. Select the organization name for the new owner.
6. Click the Transfer Ownership button.

### Copying a package

To copy a package from the channel `conda-forge` to a personal channel such as `jsmith`:

```
anaconda copy conda-forge/glueviz/0.10.4 --to-owner jsmith
```

`conda-forge/glueviz/0.10.4` is a “spec” and can match either of two formats: `user/package/version` or `user/package/version/filename`.

Previously labels were called “channels”, and the `anaconda copy` command has deprecated options `from-channel` and `to-channel` that expect to operate on labels. These deprecated options should not be used. If you attempt to run `anaconda copy --from-channel conda-forge --to-channel jsmith glueviz`, you will receive an error that Label `conda-forge` does not exist.

## Deleting a package

To delete a package from Cloud, including all of its versions:

1. Select the package name.
2. Select the Settings option.
3. In the left sidebar, select Admin.
4. Click Delete.

You may instead use the terminal window or an Anaconda Prompt:

1. Run:

```
anaconda remove USERNAME/PACKAGENAME
```

2. You can now see the change on your profile page:

```
https://anaconda.org/USERNAME
```

## Working with notebooks

To begin working with Jupyter Notebooks, see the [Official Jupyter Notebook documentation](#).

To share a [Jupyter notebook](#) on Cloud:

1. Save a notebook.
2. Download and check out the handy JupyterLab and Jupyter Notebook cheat sheet to create and save a notebook.
3. To upload your notebook to Cloud, open Anaconda Prompt or Terminal and enter:

```
anaconda upload my-notebook.ipynb
```

NOTE: Replace `my-notebook` with the actual name of your notebook.

4. You can see an HTML version of your notebook stored at:

```
http://notebooks.anaconda.org/<USERNAME>/my-notebook
```

NOTE: Replace `<USERNAME>` with your username, and `my-notebook` with the actual name of your notebook.

5. Anyone who has access to Cloud can download your notebook. To download the notebook, open Anaconda Prompt or Terminal and enter:

```
anaconda download username/my-notebook
```

NOTE: Replace `username` with your username, and `my-notebook` with the actual name of your notebook.

### Working with environments

To share an environment on Anaconda Cloud:

1. See the [conda user guide](#) to create and save a conda environment. Open the Terminal or an Anaconda Prompt and enter:

```
conda env export -n my-environment -f my-environment.yml
```

NOTE: Replace `my-environment` with the actual name of your environment.

2. Upload it to Cloud either using the web interface or the `anaconda upload` command.

- Using the web interface:

Go to <https://anaconda.org/USERNAME/environments>.

NOTE: Replace `USERNAME` with your username.

In the top right corner use the Upload button to upload your environment.

- Using the `anaconda upload` command from the Terminal or an Anaconda Prompt:

```
anaconda upload my-environment.yml
```

NOTE: Replace `my-environment` with the actual name of your environment.

3. You can see a list of your uploaded environments at:

```
http://envs.anaconda.org/USERNAME
```

NOTE: Replace `USERNAME` with your username.

4. Anyone can download and install your environment from Cloud.

- Using the web interface:

Go to <https://anaconda.org/USERNAME/environments>.

NOTE: Replace `USERNAME` with the username.

Select the environment, go to Files tab and click the file to download under Names field.

- Using the Terminal or an Anaconda Prompt:

```
conda env create user/my-environment
source activate my-environment
```

NOTE: Replace `my-environment` with the actual name of your environment.

### Working with other file types

In addition to packages and notebooks, Anaconda Cloud can be used to store and share data science files of any type.

## Uploading other file types

You can upload any type of file with the Anaconda Client command line interface (CLI) by using the steps below.

PyPI package files, conda package files and notebook files are automatically detected. There is no auto-detect for other types of files, so you must explicitly specify the `package`, `package-type` and `version` fields.

In the following example, we upload a spreadsheet named `baby-names` in comma separated value (CSV) format.

Use the Terminal window or an Anaconda Prompt to upload the spreadsheet:

1. Create a new package, which creates a *namespace* that can hold multiple files:

```
anaconda login
anaconda package --create jsmith/baby-names
```

2. Upload the file to the new namespace:

```
anaconda upload --user jsmith --package baby-names --package-type file --version 1
↪ 1 baby-names1.csv
```

NOTE: In this example, the user-or organization-name is `jsmith`, the package name is `baby-names`, the package type is `file`, the version is `1` and the full filename is `baby-names1.csv`.

## Downloading other file types

Files, such as the one created above, are available at:

```
https://anaconda.org/<USERNAME>/<PACKAGENAME>
```

Anyone can download these files using Client from the Terminal window or an Anaconda Prompt:

```
anaconda download <USERNAME>/<PACKAGENAME>
```

NOTE: Replace `<USERNAME>` with the desired username, and `<PACKAGENAME>` with the desired package name.

If the repository has multiple files with the same name and different extensions, `anaconda download` will download all of them by default. If you use `anaconda-client` 1.7 or higher, you can use `anaconda download` with the option `--package-type` or `-t` to specify only one of these files. This option can work with the values `pypi`, `conda`, `ipynb`, and `env`.

### 3.3.2 FAQs

- *What is Anaconda Cloud?*
- *What kind of packages does Cloud support?*
- *Who can find and install my packages?*
- *What is Anaconda, Inc.?*
- *What are Cloud's terms of service?*
- *How much does Cloud cost?*
- *How do I get started with Cloud?*

- *What kind of account do I have?*
- *What is included in the free version of Cloud?*
- *What is an organization account, and how is it different from an individual account?*

### What is Anaconda Cloud?

Anaconda Cloud is a package management service by Anaconda. For more information, see [Anaconda Cloud](#).

### What kind of packages does Cloud support?

Cloud supports any type of package. Today, it is primarily used for conda and PyPI packages, as well as notebooks and environments.

### Who can find and install my packages?

If you have a free account, all of your packages are public. After you upload them to Cloud, anyone can search for and download them.

### What is Anaconda, Inc.?

Anaconda is a software development and consulting company of passionate open source advocates based in Austin, Texas, USA. We are committed to the open source community. We created the Anaconda Python distribution and contribute to many other open source-based data analytics tools. You can find out more about us by reading [our story](#).

### What are Cloud's terms of service?

Our terms of service are available at <https://anaconda.org/about/legal/terms> . For any additional questions, contact us by [email](#).

### How much does Cloud cost?

Cloud is free for downloading and uploading public packages.

### How do I get started with Cloud?

You can search, download and install hundreds of public packages without having an account. If you want to upload packages, you need to sign up for a [Cloud account](#). For more information, see [sign up for a free Cloud account](#).

### What kind of account do I have?

By default your account is a personal, free account. All packages you upload to Cloud are public, and you are the only person with administrative access to your account.

### What is included in the free version of Cloud?

The free plan allows you to search for, create and host public packages, and provides up to 3 GB storage space.

### What is an organization account, and how is it different from an individual account?

An organization account allows multiple individual users to administer packages and have more control of package access by other users. An individual account is for use by one person.

### 3.3.3 Help and support

For support issues, see [Anaconda Cloud Support](#).

#### Joining community support

We invite you to join our community support mailing lists for both [Anaconda](#) and [conda](#). On these lists you can ask questions, answer questions and discuss ways to use Cloud. You also can submit requests for new features and make any other comments you may have.

#### Reporting a bug

Please use the Anaconda Cloud page [Report a Bug](#) to find the correct point of contact to report the bug you are experiencing. When reporting bugs on GitHub, please search to see if anyone else has reported it, and make a new issue if no one else has.

### 3.3.4 Command Reference

See also: [API Reference](#)

Anaconda client is the command line interface (CLI) to Anaconda Cloud, and can be used for logging in, logging out, managing your account, uploading files, generating access tokens, viewing tokens, and other tasks as shown by running:

```
anaconda -h
```

Full command reference:

#### anaconda

```
usage: anaconda [-h] [--disable-ssl-warnings] [--show-traceback] [-v] [-q]
               [-V] [-t TOKEN] [-s SITE]
               ...
```

Anaconda Cloud command line manager

optional arguments:

```
-h, --help            show this help message and exit
-V, --version         show program's version number and exit
```

output:

```
--disable-ssl-warnings  Disable SSL warnings (default: False)
--show-traceback        Show the full traceback for chalmers user errors
                        (default: False)
-v, --verbose           print debug information ot the console
```

(continues on next page)

(continued from previous page)

```

-q, --quiet          Only show warnings or errors the console

anaconda-client options:
-t TOKEN, --token TOKEN
                    Authentication token to use. May be a token or a path
                    to a file containing a token
-s SITE, --site SITE select the anaconda-client site to use

Commands:

auth               Manage Authorization Tokens
label             Manage your Anaconda Cloud labels
channel           [DEPRECATED in favor of label] Manage your Anaconda
                  Cloud channels
config            Anaconda client configuration
copy              Copy packages from one account to another
download          Download notebooks from Anaconda Cloud
groups            Manage Groups
login             Authenticate a user
logout            Log out from Anaconda Cloud
notebook          [DEPRECATED in favor of upload/download] Interact
                  with notebooks in anaconda.org

package           Package utils
remove            Remove an object from Anaconda Cloud. Must refer to
                  the formal package name as it appears in the URL of
                  the package. Also use anaconda show <USERNAME> to see
                  list of package names. Example: anaconda remove
                  continuumio/empty-example-notebook

search            Search Anaconda Cloud
show              Show information about an object
upload            Upload packages to Anaconda Cloud
whoami            Print the information of the current user
build             Anaconda build client for continuous integration,
                  testing and building packages
worker            Anaconda build client for continuous integration,
                  testing and building packages

```

## Authentication

### auth

```

usage: anaconda auth [-h] [-n NAME] [-o ORGANIZATION]
                    [--strength {strong,weak}] [--strong] [-w] [--url URL]
                    [--max-age MAX_AGE] [-s SCOPES] [--out OUT]
                    (-x | -l | -r NAME [NAME ...] | -c | -i)

```

Manage Authorization Tokens

optional arguments:

```

-h, --help          show this help message and exit
-n NAME, --name NAME A unique name so you can identify this token later.
                    View your tokens at anaconda.org/settings/access
-o ORGANIZATION, --org ORGANIZATION, --organization ORGANIZATION
                    Set the token owner (must be an organization)

```

(continues on next page)

(continued from previous page)

```

token creation arguments:
  These arguments are only valid with the `--create` action

  --strength {strong,weak}
  --strong          Create a longer token (default)
  -w, --weak        Create a shorter token
  --url URL         The url of the application that will use this token
  --max-age MAX_AGE The maximum age in seconds that this token will be
                    valid for
  -s SCOPES, --scopes SCOPES
                    Scopes for token. For example if you want to limit
                    this token to conda downloads only you would use
                    --scopes "repo conda:download"

  --out OUT

actions:
  -x, --list-scopes  list all authentication scopes
  -l, --list         list all user authentication tokens
  -r NAME [NAME ...], --remove NAME [NAME ...]
                    remove authentication tokens
  -c, --create       Create an authentication token
  -i, --info, --current-info
                    Show information about the current authentication
                    token

Manage Authentication tokens

```

See also: [Using Anaconda Cloud Tokens](#)

## login

```

usage: anaconda login [-h] [--hostname HOSTNAME] [--username LOGIN_USERNAME]
                    [--password LOGIN_PASSWORD]

Authenticate a user

optional arguments:
  -h, --help            show this help message and exit
  --hostname HOSTNAME   Specify the host name of this login, this should be
                        unique (default: hq-phone-114.corp.continuum.io)
  --username LOGIN_USERNAME
                        Specify your username. If this is not given, you will
                        be prompted
  --password LOGIN_PASSWORD
                        Specify your password. If this is not given, you will
                        be prompted

```

## logout

```

usage: anaconda logout [-h]

Log out from Anaconda Cloud

```

(continues on next page)

(continued from previous page)

```
optional arguments:
  -h, --help  show this help message and exit
```

### whoami

Print the information of the current user

```
usage: anaconda whoami [-h]

Print the information of the current user

optional arguments:
  -h, --help  show this help message and exit
```

## Informational

### show

```
usage: anaconda show [-h] spec

Show information about an object

positional arguments:
  spec          Package written as USER[/PACKAGE[/VERSION[/FILE]]]

optional arguments:
  -h, --help  show this help message and exit

Show information about an object

Examples:

    anaconda show continuumio
    anaconda show continuumio/python
    anaconda show continuumio/python/2.7.5
    anaconda show sean/meta/1.2.0/meta.tar.gz
```

### search

```
usage: anaconda search [-h] [-t {conda,pypi}]
                        [-p {osx-32,osx-64,win-32,win-64,linux-32,linux-64,linux-
                        ↪armv61,linux-armv71,linux-ppc64le,noarch}]
                        name

Search Anaconda Cloud

positional arguments:
  name          Search string
```

(continues on next page)

(continued from previous page)

```
optional arguments:
  -h, --help            show this help message and exit
  -t {conda,pypi}, --package-type {conda,pypi}
                        only search for packages of this type
  -p {osx-32,osx-64,win-32,win-64,linux-32,linux-64,linux-armv6l,linux-armv7l,linux-
  ↳ppc64le,noarch}, --platform {osx-32,osx-64,win-32,win-64,linux-32,linux-64,linux-
  ↳armv6l,linux-armv7l,linux-ppc64le,noarch}
                        only search for packages of the chosen platform

Search Anaconda Cloud for packages
```

## config

```
usage: anaconda config [-h] [--type TYPE] [--set name value] [--get name]
                      [--remove REMOVE] [--show] [-f] [--show-sources] [-u]
                      [-s]
```

Anaconda client configuration

optional arguments:

```
-h, --help            show this help message and exit
--type TYPE           The type of the values in the set commands
```

actions:

```
--set name value      sets a new variable: name value
--get name            get value: name
--remove REMOVE       removes a variable
--show               show all variables
-f, --files          show the config file names
--show-sources       Display all identified config sources
```

location:

```
-u, --user            set a variable for this user
-s, --system, --site set a variable for all users on this machine
```

anaconda-client configuration

Get, Set, Remove or Show the anaconda-client configuration.

##### anaconda-client sites

anaconda-client sites are a mechanism to allow users to quickly switch between Anaconda Cloud instances. This is primarily used for testing the anaconda alpha site. But also has applications for the on-site [Anaconda Enterprise] (<http://continuum.io/anaconda-server>).

anaconda-client comes with two pre-configured sites `alpha` and `binstar` you may use these in one of two ways:

```
* Invoke the anaconda command with the -s/--site option
  e.g. to use the alpha testing site:
```

```
anaconda -s alpha whoami
```

(continues on next page)

(continued from previous page)

```

* Set a site as the default:

    anaconda config --set default_site alpha
    anaconda whoami

##### Add an anaconda-client site

After installing Anaconda Enterprise
you can add a site named **site_name** like this:

    anaconda config --set sites.site_name.url "http://<anaconda-enterprise-ip>:<port>/
↪api"
    anaconda config --set default_site site_name

##### Site Options VS Global Options

All options can be set as global options - affecting all sites,
or site options - affecting only one site

By default options are set globally e.g.:

    anaconda config --set OPTION VALUE

If you want the option to be limited to a single site,
prefix the option with `sites.site_name` e.g.

    anaconda config --set sites.site_name.OPTION VALUE

##### Common anaconda-client configuration options

* `url`: Set the anaconda api url (default: https://api.anaconda.org)
* `ssl_verify`: Perform ssl validation on the https requests.
    ssl_verify may be `True`, `False` or a path to a root CA pem file.

##### Toggle auto_register when doing anaconda upload

The default is yes, automatically create a new package when uploading.
If no, then an upload will fail if the package name does not already exist on the_
↪server.

    anaconda config --set auto_register yes|no

```

## Managing Packages

### package

```

usage: anaconda package [-h]
                        (--add-collaborator user | --list-collaborators | --create)
                        [--summary SUMMARY] [--license LICENSE]
                        [--license-url LICENSE_URL] [--personal | --private]
                        USER/PACKAGE

Anaconda Cloud package utilities

```

(continues on next page)

(continued from previous page)

```
positional arguments:
  USER/PACKAGE      Package to operate on

optional arguments:
  -h, --help          show this help message and exit

actions:
  --add-collaborator user
                        username of the collaborator you want to add
  --list-collaborators list all of the collaborators in a package
  --create            Create a package

metadata arguments:
  --summary SUMMARY    Set the package short summary
  --license LICENSE     Set the package license
  --license-url LICENSE_URL
                        Set the package license url

privacy:
  --personal          Set the package access to personal This package will
                        be available only on your personal registries
  --private           Set the package access to private This package will
                        require authorized and authenticated access to install
```

## upload

```
usage: anaconda upload [-h] [-c CHANNELS] [-l LABELS] [--no-progress]
                        [-u USER] [--all] [-p PACKAGE] [-v VERSION]
                        [-s SUMMARY] [-t PACKAGE_TYPE] [-d DESCRIPTION]
                        [--thumbnail THUMBNAIL] [--private]
                        [--no-register | --register] [--build-id BUILD_ID]
                        [-i | -f | --force]
                        files [files ...]

Upload packages to Anaconda Cloud

positional arguments:
  files              Distributions to upload

optional arguments:
  -h, --help          show this help message and exit
  -c CHANNELS, --channel CHANNELS
                        [DEPRECATED] Add this file to a specific channel.
                        Warning: if the file channels do not include "main",
                        the file will not show up in your user channel
  -l LABELS, --label LABELS
                        Add this file to a specific label. Warning: if the
                        file labels do not include "main", the file will not
                        show up in your user label
  --no-progress       Don't show upload progress
  -u USER, --user USER
                        User account or Organization, defaults to the current
                        user
  --all              Use conda convert to generate packages for all
                        platforms and upload them
```

(continues on next page)

(continued from previous page)

```

--no-register      Don't create a new package namespace if it does not
                    exist
--register          Create a new package namespace if it does not exist
--build-id BUILD_ID Anaconda Cloud Build ID (internal only)
-i, --interactive  Run an interactive prompt if any packages are missing
-f, --fail         Fail if a package or release does not exist (default)
--force           Force a package upload regardless of errors

```

metadata options:

```

-p PACKAGE, --package PACKAGE
                    Defaults to the package name in the uploaded file
-v VERSION, --version VERSION
                    Defaults to the package version in the uploaded file
-s SUMMARY, --summary SUMMARY
                    Set the summary of the package
-t PACKAGE_TYPE, --package-type PACKAGE_TYPE
                    Set the package type [ipynb, env]. Defaults to
                    autodetect
-d DESCRIPTION, --description DESCRIPTION
                    description of the file(s)
--thumbnail THUMBNAIL
                    Notebook's thumbnail image
--private          Create the package with private access

anaconda upload CONDA_PACKAGE_1.bz2
anaconda upload notebook.ipynb
anaconda upload environment.yml

```

See Also:

- [Uploading a Conda Package](#)
- [Uploading a PyPI Package](#)

## download

```

usage: anaconda download [-h] [-f] [-o OUTPUT] handle

Download packages from Anaconda Cloud

positional arguments:
  handle                user/notebook

optional arguments:
  -h, --help            show this help message and exit
  -f, --force           Overwrite
  -o OUTPUT, --output OUTPUT
                        Download as

Usage:
  anaconda download notebook
  anaconda download user/notebook

```

## remove

```
usage: anaconda remove [-h] [-f] specs [specs ...]
```

Remove an object from Anaconda Cloud

example::

```
anaconda remove sean/meta/1.2.0/meta.tar.gz
```

positional arguments:

```
specs          Package written as <user>[/<package>[/<version>[/<filename>]]]
```

optional arguments:

```
-h, --help      show this help message and exit
-f, --force     Do not prompt removal
```

## groups

```
usage: anaconda groups [-h] [--perms {read,write,admin}]
                        {add,show,members,add_member,remove_member,packages,add_
↳package,remove_package}
                        spec
```

positional arguments:

```
{add,show,members,add_member,remove_member,packages,add_package,remove_package}
                        The group management command to execute
spec                    <organization>/<group_name>/<member>
```

optional arguments:

```
-h, --help          show this help message and exit
--perms {read,write,admin}
                        The permission the group should provide
```

## label

```
usage: anaconda label [-h] [-o ORGANIZATION]
                      (--copy LABEL LABEL | --list | --show LABEL | --lock LABEL | --
↳unlock LABEL | --remove LABEL)
```

Manage your Anaconda Cloud channels

optional arguments:

```
-h, --help          show this help message and exit
-o ORGANIZATION, --organization ORGANIZATION
                        Manage an organizations labels
--copy LABEL LABEL
--list              list all labels for a user
--show LABEL        Show all of the files in a label
--lock LABEL        Lock a label
--unlock LABEL      Unlock a label
--remove LABEL      Remove a label
```

## copy

```
usage: anaconda copy [-h] [--to-owner TO_OWNER] [--from-label FROM_LABEL]
                    [--to-label TO_LABEL]
                    spec

Copy packages from one account to another

positional arguments:
  spec                Package - written as user/package/version[/filename]
                    If filename is not given, copy all files in the
                    version

optional arguments:
  -h, --help          show this help message and exit
  --to-owner TO_OWNER  User account to copy package to (default: your
                    account)
  --from-label FROM_LABEL
                    Label to copy packages from
  --to-label TO_LABEL  Label to put all packages into
```

## move

```
usage: anaconda move [-h] [--from-label FROM_LABEL] [--to-label TO_LABEL] spec

Move packages between labels.

positional arguments:
  spec                Package - written as user/package/version[/filename]
                    If filename is not given, move all files in the
                    version

optional arguments:
  -h, --help          show this help message and exit
  --from-label FROM_LABEL
                    Label to move packages from
  --to-label TO_LABEL  Label to move packages to
```

- *token*

## Anaconda

An easy-to-install, free collection of open source packages, including Python and the conda package manager, with free community support. Over 150 packages are installed with Anaconda. After installing Anaconda, you can install or update over 250 additional open source packages contained in the Anaconda repository using the `conda install PACKAGENAME` command.

NOTE: Replace `PACKAGENAME` with the name of the desired package.

## Anaconda Cloud

[Anaconda Cloud](#) is a package management service by [Anaconda](#). Cloud makes it easy to find, access, store and share public notebooks, environments, and conda and PyPI packages. Cloud also makes it easy to stay current with updates made to the packages and environments you are using.

Cloud hosts hundreds of useful Python packages, notebooks and environments for a wide variety of applications. You do not need a Cloud account, or to be logged in, to search for public packages, download and install them.

For more information, see the [introduction to Anaconda Cloud](#).

## Anaconda Client CLI

The Anaconda Client command line interface (CLI) allows you to log into Cloud directly from your terminal window and manage your account. It is not necessary for downloading or installing packages from Cloud.

## Binstar

Binstar was an early project name for Cloud. You may still see the term Binstar in certain command and directory names.

## conda

The conda package manager and environment manager program that installs and updates packages and their dependencies, and lets you easily switch between environments on your local computer.

### conda build

The command line interface that lets you build packages for your local operating system.

### conda package

A compressed file containing system-level libraries, Python modules, executable programs or other components. The file uses the tarball format.

### label

Part of the URLs on Cloud where conda looks for packages. Labels are searched only if you specify a label.

The default label is `main`, so packages that are uploaded without specifying a label are automatically labeled `main`. The version labeled `main` is also downloaded by default, unless a user specifies a different label.

So, if a file is labeled `main`, then the label name may be omitted from the URL. For example, the following repositories are equivalent:

```
https://anaconda.org/sean/labels/main
https://anaconda.org/sean
```

Commands such as `conda install` can be used with a channel or used with a channel and a label:

```
conda install --channel sean selenium
conda install --channel sean/label/dev selenium
conda install --channel sean/label/stable selenium
```

### Miniconda

A minimal installer for [conda](#). Like [Anaconda](#), Miniconda is a software package that includes the conda package manager and Python and its dependencies. However, Miniconda does not include any other packages. Once conda is installed by installing either Anaconda or Miniconda, you can install other software packages directly from the command line using `conda install`.

### namespace

Each user and organization has their own location called a “namespace” where they may host packages. You can view the public packages in a user or organization’s namespace by navigating to their user page.

EXAMPLE: The `travis` user namespace located at <https://anaconda.org/travis> contains packages that were uploaded and shared by the user whose account is named `travis`.

### noarch package

A conda package that contains nothing specific to any system architecture, so it may be installed on any system. When conda searches for packages on any system in a channel, conda always checks both the system-specific subdirectory, for example, `linux-64` and the `noarch` directory.

## on-site repository

Cloud is powered by Anaconda Repository by Anaconda, Inc. You can run your own private repository behind firewalls or in air-gapped environments. For more information, contact [sales@anaconda.com](mailto:sales@anaconda.com).

## organization account

An organization account is a type of account on Cloud that allows multiple individual users to administer packages and control package access to different user groups. It also includes a large amount of storage space.

## package

All files uploaded to Cloud are stored in packages. Each Cloud package is visible at its own unique URL based on the name of the user who owns the package and the name of the package.

For example, if a user `travis` uploads a test package named `testpkg`, it is visible at:

`https://anaconda.org/travis/testpkg`

Cloud packages may contain multiple files, and these files may be data files such as comma separated value (CSV), tab separated value (TSV), or text (TXT), or package files such as conda packages, PyPI packages or R packages.

NOTE: All packages are public if uploaded by users of free accounts. Packages may be designated as private by upgrading to a paid account.

## package manager

A package manager is a tool that facilitates the process of installing, upgrading, configuring and removing packages, including the packages on Cloud. Cloud supports two package managers, *conda* and *PyPI*.

For more information, see *using package managers*.

## repository

A storage location from which software packages may be retrieved and installed on a computer.

## source package

“Source” packages are source code only, not yet built for any specific platform, and might be compatible with all, some or only one of the platforms.

## token

A token—or authentication token—is the mechanism by which anonymous users can download private packages without using a Cloud account. It is an alpha-numeric code that is inserted into a URL that allows access by anyone who has the URL. You can use Client to generate new tokens to give other users specifically scoped access to packages and collections.

## 3.4 Archive

This is the archive of Anaconda products that are no longer in production. This documentation is provided as a courtesy for customers who still use them.

### 3.4.1 Anaconda Accelerate

*High Performance Computing*

---

**Note:** This product is discontinued. This archived copy of the product documentation is provided for those customers who are still using it. SEE <https://www.anaconda.com/blog/developer-blog/open-sourcing-anaconda-accelerate/>

---

Anaconda Accelerate is a package that provides the Anaconda® platform access to several numerical libraries that are optimized for performance on Intel CPUs and NVidia GPUs.

The current version, 2.3.1, was released on January 30, 2017.

Anyone can now use the functionality from Accelerate without purchasing a license!

On July 27, 2017, Accelerate was split into the [Intel Distribution for Python](#) and the open source [Numba](#) project's sub-projects [pyculib](#), [pyculib\\_sorting](#) and [data\\_profiler](#). Numba and all its sub-projects are available under a BSD license.

More information is available in the post [Open Sourcing Anaconda Accelerate](#).

### Features

- **Bindings to the following *CUDA* libraries:**
  - *cuBLAS*
  - *cuFFT*
  - *cuSPARSE*
  - *cuRAND*
  - *CUDA Sorting* algorithms from the CUB and Modern GPU libraries
- Speed-boosted linear algebra operations in NumPy, SciPy, scikit-learn and NumExpr libraries using Intel's Math Kernel Library (*MKL*).
- Accelerated variants of Numpy's built-in *UFuncs*.
- Increased-speed Fast Fourier Transformations (*FFT*) in NumPy.

### Installation

This section contains information related to:

### Requirements

- 64-bit operating system—Windows, macOS or Linux
- **Supported Python and Numpy combinations:**

- Python 2.7 with Numpy 1.9, 1.10 or 1.11
  - Python 3.4 with Numpy 1.9, 1.10 or 1.11
  - Python 3.5 with Numpy 1.9, 1.10 or 1.11
  - Python 3.6 with Numpy 1.11
- Numba 0.30

### CUDA feature requirements

- NVidia driver version 349.00 or later
- CUDA toolkit 7.0
- At least one CUDA GPU with compute capability 2.0 or above

### Installing Accelerate

Accelerate is included with Anaconda Workgroup and Anaconda Enterprise [subscriptions](#).

To start a 30-day free trial, download and install the Anaconda Accelerate package.

### Installing with Anaconda

If you already have the *Anaconda free Python distribution* <<http://anaconda.com/downloads.html>>, take the following steps to install Accelerate:

1. Run the command `conda update conda`.
2. Run the command `conda install accelerate`.

If you do not have Anaconda installed, see [Downloads](#).

NOTE: Accelerate can also be installed into your own non-Anaconda Python environment.

For more information, contact [sales@anaconda.com](mailto:sales@anaconda.com).

### Updating Accelerate

To update Accelerate, take the following steps:

1. Run the command `conda update conda`.
2. Run the command `conda update accelerate`.

### Updating NumbaPro

If you have NumbaPro installed, you must manually upgrade NumbaPro to install the NumbaPro compatibility layer by taking the following steps:

1. Run the command `conda update conda`.
2. Run the command `conda update numbapro`.

## Managing your Accelerate license

You can install, view or remove your Accelerate license with the graphical Anaconda Navigator license manager, or manually with your operating system.

For more information, see </anaconda/user-guide/tasks/install-licenses>.

## User guide

This section contains information related to:

## CUDA libraries

The following CUDA libraries have bindings and algorithms that are available for use with Accelerate:

### cuBLAS

Provides basic linear algebra building blocks. See [NVIDIA cuBLAS](#).

The cuBLAS binding provides an interface that accepts NumPy arrays and Numba's CUDA device arrays. The binding automatically transfers NumPy array arguments to the device as required. This automatic transfer may generate some unnecessary transfers, so optimal performance is likely to be obtained by the manual transfer for NumPy arrays into device arrays and using the cuBLAS to manipulate device arrays where possible.

No special naming convention is used to identify the data type, unlike in the BLAS C and Fortran APIs. Arguments for array storage information which are part of the cuBLAS C API are also not necessary since NumPy arrays and device arrays contain this information.

All functions are accessed through the `accelerate.cuda.blas.Blas` class:

### BLAS Level 1

`accelerate.cuda.blas.Blas.nrm2(x)`

Computes the L2 norm for array *x*. Same as *numpy.linalg.norm(x)*.

**Parameters** *x* (*python.array*) – input vector

**Returns** resulting norm.

`accelerate.cuda.blas.Blas.dot(x, y)`

Compute the dot product of array *x* and array *y*. Same as *np.dot(x, y)*.

**Parameters**

- *x* (*python.array*) – vector
- *y* (*python.array*) – vector

**Returns** dot product of *x* and *y*

`accelerate.cuda.blas.Blas.dotc(x, y)`

Uses the conjugate of the element of the vectors to compute the dot product of array *x* and array *y* for complex dtype only. Same as *np.vdot(x, y)*.

**Parameters**

- *x* (*python.array*) – vector

- **y** (*python.array*) – vector

**Returns** dot product of *x* and *y*

`accelerate.cuda.blas.Blas.scal(alpha, x)`

Scale *x* inplace by alpha. Same as  $x = \alpha * x$

**Parameters**

- **alpha** – scalar
- **x** (*python.array*) – vector

`accelerate.cuda.blas.Blas.axy(alpha, x)`

Compute  $y = \alpha * x + y$  inplace.

**Parameters**

- **alpha** – scalar
- **x** (*python.array*) – vector

`accelerate.cuda.blas.Blas.amax(x)`

Find the index of the first largest element in array *x*. Same as `np.argmax(x)`

**Parameters** **x** (*python.array*) – vector

**Returns** index (start from 0).

`accelerate.cuda.blas.Blas.amin(x)`

Find the index of the first largest element in array *x*. Same as `np.argmin(x)`

**Parameters** **x** (*python.array*) – vector

**Returns** index (start from 0).

`accelerate.cuda.blas.Blas.asum(x)`

Compute the sum of all element in array *x*.

**Parameters** **x** (*python.array*) – vector

**Returns** *x.sum()*

`accelerate.cuda.blas.Blas.rot(x, y, c, s)`

Apply the Givens rotation matrix specified by the cosine element *c* and the sine element *s* inplace on vector element *x* and *y*.

Same as  $x, y = c * x + s * y, -s * x + c * y$

**Parameters**

- **x** (*python.array*) – vector
- **y** (*python.array*) – vector

`accelerate.cuda.blas.Blas.rotg(a, b)`

Constructs the Givens rotation matrix with the column vector (*a*, *b*).

**Parameters**

- **a** – first element of the column vector
- **b** – second element of the column vector

**Returns**

a tuple (*r*, *z*, *c*, *s*)

$r - r = a**2 + b**2$

**z** – Use to reconstruct *c* and *s*. Refer to cuBLAS documentation for detail.

*c* – The cosine element.

*s* – The sine element.

`accelerate.cuda.blas.Blas.rotm(x, y, param)`

Applies the modified Givens transformation inplace.

Same as:

```
param = flag, h11, h21, h12, h22
x[i] = h11 * x[i] + h12 * y[i]
y[i] = h21 * x[i] + h22 * y[i]
```

Refer to the cuBLAS documentation for the use of *flag*.

#### Parameters

- **x** (*python.array*) – vector
- **y** (*python.array*) – vector

`accelerate.cuda.blas.Blas.rotmg(d1, d2, x1, y1)`

Constructs the modified Givens transformation *H* that zeros out the second entry of a column vector (*d1* \* *x1*, *d2* \* *y1*).

#### Parameters

- **d1** – scaling factor for the x-coordinate of the input vector
- **d2** – scaling factor for the y-coordinate of the input vector
- **x1** – x-coordinate of the input vector
- **y1** – y-coordinate of the input vector

**Returns** A 1D array that is usable in *rotm*. The first element is the flag for *rotm*. The rest of the elements corresponds to the *h11*, *h21*, *h12*, *h22* elements of *H*.

## BLAS Level 2

All level 2 routines follow the following naming convention for all arguments:

- **A, B, C, AP – (2D array) Matrix argument.** *AP* implies packed storage for banded matrix.
- **x, y, z – (1D arrays) Vector argument.**
- **alpha, beta – (scalar)** Can be floats or complex numbers depending.
- **m – (scalar)** Number of rows of matrix *A*.
- **n – (scalar) Number of columns of matrix A. If *m* is not needed, *n* also means the number of rows of the matrix *A*; thus, implying a square matrix.**
- **trans, transa, transb – (string)** Select the operation *op* to apply to a matrix:
  - ‘N’:  $op(X) = X$ , the identity operation;
  - ‘T’:  $op(X) = X^{**T}$ , the transpose;
  - ‘C’:  $op(X) = X^{**H}$ , the conjugate transpose.

*trans* only applies to the only matrix argument. *transa* and *transb* apply to matrix *A* and matrix *B*, respectively.

- **uplo** – (string) Can be ‘U’ for filling the upper triangular matrix; or ‘L’ for filling the lower triangular matrix.
- **diag** – (boolean) Whether the matrix diagonal has unit elements.
- **mode** – (string) ‘L’ means the matrix is on the left side in the equation. ‘R’ means the matrix is on the right side in the equation.

---

**Note:** The last array argument is always overwritten with the result.

---

```

accelerate.cuda.blas.Blas.gbmv(trans, m, n, kl, ku, alpha, A, x, beta, y)
    banded matrix-vector multiplication  $y = \alpha * op(A) * x + \beta * y$  where  $A$  has  $kl$  sub-diagonals and  $ku$ 
    super-diagonals.

accelerate.cuda.blas.Blas.gemv(trans, m, n, alpha, A, x, beta, y)
    matrix-vector multiplication  $y = \alpha * op(A) * x + \beta * y$ 

accelerate.cuda.blas.Blas.trmv(uplo, trans, diag, n, A, x)
    triangular matrix-vector multiplication  $x = op(A) * x$ 

accelerate.cuda.blas.Blas.tbmv(uplo, trans, diag, n, k, A, x)
    triangular banded matrix-vector  $x = op(A) * x$ 

accelerate.cuda.blas.Blas.tpmv(uplo, trans, diag, n, AP, x)
    triangular packed matrix-vector multiplication  $x = op(A) * x$ 

accelerate.cuda.blas.Blas.trsv(uplo, trans, diag, n, A, x)
    Solves the triangular linear system with a single right-hand-side.  $op(A) * x = b$ 

accelerate.cuda.blas.Blas.tpsv(uplo, trans, diag, n, AP, x)
    Solves the packed triangular linear system with a single right-hand-side.  $op(A) * x = b$ 

accelerate.cuda.blas.Blas.tbsv(uplo, trans, diag, n, k, A, x)
    Solves the triangular banded linear system with a single right-hand-side.  $op(A) * x = b$ 

accelerate.cuda.blas.Blas.symv(uplo, n, alpha, A, x, beta, y)
    symmetric matrix-vector multiplication  $y = \alpha * A * x + \beta * y$ 

accelerate.cuda.blas.Blas.hemv(uplo, n, alpha, A, x, beta, y)
    Hermitian matrix-vector multiplication  $y = \alpha * A * x + \beta * y$ 

accelerate.cuda.blas.Blas.sbmv(uplo, n, k, alpha, A, x, beta, y)
    symmetric banded matrix-vector multiplication  $y = \alpha * A * x + \beta * y$ 

accelerate.cuda.blas.Blas.hbmv(uplo, n, k, alpha, A, x, beta, y)
    Hermitian banded matrix-vector multiplication  $y = \alpha * A * x + \beta * y$ 

accelerate.cuda.blas.Blas.spmv(uplo, n, alpha, AP, x, beta, y)
    symmetric packed matrix-vector multiplication  $y = \alpha * A * x + \beta * y$ 

accelerate.cuda.blas.Blas.hpmv(uplo, n, alpha, AP, x, beta, y)
    Hermitian packed matrix-vector multiplication  $y = \alpha * A * x + \beta * y$ 

accelerate.cuda.blas.Blas.ger(m, n, alpha, x, y, A)
    the rank-1 update  $A := \alpha * x * y ** T + A$ 

accelerate.cuda.blas.Blas.geru(m, n, alpha, x, y, A)
    the rank-1 update  $A := \alpha * x * y ** T + A$ 

accelerate.cuda.blas.Blas.gerc(m, n, alpha, x, y, A)
    the rank-1 update  $A := \alpha * x * y ** H + A$ 

```

```
accelerate.cuda.blas.Blas.syr(uplo, n, alpha, x, A)
    symmetric rank 1 operation  $A := \alpha * x * x^T + A$ 

accelerate.cuda.blas.Blas.her(uplo, n, alpha, x, A)
    hermitian rank 1 operation  $A := \alpha * x * x^H + A$ 

accelerate.cuda.blas.Blas.spr(uplo, n, alpha, x, AP)
    the symmetric rank 1 operation  $A := \alpha * x * x^T + A$ 

accelerate.cuda.blas.Blas.hpr(uplo, n, alpha, x, AP)
    hermitian rank 1 operation  $A := \alpha * x * x^H + A$ 

accelerate.cuda.blas.Blas.syr2(uplo, n, alpha, x, y, A)
    symmetric rank-2 update  $A = \alpha * x * y^T + y * x^T + A$ 

accelerate.cuda.blas.Blas.her2(uplo, n, alpha, x, y, A)
    Hermitian rank-2 update  $A = \alpha * x * y^H + \alpha * y * x^H + A$ 

accelerate.cuda.blas.Blas.spr2(uplo, n, alpha, x, y, A)
    packed symmetric rank-2 update  $A = \alpha * x * y^T + y * x^T + A$ 

accelerate.cuda.blas.Blas.hpr2(uplo, n, alpha, x, y, A)
    packed Hermitian rank-2 update  $A = \alpha * x * y^H + \alpha * y * x^H + A$ 
```

### BLAS Level 3

All level 3 routines follow the same naming convention for arguments as in level 2 routines.

```
accelerate.cuda.blas.Blas.gemm(transa, transb, m, n, k, alpha, A, B, beta, C)
    matrix-matrix multiplication  $C = \alpha * op(A) * op(B) + \beta * C$ 

accelerate.cuda.blas.Blas.syrk(uplo, trans, n, k, alpha, A, beta, C)
    symmetric rank- k update  $C = \alpha * op(A) * op(A)^T + \beta * C$ 

accelerate.cuda.blas.Blas.herk(uplo, trans, n, k, alpha, A, beta, C)
    Hermitian rank- k update  $C = \alpha * op(A) * op(A)^H + \beta * C$ 

accelerate.cuda.blas.Blas.symm(side, uplo, m, n, alpha, A, B, beta, C)
    symmetric matrix-matrix multiplication:
```

```
if side == 'L':
    C = alpha * A * B + beta * C
else: # side == 'R'
    C = alpha * B * A + beta * C
```

```
accelerate.cuda.blas.Blas.hemm(side, uplo, m, n, alpha, A, B, beta, C)
    Hermitian matrix-matrix multiplication:
```

```
if side == 'L':
    C = alpha * A * B + beta * C
else: # side == 'R':
    C = alpha * B * A + beta * C
```

```
accelerate.cuda.blas.Blas.trsm(side, uplo, trans, diag, m, n, alpha, A, B)
    Solves the triangular linear system with multiple right-hand-sides:
```

```
if side == 'L':
    op(A) * X = alpha * B
else: # side == 'R'
    X * op(A) = alpha * B
```

`accelerate.cuda.blas.Blas.ttrmm(side, uplo, trans, diag, m, n, alpha, A, B, C)`  
 triangular matrix-matrix multiplication:

```
if side == ':':
    C = alpha * op(A) * B
else: # side == 'R'
    C = alpha * B * op(A)
```

`accelerate.cuda.blas.Blas.dgmm(side, m, n, A, x, C)`  
 matrix-matrix multiplication:

```
if mode == 'R':
    C = A * x * diag(X)
else: # mode == 'L'
    C = diag(X) * x * A
```

`accelerate.cuda.blas.Blas.geam(transa, transb, m, n, alpha, A, beta, B, C)`  
 matrix-matrix addition/transposition  $C = \alpha * op(A) + \beta * op(B)$

## cuSPARSE

Provides basic linear algebra operations for sparse matrices. See [NVIDIA cuSPARSE](#) for an in-depth description of the cuSPARSE library and its methods and data types. All functions are accessed through the `accelerate.cuda.sparse.Sparse` class:

Similarly to the cuBLAS interface, no special naming convention is used for functions to operate on different datatypes - all datatypes are handled by each function, and dispatch of the corresponding library function is handled by Accelerate. However, it is often necessary to provide a *matrix descriptor* to functions, which provides some information about the format and properties of a matrix. A matrix descriptor can be obtained from the `accelerate.cuda.sparse.Sparse.matdescr()` method:

`accelerate.cuda.sparse.Sparse.matdescr(indexbase, diagtype, fillmode, matrixtype)`  
 Creates a matrix descriptor that describes a matrix with the given *indexbase*, *diagtype*, *fillmode*, and *matrixtype*. Note that not all of these options are relevant to every matrix storage format.

### Parameters

- **indexbase** – Optional. 0 for 0-based indexing, or 1 for 1-based indexing. If not specified, the default given to the `accelerate.cuda.sparse.Sparse` constructor is used instead.
- **diagtype** – Optional. Defaults to 'N'. 'N' signifies that the matrix diagonal has non-unit elements. 'U' signifies that the matrix diagonal only contains unit elements.
- **fillmode** – Optional. Defaults to 'L'. 'L' indicates that the lower triangular part of the matrix is stored. 'U' indicates that the upper triangular part of the matrix is stored.
- **matrixtype** – Optional. Defaults to 'G'. 'S' indicates that the matrix is symmetric. 'H' indicates that the matrix is Hermitian. 'T' indicates that the matrix is triangular. 'G' is used for a *general* matrix, which is not symmetric, Hermitian, or triangular.

**Returns** A matrix descriptor.

Many of the methods of the `accelerate.cuda.sparse.Sparse` class accept the individual data structures that make up a sparse representation of a matrix (for example the values, the row pointers and the column indices for a CSR format matrix). However, some methods (such as `accelerate.cuda.sparse.Sparse.csrgemm_ez()`), accept an instance of the `accelerate.cuda.sparse.CudaSparseMatrix` class:

**class** `accelerate.cuda.sparse.CudaSparseMatrix`

Base class for a representation of a sparse matrix on a CUDA device. The constructor takes no arguments.

**from\_host\_matrix** (*matrix*, *stream*)

Initialise the matrix structure and values from an instance of a matrix on the host. The host matrix must be of the corresponding host type, which is documented for each subclass below.

**copy\_to\_host** (*stream*)

Create an instance of the corresponding host matrix type and copy the matrix structure and data into it from the device. See subclass documentation for an indication of the corresponding matrix type.

Subclasses of the sparse matrix type are:

**class** `accelerate.cuda.sparse.CudaBSRMatrix`

CUDA sparse matrix for which the corresponding type is a `scipy.sparse.bsr_matrix`.

**class** `accelerate.cuda.sparse.CudaCSRMatrix`

CUDA sparse matrix for which the corresponding type is a `scipy.sparse.csr_matrix`.

**class** `accelerate.cuda.sparse.CudaCSCMatrix`

CUDA sparse matrix for which the corresponding type is a `scipy.sparse.csc_matrix`.

There are also some convenience methods for constructing CUDA sparse matrices in a similar manner to Scipy sparse matrices:

## BLAS Level 1

`accelerate.cuda.sparse.Sparse.axyi` (*alpha*, *xVal*, *xInd*, *y*)

Multiplies the sparse vector *x* by *alpha* and adds the result to the dense vector *y*.

### Parameters

- **alpha** – scalar
- **xVal** – vector of non-zero values of *x*
- **xInd** – vector of indices of non-zero values of *x*
- **y** – dense vector

**Returns** dense vector

`accelerate.cuda.sparse.Sparse.doti` (*xVal*, *xInd*, *y*)

Computes the dot product of the sparse vector *x* and dense vector *y*.

### Parameters

- **xVal** – vector of non-zero values of *x*
- **xInd** – vector of indices of non-zero values of *x*
- **y** – dense vector

**Returns** scalar

`accelerate.cuda.sparse.Sparse.dotci` (*xVal*, *xInd*, *y*)

Computes the dot product of the complex conjugate of the sparse vector *x* and the dense vector *y*.

### Parameters

- **xVal** – vector of non-zero values of *x*
- **xInd** – vector of indices of non-zero values of *x*
- **y** – dense vector

**Returns** scalar

`accelerate.cuda.sparse.Sparse.gthr(y, xVal, xInd)`

Gathers the elements of  $y$  at the indices  $xInd$  into the array  $xVal$

**Parameters**

- **xVal** – vector of non-zero values of  $x$
- **xInd** – vector of indices of non-zero values of  $x$
- **y** – dense vector

**Returns** None

`accelerate.cuda.sparse.Sparse.gthrz(y, xVal, xInd)`

Gathers the elements of  $y$  at the indices  $xInd$  into the array  $xVal$  and zeroes out the gathered elements of  $y$ .

**Parameters**

- **xVal** – vector of non-zero values of  $x$
- **xInd** – vector of indices of non-zero values of  $x$
- **y** – dense vector

**Returns** None

`accelerate.cuda.sparse.Sparse.sctr(xVal, xInd, y)`

Scatters the elements of the sparse vector  $x$  into the dense vector  $y$ . Elements of  $y$  whose indices are not listed in  $xInd$  are unmodified.

**Parameters**

- **xVal** – vector of non-zero values of  $x$
- **xInd** – vector of indices of non-zero values of  $x$
- **y** – dense vector

**Returns** None

## BLAS Level 2

All level 2 routines follow the following naming convention for the following arguments:

- **alpha, beta** – (scalar) Can be real or complex numbers.
- **descr, descrA, descrB** – (descriptor) Matrix descriptor. An appropriate descriptor may be obtained by calling `accelerate.cuda.sparse.Sparse.matdescr()`. *descr* only applies to the only matrix argument. *descrA* and *descrB* apply to matrix  $A$  and matrix  $B$ , respectively.
- **dir** – (string) Can be 'C' to indicate column-major block storage or 'R' to indicate row-major block storage.
- **trans, transa, transb** – (string) Select the operation *op* to apply to a matrix:
  - 'N':  $op(X) = X$ , the identity operation;
  - 'T':  $op(X) = X^{**T}$ , the transpose;
  - 'C':  $op(X) = X^{**H}$ , the conjugate transpose.

*trans* only applies to the only matrix argument. *transa* and *transb* apply to matrix  $A$  and matrix  $B$ , respectively.

`accelerate.cuda.sparse.Sparse.bsrnv_matrix` (*dir, trans, alpha, descr, bsrmat, x, beta, y*)  
Matrix-vector multiplication  $y = \alpha * op(A) * x + \beta * y$  with a BSR-format matrix.

#### Parameters

- **dir** – block storage direction
- **trans** – operation to apply to the matrix
- **alpha** – scalar
- **descr** – matrix descriptor
- **bsrmat** – the matrix  $A$
- **x** – dense vector
- **beta** – scalar
- **y** – dense vector

**Returns** None

`accelerate.cuda.sparse.Sparse.bsrnv` (*dir, trans, mb, nb, nnzb, alpha, descr, bsrVal, bsrRowPtr, bsrColInd, blockDim, x, beta, y*)

Matrix-vector multiplication  $y = \alpha * op(A) * x + \beta * y$  with a BSR-format matrix. This function accepts the individual arrays that make up the structure of a BSR matrix - if a `accelerate.cuda.sparse.CudaBSRMatrix` instance is to hand, it is recommended to use the `bsrnv_matrix()` method instead.

#### Parameters

- **dir** – block storage direction
- **trans** – operation to apply to the matrix
- **mb** – Number of block rows of the matrix
- **nb** – Number of block columns of the matrix
- **nnzb** – Number of nonzero blocks of the matrix
- **alpha** – scalar
- **descr** – matrix descriptor
- **bsrVal** – vector of nonzero values of the matrix
- **bsrRowPtr** – vector of block row pointers of the matrix
- **bsrColInd** – vector of block column indices of the matrix
- **blockDim** – block dimension of the matrix
- **x** – dense vector
- **beta** – scalar
- **y** – dense vector

**Returns** None

`accelerate.cuda.sparse.Sparse.bsrnxmv` (*dir, trans, sizeofMask, mb, nb, nnzb, alpha, descr, bsrVal, bsrMaskPtr, bsrRowPtr, bsrEndPtr, bsrColInd, blockDim, x, beta, y*)

Matrix-vector multiplication similar to `bsrnv()`, but including a mask operation:  $y(mask) = (\alpha * op(A) * x + \beta * y)(mask)$ . The blocks of  $y$  to be updated are specified in `bsrMaskPtr`. Blocks whose indices are not specified in `bsrMaskPtr` are left unmodified.

#### Parameters

- **dir** – block storage direction
- **trans** – operation to apply to the matrix
- **sizeOfMask** – number of updated blocks of rows of y
- **mb** – Number of block rows of the matrix
- **nb** – Number of block columns of the matrix
- **nnzb** – Number of nonzero blocks of the matrix
- **alpha** – scalar
- **descr** – matrix descriptor
- **bsrVal** – vector of nonzero values of the matrix
- **bsrMaskPtr** – vector of indices of the block elements to be updated
- **bsrRowPtr** – vector of block row pointers of the matrix
- **bsrEndPtr** – vector of pointers to the end of every block row plus one
- **bsrColInd** – vector of block column indices of the matrix
- **blockDim** – block dimension of the matrix
- **x** – dense vector
- **beta** – scalar
- **y** – dense vector

**Returns** None

`accelerate.cuda.sparse.Sparse.csrnv` (*trans, m, n, nnz, alpha, descr, csrVal, csrRowPtr, csrColInd, x, beta, y*)

Matrix-vector multiplication  $y = \alpha * op(A) * x + \beta * y$  with a CSR-format matrix.

**Parameters**

- **trans** – operation to apply to the matrix
- **m** – Number of rows of the matrix
- **n** – Number of columns of the matrix
- **nnz** – Number of nonzeros of the matrix
- **alpha** – scalar
- **descr** – matrix descriptor
- **csrVal** – vector of nonzero values of the matrix
- **csrRowPtr** – vector of row pointers of the matrix
- **csrColInd** – vector of column indices of the matrix
- **x** – dense vector
- **beta** – scalar
- **y** – dense vector

**Returns** None

`accelerate.cuda.sparse.Sparse.csrsv_analysis` (*trans, m, nnz, descr, csrVal, csrRowPtr, csrColInd*)

Performs the analysis phase of the solution of the sparse triangular linear system  $op(A) * y = alpha * x$ . This needs to be executed only once for a given matrix and operation type.

**Parameters**

- **trans** – operation to apply to the matrix
- **m** – number of rows of the matrix
- **nnz** – number of nonzeros of the matrix
- **descr** – matrix descriptor
- **csrVal** – vector of nonzero values of the matrix
- **csrRowPtr** – vector of row pointers of the matrix
- **csrColInd** – vector of column indices of the matrix

**Returns** the analysis result, which can be used as input to the solve phase

`accelerate.cuda.sparse.Sparse.csrsv_solve` (*trans, m, alpha, descr, csrVal, csrRowPtr, csrColInd, info, x, y*)

Performs the analysis phase of the solution of the sparse triangular linear system  $op(A) * y = alpha * x$ .

**Parameters**

- **trans** – operation to apply to the matrix
- **m** – number of rows of the matrix
- **alpha** – scalar
- **descr** – matrix descriptor
- **csrVal** – vector of nonzero values of the matrix
- **csrRowPtr** – vector of row pointers of the matrix
- **csrColInd** – vector of column indices of the matrix
- **info** – the analysis result from `csrsv_analysis()`
- **x** – dense vector
- **y** – dense vector into which the solve result is stored

**Returns** None

## BLAS Level 3

`accelerate.cuda.sparse.Sparse.csrmm` (*transA, m, n, k, nnz, alpha, descrA, csrValA, csrRowPtrA, csrColIndA, B, ldb, beta, C, ldc*)

Matrix-matrix multiplication  $C = alpha * op(A) * B + beta * C$  where  $A$  is a sparse matrix in CSR format and  $B$  and  $C$  are dense matrices.

**Parameters**

- **transA** – operation to apply to  $A$
- **m** – number of rows of  $A$
- **n** – number of columns of  $B$  and  $C$
- **k** – number of columns of  $A$

- **nnz** – number of nonzeros in  $A$
- **alpha** – scalar
- **descrA** – matrix descriptor
- **csrValA** – vector of nonzero values of  $A$
- **csrRowPtrA** – vector of row pointers of  $A$
- **csrColIndA** – vector of column indices of  $A$
- **B** – dense matrix
- **ldb** – leading dimension of  $B$
- **beta** – scalar
- **C** – dense matrix
- **ldc** – leading dimension of  $C$

**Returns** None

`accelerate.cuda.sparse.Sparse.csrmm2(transA, transB, m, n, k, nnz, alpha, descrA, csrValA, csrRowPtrA, csrColIndA, B, ldb, beta, C, ldc)`

Matrix-matrix multiplication  $C = \alpha * op(A) * op(B) + \beta * C$  where  $A$  is a sparse matrix in CSR format and  $B$  and  $C$  are dense matrices.

**Parameters**

- **transA** – operation to apply to  $A$
- **transB** – operation to apply to  $B$
- **m** – number of rows of  $A$
- **n** – number of columns of  $B$  and  $C$
- **k** – number of columns of  $A$
- **nnz** – number of nonzeros in  $A$
- **alpha** – scalar
- **descrA** – matrix descriptor
- **csrValA** – vector of nonzero values of  $A$
- **csrRowPtrA** – vector of row pointers of  $A$
- **csrColIndA** – vector of column indices of  $A$
- **B** – dense matrix
- **ldb** – leading dimension of  $B$
- **beta** – scalar
- **C** – dense matrix
- **ldc** – leading dimension of  $C$

**Returns** None

`accelerate.cuda.sparse.Sparse.csrsm_analysis(transA, m, nnz, descrA, csrValA, csrRowPtrA, csrColIndA)`

Performs the analysis phase of the solution of a sparse triangular linear system  $op(A) * Y = \alpha * X$  with multiple right-hand sides where  $A$  is a sparse matrix in CSR format, and  $X$  and  $Y$  are dense matrices.

**Parameters**

- **transA** – operation to apply to  $A$
- **m** – number of rows of  $A$
- **nnz** – number of nonzeros in  $A$
- **descrA** – matrix descriptor
- **csrValA** – vector of nonzero values of  $A$
- **csrRowPtrA** – vector of row pointers of  $A$
- **csrColIndA** – vector of column indices of  $A$

**Returns** the analysis result

`accelerate.cuda.sparse.Sparse.csrsm_solve(transA, m, n, alpha, descrA, csrValA, csrRowPtrA, csrColIndA, info, X, ldx, Y, ldy)`

Performs the analysis phase of the solution of a sparse triangular linear system  $op(A) * Y = alpha * X$  with multiple right-hand sides where  $A$  is a sparse matrix in CSR format, and  $X$  and  $Y$  are dense matrices.

**Parameters**

- **transA** – operation to apply to  $A$
- **m** – number of rows of  $A$
- **n** – number of columns of  $B$  and  $C$
- **alpha** – scalar
- **descrA** – matrix descriptor
- **csrValA** – vector of nonzero values of  $A$
- **csrRowPtrA** – vector of row pointers of  $A$
- **csrColIndA** – vector of column indices of  $A$
- **info** – the analysis result from `csrsm_analysis()`
- **X** – dense matrix
- **ldx** – leading dimension of  $X$
- **Y** – dense matrix
- **ldy** – leading dimension of  $Y$

**Returns** None

**Extra Functions**

`accelerate.cuda.sparse.Sparse.XcsrgeamNnz(m, n, descrA, nnzA, csrRowPtrA, csrColIndA, descrB, nnzB, csrRowPtrB, csrColIndB, descrC, csrRowPtrC)`

Set up the sparsity pattern for the matrix operation  $C = alpha * A + beta * B$  where  $A$ ,  $B$ , and  $C$  are all sparse matrices in CSR format.

**Parameters**

- **m** – number of rows of all matrices
- **n** – number of columns of all matrices

- **descrA** – matrix descriptor for *A*
- **nnzA** – number of nonzeros in *A*
- **csrRowPtrA** – vector of row pointers of *A*
- **csrColIndA** – vector of column indices of *A*
- **descrB** – matrix descriptor for *B*
- **nnzB** – number of nonzeros in *B*
- **csrRowPtrB** – vector of row pointers of *B*
- **csrColIndB** – vector of column indices of *B*
- **descrC** – matrix descriptor for *B*
- **csrRowPtrC** – vector of row pointers of *C*, written to by this method

**Returns** number of nonzeros in *C*

`accelerate.cuda.sparse.Sparse.csrgeam`(*m*, *n*, *alpha*, *descrA*, *nnzA*, *csrValA*, *csrRowPtrA*, *csrColIndA*, *beta*, *descrB*, *nnzB*, *csrValB*, *csrRowPtrB*, *csrColIndB*, *descrC*, *csrValC*, *csrRowPtrC*, *csrColIndC*)

Performs the the matrix operation  $C = \alpha * A + \beta * B$  where *A*, *B*, and *C* are all sparse matrices in CSR format.

#### Parameters

- **m** – number of rows of all matrices
- **n** – number of columns of all matrices
- **alpha** – scalar
- **descrA** – matrix descriptor for *A*
- **nnzA** – number of nonzeros in *A*
- **csrValA** – vector of nonzero values of *A*
- **csrRowPtrA** – vector of row pointers of *A*
- **csrColIndA** – vector of column indices of *A*
- **beta** – scalar
- **descrB** – matrix descriptor for *B*
- **nnzB** – number of nonzeros in *B*
- **csrValB** – vector of nonzero values of *B*
- **csrRowPtrB** – vector of row pointers of *B*
- **csrColIndB** – vector of column indices of *B*
- **descrC** – matrix descriptor for *B*
- **csrValC** – vector of nonzero values of *C*
- **csrRowPtrC** – vector of row pointers of *C*
- **csrColIndC** – vector of column indices of *C*

**Returns** None

`accelerate.cuda.sparse.Sparse.XcsrgermmNnz` (*transA, transB, m, n, k, descrA, nnzA, csrRowPtrA, csrColIndA, descrB, nnzB, csrRowPtrB, csrColIndB, descrC, csrRowPtrC*)

Set up the sparsity pattern for the matrix operation  $C = op(A) * op(B)$  where  $A$ ,  $B$ , and  $C$  are all sparse matrices in CSR format.

#### Parameters

- **transA** – operation to apply to  $A$
- **transB** – operation to apply to  $B$
- **m** – number of rows of  $A$  and  $C$
- **n** – number of columns of  $B$  and  $C$
- **k** – number of columns/rows of  $A/B$
- **descrA** – matrix descriptor for  $A$
- **nnzA** – number of nonzeros in  $A$
- **csrRowPtrA** – vector of row pointers of  $A$
- **csrColIndA** – vector of column indices of  $A$
- **descrB** – matrix descriptor for  $B$
- **nnzB** – number of nonzeros in  $B$
- **csrRowPtrB** – vector of row pointers of  $B$
- **csrColIndB** – vector of column indices of  $B$
- **descrC** – matrix descriptor for  $C$
- **csrRowPtrC** – vector of row pointers of  $C$ , written by this function

**Returns** number of nonzeros in  $C$

`accelerate.cuda.sparse.Sparse.csrgermm` (*transA, transB, m, n, k, descrA, nnzA, csrValA, csrRowPtrA, csrColIndA, descrB, nnzB, csrValB, csrRowPtrB, csrColIndB, descrC, csrValC, csrRowPtrC, csrColIndC*)

Perform the matrix operation  $C = op(A) * op(B)$  where  $A$ ,  $B$ , and  $C$  are all sparse matrices in CSR format.

#### Parameters

- **transA** – operation to apply to  $A$
- **transB** – operation to apply to  $B$
- **m** – number of rows of  $A$  and  $C$
- **n** – number of columns of  $B$  and  $C$
- **k** – number of columns/rows of  $A/B$
- **descrA** – matrix descriptor for  $A$
- **nnzA** – number of nonzeros in  $A$
- **csrValA** – vector of nonzero values in  $A$
- **csrRowPtrA** – vector of row pointers of  $A$
- **csrColIndA** – vector of column indices of  $A$
- **descrB** – matrix descriptor for  $B$

- **nnzB** – number of nonzeros in  $B$
- **csrValB** – vector of nonzero values in  $B$
- **csrRowPtrB** – vector of row pointers of  $B$
- **csrColIndB** – vector of column indices of  $B$
- **descrC** – matrix descriptor for  $C$
- **csrValC** – vector of nonzero values in  $C$
- **csrRowPtrC** – vector of row pointers of  $C$
- **csrColIndC** – vector of column indices of  $C$

**Returns** None

`accelerate.cuda.sparse.Sparse.csrgermm_ez(A, B, transA='N', transB='N', descrA=None, descrB=None, descrC=None)`

Performs the matrix operation  $C = op(A) * op(B)$  where  $A$ ,  $B$  and  $C$  are all sparse matrices in CSR format. This function accepts and returns `accelerate.cuda.sparse.CudaCSRMatrix` matrices, and makes calls to `XcsrgermmNnz()` and `csrgermm()`.

**Parameters**

- **A** – `accelerate.cuda.sparse.CudaCSRMatrix`
- **B** – `accelerate.cuda.sparse.CudaCSRMatrix`
- **transA** – optional, operation to apply to  $A$
- **transB** – optional, operation to apply to  $B$
- **descrA** – optional, matrix descriptor for  $A$
- **descrB** – optional, matrix descriptor for  $B$
- **descrC** – optional, matrix descriptor for  $C$

**Returns** `accelerate.cuda.sparse.CudaCSRMatrix`

## Preconditioners

`accelerate.cuda.sparse.Sparse.csrinfo(trans, m, descr, csrValA, csrRowPtrA, csrColIndA, info)`

Computes incomplete Cholesky factorization of a sparse matrix in CSR format with 0 fill-in and no pivoting:  $op(A) = R^{**T} * R$ . This method must follow a call to `csrsv_analysis()`. The matrix  $A$  is overwritten with the upper or lower triangular factors  $R$  or  $R^{**T}$ .

**Parameters**

- **trans** – operation to apply to the matrix
- **m** – number of rows and columns of the matrix
- **descr** – matrix descriptor
- **csrValA** – vector of nonzero values in  $A$
- **csrRowPtrA** – vector of row pointers of  $A$
- **csrColIndA** – vector of column indices of  $A$
- **info** – analysis result

**Returns** None

`accelerate.cuda.sparse.Sparse.csrilu0(trans, m, descr, csrValA, csrRowPtrA, csrColIndA, info)`

Computes incomplete-LU factorization of a sparse matrix in CSR format with 0 fill-in and no pivoting:  $op(A) = L * U$ . This method must follow a call to `csrsv_analysis()`. The matrix  $A$  is overwritten with the lower and upper triangular factors  $L$  and  $U$ .

**Parameters**

- **trans** – operation to apply to the matrix
- **m** – number of rows and columns of the matrix
- **descr** – matrix descriptor
- **csrValA** – vector of nonzero values in  $A$
- **csrRowPtrA** – vector of row pointers of  $A$
- **csrColIndA** – vector of column indices of  $A$
- **info** – analysis result

**Returns** None

`accelerate.cuda.sparse.Sparse.gtstv(m, n, dl, d, du, B, ldb)`

Computes the solution of a tridiagonal linear system with multiple right-hand sides:  $A * Y = \alpha * X$ .

**Parameters**

- **m** – the size of the linear system
- **n** – the number of right-hand sides in the system
- **dl** – dense vector storing the lower-diagonal elements
- **d** – dense vector storing the diagonal elements
- **du** – dense vector storing the upper-diagonal elements
- **B** – dense matrix holding the right-hand sides of the system
- **ldb** – the leading dimension of  $B$

**Returns** None

`accelerate.cuda.sparse.Sparse.gtstv_nopivot(m, n, dl, d, du, B, ldb)`

Similar to `gtstv()`, but computes the solution without performing any pivoting.

**Parameters**

- **m** – the size of the linear system
- **n** – the number of right-hand sides in the system
- **dl** – dense vector storing the lower-diagonal elements
- **d** – dense vector storing the diagonal elements
- **du** – dense vector storing the upper-diagonal elements
- **B** – dense matrix holding the right-hand sides of the system
- **ldb** – the leading dimension of  $B$

**Returns** None

`accelerate.cuda.sparse.Sparse.gtstvStridedBatch(m, dl, d, du, x, batchCount, batchStride)`

Computes the solution of  $i$  tridiagonal linear systems:  $A(i) * y(i) = \alpha * x(i)$ .

**Parameters**

- **m** – the size of the linear systems
- **dl** – stacked dense vector storing the lower-diagonal elements of each system
- **d** – stacked dense vector storing the diagonal elements of each system
- **du** – stacked dense vector storing the upper-diagonal elements of each system
- **x** – dense matrix holding the right-hand sides of the systems
- **batchCount** – number of systems to solve
- **batchStride** – number of elements separating the vectors of each system

**Returns** None

**Format Conversion**

`accelerate.cuda.sparse.Sparse.bsr2csr` (*dirA, mb, nb, descrA, bsrValA, bsrRowPtrA, bsrColIndA, blockDim, descrC, csrValC, csrRowPtrC, csrColIndC*)

Convert the sparse matrix *A* in BSR format to CSR format, stored in *C*.

**Parameters**

- **dirA** – row ('R') or column ('C') orientation of block storage
- **mb** – number of block rows of *A*
- **nb** – number of block columns of *A*
- **descrA** – matrix descriptor for *A*
- **bsrValA** – vector of nonzero values of *A*
- **bsrRowPtrA** – vector of block row pointers of *A*
- **bsrColIndA** – vector of block column indices of *A*
- **blockDim** – block dimension of *A*
- **descrC** – matrix descriptor for *C*
- **csrValA** – vector of nonzero values in *C*
- **csrRowPtrA** – vector of row pointers of *C*
- **csrColIndA** – vector of column indices of *C*

**Returns** None

`accelerate.cuda.sparse.Sparse.Xcoo2csr` (*cooRowInd, nnz, m, csrRowPtr*)

Converts an array containing uncompressed row indices corresponding to the COO format into an array of compressed row pointers corresponding to the CSR format.

**Parameters**

- **cooRowInd** – integer array of uncompressed row indices
- **nnz** – number of nonzeros
- **m** – number of matrix rows
- **csrRowPtr** – vector of row pointers to be written to

**Returns** None

`accelerate.cuda.sparse.Sparse.csc2dense` (*m*, *n*, *descrA*, *cscValA*, *cscRowIndA*, *cscColPtrA*, *A*, *lda*)

Convert the sparse matrix *A* in CSC format into a dense matrix.

**Parameters**

- **m** – number of rows of *A*
- **n** – number of columns of *A*
- **descrA** – matrix descriptor for *A*
- **cscValA** – values in the CSC representation of *A*
- **cscRowIndA** – row indices in the CSC representation of *A*
- **cscColPtrA** – column pointers in the CSC representation of *A*
- **A** – dense matrix representation of *A* to be written by this function.
- **lda** – leading dimension of *A*

**Returns** None

`accelerate.cuda.sparse.Sparse.Xcsr2bsrNnz` (*dirA*, *m*, *n*, *descrA*, *csrRowPtrA*, *csrColIndA*, *blockDim*, *descrC*, *bsrRowPtrC*)

Performs the analysis necessary for converting a matrix in CSR format into BSR format.

**Parameters**

- **dirA** – row ('R') or column ('C') orientation of block storage
- **m** – number of rows of matrix
- **n** – number of columns of matrix
- **descrA** – matrix descriptor for input matrix *A*
- **csrRowPtrA** – row pointers of matrix
- **csrColIndA** – column indices of matrix
- **blockDim** – block dimension of output matrix *C*
- **descrC** – matrix descriptor for output matrix *C*

**Returns** number of nonzeros of matrix

`accelerate.cuda.sparse.Sparse.csr2bsr` (*dirA*, *m*, *n*, *descrA*, *csrValA*, *csrRowPtrA*, *csrColIndA*, *blockDim*, *descrC*, *bsrValC*, *bsrRowPtrC*, *bsrColIndC*)

Performs conversion of a matrix from CSR format into BSR format.

**Parameters**

- **dirA** – row ('R') or column ('C') orientation of block storage
- **m** – number of rows of matrix
- **n** – number of columns of matrix
- **descrA** – matrix descriptor for input matrix *A*
- **csrValA** – nonzero values of matrix
- **csrRowPtrA** – row pointers of matrix
- **csrColIndA** – column indices of matrix
- **blockDim** – block dimension of output matrix *C*

- **descrC** – matrix descriptor for output matrix *C*
- **bsrValC** – nonzero values of output matrix *C*
- **bsrRowPtrC** – block row pointers of output matrix *C*
- **bsrColIndC** – block column indices of output matrix *C*

**Returns** number of nonzeros of matrix

`accelerate.cuda.sparse.Sparse.Xcsr2coo (csrRowPtr, nnz, m, cooRowInd)`

Converts an array of compressed row pointers corresponding to the CSR format into an array of uncompressed row indices corresponding to the COO format.

**Parameters**

- **csrRowPtr** – vector of row pointers
- **nnz** – number of nonzeros
- **m** – number of rows of matrix
- **cooRowInd** – vector of uncompressed row indices written by this function

**Returns** None

`accelerate.cuda.sparse.Sparse.csr2csc (m, n, nnz, csrVal, csrRowPtr, csrColInd, cscVal, cscRowInd, cscColPtr, copyValues)`

Converts a sparse matrix in CSR format into a sparse matrix in CSC format.

**Parameters**

- **m** – number of rows of matrix
- **n** – number of columns of matrix
- **nnz** – number of nonzeros of the matrix
- **csrVal** – values in the CSR representation
- **csrRowPtr** – row indices in the CSR representation
- **csrColInd** – column pointers in the CSR representation
- **cscVal** – values in the CSC representation
- **cscRowInd** – row indices in the CSC representation
- **cscColPtr** – column pointers in the CSC representation
- **copyValues** – ‘N’ or ‘S’ for symbolic or numeric copy of values

**Returns** None

`accelerate.cuda.sparse.Sparse.csr2dense (m, n, descr, csrVal, csrRowPtr, csrColInd, A, lda)`

Convert a sparse matrix in CSR format into dense format.

**Parameters**

- **m** – number of rows of matrix
- **n** – number of columns of matrix
- **descr** – matrix descriptor
- **csrVal** – values in the CSR representation
- **csrRowPtr** – row indices in the CSR representation
- **csrColInd** – column pointers in the CSR representation

- **A** – the dense representation, written to by this function
- **lda** – leading dimension of the matrix

**Returns** None

`accelerate.cuda.sparse.Sparse.dense2csc(m, n, descrA, A, lda, nnzPerCol, cscVal, cscRowInd, cscColPtr)`

Convert a dense matrix into a sparse matrix in CSC format. The *nnzPerCol* parameter may be computed with a call to `nnz()`.

**Parameters**

- **m** – number of rows of matrix
- **n** – number of columns of matrix
- **descrA** – matrix descriptor
- **A** – the matrix in dense format
- **lda** – leading dimension of the matrix
- **nnzPerCol** – array containing the number of nonzero elements per column
- **cscVal** – values in the CSC representation
- **cscRowInd** – row indices in the CSC representation
- **cscColPtr** – column pointers in the CSC representation

**Returns** None

`accelerate.cuda.sparse.Sparse.dense2csr(m, n, descrA, A, lda, nnzPerRow, csrVal, csrRowPtr, csrColInd)`

Convert a dense matrix into a sparse matrix in CSR format. The *nnzPerRow* parameter may be computed with a call to `nnz()`.

**Parameters**

- **m** – number of rows of matrix
- **n** – number of columns of matrix
- **descrA** – matrix descriptor
- **A** – the matrix in dense format
- **lda** – leading dimension of the matrix
- **nnzPerRow** – array containing the number of nonzero elements per row
- **csrVal** – values in the CSR representation
- **csrRowPtr** – row indices in the CSR representation
- **csrColInd** – column pointers in the CSR representation

**Returns** None

`accelerate.cuda.sparse.Sparse.nnz(dirA, m, n, descrA, A, lda, nnzPerRowCol)`

Computes the number of nonzero elements per row or column of a dense matrix, and the total number of nonzero elements in the matrix.

**Parameters**

- **dirA** – ‘R’ for the number of nonzeros per row, or ‘C’ for per column.
- **m** – number of rows of matrix

- **n** – number of columns of matrix
- **descrA** – matrix descriptor
- **A** – the matrix
- **lda** – leading dimension of the matrix
- **nnzPerRowCol** – array to contain the number of nonzeros per row or column

**Returns** total number of nonzeros in the matrix

## cuFFT

Provides FFT and inverse FFT for 1D, 2D and 3D arrays. See [NVIDIA cuFFT](#).

---

**Note:** cuFFT only supports FFT operations on `numpy.float32`, `numpy.float64`, `numpy.complex64`, `numpy.complex128` with C-contiguous datalayout.

---

## Forward FFT

```
accelerate.cuda.fft.fft(ary, out[, stream])
accelerate.cuda.fft.fft_inplace(ary[, stream])
```

### Parameters

- **ary** – The input array. The inplace version stores the result in here.
- **out** – The output array for non-inplace versions.
- **stream** – The CUDA stream in which all operations will take place.

## Inverse FFT

```
accelerate.cuda.fft.ifft(ary, out[, stream])
accelerate.cuda.fft.ifft_inplace(ary[, stream])
```

### Parameters

- **ary** – The input array. The inplace version stores the result in here.
- **out** – The output array for non-inplace versions.
- **stream** – The CUDA stream in which all operations will take place.

## FFTPlan

## cuRAND

Provides *pseudo-random number generator* (PRNG) and *quasi-random generator* (QRNG). See [NVIDIA cuRAND](#).

## CUDA Sorting

Accelerate provides routines for sorting arrays on CUDA GPUs.

### Sorting Large Arrays

The `accelerate.cuda.sorting.RadixSort` class is recommended for sorting large (approx. more than 1 million items) arrays of numeric types.

### Sorting Many Small Arrays

Using `accelerate.cuda.sorting.RadixSort` on small (approx. less than 1 million items) arrays has significant overhead due to multiple kernel launches.

A better alternative is to use `accelerate.cuda.sorting.segmented_sort()` -which launches a single kernel for sorting a batch of many small arrays.

## Math Kernel Library

The Math Kernel Library provides BLAS, LAPACK, and other math routines. For more information, see [Intel's site](#).

The following functions, FFT variants and accelerated UFuncs are available for use with Accelerate:

### MKL utility functions

The `accelerate.mkl` module contains a set of functions to configure and retrieve information about the underlying Intel MKL library.

## Reference

`accelerate.mkl.set_num_threads(n)`

Set the number of threads Intel MKL should use. This is only a hint, and no guarantee is made this number of threads will actually be used. This function takes precedence over the environment variable `MKL_NUM_THREADS`.

This function wraps the Intel MKL function `mkl_set_num_threads`.

`accelerate.mkl.get_max_threads() → int`

Return the number of threads Intel MKL is targeting for parallelism.

This function wraps the Intel MKL function `mkl_get_max_threads`.

`accelerate.mkl.get_version_string() → str`

Return the Intel MKL version information as a string.

This function wraps the Intel MKL function `mkl_get_version_string`.

`accelerate.mkl.mem_stat() → int, int`

Return a (bytes, blocks) tuple of memory usage statistics about the underlying Intel MKL memory allocator. The return tuple contains:

- The total number of bytes allocated (bytes).
- The number of allocated blocks (blocks).

This function wraps the Intel MKL function `mkl_mem_stat`.

`accelerate.mkl.get_cpu_clocks()` → int

Return elapsed CPU clocks as an integer. This may be useful when timing short intervals with high resolution. Note the result is limited to unsigned 64 bit integers, so wrapping of elapsed time is possible.

This function wraps the Intel MKL function `mkl_get_cpu_clocks`.

`accelerate.mkl.get_cpu_frequency()` → int

Return CPU frequency in GHz as a float. Note the result may vary from run to run as it returns the current frequency. That frequency can change in some systems due to several factors (i.e. power management).

This function wraps the Intel MKL function `mkl_get_cpu_frequency`.

## MKL BLAS functions

The `accelerate.mkl.blas` module contains a subset of BLAS functions implemented by means of the underlying Intel MKL library.

## Reference

`accelerate.mkl.blas.dot(x, y)`

Compute and return the vector dot product of `x` and `y`.

### Parameters

- **x** – one-dimensional array
- **y** – one-dimensional array

### Return type

**Note** the input arguments may be copied to adjust their types.

## Example

```
alpha = 1.+1.j
A = np.arange(16, dtype=np.float64).reshape(4,4)
x = np.arange(4, dtype=np.float64)
beta = 0.
y = np.arange(4, dtype=np.float64)
result = blas.gemv('N', alpha, A, x, beta, y)
```

## MKL FFT

The speed-boosted variants of NumPy's FFT operations are accessible in the `numpy.fft` package, and the `accelerate.mkl.fftpack` package. The following functions in these packages are accelerated using MKL:

| Function                                      | Description   |
|---|---|
| <code>fft(a, n=None, axis=-1)</code>          | 1-dimensional forward transform                     |
| <code>ifft(a, n=None, axis=-1)</code>         | 1-dimensional inverse transform                     |
| <code>rfft(a, n=None, axis=-1)</code>         | 1-dimensional forward transform of purely real data |
| <code>irfft(a, n=None, axis=-1)</code>        | 1-dimensional inverse transform of purely real data |
| <code>hfft(a, n=None, axis=-1)</code>         | Hermite transform                                   |
| <code>ihfft(a, n=None, axis=-1)</code>        | Inverse Hermite transform                           |
| <code>fftn(a, s=None, axes=None)</code>       | N-dimensional forward transform                     |
| <code>ifftn(a, s=None, axes=None)</code>      | N-dimensional inverse transform                     |
| <code>fft2(a, s=None, axes=(-2, -1))</code>   | 2-dimensional forward transform                     |
| <code>ifft2(a, s=None, axes=(-2, -1))</code>  | 2-dimensional inverse transform                     |
| <code>rfftn(a, s=None, axes=None)</code>      | N-dimensional forward transform of purely real data |
| <code>rfft2(a, s=None, axes=(-2, -1))</code>  | 2-dimensional forward transform of purely real data |
| <code>irfftn(a, s=None, axes=None)</code>     | N-dimensional inverse transform of purely real data |
| <code>irfft2(a, s=None, axes=(-2, -1))</code> | 2-dimensional inverse transform of purely real data |

For further information on these functions, please refer to the Numpy documentation: `numpy.fft`.

## Accelerated UFuncs

Variants of some Numpy UFuncs that use Intel's Vector Math Library (VML) are found in the `accelerate.mkl` package in the `ufuncs` object. In comparison to Numpy's built-in UFuncs, Accelerated UFuncs have the following properties:

**Performance** Because Accelerated UFuncs call functions from VML, which is a library optimised for high performance using multiple threads and SIMD instructions, performance may be increased when calling Accelerated UFuncs in comparison to calling Numpy UFuncs. The performance increase will only be obtained for contiguous arguments. For non-contiguous arguments, performance comparable to Numpy's will be observed.

### Accuracy

- Accelerated UFuncs produce similar results to their Numpy equivalents for the range of finite values, up to a given relative tolerance.
- The tolerance varies between functions and data types, and is specified for each combination in the following section.
- For the range of infinite and NaN values, the majority of results computed by Accelerated UFuncs will be equal to those computed by their Numpy counterparts. However, this is not guaranteed; for example, an input for which the Numpy UFunc produces a result of  $x + \text{inf} * j$ , the equivalent Accelerated UFunc may produce a result of  $y + \text{inf} * j$ , where  $x \neq y$ .
- Towards the edge of the domain of a data type (e.g. near  $3.4\text{e}+38$  for `float` and  $1.79\text{e}+308$  for `double` and values of similar magnitude at the negative end of the domain) some Accelerated UFuncs may produce results which differ from Numpy UFuncs, or may raise `FloatingPointError` or `ZeroDivisionError` exceptions. These functions are marked *domain edge warning* in the *Accuracy* column of the tables in the following sections.
- Some numpy implementations of functions that operate in the complex domain have branch cuts which differ from those in MKL, where this has been identified in testing these functions are marked *branch cut warning* in the *Accuracy* column of the tables in the following sections. This warning may also be present in the case of implementations which contain incorrect branch cuts.
- Denormal input values may be treated as zero by Accelerated UFuncs, and denormal output values may be flushed to zero.

- The accuracy reported is approximate and related to the least accurate value encountered when testing with contiguous input arguments. Non-contiguous arguments are more directly exposed to system math library implementations and so their accuracy is not commented on.

**Exception handling** For the range of finite values, exceptions will not be raised by Accelerated UFuncs, just as they would not by Numpy. For the infinite and NaN ranges, Accelerated UFuncs may raise `FloatingPointError` or `ZeroDivisionError` exceptions in cases when Numpy would not, and vice-versa.

Supported functions are described in the following sections.

## Arithmetic Functions

| Function       | Type | Accuracy     |
|----------------|------|--------------|
| add(x, y)      | f4   | rtol=1.0e-7  |
|                | f8   | rtol=1.0e-15 |
|                | c8   | rtol=1.0e-7  |
|                | c16  | rtol=1.0e-15 |
| subtract(x, y) | f4   | rtol=1.e-7   |
|                | f8   | rtol=1.e-15  |
|                | c8   | rtol=1.e-7   |
|                | c16  | rtol=1.e-15  |
| square(x)      | f4   | rtol=1.e-7   |
|                | f8   | rtol=1.e-15  |
| multiply(x, y) | f4   | rtol=1.e-7   |
|                | f8   | rtol=1.e-15  |
|                | c8   | rtol=1.e-6   |
|                | c16  | rtol=1.e-15  |
| absolute(x)    | f4   | rtol=1.e-6   |
|                | f8   | rtol=1.e-15  |

## Power and Root Functions

| Function          | Type | Accuracy                         |
|-------------------|------|----------------------------------|
| reciprocal(x)     | f4   | rtol=1.e-7                       |
|                   | f8   | rtol=1.e-15                      |
| true_divide(x, y) | f4   | rtol=1.e-7                       |
|                   | f8   | rtol=1.e-15                      |
|                   | c8   | rtol=1.e-6                       |
|                   | c16  | rtol=1.e-15                      |
| sqrt(x, y)        | f4   | rtol=1.e-6                       |
|                   | f8   | rtol=1.e-15                      |
|                   | c8   | rtol=1.e-6, domain edge warning  |
|                   | c16  | rtol=1.e-15, domain edge warning |
| power(x, y)       | f4   | rtol=1.e-7                       |
|                   | f8   | rtol=1.e-15                      |
| hypot(x, y)       | f4   | rtol=1.e-6                       |
|                   | f8   | rtol=1.e-15                      |

## Exponential and Logarithmic Functions

| Function  | Type | Accuracy                         |
|-----------|------|----------------------------------|
| exp (x)   | f4   | rtol=1.e-6                       |
|           | f8   | rtol=1.e-15                      |
|           | c8   | rtol=1.e-6, domain edge warning  |
|           | c16  | rtol=1.e-15, domain edge warning |
| expm1 (x) | f4   | rtol=1.e-6                       |
|           | f8   | rtol=1.e-15                      |
| log (x)   | f4   | rtol=1.e-6                       |
|           | f8   | rtol=1.e-15                      |
|           | c8   | rtol=1.e-5                       |
|           | c16  | rtol=1.e-13                      |
| log10 (x) | f4   | rtol=1.e-6                       |
|           | f8   | rtol=1.e-15                      |
|           | c8   | rtol=1.e-5, domain edge warning  |
|           | c16  | rtol=1.e-13, domain edge warning |
| log1p (x) | f4   | rtol=1.e-6                       |
|           | f8   | rtol=1.e-15                      |

## Trigonometric Functions

| Function    | Type | Accuracy   |
|-------------|------|--|
| cos (x)     | f4   | rtol=1.e-6, domain edge warning                                |
|             | f8   | rtol=1.e-15, domain edge warning                               |
|             | c8   | rtol=1.e-6, domain edge warning                                |
|             | c16  | rtol=1.e-15, domain edge warning                               |
| sin (x)     | f4   | rtol=1.e-5, domain edge warning                                |
|             | f8   | rtol=1.e-15, domain edge warning                               |
|             | c8   | rtol=1.e-6, domain edge warning                                |
|             | c16  | rtol=1.e-15, domain edge warning                               |
| tan (x)     | f4   | rtol=1.e-6, domain edge warning                                |
|             | f8   | rtol=1.e-15, domain edge warning                               |
|             | c8   | rtol=5.e-4, domain edge warning                                |
|             | c16  | rtol=5.e-14, domain edge warning                               |
| arccos (x)  | f4   | rtol=1.e-6, branch cut warning                                 |
|             | f8   | rtol=1.e-15, branch cut warning                                |
|             | c8   | <b>rtol=1.e-5, domain edge warning,</b><br>branch cut warning  |
|             | c16  | <b>rtol=1.e-14, domain edge warning,</b><br>branch cut warning |
| arcsin (x)  | f4   | rtol=1.e-6, branch cut warning                                 |
|             | f8   | rtol=1.e-15, branch cut warning                                |

|             | c16  | <b>rtol=1.e-12, domain edge warning,</b><br>branch cut warning |
| arctan (x)  | f4   | rtol=1.e-6   |
|             | f8   | rtol=1.e-15  |
|             | c8   | rtol=1.e-6   |
|             | c16  | rtol=1.e-15  |
| arctan2 (x) | f4   | rtol=1.e-6   |
|             | f8   | rtol=1.e-15  |

## Hyperbolic Functions

| Function    | Type | Accuracy   |
|-------------|------|--|
| cosh (x)    | f4   | rtol=1.e-6, domain edge warning                                |
|             | f8   | rtol=1.e-15, domain edge warning                               |
|             | c8   | rtol=1.e-6, domain edge warning                                |
|             | c16  | rtol=1.e-15, domain edge warning                               |
| sinh (x)    | f4   | rtol=1.e-6, domain edge warning                                |
|             | f8   | rtol=1.e-15, domain edge warning                               |
|             | c8   | rtol=1.e-6, domain edge warning                                |
|             | c16  | rtol=1.e-15, domain edge warning                               |
| tanh (x)    | f4   | rtol=1.e-6, domain edge warning                                |
|             | f8   | rtol=1.e-15, domain edge warning                               |
|             | c8   | rtol=1.e-6, domain edge warning                                |
|             | c16  | rtol=1.e-15, domain edge warning                               |
| arccosh (x) | f4   | rtol=1.e-6   |
|             | f8   | rtol=1.e-15  |
|             | c8   | rtol=1.e-5, domain edge warning                                |
|             | c16  | rtol=1.e-14, domain edge warning                               |
| arcsinh (x) | f4   | rtol=1.e-6   |
|             | f8   | rtol=1.e-15  |
|             | c8   | rtol=5.e-5, domain edge warning                                |
|             | c16  | rtol=1.e-13, domain edge warning                               |
| arctanh (x) | f4   | rtol=1.e-5, branch cut warning                                 |
|             | f8   | rtol=5.e-11, branch cut warning                                |
|             | c8   | <b>rtol=1.e-4, domain edge warning,</b><br>branch cut warning  |
|             | c16  | <b>rtol=5.e-14, domain edge warning,</b><br>branch cut warning |

## Profiling

The Python standard library includes code profiling functionality. When active, function invocations and the time spent on them are recorded.

The `accelerate.profiler` module extends this functionality by also recording the functions' signatures, which are useful because often the precise control flow—and thus function performance—depends on the argument types. For NumPy array types, this includes not only the `dtype` attribute, but also the array's shape.

### Profiling example

The following code defines a simple dot function and profiles it without signatures to match the behaviour of the Python standard library profile module:

```
from accelerate import profiler
import numpy as np

def dot(a, b):
    sum=0
    for i in range(len(a)):
        sum += a[i]*b[i]
    return sum

a = np.arange(16, dtype=np.float32)
b = np.arange(16, dtype=np.float32)

p = profiler.Profile(signatures=False)
p.enable()
dot(a, b)
p.disable()
p.print_stats()
```

This generates the following output:

```
3 function calls in 0.000 seconds

Ordered by: standard name

ncalls  tottime  percall  cumtime  percall filename:lineno(function)
1      0.000   0.000   0.000   0.000 builtins.len
1      0.000   0.000   0.000   0.000 dot.py:7(dot)
1      0.000   0.000   0.000   0.000 {method 'disable' of 'prof.Profiler'
↳objects}
```

**NOTE:** By default, the `Profile` constructor's signature flag is set to `True`, resulting in the following output:

```
3 function calls (2 primitive calls) in 0.000 seconds

Ordered by: standard name

ncalls  tottime  percall  cumtime  percall filename:lineno(function)
1      0.000   0.000   0.000   0.000 dot.py:1(disable())
2/1     0.000   0.000   0.000   0.000 dot.py:7(dot(a:ndarray(dtype=float32,
↳shape=(16,)), b:ndarray(dtype=float32, shape=(16,)))
```

In the results for more realistic code, the call graph—and thus the table of function calls—is much bigger, making working with data in tabular form inconvenient.

To solve this, the `accelerate.profiler` module also provides functionality to visualize the data. Instead of calling the `print_stats()` method, call the `accelerate.profiler.plot()` function.

NOTE: At this time, the `accelerate.profiler.plot()` function may only be called from inside a notebook.

If the code above was executed from inside a notebook, run the following code:

```
In [3]: profiler.plot(p)
```

Which generates the following output:

Accelerate.profiler API

Environment variables

ACCELERATE\_WARNINGS

If set to anything but 0 (zero), Accelerate may issue performance warnings, such as when input arguments need to be copied to adjust their data layout, or types, to match particular backend requirements.

## License agreement

### Anaconda Accelerate End User License Agreement

Anaconda Accelerate (“the Software Product” or “Accelerate”) and accompanying documentation is licensed and not sold. The Software Product is protected by copyright laws and treaties, as well as laws and treaties related to other forms of intellectual property. Continuum Analytics, Inc. (dba Anaconda, Inc.) or its subsidiaries, affiliates, and suppliers (collectively “Continuum”) own intellectual property rights in the Software Product. The Licensee’s (“you” or “your”) license to download, use, copy, or change the Software Product is subject to these rights and to all the terms and conditions of this End User License Agreement (“Agreement”).

### Acceptance

YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS AGREEMENT BY SELECTING THE “ACCEPT” OPTION AND DOWNLOADING THE SOFTWARE PRODUCT OR BY INSTALLING, USING, OR COPYING THE SOFTWARE PRODUCT. YOU MUST AGREE TO ALL OF THE TERMS OF THIS AGREEMENT BEFORE YOU WILL BE ALLOWED TO DOWNLOAD THE SOFTWARE PRODUCT. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THIS AGREEMENT, YOU MUST SELECT “DECLINE” AND YOU MUST NOT INSTALL, USE, OR COPY THE SOFTWARE PRODUCT.

### Other Vendor Tools

In addition to Continuum’s proprietary software, the Software product may contain other software packages from other sources (“Other Vendor Tools”). These are available on an “as is” basis and subject to their individual license agreements. These licenses are available either in the package distributed with the Software Product or via request to [info@anaconda.com](mailto:info@anaconda.com). Any binary packages of Other Vendor Tools you obtain via Accelerate are subject to their individual licenses as well as the terms of this EULA. Continuum reserves the right to change which Other Vendor Tools are provided in Accelerate.

### Trial Period

You have the right to use Accelerate on a single computer or group of computers for 30 days with no license. After 30 days you must purchase an appropriate license to use the software on one or more machines or stop using the software and remove it from all of your machines on which you installed the software.

### License Grant

This Agreement entitles you to install and use one copy of the Software Product on as many machines as you will personally use. The Software Product is licensed to a particular user. Only the user to whom the software is licensed may use the software. You must obtain a license for as many users as you wish to use the software. In addition, you may make archival copies of the Software Product Installer.

### Right to Updates

This license entitles you to updates to the Software Product for one year from the time of payment. The Software Product will continue to function and you may continue to use The Software Product and any updates you have received for as long as you would like however you will no longer be able to receive updates from Continuum unless this License is renewed. Please contact [sales@anaconda.com](mailto:sales@anaconda.com) with any questions or concerns.

### Restrictions on Transfer

Without first obtaining the express written consent of Continuum, you may not assign your rights and obligations under this Agreement, or redistribute, encumber, sell, rent, lease, sublicense, or otherwise transfer your rights to the Software Product.

### Restrictions on Use

You may not use, copy, or install the Software Product on any system where more than one user will be able to use the software unless you have purchased a license for each user of the system. You may not decompile, “reverse-engineer”, disassemble, or otherwise attempt to derive the source code for the Software Product.

### Restrictions on Alteration

You may not modify the Software Product or create any derivative work of the Software Product or its accompanying documentation. Derivative works include but are not limited to translations. You may not alter any files or libraries in any portion of the Software Product.

### Restrictions on Copying

You may not copy any part of the Software Product except to the extent that licensed use inherently demands the creation of a temporary copy stored in computer memory and not permanently affixed on storage medium. You may make archival copies of the Software Product installer.

### Limited Software Product Warranty

For a period of 60 days from the date of shipment or from the date that you download the Software Product, as applicable, Continuum warrants that when properly installed and used under normal conditions, the Software Product will perform substantially as advertised.

### Disclaimer of Warranties and Limitation of Liability

UNLESS OTHERWISE EXPLICITLY AGREED TO IN WRITING BY CONTINUUM, CONTINUUM MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, IN FACT OR IN LAW, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OTHER THAN AS SET FORTH IN THIS AGREEMENT OR IN THE LIMITED WARRANTY DOCUMENTS PROVIDED WITH THE SOFTWARE PRODUCT.

Continuum makes no warranty that the Software Product will meet your requirements or operate under your specific conditions of use. Continuum makes no warranty that operation of the Software Product will be secure, error free, or free from interruption. YOU MUST DETERMINE WHETHER THE SOFTWARE PRODUCT SUFFICIENTLY MEETS YOUR REQUIREMENTS FOR SECURITY AND UNINTERRUPTABILITY. YOU BEAR SOLE RESPONSIBILITY AND ALL LIABILITY FOR ANY LOSS INCURRED DUE TO FAILURE OF THE SOFTWARE PRODUCT TO MEET YOUR REQUIREMENTS. CONTINUUM WILL NOT, UNDER ANY CIRCUMSTANCES, BE RESPONSIBLE OR LIABLE FOR THE LOSS OF DATA ON ANY COMPUTER OR INFORMATION STORAGE DEVICE. UNDER NO CIRCUMSTANCES SHALL CONTINUUM, ITS DIRECTORS, OFFICERS, EMPLOYEES OR AGENTS BE LIABLE TO YOU OR ANY OTHER PARTY FOR INDIRECT, CONSEQUENTIAL,

SPECIAL, INCIDENTAL, PUNITIVE, OR EXEMPLARY DAMAGES OF ANY KIND (INCLUDING LOST REVENUES OR PROFITS OR LOSS OF BUSINESS) RESULTING FROM THIS AGREEMENT, OR FROM THE FURNISHING, PERFORMANCE, INSTALLATION, OR USE OF THE SOFTWARE PRODUCT, WHETHER DUE TO A BREACH OF CONTRACT, BREACH OF WARRANTY, OR THE NEGLIGENCE OF CONTINUUM OR ANY OTHER PARTY, EVEN IF CONTINUUM IS ADVISED BEFOREHAND OF THE POSSIBILITY OF SUCH DAMAGES. TO THE EXTENT THAT THE APPLICABLE JURISDICTION LIMITS CONTINUUM'S ABILITY TO DISCLAIM ANY IMPLIED WARRANTIES, THIS DISCLAIMER SHALL BE EFFECTIVE TO THE MAXIMUM EXTENT PERMITTED.

### **Limitation of Remedies and Damages**

Your remedy for a breach of this Agreement or of any warranty included in this Agreement is the correction or replacement of the Software Product. Selection of whether to correct or replace shall be solely at the discretion of Continuum. Continuum reserves the right to substitute a functionally equivalent copy of the Software Product as a replacement. If Continuum is unable to provide a replacement or substitute Software Product or corrections to the Software Product, your sole alternate remedy shall be a refund of the purchase price for the Software Product exclusive of any costs for shipping and handling. Any claim must be made within the applicable warranty period. All warranties cover only defects arising under normal use and do not include malfunctions or failure resulting from misuse, abuse, neglect, alteration, problems with electrical power, acts of nature, unusual temperatures or humidity, improper installation, or damage determined by Continuum to have been caused by you. All limited warranties on the Software Product are granted only to you and are non-transferable. You agree to indemnify and hold Continuum harmless from all claims, judgments, liabilities, expenses, or costs arising from your breach of this Agreement and/or acts or omissions.

### **Governing Law, Jurisdiction and Costs**

This Agreement is governed by the laws of Texas, without regard to Texas's conflict or choice of law provisions.

### **Export Regulations**

Any use or distribution of Accelerate is made under conditions that the user and/or distributor is in full compliance with all export and other governing laws of the United States of America, including full and ongoing compliance with the Export Administration Regulations (EAR) of the United States Department of Commerce. See [www.commerce.gov/](http://www.commerce.gov/) and <http://www.bis.doc.gov/index.php/regulations/export-administration-regulations-ear>. Use or distribution of Continuum software products to any persons, entities or countries currently under US sanctions is strictly prohibited. Accelerate is classified with an ECCN of 5D992 with no license required for export to non-embargoed countries.

The United States currently has embargoes against Cuba, Iran, North Korea, Sudan and Syria. The exportation, re-exportation, sale or supply, directly or indirectly, from the United States, or by a U.S. person wherever located, of any Continuum software to any of these countries is strictly prohibited without prior authorization by the United States Government. By accepting this Agreement, you represent to Continuum that you will comply with all applicable export regulations for Accelerate.

### **Severability**

If any provision of this Agreement shall be held to be invalid or unenforceable, the remainder of this Agreement shall remain in full force and effect. To the extent any express or implied restrictions are not permitted by applicable laws, these express or implied restrictions shall remain in force and effect to the maximum extent permitted by such applicable laws.

### Release notes

### Release notes

#### Version 2.3.1

This is a minor update to bump the required version of Numba to 0.30 and to support Python 3.6.

#### Version 2.3.0

This release of Accelerate is a feature release, containing these additions:

- A new BLAS wrapper API on top of MKL.
- MKL 11.3.3 is now supported.
- Numba 0.26 is supported-and is required.

#### Version 2.2.0

This release of Accelerate is a feature release, containing two additions:

- Expanded the support of Intel MKL accelerated ufuncs with trigonometric and hyperbolic functions.
- Numba 0.25 is supported, and is a requirement.

#### Version 2.1.0

This release of Accelerate is a feature release, containing 2 additions:

- Profiling tools
  - An enhanced version of the Python profiler that captures function arguments, including shapes and dtypes of Numpy arrays.
  - Integration of tools for visualising profiles in Jupyter notebooks, allowing interactive experimentation.
- Accelerated UFuncs, which provide a speed improvement over Numpy's built-in UFuncs by using Intel MKL.

#### Version 2.0.2

This update adds support for updated versions of Numba and MKL:

- Numba 0.23 is now supported, and is a requirement.
- MKL 11.3.1, standard in Anaconda 2.5, is now supported.

#### Version 2.0.1

This minor update to Accelerate adds no functional changes, but provides additional clarification of the the relationship between the Accelerate and NumbaPro conda packages upon installation.

## Version 2.0

NumbaPro has been deprecated, and its code generation features have been moved into open-source Numba. The CUDA library functions have been moved into Accelerate, along with some Intel MKL functionality. High-level functions and access to additional native library implementations will be added in future releases of Accelerate, and there will be no further updates to NumbaPro.

A NumbaPro compatibility layer (listed as release 0.22.0 of NumbaPro) provides access to the new Accelerate packages through the old NumbaPro package names. This avoids the need to change any existing code immediately for use with Accelerate. A warning will be generated upon import of the compatibility layer, to highlight the deprecation of the NumbaPro package.

## CUDA libraries

CUDA library functionality is equivalent to that in NumbaPro 0.21, with the following packages renamed:

| NumbaPro Package                       | Accelerate package                   |
|--|--------------------------------------|
| <code>numbapro.cudalib.cublas</code>   | <code>accelerate.cuda.blas</code>    |
| <code>numbapro.cudalib.cuffft</code>   | <code>accelerate.cuda.fft</code>     |
| <code>numbapro.cudalib.curand</code>   | <code>accelerate.cuda.rand</code>    |
| <code>numbapro.cudalib.cusparse</code> | <code>accelerate.cuda.sparse</code>  |
| <code>numbapro.cudalib.sorting</code>  | <code>accelerate.cuda.sorting</code> |

## Code generation

The `vectorize` targets `parallel` and `cuda` can now be accessed with Numba, as can the `cuda.reduce` decorator. Printing of integers and floating point values from CUDA kernels is also possible in Numba, and no longer requires NumbaPro or Accelerate to be imported.

## Intel MKL

The MKL FFT implementation is available in the package `accelerate.mkl.fftpack`, and MKL service functions are available in the `accelerate.mkl` package.

## Previous versions

The following documentation is provided for users who have not yet upgraded to the current version:

### 3.4.2 Anaconda Adam

*Server & Cluster Installer & Manager*

---

**Note:** This product is discontinued. This archived copy of the product documentation is provided for those customers who are still using it.

---

Anaconda Adam is a command line interface (CLI) utility for Linux that lets you:

- Install and manage these Anaconda® platform components:

| Platform component            | Description   |
|-------------------------------|---|
| Anaconda Enterprise Notebooks | Collaborative multi-user notebooks and projects           |
| Anaconda Repository           | On-premise repository for conda packages and environments |
| Anaconda Scale                | Distributed package management and computation framework  |

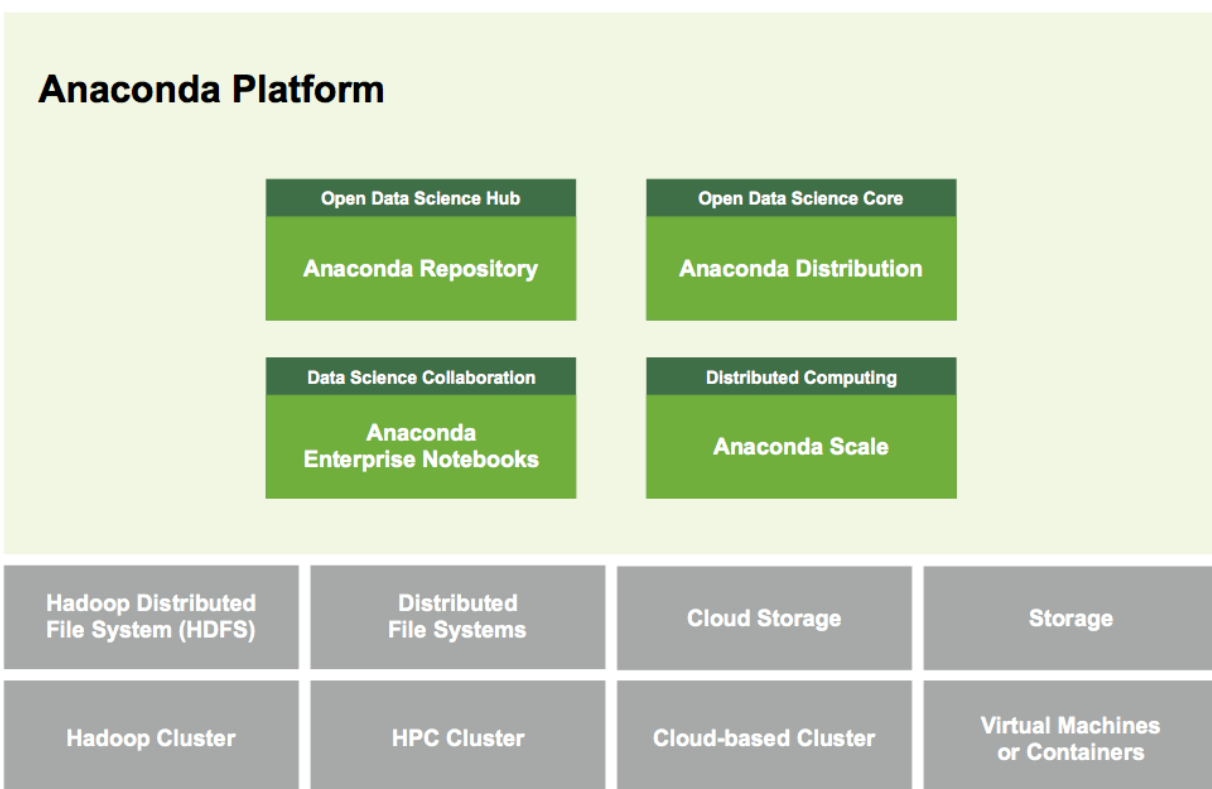

- Create, provision and remove clusters.

- Perform administration tasks on Amazon Elastic Compute Cloud (EC2) servers.
- Manage Anaconda packages.
- Execute commands on multiple nodes.

You must have an [Anaconda Enterprise](#) license to install Anaconda platform components. If you would like to purchase Anaconda platform, please contact [sales@anaconda.com](mailto:sales@anaconda.com).

You can use Adam with:

- Distributed computation frameworks such as Spark or Dask.
- Enterprise Hadoop distributions such as Cloudera CDH or Hortonworks HDP.
- HPC clusters.
- A collection of virtual machines or containers.

## Installation

### Installation requirements

Make sure your system meets the requirements below before installing and using Anaconda Adam.

### Hardware and operating system

To install Adam, you must have one or more 64-bit Linux machines with one of the following Linux distributions:

- RHEL/CentOS 6 or 7
- Ubuntu 14.04 or 16.04

and the following commands installed:

- `ssh`
- `openssl`
- `curl`
- `md5sum`

## License

To install Adam, you must have a valid [Anaconda Enterprise](#) license.

## Account access and security

To install Adam, you need one of the following access options on the target machines:

- Access to the root user with the root password.
- Access to the root user with an SSH key pair.
- Passwordless SSH/sudo enabled for a user account.
- Password-based SSH and passwordless sudo enabled for a user account.

The root or user credentials used for installation must be the same on all of the target nodes.

## Network

You must configure network and security settings to allow access to and from each node—for example, using IPTables or SELinux.

Anaconda platform components use the default network ports listed below. You can configure these ports when you define a cluster profile.

| Platform Component                      | Port  |
|---|-------|
| Anaconda Adam (SSH)                     | 22    |
| Anaconda Adam (Salt)                    | 14505 |
| Anaconda Adam (Salt)                    | 14506 |
| Anaconda Adam (Salt REST API)           | 18000 |
| Anaconda Enterprise Notebooks (UI)      | 80    |
| Anaconda Enterprise Notebooks (Gateway) | 8089  |
| Anaconda Repository (UI)                | 8080  |
| Anaconda Scale (Dask/Distributed)       | 8786  |
| Anaconda Scale (Dask/Distributed UI)    | 8787  |
| Anaconda Scale (Jupyter Notebook UI)    | 8888  |

Network ports with a browser user interface (UI) must be accessible by machines outside of the network of Anaconda platform nodes.

Network ports without a browser UI must be accessible between the other Anaconda platform nodes.

### Platform components

See the documentation below for information on CPU, memory and disk space requirements for Anaconda platform components.

- [Anaconda Enterprise Notebooks](#).
- [Anaconda Repository](#).
- [Anaconda Scale](#).

### Python considerations

Adam and Anaconda platform components do not affect existing framework installations of Python. Adam operates independently from the system installation of Python, while Anaconda platform components install their own versions of Python via Anaconda or Miniconda.

### Standard installation

#### Downloading the Adam installer

To download the installer, run one of the commands below on the host machine where you want to manage the Anaconda platform:

```
wget https://anaconda.org/anaconda-adam/adam-installer/4.4.0/download/adam-installer-4.4.0-Linux-x86_64.sh
```

Or:

```
curl -LO https://anaconda.org/anaconda-adam/adam-installer/4.4.0/download/adam-installer-4.4.0-Linux-x86_64.sh
```

#### Installing Adam

1. Run the installer, specifying the installation directory:

```
bash adam-installer-4.4.0-Linux-x86_64.sh -b -p ~/adam
```

NOTE: Replace ~/adam with the actual installation directory.

2. Add the adam command to your path by modifying the ~/.bashrc file:

```
echo -e '\n# Anaconda Adam\nexport PATH=~/.adam/bin:$PATH' >> ~/.bashrc
```

3. To activate the changes, source your ~/.bashrc file:

```
source ~/.bashrc
```

#### Verifying the installation

To verify that the installation succeeded and to create configuration files in ~/.continuum/adam, run the adam command, which outputs the Adam help text:

```

$ adam
Usage: adam [OPTIONS] COMMAND [ARGS]...

Options:
  --version            Show the version and exit.
  -l, --log-level [info|debug|error]
                        Logging level [default: debug]
  -h, --help            Show this message and exit.

Commands:
  cmd                Execute a command on the nodes
  describe            Describe an Adam cluster or profile
  ec2                 EC2 options
  enterprise-notebooks Anaconda Enterprise Notebooks options
  info                Display Adam version, system, and
                        license information
  jupyter             Jupyter options
  kubernetes           Kubernetes options
  list                 List Adam clusters and profiles
  platform             Anaconda Platform options
  provision            Provision options
  remove              Remove a cluster
  repository           Anaconda Repository options
  salt                 Execute a Salt module
  scale                Anaconda Scale options
  ssh                  SSH to one of the nodes (0-based
                        index)
  up                  Create a cluster from a profile

```

## Installing your Anaconda Enterprise license file

Copy your Anaconda Enterprise license file to any of the following directories:

- `~/adam/licenses/`.
- `~/continuum/`.
- Any other directory shown by the command `~/adam/bin/conda info --license`.

Adam searches all of these directories for license files named `license*.txt`.

EXAMPLE: `~/adam/licenses/license_bundle_20170428044737.txt`.

## Defining a cluster profile

1. Switch to root user and create a file with this name and path `~/continuum/adam/profile.d/profile.yaml` and the following contents:

```

name: profile
provider: bare

bare:
  username: centos
  \# password: password \# Optional
  port: 22
  keypair: ~/.ssh/my-private-key

```

(continues on next page)

(continued from previous page)

```
nodes:
- host: node1.company.com
- host: node2.company.com
- host: node3.company.com
- host: node4.company.com

security:
flush_iptables: false
selinux_context: false
selinux_permissive: false
```

2. Replace `centos` with an actual username. Verify that the username has `sudo` privileges.
3. Replace `22` with the appropriate *SSH port number*.
4. Replace `~/.ssh/my-private-key` with the location of the private SSH key (key pair) to be used. Verify that you have SSH access to all of the cluster nodes.
5. Edit the IP addresses or hostnames of the nodes in the cluster. Each host must be able to connect to the other hosts using the specified FQDN or IP address.

TIP: We recommend using the nodes' FQDN that matches the hostname on each machine.

NOTE: The first node in the list of nodes is the head node. The remaining nodes are compute nodes.

By default, the `anaconda` user/group is created across the cluster and owns the directory and files located in the root installation directory. If desired, you can *customize the cluster profile* to change these and other settings.

## Creating a cluster

To create a cluster, run:

```
adam up -n [cluster-name] [profile-name]
```

EXAMPLE: To create a cluster named “cluster” from a cluster profile named “profile”:

```
adam up -n cluster profile
```

## Installing platform components

After creating or *provisioning a cluster*, you can install platform components by running:

```
adam [platform-component] -n [cluster-name] install
```

EXAMPLE: To install Repository, Enterprise Notebooks, and Scale on a cluster named “cluster”:

```
$ adam repository -n cluster install
$ adam enterprise-notebooks -n cluster install
$ adam scale -n cluster cluster install
$ adam scale -n cluster dask install
```

## Opening a platform component

To open a platform component's user interface in your browser, run:

```
$ adam [platform-component] -n [cluster-name] open
```

EXAMPLE: To open Repository and Enterprise Notebooks on a cluster named “cluster”:

```
$ adam repository -n cluster open
$ adam enterprise-notebooks -n cluster open
```

For more information see *Working with platform components*.

## Installing into an air gapped environment

Currently, Adam can install the remote conda management functionality in an *air gapped* environment using artifacts from Repository. In future versions of Adam, air gapped installations of all Anaconda platform components will be fully supported.

1. *Install Repository*.
2. Configure Repository for the Adam installation on the nodes:
  1. Mirror the `anaconda` and `anaconda-adam` channels onto your local Repository.
  2. Copy the latest versions of the [Anaconda](#) and [Miniconda](#) installers to the `/static/extras/` folder on the Repository web server.
3. Switch to root user and create a cluster profile at `~/.continuum/adam/profile.d/profile.yaml` with the following contents:

```
name: profile
provider: bare

bare:
  username: centos
  # password: password # Optional
  port: 22
  keypair: ~/.ssh/my-private-key
  nodes:
    - host: node1.company.com
    - host: node2.company.com
    - host: node3.company.com
    - host: node4.company.com

plugins:
  conda:
    anaconda_hash: md5=d72add23bc937ccdfc7de4f47deff843
    anaconda_url: http://local.anaconda.repository.address:8080/static/extras/
    ↪Anaconda2-4.4.0-Linux-x86_64.sh
    channel_alias: http://local.anaconda.repository.address:8080/conda/
    channels:
      - http://local.anaconda.repository.address:8080/conda/anaconda
      - http://local.anaconda.repository.address:8080/conda/anaconda-adam
    enabled: true
    miniconda_hash: md5=7097150146dd3b83c805223663ebffcc
    miniconda_url: http://local.anaconda.repository.address:8080/static/extras/
    ↪Miniconda2-4.3.21-Linux-x86_64.sh
    rootdir: /opt/continuum
    ssl_verify: False
```

(continues on next page)

(continued from previous page)

```
security:
  flush_iptables: false
  selinux_context: false
  selinux_permissive: false
```

4. Replace `centos` with an actual username. Verify that the username has `sudo` privileges.
5. Replace `22` with the appropriate *SSH port number*.
6. Replace `~/ .ssh/my-private-key` with the location of the private SSH key (`keypair`) to be used. Verify that you have SSH access to all of the cluster nodes.
7. Edit the port and IP addresses or hostnames of the nodes in the cluster.  
NOTE: The first node in the list of nodes is the head node. The remaining nodes are compute nodes.
8. Replace the `anaconda_hash` value with the hash of your Anaconda installer.
9. Replace the `miniconda_hash` value with the hash of your Miniconda installer.
10. Replace `local.anaconda.repository.address` with the address of your Repository.

## Installing into a cloud environment

Adam can be used to create cloud-based instances and install Anaconda platform components on the nodes.

Currently, Adam fully supports Amazon Elastic Compute Cloud (EC2).

To use Adam with instances that already exist on Amazon EC2, or with other cloud providers, follow the *primary installation instructions*.

Refer to the *Installation requirements* page for more information about system requirements, including networking and security requirements.

- *Downloading the Adam installer*
- *Installing Adam*
- *Verifying the installation*
- *Installing your Anaconda Enterprise license file*
- *Creating an EC2 cluster*
- *Installing platform components*
- *Opening a platform component*
- *Removing an EC2 cluster*

## Downloading the Adam installer

To download the installer, run one of the commands below on the host machine where you want to manage the Anaconda platform:

```
wget https://anaconda.org/anaconda-adam/adam-installer/4.4.0/download/adam-installer-
↪ 4.4.0-Linux-x86_64.sh
```

Or:

```
curl -LO https://anaconda.org/anaconda-adam/adam-installer/4.4.0/download/adam-
↪installer-4.4.0-Linux-x86_64.sh
```

## Installing Adam

1. Run the installer, specifying the installation directory:

```
bash adam-installer-4.4.0-Linux-x86_64.sh -b -p ~/adam
```

NOTE: Replace ~/adam with the actual installation directory.

2. Add the adam command to your path by modifying the ~/.bashrc file:

```
echo -e '\n# Anaconda Adam\nexport PATH=~/.adam/bin:$PATH' >> ~/.bashrc
```

3. To activate the changes, source your ~/.bashrc file:

```
source ~/.bashrc
```

## Verifying the installation

To verify that the installation succeeded and to create configuration files in ~/.continuum/adam, run the adam command, which outputs the Adam help text:

```
$ adam
Usage: adam [OPTIONS] COMMAND [ARGS]...

Options:
  --version            Show the version and exit.
  -l, --log-level [info|debug|error]
                        Logging level [default: debug]
  -h, --help          Show this message and exit.

Commands:
  cmd                Execute a command on the nodes
  describe           Describe an Adam cluster or profile
  ec2                EC2 options
  enterprise-notebooks
  info              Anaconda Enterprise Notebooks options
                   Display Adam version, system, and
                   license information
  jupyter            Jupyter options
  kubernetes         Kubernetes options
  list               List Adam clusters and profiles
  platform           Anaconda Platform options
  provision           Provision options
  remove             Remove a cluster
  repository         Anaconda Repository options
  salt               Execute a Salt module
  scale              Anaconda Scale options
  ssh                SSH to one of the nodes (0-based
                   index)
  up                 Create a cluster from a profile
```

## Installing your Anaconda Enterprise license file

Copy your Anaconda Enterprise license file to any of the following directories:

- `~/adam/licenses/`.
- `~/continuum/`.
- Any other directory shown by the command `~/adam/bin/conda info --license`.

Adam searches all of these directories for license files named `license*.txt`.

EXAMPLE: `~/adam/licenses/license_bundle_20170428044737.txt`.

## Creating an EC2 cluster

1. Create a file named `~/aws/credentials` that contains your AWS credentials:

```
[default]
aws_access_key_id = your-access-key
aws_secret_access_key = your-secret-key
region = us-east-1
```

NOTE: Replace `your-access-key`, `your-secret-key`, and `us-east-1` with your actual AWS access key ID, your AWS secret access key, and your default region. Region is optional. For more information about configuring your AWS credentials, see the [Boto documentation](#).

2. Create a cluster on EC2 by running:

```
adam ec2 -n mycluster up --keyname my_keypair --keypair ~/.ssh/my_keypair.pem
```

NOTE: Replace “mycluster” with the name you wish to give the new cluster. Replace “my\_keypair” with the keyname on the EC2 console. Replace `~/ .ssh/my_keypair.pem` with the path to the keypair that matches the keyname.

keyname and keypair are required.

OPTIONAL: You can also specify the AMI, number of nodes, instance types and more. To see the available options, run `adam ec2 up --help`:

```
$ adam ec2 -n cluster up --help
Usage: adam ec2 up [OPTIONS]

Options:
  --keyname TEXT           Keyname on EC2 console
                           [required]
  --keypair PATH           Path to the keypair that
                           matches the keyname
                           [required]
  --vpc-id TEXT            EC2 VPC ID
  --subnet-id TEXT         EC2 Subnet ID on the VPC
  --region-name TEXT       AWS region [default:
                           us-east-1]
  --ami TEXT               EC2 AMI [default:
                           ami-d05e75b8]
  --username TEXT          User to SSH to the AMI
                           [default: ubuntu]
  --type TEXT              EC2 Instance Type
```

(continues on next page)

(continued from previous page)

```

                                [default: m4.xlarge]
--count INTEGER                Number of nodes
                                [default: 4]
--security-group TEXT          Security Group Name
                                [default: adam-default]
--volume-type TEXT             Root volume type
                                [default: gp2]
--volume-size INTEGER          Root volume size (GB)
                                [default: 500]
-t, --tag TEXT                 Extra tags to add to the
                                instances
--check-ami / --no-check-ami   Whether or not to check
                                the AMI [default: True]
--provision / --no-provision   Provision salt on the
                                nodes [default: True]
-y, --yes                      Answers yes to questions
-h, --help                     Show this message and exit.
```

## Installing platform components

After creating or *provisioning a cluster*, you can install platform components by running:

```
adam [platform-component] -n [cluster-name] install
```

EXAMPLE: To install Repository, Enterprise Notebooks, and Scale on a cluster named “cluster”:

```
$ adam repository -n cluster install
$ adam enterprise-notebooks -n cluster install
$ adam scale -n cluster cluster install
$ adam scale -n cluster dask install
```

## Opening a platform component

To open a platform component’s user interface in your browser, run:

```
adam [platform-component] -n [cluster-name] open
```

EXAMPLE: To open Repository and Enterprise Notebooks on a cluster named “cluster”:

```
$ adam repository -n cluster open
$ adam enterprise-notebooks -n cluster open
```

For more information see *Working with platform components*.

## Removing an EC2 cluster

To remove an EC2 cluster and terminate the corresponding instances:

1. Run:

```
adam ec2 -n [cluster-name] destroy
```

2. When prompted, type `y`.

EXAMPLE: To remove the cluster named “cluster”:

```
$ adam ec2 -n cluster destroy
Are you sure you want to destroy the cluster cluster?
[y/N]: y
```

The installation process described in the pages above is appropriate for most environments and use cases. However, if you want to customize Anaconda platform settings related to security, network, installation paths, or other settings, please see [Customizing a cluster profile](#).

## User guide

### Concepts

Anaconda platform components run on clusters, which are groups of machines listed in a cluster profile.

### Cluster profile

A cluster profile defines the cluster’s name, its machine nodes and other options such as security and network settings.

One or more cluster profiles are defined during Adam [installation](#), just before creating the cluster.

Cluster profiles are located in the `~/.continuum/adam/profile.d/` directory.

### Cluster definition

A cluster definition identifies information about a running cluster, including the cluster name, nodes in the cluster and other platform component options. Cluster definitions are located in the `~/.continuum/adam/cluster.d/` directory.

### Air gap installation

Installation in an environment without connectivity to the internet for security reasons.

### Getting started

Running the `adam` command shows the options and subcommands that you can use:

```
$ adam
Usage: adam [OPTIONS] COMMAND [ARGS]...

Options:
  --version                Show the version and exit.
  -l, --log-level [info|debug|error]
                           Logging level [default: debug]
  -h, --help                Show this message and exit.

Commands:
  cmd                      Execute a command on the nodes
```

(continues on next page)

(continued from previous page)

|                      |  |
|----------------------|--|
| describe             | Describe an Adam cluster or profile                      |
| ec2                  | EC2 options  |
| enterprise-notebooks | Anaconda Enterprise Notebooks options                    |

| list                 | List Adam clusters and profiles                          |
| provision            | Provision options  |
| remove               | Remove a cluster   |
| repository           | Anaconda Repository options                              |
| salt                 | Execute a Salt module                                    |
| scale                | Anaconda Scale options                                   |
| ssh                  | SSH to one of the nodes<br>(0-based index)               |
| up                   | Create a cluster from a profile                          |

To see more information about a subcommand, add the `-h` or `--help` option after the subcommand.

EXAMPLE: `adam up --help`.

For details on using the various subcommands, see [Tasks](#).

For information on installing Adam, creating a cluster, and installing and managing platform components, see the [installation guide](#).

## Tasks

### Working with cluster profiles

After installing Anaconda Adam and before creating clusters, you must define one or more cluster profiles.

NOTE: An *air gapped machine* needs additional setup and a special cluster profile.

### Customizing a cluster profile

Although the default cluster profile described in the [installation guide](#) is appropriate for most environments and use cases, you can customize profile settings as needed.

**Cluster profiles** are used to define information about a cluster before it is created, including the cluster name, nodes in the cluster, and other platform component options. Cluster files are located in the `~/.continuum/adam/profile.d/` directory.

**Cluster definitions** are used to identify information about a running cluster, including the cluster name, nodes in the cluster, and other platform component options. Cluster definitions are located in the `~/.continuum/adam/cluster.d/` directory.

- *Sample profile showing all settings*
- *Cluster name*
- *SSH authentication*
- *Node specification*
- *Security settings*

- *Network settings—proxy configuration*
- *Conda settings*
- *Salt settings*
- *System settings*

## Sample profile showing all settings

A cluster profile located at `~/.continuum/adam/profile.d/cluster.yaml` with all configurable settings is shown below:

```
name: cluster
provider: bare

bare:
  username: centos
  # password: anaconda # Optional
  port: 22
  keypair: ~/.ssh/my-private-key
  nodes:
    - host: node1.company.com
    - host: node2.company.com
    - host: node3.company.com
    - host: node4.company.com

security:
  flush_iptables: false
  selinux_context: false
  selinux_permissive: false

network:
  http_proxy: http://server:port/
  # https_proxy: http://server:port/

system:
  tmp_dir: /tmp

plugins:
  conda:
    anaconda_hash: md5=d72add23bc937ccdfc7de4f47deff843

server_user: anaconda-server
superuser: superuser
token: qu-a49e2e69-1047-4eab-a879-a2ee9c198381

salt_settings:
  acl:
    - anaconda
  job_pub_port: 14505
  minion_pub_port: 14510
  minion_pull_port: 14511
  minion_ret_port: 14506
  rest_port: 18000
  salt_groupname: anaconda
  salt_password: anaconda
  salt_username: anaconda
  service_scripts: false

```

## Cluster name

The name setting specifies the name of the cluster and is used by the `-n` option in Anaconda Adam commands.

EXAMPLE: To create a new cluster named “cluster” from a profile named “profile”:

```
$ adam up -n cluster profile
```

## SSH authentication

To connect to remote machines via SSH, Adam requires a valid username, port—default is 22—and an authentication method. Adam supports the following SSH authentication methods:

- Password.
- Key pair—full path to your private key.
- Encrypted key pair—full path to your public key and ssh-agent. The private key must first be added to a running ssh-agent. Use the `agent_pubkey` setting to specify the full path to the associated public key.

For more information about system and account requirements, see [Account access and security](#).

EXAMPLE: To use SSH with a username and password:

```

bare:
  username: centos
  password: anaconda

```

EXAMPLE: To use SSH with a key pair:

```
bare:
  username: centos
  keypair: /full/path/to/key.rsa
```

EXAMPLE: To use SSH with an encrypted key pair:

```
bare:
  username: centos
  agent_pubkey: /full/path/to/key.pub
```

## Node specification

The `nodes` setting defines the nodes that exist within the cluster. By default, the first node in the list of nodes is defined as the head node and the remaining nodes are defined as compute nodes.

Each host must be able to connect to the other hosts via the specified FQDN or IP address.

TIP: We recommended using the node's FQDN that matches the hostname on each machine:

EXAMPLE:

```
bare:
  nodes:
    - host: node1.company.com
    - host: node2.company.com
    - host: node3.company.com
    - host: node4.company.com
```

## Security settings

The `security` settings let you configure IPTables and SELinux.

To flush iptables, reset `flush_iptables` to `true`. Default value: `false`.

```
security:
  flush_iptables: false
```

To set SELinux to permissive, reset `selinux_permissive` to `true`. Default value: `false`.

```
security:
  selinux_permissive: false
```

To set SELinux contexts, reset `selinux_context` to `true`. Default value: `false`.

```
security:
  selinux_context: false
```

## Network settings—proxy configuration

The `network` settings let you install Adam to nodes that access the internet via an HTTP or HTTPS proxy.

To specify an HTTP proxy:

```
network:
  http_proxy: http://server:port/
```

NOTE: Replace `server:port` with the actual server and port.

To specify an HTTPS proxy:

```
network:
  https_proxy: http://server:port/
```

NOTE: Replace `server:port` with the actual server and port.

### Conda settings

These are the default settings for configuring conda:

```
conda:
  anaconda_hash: md5=d72add23bc937ccdfc7de4f47deff843
  anaconda_url: http://repo.anaconda.com/archive/Anaconda2-4.4.0-Linux-x86_64.sh
  channel_alias: https://conda.anaconda.org/
  channels:
    - defaults
    - anaconda-adam
  enabled: true
  miniconda_hash: md5=7097150146dd3b83c805223663ebffcc
  miniconda_url: http://repo.anaconda.com/miniconda/Miniconda2-4.3.21-Linux-x86_64.
↪ sh
  rootdir: /opt/continuum
  ssl_verify: False
```

You can set `ssl_verify` to:

- `False`—no SSL verification—default.
- `True`—SSL verification is used and conda verifies certificates for SSL connections.
- `[cert path]`—the string path to a certificate to be used to verify SSL connections.

### Salt settings

Salt is the configuration management system used by Adam. The `salt_settings` let you configure the network options, access control list and API user credentials used by Salt.

Use the settings below to specify the ports used by the Salt master, minions and REST API:

```
plugins:
  salt_settings:
    job_pub_port: 14505
    minion_pub_port: 14510
    minion_pull_port: 14511
    minion_ret_port: 14506
    rest_port: 18000
```

Use the `acl` setting to specify an access control list that defines non-root system users who can execute Salt commands:

```
plugins:
  salt_settings:
    acl:
      - anaconda
```

Use the settings below to specify the username, password and group that gets created across the cluster and owns the directory and files located in the root installation directory—default: `/opt/continuum`:

```
plugins:
  salt_settings:
    salt_username: anaconda
    salt_password: anaconda
    salt_groupname: anaconda
```

If you do not want to store a clear text password in the cluster profile or cluster definition file, set `salt_password` to an empty string:

```
plugins:
  salt_settings:
    salt_username: anaconda
    salt_password: ''
    salt_groupname: anaconda
```

In this case, Adam prompts for a password in the CLI and only stores the password in memory for the duration of the command or job.

## System settings

The `tmp_dir` setting lets you specify the download directory where temporary installers are downloaded—default: `/tmp`:

```
system:
  tmp_dir: /tmp
```

## Viewing cluster profile information

To view a list of cluster profiles, run `adam list profiles`:

```
$ adam list profiles
profile
second-profile
third-profile
```

To view more detailed information about a profile, run:

```
$ adam describe -p [profile-name]
```

You may also use the `--verbose` flag for increased detail.

EXAMPLE: To view verbose information about the profile named “profile”:

```
$ adam describe -p profile --verbose
bare:
  keypair: ~/.ssh/my_keypair.pem
```

(continues on next page)

(continued from previous page)

```
nodes:
- host: 192.168.1.1
- host: 192.168.1.2
- host: 192.168.1.3
- host: 192.168.1.4
port: 22
username: centos
name: cluster
provider: bare
security:
  flush_iptables: false
  selinux_context: false
  selinux_permissive: false
```

## Working with clusters

Defining one or more cluster profiles and creating clusters are described in the *installation guide*.

## Provisioning a cluster

To provision or reprovision an existing cluster, run:

```
$ adam provision -n [cluster-name]
```

EXAMPLE: To provision the cluster named “cluster”:

```
$ adam provision -n cluster
```

## Customizing the provision command—advanced

By default, the `adam provision` command:

- Checks SSH connectivity.
- Creates a default user.
- Installs Salt.
- Syncs formulas.
- Provisions enabled plugins and security settings that are defined in the cluster’s profile.

To run only a portion of this provisioning process, use `adam provision` options and subcommands to control what happens during provisioning.

Run `adam provision --help` to see the available options and subcommands:

```
$ adam provision --help
Usage: adam provision [OPTIONS] COMMAND [ARGS]...

Execute all the provisioning steps for a cluster

See subcommands help for more info. Usage: adam provision -n
```

(continues on next page)

(continued from previous page)

```
Options:
  -n, --cluster TEXT      Cluster name [required]
  --flush-iptables        Flush IPTables [default: False]
  --selinux-permissive    Set SELinux to permissive [default:
                          False]
  --selinux-context       Set SELinux contexts [default: False]
  --plugins               Install enabled plugins on provision
                          [default: False]
  -h, --help              Show this message and exit.

Commands:
  anaconda-user           Create the default anaconda user in all
                          the nodes
  check-ssh               Check SSH connection to the nodes
  flush-iptables          Flush IPTables
  plugins                 Provision enabled plugins
  roles                   Set roles on the cluster nodes
  salt                    Provision Salt
  security-settings       Execute the security settings
  selinux-context         Set SELinux contexts
  selinux-permissive      Set SELinux to permissive
  sync                    Sync formulas and settings
```

**EXAMPLE:** To check SSH connectivity to all of the nodes in an existing cluster:

```
$ adam provision -n cluster check-ssh
Checking SSH connection to nodes
2016-10-03 22:10:49,327 - adam.models - DEBUG - Checking ssh
connection for 54.88.20.164
2016-10-03 22:10:50,905 - adam.models - DEBUG - SSH
connection to 54.88.20.164: OK
2016-10-03 22:10:51,008 - adam.models - DEBUG - Checking ssh
connection for 52.90.168.130
2016-10-03 22:10:51,996 - adam.models - DEBUG - SSH
connection to 52.90.168.130: OK
+-----+-----+
| Node IP      | SSH Available |
+-----+-----+
| 54.88.20.164 | True          |
| 52.90.168.130 | True          |
+-----+-----+
| All nodes    | True          |
+-----+-----+
```

## Viewing cluster information

To view a list of running clusters, run `adam list`:

```
$ adam list
cluster
second-cluster
third-cluster
```

To view detailed information about a cluster, run:

```
$ adam describe -n [cluster-name]
```

EXAMPLE: To view information about the cluster named “cluster”:

```
$ adam describe -n cluster
conda:
  anaconda_hash: md5=7097150146dd3b83c805223663ebffcc
  anaconda_url: https://repo.anaconda.com/miniconda/Miniconda2-4.3.21-Linux-x86_64.sh
↪ #adam-ci
  enabled: true
  rootdir: /opt/continuum
name: cluster
nodes:
- host: ci_head_1
  keypair: ~/.ssh/my_private_key
  port: 22
  username: root
- host: ci_compute_1
  keypair: ~/.ssh/my_private_key
  port: 22
  username: root
```

## Adding nodes to an existing cluster

1. In the existing cluster profile, add `host` lines to specify the additional node(s).

EXAMPLE: You have this existing cluster profile, `~/.continuum/adam/profile.d/profile.yaml`:

```
name: profile
provider: bare

bare:
  username: centos
  # password: password # Optional
  port: 22
  keypair: ~/.ssh/my-private-key
  nodes:
  - host: node1.company.com
  - host: node2.company.com
  - host: node3.company.com
  - host: node4.company.com
```

You want to add the following nodes:

- node10.company.com
- node11.company.com
- node12.company.com

Assuming these nodes use the same authentication mode as the existing nodes, add a `host` line for each node:

```
name: profile
provider: bare

bare:
  username: centos
```

(continues on next page)

(continued from previous page)

```
# password: password # Optional
port: 22
keypair: ~/.ssh/my-private-key
nodes:
- host: node1.company.com
- host: node2.company.com
- host: node3.company.com
- host: node4.company.com
- host: node10.company.com
- host: node11.company.com
- host: node12.company.com
```

2. Run the `adam up` command to provision the cluster.

EXAMPLE: To use the profile named “profile” to provision the cluster named “cluster”, run:

```
$ adam up -n cluster profile
```

You are prompted to overwrite the cluster definition file located at `~/.continuum/adam/cluster.d/cluster.yaml` to include the newly defined nodes.

During the provisioning process, Adam will install on the new nodes and will not reinstall on the previously defined nodes.

## Managing Anaconda across a cluster

Using Anaconda Scale, you can create and manage conda packages, including Python and R, in multiple conda environments across your nodes.

For more information about installing and managing Anaconda across a cluster, see [Anaconda Scale](#).

## Using SSH to connect to nodes

To SSH to the head node in a cluster, run:

```
$ adam ssh -n [cluster-name]
```

EXAMPLE: To SSH to the head node in a cluster named “cluster”:

```
$ adam ssh -n cluster
Last login: Wed Jun 29 03:08:49 2016 from 172.18.0.1
[root@192.168.1.1 ~]#
```

To connect to a specific node, include the node number after the cluster name. Node 0 is the head node, node 1 is the first compute node, and so on.

EXAMPLE: To SSH to the second compute node in a cluster named “cluster”:

```
$ adam ssh -n cluster 2
Last login: Wed Jun 29 03:10:14 2016 from 172.18.0.1
[root@192.168.1.3 ~]#
```

### Running remote commands

To execute remote commands on a cluster, run:

```
$ adam cmd -n [cluster-name] -t [target-nodes] [command]
```

EXAMPLE: To run the `date` command on all nodes in a cluster named “cluster”:

```
$ adam cmd -n cluster date
192.168.1.1: Wed Jun 29 03:08:10 UTC 2016
192.168.1.2: Wed Jun 29 03:08:10 UTC 2016
192.168.1.3: Wed Jun 29 03:08:10 UTC 2016
192.168.1.4: Wed Jun 29 03:08:10 UTC 2016
```

### Executing Salt modules

To execute Salt modules, run:

```
$ adam salt -n [cluster-name] [nodes] [module-name]
```

EXAMPLE: To execute the “test.ping” Salt module on all nodes in a cluster named “cluster”:

```
$ adam salt -n cluster '*' test.ping
192.168.1.1: true
192.168.1.2: true
192.168.1.3: true
192.168.1.4: true
```

### Removing a cluster

To remove the cluster definition file for an existing bare-metal cluster:

1. Run:

```
$ adam remove -n [cluster-name]
```

2. When prompted, type `y`.

EXAMPLE: To remove the cluster named “cluster”:

```
$ adam remove -n cluster
Are you sure you want to remove the cluster cluster? [y/N]: y
```

To remove an EC2 cluster, see the removal instructions at the end of the [cloud installation guide](#).

### Working with platform components

- [Overview](#)
- [Viewing a platform component’s status](#)
- [Stopping services for a platform component](#)

- *Restarting services for a platform component*

## Overview

Using Anaconda Adam, you can install and manage the Anaconda platform components listed below. An Adam command for managing an Anaconda component has the format:

```
$ adam [platform-component] [command]
```

| Platform component            | Adam Command Prefix       |
|-------------------------------|---------------------------|
| Anaconda Enterprise Notebooks | adam enterprise-notebooks |
| Anaconda Repository           | adam repository           |
| Anaconda Scale                | adam scale                |

You can also use Adam to install and manage the Anaconda platform on *Amazon EC2 cloud-based nodes* and *air gapped machines*.

## Default usernames and passwords

The default administrator usernames and passwords for each platform component are:

| Platform component            | Username  | Password |
|-------------------------------|-----------|----------|
| Anaconda Enterprise Notebooks | wakari    | anaconda |
| Anaconda Repository           | superuser | anaconda |
| Jupyter Notebook              | -         | anaconda |

## Platform component documentation

For more information on a platform component, see:

- *Anaconda Enterprise Notebooks*.
- *Anaconda Repository*.
- *Anaconda Scale*.

## Viewing a platform component's status

To view the status of a platform component, run:

```
$ adam [platform-component] -n [cluster-name] status
```

EXAMPLE: To view the status of Repository on a cluster named “cluster”:

```
$ adam repository -n cluster status
```

## Stopping services for a platform component

To stop services related to a platform component, run:

```
$ adam [platform-component] -n [cluster-name] stop
```

EXAMPLE: To stop Repository services on a cluster named “cluster”:

```
$ adam repository -n cluster stop
```

## Restarting services for a platform component

To restart services related to a platform component, run:

```
$ adam [platform-component] -n [cluster-name] restart
```

EXAMPLE: To restart Repository services on a cluster named “cluster”:

```
$ adam repository -n cluster restart
```

## Viewing your Adam version and license

To view version and license information, run `adam info`:

```
$ adam info
Adam version: 4.1.0
Plugins:
  adam_enterprise_notebooks: 4.1.0
  adam_repository: 4.1.0
  adam_notebook: 4.1.0
  adam_dask: 4.1.0

Platform: Darwin-15.6.0-x86_64
Darwin Kernel Version 15.6.0: Thu Jun 23 18:25:34 PDT 2016;
root:xnu-3248.60.10~1/RELEASE_X86_64
Python version: 3.5.1 |Continuum Analytics, Inc.| (default,
Dec 7 2015, 11:24:55)
[GCC 4.2.1 (Apple Inc. build 5577)]
Processor: i386
Byte-ordering: little

License information:
Number of nodes currently in use: 14
Number of licensed nodes: 16
Number of managed clusters: 2

Valid platform component licenses:
1: Anaconda Repository Enterprise. End date: 2018-05-24
2: Anaconda Cluster. End date: 2018-05-24
3: Wakari Enterprise. End date: 2018-05-24
4: MKL Optimizations. End date: 2018-05-24
5: IOPro. End date: 2018-05-24
6: Accelerate. End date: 2018-05-24
```

## Updating Adam

To update Anaconda Adam to a newer version:

1. Delete the existing Adam installation directory. By default, this is `~/adam`.

NOTE: *Cluster profile* and *cluster definition* files are stored in `~/.continuum/adam`, which is preserved during the update process.

2. *Re-install Adam.*

## Troubleshooting

- *Errors when creating or provisioning a cluster*
- *Error: unsupported or unrecognized field*

### Errors when creating or provisioning a cluster

You get errors when you run `adam up` to create a cluster or `adam provision` to provision a cluster.

#### Cause

These errors may be caused by an invalid SSH private key or incorrect settings in a cluster profile.

#### Solution

Verify the following:

- The contents of your SSH private key are correct and, on Mac/Linux, set to 600 permissions.
- The user name in the cluster profile, such as `username: centos`, is defined correctly.
- The cluster profile settings are defined correctly in `~/.continuum/adam/profile.d/<profile_name>.yaml`.

### Error: unsupported or unrecognized field

When running Adam commands, you get an error similar to the following:

```
2016-12-05 11:09:50,120 - adam.config - ERROR - {'notebook':
'Rogue field'}
Error: One or more fields is not supported or recognized by
this version of Anaconda Adam. Correct or remove the
unsupported field in the cluster YAML profile or cluster
definition YAML file, and try the operation again. See the
above errors for more details: {'notebook': 'Rogue field'}
```

### Cause

There is an unsupported or unrecognized field in a cluster profile or definition file. If you have updated to a newer version of Adam, some fields in the cluster profile or cluster definition file may have been renamed or removed between versions.

### Solution

1. In the cluster profile file in the `~/ .continuum/adam/profile.d` directory or the cluster definition file in the `~/ .continuum/adam/cluster.d` directory, remove or rename the field shown in the error.
2. Retry the command.

### FAQs

- *Does Anaconda Adam work with a cluster that already has a managed Spark/Hadoop stack?*
- *Which cloud providers does Adam support?*
- *Can I use Adam with a different cloud provider?*
- *Which network ports need to be accessible from the client machine and cluster nodes?*

#### Does Anaconda Adam work with a cluster that already has a managed Spark/Hadoop stack?

Yes, you can install Adam alongside existing Hadoop distributions such as Cloudera CDH or Hortonworks HDP. You can use Adam to manage Python and R conda packages and environments across a cluster.

#### Which cloud providers does Adam support?

Currently, Adam offers full support for Amazon Elastic Compute Cloud (EC2).

#### Can I use Adam with a different cloud provider?

Yes, you can manually create instances on another cloud provider and then provision the nodes. For more information, see [Tasks](#).

#### Which network ports need to be accessible from the client machine and cluster nodes?

For communication between the cluster nodes, ports 22, 4505 and 4506 are used to provision the cluster via SSH and Salt.

### Help and support

Priority support is included with the purchase of an Anaconda subscription. Visit the [support](#) section of our website for documentation and contact information for support.

## Training and consulting

Training and consulting are available for the Anaconda platform and all Anaconda platform components. For more information, contact [sales@anaconda.com](mailto:sales@anaconda.com).

## Release notes

Below is a summary of platform component updates, features, bug fixes, and backend improvements for each Anaconda Adam release.

- *Anaconda Adam 4.4.0*
- *Anaconda Adam 4.2.14*
- *Anaconda Adam 4.2.13*
- *Anaconda Adam 4.2.12*
- *Anaconda Adam 4.2.11*
- *Anaconda Adam 4.2.10*
- *Anaconda Adam 4.2.9*
- *Anaconda Adam 4.2.8*
- *Anaconda Adam 4.2.7*
- *Anaconda Adam 4.2.6*
- *Anaconda Adam 4.2.5*
- *Anaconda Adam 4.2.4*
- *Anaconda Adam 4.2.3*
- *Anaconda Adam 4.2.2*
- *Anaconda Adam 4.2.1*
- *Anaconda Adam 4.2.0*
- *Anaconda Adam 4.1.2*
- *Anaconda Adam 4.1.1*
- *Anaconda Adam 4.1.0*
- *Anaconda Adam 4.0.1*
- *Anaconda Adam 4.0.0*
- *Anaconda Adam 1.6.2*
- *Anaconda Adam 1.6.0*
- *Anaconda Adam 1.5.5*
- *Anaconda Adam 1.5.4*
- *Anaconda Adam 1.5.3*
- *Anaconda Adam 1.5.1*
- *Anaconda Adam 1.5.0*

- *Anaconda Adam 1.4.2*
- *Anaconda Adam 1.4.1*
- *Anaconda Adam 1.4.0*

### Anaconda Adam 4.4.0

Released: June 20, 2017

| Platform Component                | Version       | Plugin Version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.4.0/4.3.21  | -              |
| Anaconda Enterprise Notebooks     | 4.1.2         | 4.2.14         |
| Anaconda Repository               | 2.30.3        | 4.4.0          |
| Anaconda Scale (Dask/Distributed) | 0.15.0/1.17.1 | 4.4.0          |
| Anaconda Scale (Jupyter Notebook) | 5.0.0         | 4.2.14         |

Download Anaconda Adam:

- MD5: 64cc02dcaaf7829144cd82db786ab775
- SHA256: 663e2f93177830badadf5dea6647cb0e3d5376770999b85bb02d535d13cfac6d

Platform Component Updates:

- Updated to Anaconda 4.4.0 (conda 4.3.21)
- Updated to Miniconda 4.3.21 (conda 4.3.21)
- Updated to Anaconda Repository 2.30.3
- Updated to Dask 0.15.0 and Distributed 1.17.1

### Anaconda Adam 4.2.14

Released: April 28, 2017

| Platform Component                | Version       | Plugin Version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.2.12  | -              |
| Anaconda Enterprise Notebooks     | 4.1.2         | 4.2.14         |
| Anaconda Repository               | 2.29.1        | 4.2.14         |
| Anaconda Scale (Dask/Distributed) | 0.14.1/1.16.1 | 4.2.14         |
| Anaconda Scale (Jupyter Notebook) | 5.0.0         | 4.2.14         |

Download Anaconda Adam:

- MD5: 3fd72336d12ee635323d3f3541cce1c0
- SHA256: 43275084838a698fee7329651d55b20b3087037cc14bec04e27d6d985d402fbd

Platform Component Updates:

- Updated to Anaconda Enterprise Notebooks 4.1.2
- Updated to Anaconda Repository 2.29.1
- Updated to Dask 0.14.1 and Distributed 1.16.1
- Updated to Jupyter Notebook 5.0.0

### Anaconda Adam 4.2.13

Released: March 2, 2017

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.2.12  | -              |
| Anaconda Enterprise Notebooks     | 4.1.1         | 4.2.11         |
| Anaconda Repository               | 2.27.2        | 4.2.13         |
| Anaconda Scale (Dask/Distributed) | 0.14.0/1.16.0 | 4.2.13         |
| Anaconda Scale (Jupyter Notebook) | 4.3.1         | 4.2.11         |

### Platform component updates

- Updated to Anaconda Repository 2.27.2.
- Updated to Dask 0.14.0 and Distributed 1.16.0.

### Download Adam

### Anaconda Adam 4.2.12

Released: February 3, 2017

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.2.12  | -              |
| Anaconda Enterprise Notebooks     | 4.1.1         | 4.2.11         |
| Anaconda Repository               | 2.26.3        | 4.2.11         |
| Anaconda Scale (Dask/Distributed) | 0.13.0/1.15.0 | 4.2.11         |
| Anaconda Scale (Jupyter Notebook) | 4.3.1         | 4.2.11         |

### Bug fixes

Fixed Anaconda/Miniconda download links to be compatible with new `repo.anaconda.com` CDN.

### Download Adam

### Anaconda Adam 4.2.11

Released: January 16, 2017

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.2.12  | -              |
| Anaconda Enterprise Notebooks     | 4.1.1         | 4.2.11         |
| Anaconda Repository               | 2.26.3        | 4.2.11         |
| Anaconda Scale (Dask/Distributed) | 0.13.0/1.15.0 | 4.2.11         |
| Anaconda Scale (Jupyter Notebook) | 4.3.1         | 4.2.11         |

### Features

Implemented default password in Jupyter Notebooks.

### Backend improvements

- Disable automatic updates of conda.
- Updates for compatibility with conda 4.3.x features.

### Platform component updates

- Updated to Anaconda Enterprise Notebooks 4.1.1.
- Updated to Anaconda Repository 2.26.3.
- Updated to Dask 0.13.0 and Distributed 1.15.0.
- Updated to Jupyter Notebook 4.3.1.
- Removed Anaconda Accelerate as a standalone platform component (now installed as part of Anaconda Scale).

### Download Adam

## Anaconda Adam 4.2.10

Released: December 5, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.2.12  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.2.7          |
| Anaconda Enterprise Notebooks     | 4.1.0         | 4.2.4          |
| Anaconda Repository               | 2.25.1        | 4.2.10         |
| Anaconda Scale (Dask/Distributed) | 0.12.0/1.14.3 | 4.2.10         |
| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.7          |

### Platform component updates

- Updated to Anaconda Repository 2.25.1.
- Updated to Dask 0.12.0 and Distributed 1.14.3.
- Removed Anaconda Mosaic.

### Download Adam

## Anaconda Adam 4.2.9

Released: November 29, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.2.12  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.2.7          |
| Anaconda Enterprise Notebooks     | 4.1.0         | 4.2.4          |
| Anaconda Mosaic                   | 1.3.1         | 4.2.7          |
| Anaconda Repository               | 2.23.1        | 4.2.4          |
| Anaconda Scale (Dask/Distributed) | 0.11.1/1.13.3 | 4.2.7          |
| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.7          |

### Bug fixes

Fixed scripts that were not included in the release bundle (required for `service_scripts` setting).

## Download Adam

## Anaconda Adam 4.2.8

Released: November 29, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.2.12  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.2.7          |
| Anaconda Enterprise Notebooks     | 4.1.0         | 4.2.4          |
| Anaconda Mosaic                   | 1.3.1         | 4.2.7          |
| Anaconda Repository               | 2.23.1        | 4.2.4          |
| Anaconda Scale (Dask/Distributed) | 0.11.1/1.13.3 | 4.2.7          |
| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.7          |

## Bug fixes

Fixed issue with cluster profile settings not being migrated to cluster definition file.

## Download Adam

- MD5: f1083e30500b281e8c1d668c02ae8e3c.
- SHA256: 5a4b4391b1743cfc03d7bfa2e5693cc064cbd609f4c4fea7438846f2fa8d27e8.

## Anaconda Adam 4.2.7

Released: November 16, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.2.12  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.2.7          |
| Anaconda Enterprise Notebooks     | 4.1.0         | 4.2.4          |
| Anaconda Mosaic                   | 1.3.1         | 4.2.7          |
| Anaconda Repository               | 2.23.1        | 4.2.4          |
| Anaconda Scale (Dask/Distributed) | 0.11.1/1.13.3 | 4.2.7          |
| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.7          |

## Features

Added configuration settings for `salt_username`, `salt_groupname` and `salt_password`, for a user that is created across the cluster and owns the directory and files located in the root installation directory.

## Backend improvements

Added retries for Salt minion/API connection.

| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.1          |

## Bug fixes

Fixed installation issue with Anaconda Mosaic related to conda environments.

## Backend improvements

Reverted to `requests` for file downloads via Salt HTTP module backend.

## Anaconda Adam 4.2.5

Released: November 9, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.2.12  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.2.1          |
| Anaconda Enterprise Notebooks     | 4.1.0         | 4.2.4          |
| Anaconda Mosaic                   | 1.3.1         | 4.2.1          |
| Anaconda Repository               | 2.23.1        | 4.2.4          |
| Anaconda Scale (Dask/Distributed) | 0.11.1/1.13.3 | 4.2.3          |
| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.1          |

### Platform component updates

Updated to Miniconda 4.2.12 (conda 4.2.12).

### Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/4.2.5/download/adam-installer-4.2.5-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/4.2.5/download/adam-installer-4.2.5-Linux-x86_64.sh).
- MD5: 2614d2f8239aa0f3b8d070bd2a1ea83e.
- SHA256: 5355646e8e143cc5929061422427ee6e1f2fa143c5898865ccd0122803b72fa5.

## Anaconda Adam 4.2.4

Released: November 8, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.1.11  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.2.1          |
| Anaconda Enterprise Notebooks     | 4.1.0         | 4.2.4          |
| Anaconda Mosaic                   | 1.3.1         | 4.2.1          |
| Anaconda Repository               | 2.23.1        | 4.2.4          |
| Anaconda Scale (Dask/Distributed) | 0.11.1/1.13.3 | 4.2.3          |
| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.1          |

### Features

- Added support for creating and updating environments using `conda env` YAML files and listing and removing environments with `adam scale env`.
- Added `tmp_dir` setting to cluster profile to configure temporary download location.
- Added support for removing conda environments using `adam scale conda remove -n my-env --all`.

## Backend improvements

- Added support for downloads from CDN by enabling location header redirects when using `curl`.
- Improved handling and catching for errors returned from Salt.

## Bug fixes

- Fixed handling of proxy settings (including `.condarc` files) in cluster configuration/profile.
- Fixed handling of security settings in cluster definition when using Amazon EC2 instances.
- Fixed ownership for license directory in Anaconda Scale `rootdir`; default: `/opt/continuum/anaconda/licenses`.

## Platform component updates

- Updated to Anaconda Enterprise Notebooks 4.1.0.
- Updated to Anaconda Repository 2.23.1.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/4.2.4/download/adam-installer-4.2.4-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/4.2.4/download/adam-installer-4.2.4-Linux-x86_64.sh).
- MD5: 67df6905007d892aa6597c06d3fe0693.
- SHA256: 2630798205a215ce0021db50591e8507c20cd36164eda27d74dcf1eb9a4d58fd.

## Anaconda Adam 4.2.3

Released: October 24, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.1.11  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.2.1          |
| Anaconda Enterprise Notebooks     | 4.0.0         | 4.2.1          |
| Anaconda Mosaic                   | 1.3.1         | 4.2.1          |
| Anaconda Repository               | 2.22.0        | 4.2.3          |
| Anaconda Scale (Dask/Distributed) | 0.11.1/1.13.3 | 4.2.3          |
| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.1          |

## Backend improvements

- Updated `ssl_verify` setting to handle various inputs (true, false, or string).
- Switched to `curl` for downloading Anaconda/Miniconda in environments with SSL/proxies.

### Platform component updates

- Updated to Anaconda Repository 2.22.0.
- Updated to Dask 0.11.1 and Distributed 1.13.3.

### Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/4.2.3/download/adam-installer-4.2.3-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/4.2.3/download/adam-installer-4.2.3-Linux-x86_64.sh).
- MD5: a484a933afcebb99bafbc5bde4e63081.
- SHA256: 8beb36f619f9d6177f0815090fa1ba7d41c769e47978d86c0b0c60164d63b996.

### Anaconda Adam 4.2.2

Released: October 19, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.1.11  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.2.1          |
| Anaconda Enterprise Notebooks     | 4.0.0         | 4.2.1          |
| Anaconda Mosaic                   | 1.3.1         | 4.2.1          |
| Anaconda Repository               | 2.21.0        | 4.2.1          |
| Anaconda Scale (Dask/Distributed) | 0.11.0/1.12.2 | 4.2.1          |
| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.1          |

### Bug fixes

Implemented various fixes related to conda configuration file (`.condarc`) and environment variable (`CONDARC`).

### Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/4.2.2/download/adam-installer-4.2.2-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/4.2.2/download/adam-installer-4.2.2-Linux-x86_64.sh).

### Anaconda Adam 4.2.1

Released: October 14, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.1.11  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.2.1          |
| Anaconda Enterprise Notebooks     | 4.0.0         | 4.2.1          |
| Anaconda Mosaic                   | 1.3.1         | 4.2.1          |
| Anaconda Repository               | 2.21.0        | 4.2.1          |
| Anaconda Scale (Dask/Distributed) | 0.11.0/1.12.2 | 4.2.1          |
| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.1          |

## Features

- Improved output when checking node status (using `Salt test.ping`).
- Added configuration settings to cluster profile related to Salt API username, password, and group.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/4.2.1/download/adam-installer-4.2.1-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/4.2.1/download/adam-installer-4.2.1-Linux-x86_64.sh).
- MD5: f8b01e94cf6b114b4d9df0f2074206a2.
- SHA256: 3ce27577757eb576ed7e3863ad35c5ca37755cdcb0de8f634ca6215ee4b6c67a.

## Anaconda Adam 4.2.0

Released: October 6, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.2.0/4.1.11  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.2.0          |
| Anaconda Enterprise Notebooks     | 4.0.0         | 4.2.0          |
| Anaconda Mosaic                   | 1.3.1         | 4.2.0          |
| Anaconda Repository               | 2.21.0        | 4.2.0          |
| Anaconda Scale (Dask/Distributed) | 0.11.0/1.12.2 | 4.2.0          |
| Anaconda Scale (Jupyter Notebook) | 4.2.3         | 4.2.0          |

## Features

- Improved error messaging for missing/incompatible cluster profile fields.
- Improved handling of state for installed/enabled platform components.
- Simplified `adam describe` output to hide platform components that are not installed.

## Backend improvements

- Renamed `salt` to `salt_settings` in cluster profile and added documentation.
- Added conda canary builds to test framework.

## Bug fixes

- Fixed user/group ownership for platform component license directories.
- Improved validation of SSH key pairs, passwords, or agent public keys.
- Fixed check for existing Anaconda/Supervisor installations.
- Improved hash check for Miniconda downloads.
- Improved retry functionality for commands executed in parallel across multiple nodes.
- Improved handling of returned states from remote conda commands.
- Print URL when opening/viewing platform components if no browser is available.

## Platform component updates

- Updated to Anaconda 4.2.0 (conda 4.2.9).
- Updated to Anaconda Repository 2.21.0.
- Updated to Dask 0.11.0 and Distributed 1.12.2.
- Updated to Jupyter Notebook 4.2.3.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/4.2.0/download/adam-installer-4.2.0-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/4.2.0/download/adam-installer-4.2.0-Linux-x86_64.sh).
- MD5: 4c6e685615d58486911f06c264bc1990.
- SHA256: 0556ee1b7e8bcd379faf6c2089e7fb525d2845187361a2a96d99a281ba207108.

## Anaconda Adam 4.1.2

Released: August 24, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.1.1/4.1.11  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.1.0          |
| Anaconda Enterprise Notebooks     | 4.0.0         | 4.1.1          |
| Anaconda Mosaic                   | 1.3.1         | 4.1.0          |
| Anaconda Repository               | 2.19.7        | 4.1.1          |
| Anaconda Scale (Dask/Distributed) | 0.10.2/1.11.3 | 4.1.0          |
| Anaconda Scale (Jupyter Notebook) | 4.2.2         | 4.1.0          |

## Features

Added support for installations via proxy (HTTP and HTTPS).

## Bug fixes

Fixed issue with the creation of a custom home directory for the `anaconda` user.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/4.1.2/download/adam-installer-4.1.2-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/4.1.2/download/adam-installer-4.1.2-Linux-x86_64.sh).

## Anaconda Adam 4.1.1

Released: August 18, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.1.1/4.1.11  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.1.0          |
| Anaconda Enterprise Notebooks     | 4.0.0         | 4.1.0          |
| Anaconda Mosaic                   | 1.3.1         | 4.1.0          |
| Anaconda Repository               | 2.19.7        | 4.1.0          |
| Anaconda Scale (Dask/Distributed) | 0.10.2/1.11.3 | 4.1.0          |
| Anaconda Scale (Jupyter Notebook) | 4.2.2         | 4.1.0          |

## Bug fixes

- Fixed issue with Salt API job responses.
- Fixed issue with `invoke_shell` buffer size.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/4.1.1/download/adam-installer-4.1.1-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/4.1.1/download/adam-installer-4.1.1-Linux-x86_64.sh).
- MD5: 48a6fda5c16842ea2f138fe59723f425.

## Anaconda Adam 4.1.0

Released: August 17, 2016

| Platform component                | Version       | Plugin version |
|-----------------------------------|---------------|----------------|
| Anaconda/Miniconda                | 4.1.1/4.1.11  | -              |
| Anaconda Accelerate               | 2.3.0         | 4.1.0          |
| Anaconda Enterprise Notebooks     | 4.0.0         | 4.1.0          |
| Anaconda Mosaic                   | 1.3.1         | 4.1.0          |
| Anaconda Repository               | 2.19.7        | 4.1.0          |
| Anaconda Scale (Dask/Distributed) | 0.10.2/1.11.3 | 4.1.0          |
| Anaconda Scale (Jupyter Notebook) | 4.2.2         | 4.1.0          |

## Bug fixes

- Fixed issue when attempting to disable SELinux.
- Fixed licensing check when recreating an existing cluster.
- Fixed use of `host` during installation of Anaconda Enterprise Notebooks.

## Backend improvements

- Renamed `fqdn` to `host` in cluster profile.
- Changed default AEN Gateway port to 8089 in Anaconda Enterprise Notebooks.
- Changed default system account to `anaconda-server` for Anaconda Repository.
- Added diagnostic SSH checks to initial cluster provision.
- Implemented asynchronous Salt jobs for cluster-wide tasks.
- Added support for DSA and ECDSA SSH keys.
- Added optional `invoke_shell` mode for installations with restricted `sudo` functionality.
- Updated to Salt 2016.3.1.

## Platform component updates

- Updated to Miniconda 4.1.11 (conda 4.1.11).
- Updated to Anaconda Repository 2.19.7.
- Updated to Jupyter Notebook 4.2.2.
- Initial release of Anaconda Scale platform component (replaces Anaconda for cluster management).

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/4.1.0/download/adam-installer-4.1.0-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/4.1.0/download/adam-installer-4.1.0-Linux-x86_64.sh).
- MD5: 063b75a7352e711626dd6e4eabef5228.
- SHA256: 6dd4b344bec10ed6933a04d1d014260e94a6afb1b3acda4ca8093c60e80b6d3f.

## Anaconda Adam 4.0.1

Released: July 23, 2016

| Platform component            | Version       | Plugin version |
|-------------------------------|---------------|----------------|
| Anaconda/Miniconda            | 4.1.1/4.0.5   | -              |
| Anaconda Accelerate           | 2.3.0         | 4.0.0          |
| Anaconda Enterprise Notebooks | 4.0.0         | 4.0.1          |
| Anaconda Mosaic               | 1.3.1         | 4.0.0          |
| Anaconda Repository           | 2.19.2        | 4.0.0          |
| Dask/Distributed              | 0.10.1/1.11.2 | 4.0.0          |
| Jupyter Notebook              | 4.2.1         | 4.0.0          |

### Backend improvements

- Store Anaconda Adam API certificates and keys in isolated location.
- Disabled `requiretty` setting in `/etc/sudoers` when installing Anaconda Enterprise Notebooks.

### Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/4.0.1/download/adam-installer-4.0.1-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/4.0.1/download/adam-installer-4.0.1-Linux-x86_64.sh).
- MD5: 90027abca5f16917946df2c9018a443f.

### Anaconda Adam 1.6.2

Released: July 21, 2016

| Platform component            | Version       | Plugin version |
|-------------------------------|---------------|----------------|
| Anaconda/Miniconda            | 4.1.1/4.0.5   | -              |
| Anaconda Accelerate           | 2.3.0         | 1.6.0          |
| Anaconda Enterprise Notebooks | 4.0.0         | 1.6.0          |
| Anaconda Mosaic               | 1.3.1         | 1.6.2          |
| Anaconda Repository           | 2.19.2        | 1.6.0          |
| Dask/Distributed              | 0.10.1/1.11.2 | 1.6.1          |
| Jupyter Notebook              | 4.2.1         | 1.6.0          |

### Features

Added `conda channel_alias` setting for global Anaconda installation.

### Platform component updates

- Updated to Dask 0.10.0 and Distributed 1.11.0.
- Updated to Anaconda Mosaic 1.3.1.

### Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/1.6.2/download/adam-installer-1.6.2-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/1.6.2/download/adam-installer-1.6.2-Linux-x86_64.sh).
- MD5: 859d1b4b759cc0562866ee58a8ceeb35.
- SHA256: 5d378bc7cb681f80f0b80435467d1f889788dd5efc61b5be0f1a07c5993d131e.

### Anaconda Adam 1.6.0

Released: July 19, 2016

| Platform component            | Version       | Plugin version |
|-------------------------------|---------------|----------------|
| Anaconda/Miniconda            | 4.1.1/4.0.5   | -              |
| Anaconda Accelerate           | 2.3.0         | 1.6.0          |
| Anaconda Enterprise Notebooks | 4.0.0         | 1.6.0          |
| Anaconda Mosaic               | 1.2.3         | 1.6.0          |
| Anaconda Repository           | 2.19.2        | 1.6.0          |
| Dask/Distributed              | 0.10.0/1.11.0 | 1.6.0          |
| Jupyter Notebook              | 4.2.1         | 1.6.0          |

## Features

- Improvements to air gapped installation process for Adam core library.
- Added optional `sudo_su` mode for installations with restricted `sudo` functionality.
- A `licenses` directory is now created in the root of the `adam` installation location.

## Backend improvements

Improved checks for failed remote commands and `conda` commands.

## Bug fixes

Fixed hash key/value check for Anaconda/Miniconda installers.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/1.6.0/download/adam-installer-1.6.0-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/1.6.0/download/adam-installer-1.6.0-Linux-x86_64.sh).
- MD5: `ae7a4614b8e1312812baa9402f462aac`.
- SHA256: `996e66e0ca956aaa05cc089cf66ebaf76bb1d8532d69900abb765f9246d5bf60`.

## Anaconda Adam 1.5.5

Released: July 14, 2016

| Platform component            | Version       | Plugin version |
|-------------------------------|---------------|----------------|
| Anaconda/Miniconda            | 4.1.1/4.0.5   | -              |
| Anaconda Accelerate           | 2.3.0         | 1.5.2          |
| Anaconda Enterprise Notebooks | 4.0.0         | 1.5.2          |
| Anaconda Mosaic               | 1.2.3         | 1.5.2          |
| Anaconda Repository           | 2.19.2        | 1.5.4          |
| Dask/Distributed              | 0.10.0/1.11.0 | 1.5.1          |
| Jupyter Notebook              | 4.2.1         | 1.5.2          |

### Bug fixes

Fixed password-based SSH commands used during provision/installation.

### Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/1.5.5/download/adam-installer-1.5.5-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/1.5.5/download/adam-installer-1.5.5-Linux-x86_64.sh).
- MD5: e28887409326f3539743eda9beeff0b6.
- SHA256: 9e6eb3854ed2bff57aab6573804478ec05f8586e8b4ecd8ee6d0cd5faa44d570.

### Anaconda Adam 1.5.4

Released: July 13, 2016

| Platform component            | Version       | Plugin version |
|-------------------------------|---------------|----------------|
| Anaconda/Miniconda            | 4.1.1/4.0.5   | -              |
| Anaconda Accelerate           | 2.3.0         | 1.5.2          |
| Anaconda Enterprise Notebooks | 4.0.0         | 1.5.2          |
| Anaconda Mosaic               | 1.2.3         | 1.5.2          |
| Anaconda Repository           | 2.19.2        | 1.5.4          |
| Dask/Distributed              | 0.10.0/1.11.0 | 1.5.1          |
| Jupyter Notebook              | 4.2.1         | 1.5.2          |

### Features

- Added `conda channels` setting for global Anaconda installation.
- Support for multiple conda channels in conda commands.
- Added explicit Anaconda and platform component installation steps to `adam provision`, `adam ec2`, and `adam up`.
- Added customizable platform component settings to cluster definition.
- Ability to configure security settings for IPTables and SELinux.
- Improved confirmation/details when destroying Amazon EC2 instances.

### Bug fixes

Fixed password-based SSH logins for cluster nodes.

### Platform component updates

- Updated to Anaconda 4.1.1 (conda 4.1.6).
- Updated to Anaconda Repository 2.19.2.

## Download Adam

- MD5: 348928b0816c93a9ccb20a32fa6a6b20.
- SHA256: a3f76295b61b02cda3d2f31c24dfd08fdb4739fb7aff3312753c5ba87ca3eaff.

## Anaconda Adam 1.5.3

Released: July 11, 2016

| Platform component            | Version       | Plugin version |
|-------------------------------|---------------|----------------|
| Anaconda/Miniconda            | 4.1.0/4.0.5   | -              |
| Anaconda Accelerate           | 2.3.0         | 1.5.1          |
| Anaconda Enterprise Notebooks | 4.0.0         | 1.5.1          |
| Anaconda Mosaic               | 1.2.3         | 1.5.1          |
| Anaconda Repository           | 2.19.1        | 1.5.2          |
| Dask/Distributed              | 0.10.0/1.11.0 | 1.5.0          |
| Jupyter Notebook              | 4.2.1         | 1.5.1          |

## Features

Changed default admin username and password for Anaconda Repository.

## Bug fixes

Added `setuptools` as dependency for Adam.

## Platform component updates

Updated to Anaconda 4.1.0 (conda 4.1.4).

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/1.5.3/download/adam-installer-1.5.3-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/1.5.3/download/adam-installer-1.5.3-Linux-x86_64.sh).
- MD5: 4e30813039ec5a7010324a3cf577c621.
- SHA256: 83b03a7704b448bda9eec05b1cf6aa0c7b384cb4c4401a820559e077c2c104d6.

## Anaconda Adam 1.5.1

Released: July 8, 2016

| Platform component            | Version       | Plugin version |
|-------------------------------|---------------|----------------|
| Anaconda/Miniconda            | 4.0.0/4.0.5   | -              |
| Anaconda Accelerate           | 2.3.0         | 1.5.1          |
| Anaconda Enterprise Notebooks | 4.0.0         | 1.5.1          |
| Anaconda Mosaic               | 1.2.3         | 1.5.1          |
| Anaconda Repository           | 2.19.1        | 1.5.1          |
| Dask/Distributed              | 0.10.0/1.11.0 | 1.5.0          |
| Jupyter Notebook              | 4.2.1         | 1.5.0          |

## Features

- Changed default AEN Gateway port to 8088 in Anaconda Enterprise Notebooks.
- Added profile settings for Anaconda Repository.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/1.5.1/download/adam-installer-1.5.1-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/1.5.1/download/adam-installer-1.5.1-Linux-x86_64.sh).
- MD5: 8dfe05136a4f022c9611092b1cfc2373.
- SHA256: 89b500affce32c0fb2df78b553d2c96277f0d7852037553710838ed4e82df36f.

## Anaconda Adam 1.5.0

Released: July 7, 2016

| Platform component            | Version       | Plugin version |
|-------------------------------|---------------|----------------|
| Anaconda/Miniconda            | 4.0.0/4.0.5   | -              |
| Anaconda Accelerate           | 2.3.0         | 1.5.1          |
| Anaconda Enterprise Notebooks | 4.0.0         | 1.5.0          |
| Anaconda Mosaic               | 1.2.3         | 1.5.1          |
| Anaconda Repository           | 2.19.1        | 1.5.0          |
| Dask/Distributed              | 0.10.0/1.11.0 | 1.5.0          |
| Jupyter Notebook              | 4.2.1         | 1.5.0          |

## Backend improvements

Updated license checks to be compatible with new platform component names.

## Platform component updates

- Updated to Anaconda Repository 2.19.1.
- Updated to Anaconda Accelerate 2.3.0.
- Updated to Anaconda Mosaic 1.2.3.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/1.5.0/download/adam-installer-1.5.0-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/1.5.0/download/adam-installer-1.5.0-Linux-x86_64.sh).
- MD5: b162d5425b0d41c96da6b65e45f841e7.
- SHA256: 00d23cae15fc55fea1c82645f79d10d34e085d05c105d4a556402138730d7ae4.

## Anaconda Adam 1.4.2

Released: July 6, 2016

| Platform component            | Version       | Plugin version |
|-------------------------------|---------------|----------------|
| Anaconda/Miniconda            | 4.0.0/4.0.5   | -              |
| Anaconda Accelerate           | 2.2.0         | 1.4.1          |
| Anaconda Enterprise Notebooks | 4.0.0         | 1.4.1          |
| Anaconda Mosaic               | 1.2.2         | 1.4.1          |
| Anaconda Repository           | 2.18.1        | 1.4.1          |
| Dask/Distributed              | 0.10.0/1.11.0 | 1.4.2          |
| Jupyter Notebook              | 4.2.1         | 1.4.2          |

## Features

Added `adam describe` command to get detailed information about clusters and profiles.

## Bug fixes

Fixed issue with compute node registration in Anaconda Enterprise Notebooks.

## Platform component updates

- Updated to Dask 0.10.0 and Distributed 1.11.0.
- Updated to Jupyter 1.4.2.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/1.4.2/download/adam-installer-1.4.2-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/1.4.2/download/adam-installer-1.4.2-Linux-x86_64.sh).
- MD5: c8c906b1623bf109813c588a126d7407.
- SHA256: 0c17e670e13da18dc2d64e09980ce790bc0812754802f6937cc9ecc44efd0da0.

## Anaconda Adam 1.4.1

Released: June 28, 2016

| Platform component            | Version      | Plugin version |
|-------------------------------|--------------|----------------|
| Anaconda/Miniconda            | 4.0.0/4.0.5  | -              |
| Anaconda Accelerate           | 2.2.0        | 1.4.1          |
| Anaconda Enterprise Notebooks | 4.0.0        | 1.4.0          |
| Anaconda Mosaic               | 1.2.2        | 1.4.1          |
| Anaconda Repository           | 2.18.1       | 1.4.1          |
| Dask/Distributed              | 0.9.0/1.10.2 | 1.4.1          |
| Jupyter Notebook              | -            | 1.4.1          |

## Features

Updated license checks in Dask and Notebook platform components.

## Bug fixes

Fixed issue with license check.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/1.4.1/download/adam-installer-1.4.1-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/1.4.1/download/adam-installer-1.4.1-Linux-x86_64.sh).
- MD5: 5ec1faec73d8cf53c3fdb6742f86daf5.
- SHA256: 8f61c01029eaff31a1910bf56fbc3b33a0a4a845fcd86ddc12c673706dd1e06e.

## Anaconda Adam 1.4.0

Released: June 28, 2016

| Platform component            | Version      | Plugin version |
|-------------------------------|--------------|----------------|
| Anaconda/Miniconda            | 4.0.0/4.0.5  | -              |
| Anaconda Accelerate           | 2.2.0        | 1.4.1          |
| Anaconda Enterprise Notebooks | 4.0.0        | 1.4.0          |
| Anaconda Mosaic               | 1.2.2        | 1.4.1          |
| Anaconda Repository           | 2.18.1       | 1.4.1          |
| Dask/Distributed              | 0.9.0/1.10.2 | 1.4.0          |
| Jupyter Notebook              | -            | 1.4.1          |

## Features

- Added `adam info` command with license information.
- Added `adam remove` command to remove cluster definition file.
- License files are now uploaded to nodes for each platform component.
- Improved handling of license issues.
- Installers are now automatically built and uploaded.

## Backend improvements

Updated Salt to 2016.3.0.

## Bug fixes

- Fixed Salt API timeout issue.
- Fixed issue with Salt master and minions starting up.

## Download Adam

- Link: [https://anaconda.org/anaconda-adam/adam-installer/1.4.0/download/adam-installer-1.4.0-Linux-x86\\_64.sh](https://anaconda.org/anaconda-adam/adam-installer/1.4.0/download/adam-installer-1.4.0-Linux-x86_64.sh).
- MD5: 7d9d2ebfb02e33977fb41d1dcf1240fc.
- SHA256: a2f9c98338d4ba4e224ea815bb338d45ee719cc002af0f5c7d18a8f593a33d54.

## 3.4.3 Anaconda for Cluster Management

---

**Note:** This product is discontinued. This archived copy of the product documentation is provided for those customers who are still using it.

---

NOTE: Anaconda for cluster management has been replaced by [Anaconda Scale](#). This documentation is made available for existing installations only.

To use Anaconda with a cluster, please use Anaconda Scale and refer to the [Anaconda Scale](#) documentation.

---

Anaconda for cluster management provides resource management tools to easily deploy Anaconda across a cluster. It helps you manage multiple conda environments and packages (including Python and R) on bare-metal or cloud-based clusters. Supported platforms include Amazon EC2, bare-metal clusters, or even a collection of virtual machines.

Anaconda for cluster management can be used with distributed computation frameworks such as Spark or Dask and works alongside enterprise Hadoop distributions such as Cloudera CDH or Hortonworks HDP.

Anaconda for cluster management is freely available via Anaconda Cloud for unlicensed, unsupported use with up to 4 cluster nodes. Anaconda Workgroup and Enterprise include licenses for 8 and 16 nodes, respectively. If you would like to use Anaconda for cluster management with additional nodes on a bare-metal, on-premises, or cloud-based cluster, please contact [sales@anaconda.com](mailto:sales@anaconda.com).

### Features of Anaconda for cluster management:

- Easily install Python and R packages across multiple cluster nodes
- Manage multiple conda environments across a cluster
- Push local conda environments to all cluster nodes
- Manage both cloud-based and bare-metal clusters
- Remotely SSH and upload/download files to and from cluster nodes

### Typical configuration of Anaconda for cluster management:

## Table of contents:

### Quickstart

This quickstart provides a walkthrough of Anaconda for cluster management using Amazon Web Services (AWS) Elastic Compute Cloud (EC2). The steps covered in this quickstart include defining and launching a cloud-based cluster on Amazon EC2, managing conda packages on the cluster nodes, and installing plugins.

### Installation

Install Anaconda for cluster management on your local machine following the instructions on the installation page.

### Create a provider

A sample providers file (shown below) is included with a new installation of Anaconda for cluster management and is located within the `~/.acluster/providers.yaml` file.

```
aws_east:
  cloud_provider: ec2
  keyname: my-private-key
  location: us-east-1
  private_key: ~/.ssh/my-private-key.pem
  secret_id: AKIAXXXXXX
  secret_key: XXXXXXXXXXXX
```

Edit this file and replace the settings and credentials with your information.

Refer to the [Provider settings](#) page for more details about provider settings, including security groups.

You can list the providers with the command:

```
$ acluster list providers
```

## Create a profile

A sample profile is included with a new installation of Anaconda for cluster management and is located in the `~/ .acluster/profiles.d/` directory. The sample profile named `aws_profile_sample` is shown below:

```
name: aws_profile_sample
provider: aws_east
num_nodes: 4
node_id: ami-d05e75b8 # Ubuntu 14.04, us-east-1 region
node_type: m3.large
user: ubuntu
```

You can use this profile to create a 4-node cluster based on Ubuntu 14.04.

Refer to the [Profile settings](#) page for more details about profile settings.

You can list the profiles with the command:

```
$ acluster list profiles
```

## Create the cluster

After the provider and profile files are defined, you can create a cluster using the command:

```
$ acluster create demo_cluster --profile aws_profile_sample
```

This will create your new cluster on Amazon EC2 and provision the cluster nodes, which typically requires between 5 and 10 minutes. You will see updates as the tasks and initialization steps are completed.

## Install conda packages

Now that you have a cluster running, you can install conda packages using the `acluster conda` command. The `acluster` command can be prepended to most of the conda commands.

To install numpy, scipy, and pandas on all of the cluster nodes, use the following command:

```
$ acluster conda install numpy scipy pandas
```

**Note:** Refer to the [Conda management](#) page for a full list of remote conda commands.

### Install plugins

Anaconda for cluster management supports multiple plugins such as Apache Spark, Hadoop Distributed File System (HDFS), the Jupyter Notebook, and more. These plugins can be installed on the cluster by using the `acluster install` command.

For example, the following command can be used to install IPython Notebook on the cluster:

```
$ acluster install notebook
```

The notebook will be available on `http://{ HEAD_NODE_IP }:8888`. You can open the respective URLs for many of these applications in your browser using the `acluster open` command:

```
$ acluster open notebook
```

Run the `acluster open` command to view a complete list of supported applications.

### Destroy the cluster

When you are finished, the following command can be used to destroy the cluster and terminate all instances in it. It will prompt for confirmation before destroying the cluster.

```
$ acluster destroy demo_cluster
```

### Further information

Refer to the [Python with Spark How-tos](#) page for more example use cases for use-cases and example scripts.

### Creating a cluster

#### Requirements

- **Client machine:**
  - Windows, Mac, or Linux, 64-bit
  - Anaconda for cluster management client library installed
- **Cluster Nodes:**
  - One or more 64-bit Linux machines with 8+ GB RAM, 8+ cores (recommended)
  - Access to ports 22, 4505, and 4506 from the client machine to the cluster nodes to provision the cluster via SSH and Salt

#### Supported operating systems

For the cluster nodes, we support and test Anaconda for cluster management with the following Linux distributions:

- CentOS 6 and CentOS 7
- RHEL 6 and RHEL 7
- Ubuntu 12.04 and Ubuntu 14.04

#### Cloud-based or bare-metal cluster creation

For more information about configuring and creating a cloud-based or bare-metal cluster, refer to the following documentation:

## Cloud-based Cluster Setup

Anaconda for cluster management can launch and bootstrap clusters on a variety of cloud services. We currently support [Amazon EC2](#). Other providers such as Microsoft Azure, Rackspace, Google Cloud Platform, and others are on our roadmap. If you are interested in using a cloud provider that is not listed here, please contact us at [sales@anaconda.com](mailto:sales@anaconda.com).

Cloud configuration involves the use of `profiles` and `providers`. Splitting configurations allows users to easily share and distribute specific cluster configurations (`profiles`), while retaining private authentication credentials (`providers`).

### 1. Provider Setup

Authentication and cloud definitions are managed in a single provider file on the client machine: `~/.acluster/providers.yaml`. A provider file can contain multiple providers with different settings and credentials.

A sample providers file is included with a new installation of Anaconda for cluster management and is located within the `~/.acluster/providers.yaml` file on the client machine. You can edit the contents of this file to reflect the settings and credentials for your cloud provider.

An example `~/.acluster/providers.yaml` file with a provider named `aws_east` that is configured for Amazon EC2 is shown below:

```
aws_east:
  cloud_provider: ec2
  keyname: my-private-key
  location: us-east-1
  private_key: ~/.ssh/my-private-key.pem
  secret_id: AKIAXXXXXX
  secret_key: XXXXXXXXXXXX
```

Note that you will need access to ports 22, 4505, and 4506 from the client machine to the cluster nodes to provision the cluster via SSH and Salt.

Refer to the [Provider settings](#) page for more details about provider settings, including security groups.

**Linux or Mac:** You should set the permissions of `providers.yaml` file to 0600.

### 2. Profile Setup

The settings for each cluster are managed in a profile file.

A sample profile is included with a new installation of Anaconda for cluster management and is located in the `~/.acluster/profiles.d/` directory on the client machine. You can edit the contents of this file to reflect the settings for your cluster.

An example profile located at `~/.acluster/profiles.d/profile_name.yaml` and named `profile_name` that is configured to use the `aws_east` provider is shown below:

```
name: profile_name
provider: aws_east
num_nodes: 4
node_id: ami-d05e75b8 # Ubuntu 14.04, us-east-1 region
node_type: m3.large
user: ubuntu
```

Anaconda for cluster management supports and is tested with the following Linux-based AMIs on Amazon EC2 (us-east-1 region), which can be set as the `node_id`:

| OS           | AMI          | User   |
|--------------|--------------|--------|
| Ubuntu 12.04 | ami-08faa660 | ubuntu |
| Ubuntu 14.04 | ami-d05e75b8 | ubuntu |
| CentOS 6.6   | ami-d89fb7b0 | root   |

For more information on AMIs that are available in other Amazon EC2 regions, refer to the [Amazon EC2 documentation](#) or the [Ubuntu Amazon EC2 AMI Locator](#).

Refer to the [Profile settings](#) page for more details about profile settings.

### 3. Create Cluster

Use the following command to launch a cluster with the specified profile:

```
$ acluster create demo_cluster --profile profile_name
```

**Note:** Replace `demo_cluster` with the name of your cluster, and `profile_name` with the name of your profile.

After this command is executed, the cloud-based cluster will be created, and you will see updates as the tasks and initialization steps are completed.

A typical launch takes between 5 and 10 minutes, and has output similar to the following:

```
$ acluster create demo_cluster --profile profile_name
Creating cluster
Number of existing nodes: 0
Number of requested nodes: 4
Licensed nodes: 16
License is valid for the current number of nodes.
INFO: Creating new cluster "demo_cluster" with profile "profile_name"

```

The cluster is now ready for use.

View the [Troubleshooting FAQ](#) if you encounter errors while creating a cluster.

## 4. Destroy Cluster

If you want to destroy a cluster, use the following command:

```
$ acluster destroy demo_cluster
```

**Note:** Replace the name `demo_cluster` above with the actual name of your cluster.

After issuing the above command, you will be prompted to confirm termination of the specified cluster.

## Bare-metal Cluster Setup

Anaconda for cluster management can be used to manage pre-existing clusters, such as bare-metal machines, collections of virtual machines (Vagrant, Docker, etc.), or previously instantiated cloud instances. These types of installations are collectively referred to as *bare-metal installations*.

### Additional bare-metal cluster requirements:

- **Client machine:**
  - Passwordless SSH access to all cluster nodes
- **Cluster Nodes:**
  - Matching user account/credentials on all nodes with passwordless sudo enabled

## Provisioning instructions

### 1. Provider Setup

A sample providers file is included with a new installation of Anaconda for cluster management and is located within the `~/.acluster/providers.yaml` file on the client machine. You can edit the contents of this file to reflect the settings for your bare metal provider.

An example `~/.acluster/providers.yaml` file with a provider named `bare_metal` is shown below:

```
bare_metal:
  cloud_provider: none
  private_key: ~/.ssh/my-private-key
```

Refer to the [Provider settings](#) page for more details about provider settings.

### 2. Profile Setup

Create a file on the client machine located at `~/.acluster/profiles.d/profile_name.yaml` that defines the following information:

```
name: profile_name
provider: bare_metal
node_id: bare_metal
node_type: bare_metal
user: ubuntu
num_nodes: 4
machines:
  head:
    - 192.168.1.1
  compute:
    - 192.168.1.2
    - 192.168.1.3
    - 192.168.1.4

# Optional for Anaconda Server
# (note that the ports might be different in your configuration)
anaconda_url: http://[your-anaconda-server-ip]:9000/Miniconda-latest-Linux-x86_64.sh
conda_channels:
  - http://[your-anaconda-server-ip]:8080/conda/anaconda-cluster
  - http://[your-anaconda-server-ip]:8080/conda/anaconda
  - defaults
```

The example profile shown above is named `profile_name` and is configured for a 4-node bare-metal cluster.

Refer to the [Profile settings](#) page for more details about profile settings.

### 3. Configure Cluster

Use the following command to configure a bare-metal cluster with the specified profile:

```
$ acluster create demo_cluster --profile profile_name
```

**Note:** Replace `demo_cluster` with the name of your cluster, and `profile_name` with the name of your profile.

After this command is executed, the bare-metal cluster will be configured, and you will see updates as the tasks and initialization steps are completed.

A typical bare-metal cluster configuration takes a few minutes, and has output similar to the following:

```
$ acluster create demo_cluster --profile profile_name
Creating cluster
Number of existing nodes: 0
Number of requested nodes: 4
Licensed nodes: 16
License is valid for the current number of nodes.
INFO: Creating new cluster "demo_cluster" with profile "profile_name"

The cluster is now ready for use.

View the [Troubleshooting FAQ](#) if you encounter errors while creating a cluster.

## Configuration

After installing Anaconda for cluster management and running any `acluster` command, the `~/ .acluster` directory is created, along with a sample provider file located in `~/ .acluster/providers.yaml` and a sample

profile file located in `~/ .acluster/profiles.d/`.

An example of an `~/ .acluster` directory with multiple clusters and profiles is shown below:

```
/home/user/.acluster
├── clusters.d
│   ├── cluster1.yaml
│   ├── cluster2.yaml
│   └── cluster3.yaml
├── profiles.d
│   ├── profile1.yaml
│   └── profile2.yaml
└── providers.yaml
```

The `profiles.d` directory contains information about cluster setups, including the number and type of nodes, plugins, and other settings.

The `providers.yaml` file contains information about cloud providers.

The `clusters.d` directory contains information about clusters that are currently running.

For more information about profile and provider settings, refer to the following pages:

### Profile settings

The following profile settings can be used to define cluster configurations for cloud-based or bare-metal clusters. Each named profile file should contain information for a single cluster definition.

- *Profile settings*
  - *anaconda\_url (optional)*
  - *aws (optional)*
  - *conda\_channels (optional)*
  - *default\_channels (optional)*
  - *channel\_alias (optional)*
  - *name*
  - *node\_id*
  - *node\_type*
  - *num\_nodes*
  - *machines (optional)*
  - *plugins (optional)*
  - *provider*
  - *root\_size (optional)*
  - *security (optional)*
  - *user*
- *Sample cloud-based profile file*
- *Sample bare-metal profile file*

## Profile settings

### `anaconda_url` (optional)

Set a custom location to download Anaconda/Miniconda from (default: Miniconda with Python 2).

```
anaconda_url: http://localhost/miniconda/Miniconda-latest-Linux-x86_64.sh
```

### `aws` (optional)

Set AWS options for all instances:

- `tags` are optional key/value metadata that are assigned to each instance.
- `termination_protection` prevents your instances from being accidentally terminated (default: `true`).
- `use_private_ip` uses the private IP addresses of the AWS nodes instead of the public IP addresses. This is useful if you are using a custom security group (default: `false`).

```
aws:  
  tags:  
    - billingProject: anaconda-cluster  
    - cluster_version: production  
    - ...  
  termination_protection: true  
  use_private_ip: true
```

### `conda_channels` (optional)

Set custom channels to download conda packages from on the cluster nodes. This setting will overwrite all of the configured conda channels, including the default channels. If you are using this setting, you will need to explicitly include the two default channels, `defaults` and `anaconda-cluster`, followed by your custom channels.

```
conda_channels:  
- defaults  
- anaconda-cluster  
- blaze  
- pypi  
- username  
- https://conda.anaconda.org/username/
```

### `default_channels` (optional)

Set `default_channels` to download the default conda packages from the URL defined. This setting will overwrite the default conda channels: <http://repo.anaconda.com>.

```
default_channels: http://localhost/conda/anaconda
```

### channel\_alias (optional)

Set `channel_alias` to instruct conda to look for channels in a local repository. This setting will overwrite the default: <http://conda.anaconda.org>.

```
channel_alias: http://localhost/conda/
```

### name

Name of the profile.

```
name: profile_name
```

### node\_id

Image to configure on each node. For bare-metal clusters, a dummy value such as `bare-metal` can be used.

```
node_id: ami-d05e75b8 # Ubuntu 14.04, us-east-1 region
```

### node\_type

The type of node to launch. For bare-metal clusters, a dummy value such as `bare-metal` can be used.

```
node_type: m3.large
```

### num\_nodes

Number of nodes to launch (cloud-based) or manage (bare-metal).

```
num_nodes: 4
```

### machines (optional)

IP addresses of head and compute nodes in the cluster. Note that only IP addresses should be used with this setting, not hostnames or FQDNs.

This is used along with the *Bare-metal Cluster Setup* and can refer to bare-metal nodes, cloud-based nodes that were manually launched outside of Anaconda for cluster management, or a collection of virtual machines. If SSH is running on a port other than 22, you can optionally include the SSH port number (e.g., `192.168.1.1:2222`).

```
machines:
  head:
    - 192.168.1.1
  compute:
    - 192.168.1.2
    - 192.168.1.3
    - 192.168.1.4
```

### plugins (optional)

Install plugins upon cluster creation or provisioning. Some plugins also have configurable settings. Refer to the *Plugin Settings* documentation for more information.

```
plugins:
- notebook
- dask
```

### provider

Name of the provider to use to launch instances for a cloud-based or bare-metal cluster. For more information, refer to the *Provider settings* documentation.

```
provider: aws_east
```

### root\_size (optional)

Size of the root volume (GB). Currently only used for Amazon EBS volumes.

```
root_size: 200
```

### security (optional)

Security settings to enable/disable SELinux or flush iptables rules (default: true).

```
security:
  disable_selinux: true
  flush_iptables: true
```

### user

User to SSH to the cluster nodes as. This user must have passwordless sudo access.

```
user: ubuntu
```

### Sample cloud-based profile file

Below is a sample cloud-based profile named `profile_name` located in the `~/.acluster/profiles/profile_name.yaml` file that is configured with all required and optional settings.

```
name: profile_name
node_id: ami-d05e75b8 # Ubuntu 14.04, us-east-1 region
node_type: m3.large
num_nodes: 4
provider: aws_east
root_size: 50
user: ubuntu
```

(continues on next page)

(continued from previous page)

```
anaconda_url: http://localhost/miniconda/Miniconda-latest-Linux-x86_64.sh

aws:
  tags:
    - billingProject: anaconda-cluster

plugins:
  - notebook
  - dask

default_channels: http://localhost/conda/anaconda

channel_alias: http://localhost/conda/

conda_channels:
  - defaults
  - anaconda-cluster
  - blaze
  - pypi
  - username
  - https://conda.anaconda.org/username/

security:
  disable_selinux: true
  flush_iptables: true
```

### Sample bare-metal profile file

Below is a sample bare-metal profile named `profile_name` located in the `~/.acluster/profiles/profile_name.yaml` file that is configured with all required and optional settings.

```
name: profile_name
node_id: bare_metal
node_type: bare_metal
num_nodes: 4
provider: bare_metal
user: ubuntu
anaconda_url: http://localhost/miniconda/Miniconda-latest-Linux-x86_64.sh

machines:
  head:
    - 192.168.1.1
  compute:
    - 192.168.1.2
    - 192.168.1.3
    - 192.168.1.4

plugins:
  - notebook
  - dask

default_channels: http://localhost/conda/anaconda

channel_alias: http://localhost/conda/
```

(continues on next page)

(continued from previous page)

```
conda_channels:
- defaults
- anaconda-cluster
- blaze
- pypi
- username
- https://conda.anaconda.org/username/

security:
  disable_selinux: false
  flush_iptables: false
```

## Provider settings

The following provider settings can be used to define settings for creating cloud-based or bare-metal clusters. The `providers.yaml` file can contain credentials and settings for multiple providers.

- *Provider settings*
  - *cloud\_provider*
  - *keyname (optional)*
  - *location (optional)*
  - *private\_key*
  - *secret\_id (optional)*
  - *secret\_key (optional)*
  - *security\_group (optional)*
- *Sample providers file*

## Provider settings

### cloud\_provider

Name of the cloud provider (`ec2`, `none`). Use `none` for bare-metal clusters.

```
cloud_provider: ec2
```

### keyname (optional)

Name of the key to authenticate with the cluster nodes. This setting is used with a cloud provider.

```
keyname: my-private-key
```

### location (optional)

Region or location to use with a cloud provider.

```
location: us-east-1
```

### private\_key

Path to the private SSH key on the client machine.

```
private_key: ~/.ssh/my-private-key.pem
```

### secret\_id (optional)

Secret ID to authenticate with a cloud provider.

```
secret_id: AKIA*****
```

### secret\_key (optional)

Secret key to authenticate with a cloud provider.

```
secret_key: RXE*****
```

### security\_group (optional)

Security Group to use with a cloud provider. Note that this is the “Group Name” in the AWS Console, not the “Name” or “Group ID”. Note that you will need access to ports 22, 4505, and 4506 from the client machine to the cluster nodes to provision the cluster via SSH and Salt. If this parameter is not specified, then a default Security Group will be created for you, called `anaconda-cluster-default`, with all ports open.

```
security_group: my-security-group
```

### Sample providers file

Below is a sample providers file located in the `~/.acluster/providers.yaml` file that is configured with all required and optional settings. The `providers.yaml` file can contain credentials and settings for multiple providers. The sample providers file shown below defines two providers named `aws_east` and `bare_metal` for cloud-based and bare-metal clusters, respectively.

```
aws_east:
  cloud_provider: ec2
  keyname: my-private-key
  location: us-east-1
  private_key: ~/.ssh/my-private-key.pem
  secret_id: AKIAXXXXXX
  secret_key: XXXXXXXXXX
  security_group: my-security-group
```

(continues on next page)

(continued from previous page)

```
bare_metal:  
  cloud_provider: none  
  private_key: ~/.ssh/my-private-key
```

## Plugins

- *List of available plugins*
- *Installing Plugins*
- *Plugin Settings*
  - *Conda*
  - *Dask*
  - *HDFS*
  - *Jupyter Notebook*
  - *Custom download settings for plugins*
- *Managing Plugins*
  - *Plugin Status*
  - *Open Plugin UIs*
  - *Restart Plugins*
  - *Stop Plugins*
- *Plugin Notes and Network Ports*
  - *HDFS*
  - *Jupyter Notebook*
  - *Miniconda*
  - *Salt*
  - *Spark*
  - *YARN*

## List of available plugins

Anaconda for cluster management can install and manage the following plugins on a cluster:

- Anaconda distribution
- Dask/Distributed
- Ganglia
- IPython Parallel
- Jupyter Notebook

- Salt

The following plugins are unsupported and should only be used for prototyping/experimental purposes:

- Elasticsearch
- HDFS
- Hive
- Impala
- Kibana
- Logstash
- Spark (standalone mode or YARN)
- Storm
- YARN
- ZooKeeper

If you're interested in using Anaconda with production Hadoop clusters, Anaconda for cluster management works with enterprise Hadoop distributions such as [Cloudera CDH](#) or [Hortonworks HDP](#).

On clusters with existing enterprise Hadoop installations, Anaconda for cluster management can manage packages (e.g., for PySpark, SparkR, or Dask) and can install and manage the Jupyter Notebook and Dask plugins.

## Installing Plugins

Plugins can be installed using two methods:

1. Using the `cluster_profile.yaml` file when creating or provisioning a cluster.
2. Using the `acluster install` command after the cluster is created.

### 1. Install plugins with the `profile.yaml` file

When creating or provisioning a cluster, create or edit the file `~/.acluster/profiles.d/profile_name.yaml` as shown in the example below:

```
name: profile_name
provider: aws
node_id: ami-d05e75b8 # Ubuntu 14.04, us-east-1 region
user: ubuntu
node_type: m3.large
num_nodes: 5
plugins:
  - notebook
  - dask
```

Optionally, you can configure some plugin settings from within your profile. For example, you can specify a password to protect a Jupyter Notebook using:

```
name: profile_name
provider: aws
node_id: ami-d05e75b8 # Ubuntu 14.04, us-east-1 region
user: ubuntu
node_type: m3.large
num_nodes: 5
```

(continues on next page)

(continued from previous page)

```
plugins:
  - notebook:
      password: secret
```

Refer to the [Plugin Settings](#) section for more details on configuring plugin settings.

## 2. Install plugins using the `acluster install` command

After the cluster has been created, you can view a list of available plugins with the command `acluster install` as shown in the example below:

```
$ acluster install
Usage: acluster install [OPTIONS] COMMAND [ARGS]...

  Install plugins across the cluster

Options:
  -h, --help  Show this message and exit.

Commands:
  conda          Install (mini)conda
  dask           Install Dask/Distributed
  elasticsearch  Install Elasticsearch
  ganglia        Install Ganglia
  hdfs          Install HDFS
  hive          Install Hive
  impala        Install Impala
  ipython-parallel  Install IPython Parallel
  kibana        Install Kibana
  notebook      Install Jupyter Notebook
  logstash      Install Logstash
  salt          Install Salt
  spark-standalone  Install Spark (standalone)
  spark-yarn     Install Spark (YARN)
  storm         Install Storm
  yarn          Install YARN
  zookeeper     Install Zookeeper
```

All of the above subcommands can optionally receive a `--cluster/-x` option to specify a cluster. This option is not required if you only have one cluster running.

**Note:** Salt is the base for all plugins except Conda. Therefore, the Salt plugin needs to be installed before the other plugins can be installed. Salt is installed by default when you create or provision a cluster using the `acluster create` or `acluster provision` command.

## Plugin Settings

The following plugins support custom settings that can be defined within a profile.

### Conda

Configure conda packages and environments to be installed upon cluster creation or provisioning:

```
name: profile_name
plugins:
  - conda:
      environments:
        root:
          - numpy
        py27:
          - python=2.7
          - scipy
          - numba
        py34:
          - python=3.4
          - pandas
          - nltk
```

Configure the installation location of conda (default: `/opt/anaconda`):

```
name: profile_name
plugins:
  - conda:
      install_prefix: /opt/another_anaconda
```

Set `conda_sh` to `false` to disable the creation of `/etc/profile.d/conda.sh` on cluster nodes (default: `true`):

```
name: profile_name
plugins:
  - conda:
      conda_sh: false
```

Set `conda_group_name` to any valid unix group (default: `anaconda`):

```
name: profile_name
plugins:
  - conda:
      conda_group_name: anaconda
```

Set `conda_acl` to a list of users who will be given access for Anaconda Cluster admin capabilities. Note: When using this setting at least one user must have `sudo` access during the provisioning phase. Typically, this will include the user previously set above as `user`.

```
name: profile_name
plugins:
  - conda:
      conda_acl:
        - user1
        - user2
```

Set `ssl_verify` to a custom SSL path or to `False` to disable SSL verification for conda. Refer to the [conda documentation](#) for more information.

```
name: profile_name
plugins:
  - conda:
      ssl_verify: False
```

## Dask

You can optionally set the number of processes (`nprocs`) to use for the Dask/Distributed workers and the `host` to access the Dask/Distributed UI via a browser. Refer to the [Dask distributed scheduler documentation](#) for more information about these settings.

```
name: profile_name
plugins:
  - dask:
      nprocs: 8
      host: dask-ui.com
```

## HDFS

By default, the HDFS plugin is configured to use the following directories: `/data/dfs/nn` on the namenode and `/data/dfs/dn` on the datanodes. When multiple drives are available, the same directories are used on all non-root drives.

You can optionally set custom directories for the HDFS namenode and datanode. For example, the following settings can be used if you want to utilize a large root volume (e.g., using the `root_volume` profile setting with Amazon EC2):

```
name: profile_name
plugins:
  - hdfs:
      namenode_dirs:
        - /data/dfs/nn
      datanode_dirs:
        - /data/dfs/dn
```

## Jupyter Notebook

Set a custom password to protect a Jupyter Notebook (default: `acluster`):

```
name: profile_name
plugins:
  - notebook:
      password: acluster
```

Set a custom port for the Jupyter Notebook server (default: `8888`):

```
name: profile_name
plugins:
  - notebook:
      port: 8888
```

Set a custom directory for Jupyter Notebooks (default: `/opt/notebooks`):

```
name: profile_name
plugins:
  - notebook:
      directory: /opt/notebooks
```

## Custom download settings for plugins

Most plugins are installed from the standard package management repositories for your Linux distribution. Some plugins are downloaded directly from their source/project website. You can override the default download settings for the following plugins:

```
name: profile_name
plugins:
  - elasticsearch:
      download_url: https://download.elasticsearch.org/elasticsearch/release/org/
↪elasticsearch/distribution/tar/elasticsearch/2.1.0/elasticsearch-2.1.0.tar.gz
      download_hash: sha1=b6d681b878e3a906fff8c067b3cfe855240bffb
      version: elasticsearch-2.1.0
  - logstash:
      download_url: https://download.elastic.co/logstash/logstash/logstash-2.1.1.tar.
↪gz
      download_hash: sha1=d71a6e015509030ab6012adcf79291994ece0b39
      version: logstash-2.1.1
  - kibana:
      download_url: https://download.elastic.co/kibana/kibana/kibana-4.3.0-linux-x64.
↪tar.gz
      download_hash: sha1=d64e1fc0ddeaaab85e168177de6c78ed82bb3a3b
      version: kibana-4.3.0-linux-x64
  - storm:
      source_url: http://apache.arvixe.com/storm/apache-storm-0.9.5/apache-storm-0.9.
↪5.tar.gz
      version_name: apache-storm-0.9.5
```

## Managing Plugins

The following commands can be used to manage your plugins:

### Plugin Status

Check the status of the plugins by using the `acluster status` command:

```
$ acluster status
Usage: acluster status [OPTIONS] COMMAND [ARGS]...

Options:
  -x, --cluster TEXT           Cluster name
  -l, --log-level [info|debug|error]
                                Library logging level
  -h, --help                   Show this message and exit.

Commands:
  conda           Check Conda status
  dask            Check Dask/Distributed status
  elasticsearch   Check Elasticsearch status
  ganglia         Check Ganglia status
  hdfs           Check HDFS status
  hive           Check Hive status
  impala         Check Impala status
  ipython-parallel Check IPython Parallel status
```

(continues on next page)

(continued from previous page)

|                  |                                       |
|------------------|---------------------------------------|
| kibana           | Check Kibana status                   |
| notebook         | Check IPython/Jupyter Notebook status |
| salt             | Check Salt package status             |
| salt-conda       | Check Salt Conda module status        |
| salt-key         | Check salt-minion keys status         |
| spark-standalone | Check Spark (standalone) status       |
| ssh              | Check SSH status                      |
| storm            | Check Storm status                    |
| yarn             | Check YARN status                     |

**Example:**

```
$ acluster status conda
Checking status of conda on cluster: demo_cluster
54.81.187.22: True
54.91.219.252: True
54.163.26.229: True
54.145.10.211: True
Status all: True

$ acluster status salt
54.167.128.130: True
54.205.160.114: True
50.16.32.99: True
50.16.34.82: True
54.163.143.34: True
Status all: True

$ acluster status salt-key
ip-10-156-23-215.ec2.internal: True
ip-10-147-47-235.ec2.internal: True
ip-10-225-181-251.ec2.internal: True
ip-10-237-145-2.ec2.internal: True
ip-10-156-30-32.ec2.internal: True
Status all: True

$ acluster status salt-conda
ip-10-156-23-215.ec2.internal: True
ip-10-237-145-2.ec2.internal: True
ip-10-225-181-251.ec2.internal: True
ip-10-147-47-235.ec2.internal: True
ip-10-156-30-32.ec2.internal: True
Status all: True
```

The multiple salt status checks perform different checks. The `acluster status salt` command verifies that the salt package is installed, the `acluster status salt-key` command verifies that the salt minions are connected to the head node, and the `acluster status salt-conda` command verifies that the salt conda module is distributed across the cluster and is operational.

All of the above checks should return a successful status after executing `acluster install salt`.

**Open Plugin UIs**

Some of the plugins provide a browser UI that can be displayed to the user. The `acluster open` command is a utility command that opens a browser window corresponding to each plugin. The command:

```
$ acluster open notebook
```

will open a browser window to the Jupyter Notebook (port 8888).

Use the `--no-browser` option to print the URL for the plugin interface without opening a browser window.

```
$ acluster open notebook --no-browser
notebook: http://54.172.82.53:8888
```

### Restart Plugins

If a plugin is not working correctly, restart the processes by using the `acluster restart` command.

### Stop Plugins

To stop a plugin, use the `acluster stop` command.

### Plugin Notes and Network Ports

#### HDFS

Requires: `salt`

Distributed file system used by many of the distributed analytics engines such as Impala, Hive, and Spark.

| Service     | Location  | Port  |
|-------------|-----------|-------|
| NameNode UI | Head node | 50070 |
| HDFS Master | Head node | 9000  |
| WebHDFS     | Head node | 14000 |

#### Jupyter Notebook

Requires: `salt`

Web-based interactive computational environment for Python.

| Service  | Location  | Port |
|----------|-----------|------|
| Notebook | Head node | 8888 |

Notebooks are saved in the directory `/opt/notebooks`. You can upload and download notebooks from the cluster by using the `put` and `get` commands, respectively.

```
$ acluster put mynotebook.ipynb /opt/notebooks/mynotebook.ipynb
$ acluster get /opt/notebooks/mynotebook.ipynb mynotebook.ipynb
```

#### Miniconda

Python distribution from [Anaconda](#) – ships with Python libraries for large-scale data processing, predictive analytics, and scientific computing.

## Salt

Requires: `conda`

Configuration management system.

| Service            | Location  | Port |
|--------------------|-----------|------|
| Salt Master/Minion | All nodes | 4505 |
| Salt Master/Minion | All nodes | 4506 |

## Spark

Computing framework and analytics engine written in Java/Scala with a Python interface (PySpark).

| Service               | Location  | Port |
|-----------------------|-----------|------|
| Spark UI (standalone) | Head node | 8080 |

## YARN

Resource manager in which all Hadoop and Hadoop-like jobs are run.

| Service     | Location        | Port |
|-------------|-----------------|------|
| Resource UI | Head node       | 9026 |
| NodeManager | Compute node(s) | 9035 |

## Cluster management

- *Overview*
- *SSH access*
- *Executing commands*
- *Upload/download files*
- *Command history*
- *Centralized logging*
- *Anaconda for cluster management client information*
- *Advanced: Running Salt modules*
- *Advanced: Syncing Salt formulas*

## Overview

Anaconda for cluster management provides functionality to easily interact with clusters, including:

- Secure shell (SSH) to cluster nodes

- Executing commands on cluster nodes
- Uploading (put) and downloading (get) files from cluster nodes
- Executing salt module commands: <http://docs.saltstack.com/en/latest/ref/modules/all/>

For a concise overview of all of the available commands, view the Anaconda for cluster management Cheat Sheet.

For the `acluster` commands shown below, you can optionally specify a `--cluster/-x` option to specify a target cluster to operate on. This option is not required if only one cluster is running.

### SSH access

The command `acluster ssh` can be used to SSH into any node within the cluster.

The first (optional) argument is a zero-indexed number that refers to a node, where 0 is the head node, 1 is the first compute node, and so on.

**Note:** This functionality requires SSH. **Windows users:** Install an SSH client such as [PuTTY](#).

### Executing commands

The `acluster cmd` command allows commands to be executed across multiple nodes on the cluster. This functionality is performed via salt (default) or fabric (using the `--ssh/-s` flag).

Salt provides faster execution times (especially in large clusters) of remote commands, assuming salt is installed and running on the cluster. Salt is installed by default on cloud providers and can be installed on bare-metal clusters using the command `acluster install salt`.

Fabric provides remote command execution based on SSH, which can be slow in big clusters but does not require salt to be installed on the cluster. Using fabric, you can also target specific nodes using the `--target/-t` option. The `--target/-t` option can receive the keywords 'head' and 'compute', a number (zero-indexed, where 0 is the head node and 1 is the first compute node), or two numbers separated by a comma to target a group of consecutive nodes.

Example:

```
$ acluster cmd 'date'
Executing command "date" target: "*" cluster: "demo_cluster"
4 nodes response: Thu May 14 19:21:48 UTC 2015
1 nodes response: Thu May 14 19:21:44 UTC 2015
1 nodes response: Thu May 14 19:21:47 UTC 2015

$ acluster cmd 'date' --ssh
54.196.149.0: Thu May 14 19:22:06 UTC 2015
54.159.15.86: Thu May 14 19:22:03 UTC 2015
107.21.159.226: Thu May 14 19:22:06 UTC 2015
107.20.60.246: Thu May 14 19:22:06 UTC 2015
54.237.177.104: Thu May 14 19:22:06 UTC 2015
54.227.91.24: Thu May 14 19:22:06 UTC 2015

$ acluster cmd 'date' --ssh -t head
107.21.159.226: Thu May 14 19:23:02 UTC 2015

$ acluster cmd 'date' --ssh -t 3,6
54.196.149.0: Thu May 14 19:23:29 UTC 2015
54.159.15.86: Thu May 14 19:23:26 UTC 2015
54.227.91.24: Thu May 14 19:23:29 UTC 2015
```

## Upload/download files

The commands `acluster put` and `acluster get` allow files to be uploaded to and downloaded from any node in the cluster. By default, the `put` and `get` commands target the head node.

Both of the `put` and `get` commands have the same `--target/-t` option, which has the same functionality as `cmd` with the `-ssh/-s` flag.

Example:

```
$ acluster put environment.yml /tmp/env.yml
Uploading file "environment.yml" to "/tmp/env.yml" - cluster: "demo_cluster" - hosts:
["107.21.159.226"]

$ acluster put environment.yml /tmp/env.yml --all
Uploading file "environment.yml" to "/tmp/env.yml" - cluster: "demo_cluster" - hosts:
["107.21.159.226", '107.20.60.246', '54.237.177.104', '54.159.15.86', '54.196.149.0',
'54.227.91.24']

$ acluster put environment.yml /tmp/env.yml -t ,3
Uploading file "environment.yml" to "/tmp/env.yml" - cluster: "demo_cluster" - hosts:
["107.21.159.226", '107.20.60.246', '54.237.177.104']

$ acluster put environment.yml /tmp/env.yml -t compute
Uploading file "environment.yml" to "/tmp/env.yml" - cluster: "demo_cluster" - hosts:
["107.20.60.246", '54.237.177.104', '54.159.15.86', '54.196.149.0', '54.227.91.24']"
```

The `get` command has similar behavior. Although the `-target/-t` option is also available, it might not make sense to download the same file repeatedly since it will get overwritten.

Example:

```
$ acluster get /tmp/env.yml env2.yml
Downloading file "/tmp/env.yml" to "env2.yml" - cluster: "demo_cluster" - hosts:
["107.21.159.226"]

$ acluster get /tmp/env.yml env2.yml --all
Downloading file "/tmp/env.yml" to "env2.yml" - cluster: "demo_cluster" - hosts:
["107.21.159.226", '107.20.60.246', '54.237.177.104', '54.159.15.86', '54.196.149.0',
'54.227.91.24']
Warning: Local file /tmp/env2.yml already exists and is being overwritten.
Warning: Local file /tmp/env2.yml already exists and is being overwritten.
```

## Command history

The `acluster history` command displays commands that were previously executed using `acluster`. By default, the ten most recent commands are shown.

```
$ acluster history
2015-06-09 23:39:22,515: acluster create demo_cluster --profile profile_name
2015-06-10 00:00:46,151: acluster ssh
2015-06-10 00:01:35,304: acluster acluster conda install numpy scipy
2015-06-10 00:02:01,029: acluster open notebook
```

### Centralized logging

You can install the Elasticsearch, Logstash, and Kibana (ELK) plugins and use them to collect, search, and analyze data. When you install the ELK plugins, they come preconfigured for centralized logging of other Anaconda for cluster management plugins. For more information about plugins, refer to the [Plugins](#) documentation.

To install the ELK plugins, insert the following in your cluster profile before you create or provision a cluster:

```
plugins:
  - elasticsearch
  - logstash
  - kibana
```

or, use the following command to install the ELK plugins on an active cluster:

```
$ acluster install elasticsearch logstash kibana
```

After the ELK plugins are installed, they will begin collecting logs for various services, and the log data can be searched using Elasticsearch and visualized using Kibana. You can open the Kibana UI in your browser using the following command:

```
$ acluster open kibana
```

By default, the following index patterns are available in Kibana:

```
YYYY-MM-DD
salt
hdfs
yarn
spark_yarn
spark_standalone
zookeeper
impala
hive
hbase
hadoop-httpfs
mapreduce
syslog
```

Note that you can use the ELK plugins in a number of different workflows once they are installed on the cluster, including:

- Viewing and searching logs for all cluster-related plugins
- Viewing logs for Spark or YARN jobs for centralized job monitoring and troubleshooting
- Utilizing centralized logging capabilities from your application

### Anaconda for cluster management client information

The `acluster info` command displays version information related to the Anaconda for cluster management client installation.

```
$ acluster info
anaconda-cluster version: 1.0
Platform: Darwin-14.3.0-x86_64
Processor: i386
```

(continues on next page)

(continued from previous page)

```

Byte-ordering: little
Python version: 2.7.10 |Continuum Analytics, Inc.| (default, May 28 2015, 17:04:42)
[GCC 4.2.1 (Apple Inc. build 5577)]
apache-libcloud version: 0.16.0
yaml version: 3.11

```

### Advanced: Running Salt modules

By default, salt provides quite a bit of functionality in its default modules. All of this functionality is available by using the `acluster function` command.

For example, you can ping all of the cluster nodes to see that they are available:

```

$ acluster function test.ping
ip-10-153-156-45.ec2.internal:
    True
ip-10-169-57-125.ec2.internal:
    True
ip-10-181-18-153.ec2.internal:
    True
ip-10-144-199-24.ec2.internal:
    True
ip-10-113-145-230.ec2.internal:
    True
ip-10-136-78-206.ec2.internal:
    True

```

Advanced functions are also available, such as listing all of the IP address associated with a node:

```

$ acluster function network.ipaddr
ip-10-169-57-125.ec2.internal:
    - 10.169.57.125
ip-10-144-199-24.ec2.internal:
    - 10.144.199.24
ip-10-181-18-153.ec2.internal:
    - 10.181.18.153
ip-10-153-156-45.ec2.internal:
    - 10.153.156.45
ip-10-136-78-206.ec2.internal:
    - 10.136.78.206
ip-10-113-145-230.ec2.internal:
    - 10.113.145.230

```

Another common salt command can be used to install packages using the system package manager:

```

$ acluster function pkg.install httpd
ip-10-136-78-206.ec2.internal:
    ...
    httpd:
        -----
        new:
            2.2.15-39.el6.centos
        old:
        ...

```

(continues on next page)

(continued from previous page)

```
ip-10-144-199-24.ec2.internal:
...
  httpd:
    -----
    new:
      2.2.15-39.el6.centos
    old:
    ...
...

```

For more information on salt commands, see <http://docs.saltstack.com/en/latest/ref/modules/all/>

## Advanced: Syncing Salt formulas

The `acluster sync` command is an advanced feature that synchronizes the Salt formulas from the client to the head node and then across the cluster.

## Conda management

- *Overview*
- *Installing packages from channels*
- *List of remote conda commands*
- *Example remote conda commands*
  - *Install conda packages*
  - *List conda packages*
  - *Update conda packages*
  - *Remove conda packages*
  - *Create conda environments*
  - *Push conda environments*
  - *List conda environments*

## Overview

One of the primary features of Anaconda for cluster management is the remote deployment and management of Anaconda environments across a cluster.

Prepending `acluster` to core conda commands will execute those commands across all of the cluster nodes.

For example, to view the conda environments on all of the cluster nodes:

```
$ acluster conda info -e
All nodes (x3) response:
# conda environments:
```

(continues on next page)

(continued from previous page)

```
#
root          *   /opt/anaconda
```

To install numpy on all of the cluster nodes:

```
$ acluster conda install numpy
Installing (u'numpy',) on cluster "demo_cluster"
Node "ip-10-234-8-208.ec2.internal":
    Successful actions: 1/1
Node "ip-10-170-59-28.ec2.internal":
    Successful actions: 1/1
Node "ip-10-232-42-58.ec2.internal":
    Successful actions: 1/1
```

For a concise overview of all of the available commands, view the [Anaconda for cluster management Cheat Sheet](#).

## Installing packages from channels

You can install packages from [Anaconda Cloud](#) or from an Anaconda Repository installation by adding the `--channel/-c` option. For example, to install the `apache-libcloud` package from the `anaconda-cluster` channel:

```
$ acluster conda install -c https://conda.anaconda.org/anaconda-cluster apache-
↳ libcloud
Installing (u'apache-libcloud',) on cluster "demo_cluster"
Node "ip-10-136-80-92.ec2.internal":
    Successful actions: 1/1
Node "ip-10-63-173-62.ec2.internal":
    Successful actions: 1/1
$ acluster conda list | grep apache-libcloud
- 'apache-libcloud: 0.16.0 (py27_0)'
```

## List of remote conda commands

The following conda commands are available in Anaconda for cluster management:

- `acluster conda install` – Install package(s)
- `acluster conda update` – Update package(s)
- `acluster conda remove` – Remove package(s)
- `acluster conda list` – List package(s)
- `acluster conda create` – Create conda environment
- `acluster conda info` – Display information about current conda install
- `acluster conda push` – Push conda environment to cluster

For more information about conda, refer to the [conda documentation](#).

## Example remote conda commands

### Install conda packages

Any conda package can be installed on a cluster managed by Anaconda for cluster management:

```
$ acluster conda install numpy

Node "ip-10-136-80-92.ec2.internal":
    Successful actions: 1/1
Node "ip-10-63-173-62.ec2.internal":
    Successful actions: 1/1
```

Verify that the package was installed using the `list` command:

```
$ acluster conda list

All nodes (x2) response:
...
- 'numpy: 1.9.2 (py27_0)'
...
```

You may also install multiple conda packages with a single command:

```
$ acluster conda install scipy pandas scikit-learn
Node "ip-10-136-80-92.ec2.internal":
    Successful actions: 3/3
Node "ip-10-63-173-62.ec2.internal":
    Successful actions: 3/3

$ acluster conda list
All nodes (x2) response:
...
- 'pandas: 0.16.1 (np19py27_0)'
...
- 'scikit-learn: 0.16.1 (np19py27_0)'
- 'scipy: 0.15.1 (np19py27_0)'
...
```

**Note:** It is recommended that you install all of the packages you want at once. Installing one package at a time can result in dependency conflicts.

### List conda packages

A useful conda command to run on a cluster is to list the packages that are available on the nodes (by default all of the nodes should have the same packages):

```
$ acluster conda list

All nodes (x2) response:
- 'libsodium: 0.4.5 (0)'
- 'sqlite: 3.8.4.1 (1)'
- 'conda-env: 2.1.4 (py27_0)'
- 'python: 2.7.9 (3)'
...
```

## Update conda packages

You can also specify which versions of conda packages to install or update:

```
$ acluster conda install pandas==0.13
Installing (u'pandas==0.13',) on cluster "demo_cluster"
Node "ip-10-136-80-92.ec2.internal":
    Successful actions: 1/1
Node "ip-10-63-173-62.ec2.internal":
    Successful actions: 1/1
$ acluster conda list | grep pandas
- 'pandas: 0.13.0 (np18py27_0)'

$ acluster conda update pandas
Updating (u'pandas',) on cluster "demo_cluster"
Node "ip-10-136-80-92.ec2.internal":
    Successful actions: 1/1
Node "ip-10-63-173-62.ec2.internal":
    Successful actions: 1/1
$ acluster conda list | grep pandas
- 'pandas: 0.16.1 (np19py27_0)'
```

## Remove conda packages

You can remove conda packages across a cluster:

```
$ acluster conda remove pandas
Removing (u'pandas',) on cluster "demo_cluster"
Node "ip-10-136-80-92.ec2.internal":
    Successful actions: 1/1
Node "ip-10-63-173-62.ec2.internal":
    Successful actions: 1/1

$ acluster conda list | grep pandas
... NO OUTPUT ...
```

## Create conda environments

You can also manage conda environments across a cluster with Anaconda for cluster management.

To create a new conda environment that contains Python and numpy, use the command `conda create -n test_env numpy`.

On a cluster, use the same command and simply prepend `acluster` as shown:

```
$ acluster conda create -n test_env numpy
All nodes (x2) response:
Conda environment "test_env" created
```

Once the environment is created, refer to that named environment by adding the `-n` name option to conda commands:

```
$ acluster conda list -n test_env
All nodes (x2) response:
- 'sqlite: 3.8.4.1 (1)'
```

(continues on next page)

(continued from previous page)

```

- 'python: 2.7.9 (3)'
- 'zlib: 1.2.8 (0)'
- 'openssl: 1.0.1k (1)'
- 'system: 5.8 (2)'
- 'tk: 8.5.18 (0)'
- 'setuptools: 15.2 (py27_0)'
- 'pip: 6.1.1 (py27_0)'
- 'readline: 6.2 (2)'
- 'numpy: 1.9.2 (py27_0)'

$ acluster conda install -n test_env requests
Installing (u'requests',) on cluster "d" - target: "*"
Node "ip-10-136-80-92.ec2.internal":
    Successful actions: 1/1
Node "ip-10-63-173-62.ec2.internal":
    Successful actions: 1/1

$ acluster conda list -n test_env
All nodes (x2) response:
- 'sqlite: 3.8.4.1 (1)'
- 'python: 2.7.9 (3)'
- 'zlib: 1.2.8 (0)'
- 'openssl: 1.0.1k (1)'
- 'system: 5.8 (2)'
- 'tk: 8.5.18 (0)'
- 'setuptools: 15.2 (py27_0)'
- 'pip: 6.1.1 (py27_0)'
- 'readline: 6.2 (2)'
- 'numpy: 1.9.2 (py27_0)'
- 'requests: 2.7.0 (py27_0)'

```

## Push conda environments

You can also push conda environments from the client machine to the cluster by using a `conda environment.yml` file:

```

$ acluster conda push ./environment.yml
['ip-10-234-8-208.ec2.internal'] nodes response:
Conda environment with "/tmp/anaconda-cluster/environment.yml" created
...

```

## List conda environments

To verify that the environment has been pushed to all nodes, use the `info` command:

```

$ acluster conda info -e
All nodes (x3) response:
# conda environments:
#
stats                /opt/anaconda/envs/stats
root                 *  /opt/anaconda

```

## Python with Spark How-tos

These how-tos will show you how to run Python tasks on a Spark cluster using the PySpark module. These how-tos will also show you how to interact with data stored within HDFS on the cluster.

While these how-tos are not dependent on each other and can be accomplished in any order it is recommended that you begin with the *Overview of Spark, YARN and HDFS* first.

## Overview of Spark, YARN and HDFS

[Spark](#) is an analytics engine and framework that is capable of running queries 100 times faster than traditional MapReduce jobs written in Hadoop. In addition to the performance boost, developers can write Spark jobs in Scala, Python and Java if they so desire. Spark can load data directly from disk, memory and other data storage technologies such as Amazon S3, Hadoop Distributed File System (HDFS), HBase, Cassandra, etc.

You can install Spark using an enterprise Hadoop distribution such as [Cloudera CDH](#) or [Hortonworks HDP](#).

## Submitting Spark Jobs

Spark scripts are often developed interactively and can be written as a script file or as a Jupyter notebook file.

A Spark script can be submitted to a Spark cluster using various methods:

- Running the script directly on the head node.
- Using the `spark-submit` script in either Standalone mode or with the YARN resource manager
- Interactively in an IPython shell or Jupyter Notebook on the cluster

To run a script on the head node, simply execute `python example.py` on the cluster.

Note: that in order to launch Jupyter Notebook on the cluster, the plugin must already be installed. See the *Plugins* documentation for more information.

## Working with Data in HDFS

Moving data in and around HDFS can be difficult. If you need to move data from your local machine to HDFS, from Amazon S3 to HDFS, from Amazon S3 to Redshift, from HDFS to Hive and so on, we recommend using [odo](#), which is part of the [Blaze ecosystem](#). Odo efficiently migrates data from the source to the target through a network of conversions.

If you are unfamiliar with Spark and/or SQL, we recommend using [Blaze](#) to express selections, aggregations, group-bys, etc. in a dataframe-like style. Blaze provides Python users with a familiar interface to query data that exists in different data storage systems.

## How to Run a Spark Standalone Job

### Overview

This is a minimal Spark script that imports PySpark, initializes a SparkContext and performs a distributed calculation on a Spark cluster in standalone mode.

## Who is this for?

This how-to is for users of a Spark cluster that has been configured in standalone mode who wish to run Python code.

## Spark Standalone Summary

1. *Before you start*
2. *Modifying the script*
3. *Running the job*
4. *Troubleshooting*
5. *Further information*

### Before you start

To execute this example, download the `cluster-spark-basic.py` example script to the cluster node where you submit Spark jobs.

For this example, you'll need Spark running with the standalone scheduler. You can install Spark using an enterprise Hadoop distribution such as [Cloudera CDH](#) or [Hortonworks HDP](#). Some additional configuration might be necessary to use Spark in standalone mode.

### Modifying the script

After downloading the `cluster-spark-basic.py` example script open the file in a text editor on your cluster. Replace `HEAD_NODE_HOSTNAME` with the hostname of the head node of the Spark cluster.

```
# cluster-spark-basic.py
from pyspark import SparkConf
from pyspark import SparkContext

conf = SparkConf()
conf.setMaster('spark://HEAD_NODE_HOSTNAME:7077')
conf.setAppName('spark-basic')
sc = SparkContext(conf=conf)

def mod(x):
    import numpy as np
    return (x, np.mod(x, 2))

rdd = sc.parallelize(range(1000)).map(mod).take(10)
print rdd
```

Let's analyze the contents of the `spark-basic.rst` example script. The first code block contains imports from PySpark.

The second code block initializes the `SparkContext` and sets the application name.

The third code block contains the analysis code that calculates the modulus of a range of numbers up to 1000 using the NumPy package and returns/prints the first 10 results.

Note: you may have to install NumPy with `cluster conda install numpy`.

## Running the job

You can run this script by submitting it to your cluster for execution using `spark-submit` or by running this command

```
python cluster-spark-basic.py
```

The output from the above command shows the first ten values that were returned from the `cluster-spark-basic.py` script.

```
16/05/05 22:26:53 INFO spark.SparkContext: Running Spark version 1.6.0

[...]

16/05/05 22:27:03 INFO scheduler.TaskSetManager: Starting task 0.0 in stage 0.0 (TID_
↪0, localhost, partition 0,PROCESS_LOCAL, 3242 bytes)

```

## Troubleshooting

If something goes wrong consult the [FAQ / Known issues](#) page.

## Further information

See the [Spark](#) and [PySpark](#) documentation pages for more information.

## How to Run with the YARN resource manager

### Overview

This script runs on the Spark cluster with the YARN resource manager and returns the hostname of each node in the cluster.

### Who is this for?

This how-to is for users of a Spark cluster who wish to run Python code using the YARN resource manager.

## Spark YARN Summary

1. *Before you start*

2. *Running the Job*
3. *Troubleshooting*
4. *Further information*

## Before you start

To execute this example, download the `cluster-spark-yarn.py` example script to your cluster.

For this example, you'll need Spark running with the YARN resource manager. You can install Spark and YARN using an enterprise Hadoop distribution such as [Cloudera CDH](#) or [Hortonworks HDP](#).

## Running the Job

Here is the complete script to run the Spark + YARN example in PySpark:

```
# cluster-spark-yarn.py
from pyspark import SparkConf
from pyspark import SparkContext

conf = SparkConf()
conf.setMaster('yarn-client')
conf.setAppName('spark-yarn')
sc = SparkContext(conf=conf)

def mod(x):
    import numpy as np
    return (x, np.mod(x, 2))

rdd = sc.parallelize(range(1000)).map(mod).take(10)
print rdd
```

Note: you may have to install NumPy with `cluster conda install numpy`.

Run the script on the Spark cluster with `spark-submit`. The output shows the first ten values that were returned from the `cluster-spark-basic.py` script.

```
16/05/05 22:26:53 INFO spark.SparkContext: Running Spark version 1.6.0

[...]

16/05/05 22:27:03 INFO scheduler.TaskSetManager: Starting task 0.0 in stage 0.0 (TID_

## Troubleshooting

If something goes wrong consult the [FAQ / Known issues](#) page.

## Further information

See the [Spark](#) and [PySpark](#) documentation pages for more information.

## How to perform a word count on text data in HDFS

### Overview

This example counts the number of words in text files that are stored in HDFS.

### Who is this for?

This how-to is for users of a Spark cluster who wish to run Python code using the YARN resource manager that reads and processes files stored in HDFS.

### Spark Wordcount Summary

1. *Before you start*
2. *Load HDFS data*
3. *Running the Job*
4. *Troubleshooting*
5. *Further information*

### Before you start

To execute this example, download the `cluster-spark-wordcount.py` example script and the `cluster-download-wc-data.py` script.

For this example, you'll need Spark running with the YARN resource manager and the Hadoop Distributed File System (HDFS). You can install Spark, YARN, and HDFS using an enterprise Hadoop distribution such as [Cloudera CDH](#) or [Hortonworks HDP](#).

You will also need valid [Amazon Web Services](#) (AWS) credentials.

### Load HDFS data

First, we will load the sample text data into the HDFS data store. The following script will transfer sample text data (approximately 6.4 GB) from a public Amazon S3 bucket to the HDFS data store on the cluster.

Download the `cluster-download-wc-data.py` script to your cluster and Insert your Amazon AWS credentials in the `AWS_KEY` and `AWS_SECRET` variables.

```
import subprocess

AWS_KEY = ''
AWS_SECRET = ''

s3_path = 's3n://{0}:{1}@blaze-data/enron-email'.format(AWS_KEY, AWS_SECRET)
cmd = ['hadoop', 'distcp', s3_path, 'hdfs:///tmp/enron']
subprocess.call(cmd)
```

**Note:** The `hadoop distcp` command might cause HDFS to fail on smaller instance sizes due to memory limits.

Run the `cluster-download-wc-data.py` script on the Spark cluster.

```
python cluster-download-wc-data.py
```

After a few minutes, the text data will be in the HDFS data store on the cluster and ready for analysis.

## Running the Job

Download the `cluster-spark-wordcount.py` example script to your cluster. This script will read the text files downloaded in step 2 and count all of the words.

```
# cluster-spark-wordcount.py
from pyspark import SparkConf
from pyspark import SparkContext

HDFS_MASTER = 'HEAD_NODE_IP'

conf = SparkConf()
conf.setMaster('yarn-client')
conf.setAppName('spark-wordcount')
conf.set('spark.executor.instances', 10)
sc = SparkContext(conf=conf)

distFile = sc.textFile('hdfs://{0}:9000/tmp/enron/*/*.txt'.format(HDFS_MASTER))

nonempty_lines = distFile.filter(lambda x: len(x) > 0)
print 'Nonempty lines', nonempty_lines.count()

words = nonempty_lines.flatMap(lambda x: x.split(' '))

wordcounts = words.map(lambda x: (x, 1)) \
    .reduceByKey(lambda x, y: x+y) \
    .map(lambda x: (x[1], x[0])).sortByKey(False)

print 'Top 100 words:'
print wordcounts.take(100)
```

Replace the `HEAD_NODE_IP` text with the IP address of the head node.

Run the script on your Spark cluster using `spark-submit`. The output shows the top 100 words from the sample text data that were returned from the Spark script.

```
54.237.100.240: Using Spark's default log4j profile: org/apache/spark/log4j-defaults.
→properties

## Troubleshooting

If something goes wrong consult the [FAQ / Known issues](#) page.

### Further information

See the [Spark](#) and [PySpark](#) documentation pages for more information.

## How to do Natural Language Processing

### Overview

This example provides a simple PySpark job that utilizes the [NLTK library](#). NLTK is a popular Python package for natural language processing. This example will demonstrate the installation of Python libraries on the cluster, the usage of Spark with the YARN resource manager and execution of the Spark job.

### Who is this for?

This how-to is for users of a Spark cluster who wish to run Python code using the YARN resource manager. This how-to will show you how to integrate third-party Python libraries with Spark.

### Spark NLTK summary

1. *Before you start*
2. *Install NLTK*
3. *Running the Job*
4. *Troubleshooting*
5. *Further information*

### Before you start

To execute this example, download the: `cluster-spark-nltk.py` example script or `cluster-spark-nltk.ipynb` example notebook.

For this example you'll need Spark running with the YARN resource manager. You can install Spark and YARN using an enterprise Hadoop distribution such as [Cloudera CDH](#) or [Hortonworks HDP](#).

### Install NLTK

If you have permission to install packages with `acluster` you can install NLTK as a conda package.

```
acluster conda install nltk
```

You should see output similar to this from each node, which indicates that the package was successfully installed across the cluster:

```
Node "ip-10-140-235-89.ec2.internal":
  Successful actions: 1/1
Node "ip-10-154-10-144.ec2.internal":
  Successful actions: 1/1
Node "ip-10-31-96-152.ec2.internal":
  Successful actions: 1/1
```

In order to use the full NLTK library, you will need to download the data for the NLTK project. You can download the data on all cluster nodes by using the `acluster cmd` command.

```
acluster cmd 'sudo /opt/anaconda/bin/python -m nltk.downloader -d /usr/share/nltk_
↳data all'
```

After a few minutes you should see output similar to this.

```
Execute command "sudo /opt/anaconda/bin/python -m nltk.downloader -d /usr/share/nltk_
↳data all" target: "*" cluster: "d"
  All nodes (x3) response: [nltk_data] Downloading collection 'all'
[nltk_data] |
[nltk_data] | Downloading package abc to /usr/share/nltk_data...
[nltk_data] | Unzipping corpora/abc.zip.
[nltk_data] | Downloading package alpino to /usr/share/nltk_data...
[nltk_data] | Unzipping corpora/alpino.zip.
[nltk_data] | Downloading package biocreative_ppi to
[nltk_data] | /usr/share/nltk_data...
....
[nltk_data] | Unzipping models/bllip_wsj_no_aux.zip.
[nltk_data] | Downloading package word2vec_sample to
[nltk_data] | /usr/share/nltk_data...
[nltk_data] | Unzipping models/word2vec_sample.zip.
[nltk_data] |
[nltk_data] Done downloading collection all
```

## Running the Job

Here is the complete script to run the Spark + NLTK example in PySpark.

```
# cluster-spark-nltk.py
from pyspark import SparkConf
from pyspark import SparkContext

conf = SparkConf()
conf.setMaster('yarn-client')
conf.setAppName('spark-nltk')
sc = SparkContext(conf=conf)

data = sc.textFile('file:///usr/share/nltk_data/corpora/state_union/1972-Nixon.txt')

def word_tokenize(x):
    import nltk
    return nltk.word_tokenize(x)

def pos_tag(x):
```

(continues on next page)

(continued from previous page)

```
import nltk
return nltk.pos_tag([x])

words = data.flatMap(word_tokenize)
print words.take(10)

pos_word = words.map(pos_tag)
print pos_word.take(5)
```

Let's walk through the above code example. First, we will create a `SparkContext`. Note that Anaconda for cluster management will not create a `SparkContext` by default. In this example, we use the YARN resource manager.

```
from pyspark import SparkConf
from pyspark import SparkContext

conf = SparkConf()
conf.setMaster('yarn-client')
conf.setAppName('spark-nltk')
sc = SparkContext(conf=conf)
```

After a `SparkContext` is created, we can load some data into Spark. In this case, the data file is from one of the example documents provided by NLTK.

```
data = sc.textFile('file:///usr/share/nltk_data/corpora/state_union/1972-Nixon.txt')
```

Next, we write a function that imports `nltk` and calls `nltk.word_tokenize`. The function is mapped to the text file that was read in the previous step.

```
def word_tokenize(x):
    import nltk
    return nltk.word_tokenize(x)

words = data.flatMap(word_tokenize)
```

We can confirm that the `flatMap` operation worked by returning some of the words in the dataset.

```
print words.take(10)
```

Finally, NTLK's [POS-tagger](#) can be used to find the part of speech for each word.

```
def pos_tag(x):
    import nltk
    return nltk.pos_tag([x])

pos_word = words.map(pos_tag)
print pos_word.take(5)
```

Run the script on the Spark cluster using the `spark-submit` script. The output shows the words that were returned from the Spark script, including the results from the `flatMap` operation and the POS-tagger.

```
Using Spark's default log4j profile: org/apache/spark/log4j-defaults.properties
15/06/13 05:14:29 INFO SparkContext: Running Spark version 1.4.0

[...]

['Address',
```

(continues on next page)

(continued from previous page)

```

```

## Troubleshooting

If something goes wrong consult the *FAQ / Known issues* page.

## Further information

See the [Spark](#) and [PySpark](#) documentation pages for more information.

For more information on NLTK see the *NLTK book* <<http://www.nltk.org/book/>>.

## How to do Image Processing with GPUs

### Overview

To demonstrate the capability of running a distributed job in PySpark using a GPU, this example uses [NumbaPro](#) and the CUDA platform for image analysis. This example executes 2-dimensional FFT convolution on images in grayscale and compares the execution time of CPU-based and GPU-based calculations.

### Who is this for?

This how-to is for users of a Spark cluster who wish to run Python code using the YARN resource manager. This how-to will show you how to integrate third-party Python libraries with Spark.

### Image processing summary

1. *Before you start*

3. *Load data into HDFS*
4. *Running the Job*

- 5. *Troubleshooting*
- 6. *Further information*

### Before you start

For this example, you'll need Spark running with the YARN resource manager. You can install Spark and YARN using an enterprise Hadoop distribution such as [Cloudera CDH](#) or [Hortonworks HDP](#).

You will also need valid [Amazon Web Services](#) (AWS) credentials in order to download the example data.

For this example, we recommend the use of the GPU-enabled AWS instance type `g2.2xlarge` and the AMI `ami-12fd8178` (us-east-1 region), which has CUDA 7.0 and the NVIDIA drivers pre-installed. An example profile (to be placed in `~/.acluster/profiles.d/gpu_profile.yaml`) is shown below:

```
name: gpu_profile
node_id: ami-12fd8178 # Ubuntu 14.04, Cuda 7.0, us-east-1 region
node_type: g2.2xlarge
num_nodes: 4
provider: aws_east
user: ubuntu
```

To execute this example, download the: `spark-numbapro.py` example script or `spark-numbapro.ipynb` example notebook.

If you wish to use the `spark-numbapro.ipynb` example notebook the Jupyter Notebook plugin can be installed on the cluster using the following command:

```
acluster install notebook
```

Once the Jupyter Notebook plugin is installed, you can view Jupyter Notebook in your browser using the following command:

```
acluster open notebook
```

### Install dependencies

If you have permission to install packages with `acluster` you can install the required packages on all nodes using the following command.

```
acluster conda install scipy matplotlib numbapro PIL
```

### Load data into HDFS

First, we will load the sample text data into the HDFS data store. The following script will transfer sample image data (approximately 1.1 GB) from a public Amazon S3 bucket to the HDFS data store on the cluster.

Download the `cluster-download-data.py` script to your cluster and insert your Amazon AWS credentials in the `AWS_KEY` and `AWS_SECRET` variables.

```
import subprocess

AWS_KEY = 'YOUR_AWS_KEY'
AWS_SECRET = 'YOUR_AWS_SECRET'
```

(continues on next page)

(continued from previous page)

```
s3_path = 's3n://{0}:{1}@blaze-data/dogs-cats-img/images'.format(AWS_KEY, AWS_SECRET)
cmd = ['hadoop', 'distcp', s3_path, 'hdfs:///tmp/dogs-cats']
subprocess.call(cmd)
```

**Note:** The `hadoop distcp` command might cause HDFS to fail on smaller instance sizes due to memory limits.

Run the `cluster-download-data.py` script on the cluster.

```
python cluster-download-data.py
```

After a few minutes, the image data will be in the HDFS data store on the cluster and ready for analysis.

## Running the Job

Run the `spark-numbapro.py` script on the Spark cluster using `spark-submit`. The output shows the image processing execution times for the CPU-based vs. GPU-based calculations.

```
54.164.123.31: Using Spark's default log4j profile: org/apache/spark/log4j-defaults.

### Troubleshooting

If something goes wrong consult the [FAQ / Known issues](#) page.

### Further information

See the [Spark](#) and [PySpark](#) documentation pages for more information.

For more information on NumbaPro see the [NumbaPro documentation](#).

### Using Anaconda with Cloudera CDH

NOTE: This page is superseded, please see <https://docs.continuum.io/anaconda-scale/cloudera-cdh>

There are two methods of using Anaconda on an existing cluster with [Cloudera CDH](#), Cloudera's Distribution Including Apache Hadoop: 1) the [Anaconda parcel for Cloudera CDH](#), and 2) Anaconda for cluster management. The instructions below describe how to uninstall the Anaconda parcel on a CDH cluster and transition to Anaconda for cluster management.

### Uninstalling the Anaconda parcel

If the Anaconda parcel is installed on the CDH cluster, use the following steps to uninstall the parcel. Otherwise, you can skip to the next section.

1. From the Cloudera Manager Admin Console, click the Parcels indicator in the top navigation bar.
2. Click the `Deactivate` button to the right of the Anaconda parcel listing.
3. Click `OK` on the Deactivate prompt to deactivate the Anaconda parcel and restart Spark and related services.
4. Click the arrow to the right of the Anaconda parcel listing and choose `Remove From Hosts`, which will prompt with a confirmation dialog.
5. The Anaconda parcel has been removed from the cluster nodes.

For more information about managing Cloudera parcels, refer to the [Cloudera documentation](#).

### Using Anaconda for cluster management

Anaconda for cluster management provides additional functionality, including the ability to manage multiple conda environments and packages (including Python and R) alongside an existing CDH cluster.

1. Configure the nodes with Anaconda for cluster management using the [Bare-metal Cluster Setup instructions](#).
2. During this process, you will create a profile and provider that describes the cluster.
3. Provision the cluster using the following command, replacing `cluster-cdh` with the name of your cluster and `profile-cdh` with the name of your profile:

```
$ acluster create cluster-cdh -p profile-cdh
```

4. You can submit Spark jobs along with the `PYSPARK_PYTHON` environment variable that refers to the location of Anaconda, for example:

```
$ PYSPARK_PYTHON=/opt/anaconda/bin/python spark-submit pyspark_script.py
```

## Support

### Priority support

Support is included with the purchase of an Anaconda subscription. Please contact Anaconda for cluster management support at [ac\\_support@anaconda.com](mailto:ac_support@anaconda.com).

### Report a bug

If you think you may have encountered a bug, please contact Anaconda for cluster management support at [ac\\_support@anaconda.com](mailto:ac_support@anaconda.com).

### Additional nodes

With the unlicensed, unsupported version of Anaconda for cluster management, you can create and manage up to four cluster nodes. To request a license to manage more cluster nodes, please contact your account representative or [sales@anaconda.com](mailto:sales@anaconda.com).

### Training and consulting

Training and consulting is available for Anaconda for cluster management and all Anaconda products. For more information, please contact your account representative or [sales@anaconda.com](mailto:sales@anaconda.com).

### FAQ / Known issues

- *[Product FAQ](#)*
- *[Technical FAQ](#)*
- *[Troubleshooting FAQ](#)*
- *[Known Issues](#)*

### Product FAQ

#### **Does Anaconda for cluster management work with a cluster that already has a managed Spark/Hadoop stack?**

Yes, Anaconda for cluster management can be installed alongside enterprise Hadoop distributions such as Cloudera CDH or Hortonworks HDP and can be used to manage Python and R conda packages and environments across a cluster.

#### **Does Anaconda for cluster management offer integration with Anaconda Repository or Anaconda Cloud?**

Yes, conda packages can be installed from Anaconda Repository or [Anaconda Cloud](#) by using channel specifications. Refer to the documentation regarding *[Installing packages from channels](#)* for more details.

#### **Which cloud providers does Anaconda for cluster management support?**

Currently Anaconda for cluster management offers full support for Amazon Elastic Compute Cloud (EC2). Other providers such as Microsoft Azure, Google Cloud Platform, Rackspace, and others are on our roadmap. If you are interested in a cloud provider that is not listed here, please contact us at [sales@anaconda.com](mailto:sales@anaconda.com).

### Can I use Anaconda for cluster management with a different cloud provider?

Yes, you can manually create instances on another cloud provider, then provision the nodes as if you were using a bare-metal cluster. Refer to the [Bare-metal Cluster Setup](#) documentation for more information.

### Does Anaconda for cluster management support Amazon EMR?

Anaconda for cluster management does not support Amazon Elastic MapReduce (EMR), which provides a managed Hadoop framework in the cloud. Anaconda for cluster management can be used to manage conda packages and environments across a cluster. Anaconda for cluster management does support Amazon EC2.

## Technical FAQ

### Which versions of Python does Anaconda for cluster management support?

Some of the plugins have dependencies that require the use of Python 2. Therefore, by default, Anaconda for cluster management installs Miniconda with Python 2 into the root conda environment.

However, you can easily create a new conda environment on the cluster with Python 3, or you can specify a different root version of Anaconda/Miniconda in the profile.

### Which network ports need to be accessible from the client machine and cluster nodes?

From the client machine to the cluster nodes, you will need access to ports 22, 4505, and 4506 to provision the cluster via SSH and Salt. For communication between the cluster nodes, Salt uses ports 4505 and 4506.

### Can I use Anaconda for cluster management with iptables and SELinux?

Yes, you can customize the security behavior of Anaconda for cluster management when creating or provisioning a cluster using the Security settings in the profile. Refer to the [Profile settings](#) documentation for more information.

## Troubleshooting FAQ

### Errors when creating or provisioning a cluster

Verify the following:

- The contents of your SSH private key are correct (and set to 600 permissions on Mac/Linux)
- The user name in your profile (e.g., `user: ubuntu`) is defined correctly
- Profile settings are defined correctly in `~/.acluster/profiles.d/<profile_name>.yaml`
- Provider settings are defined correctly in `~/.acluster/providers.yaml`

## Known Issues

### No matching SLS error (Salt)

When installing a plugin during cluster creation/provisioning or using the `acluster install` command, you might receive an error similar to:

```
===== Standard output =====
ip-10-144-206-102.ec2.internal:
- No matching sls found for 'cdh5.hdfs' in env 'base'
=====
```

(continues on next page)

(continued from previous page)

```
Fatal error: One or more hosts failed while executing task 'parallel_sudo'

Aborting.
One or more hosts failed while executing task 'parallel_sudo'
```

This is a known issue with Salt that periodically occurs. You can reprovision or reinstall the plugin that failed, and the installation should succeed.

### Theading error when creating a cluster

When creating/provisioning a cluster, you might receive an error similar to:

```
Uploading formulas
INFO: Uploading formulas to head
Syncing formulas
INFO: Syncing formulas across the cluster
Done
Exception in thread Thread-6 (most likely raised during interpreter shutdown):
Exception in thread Thread-8 (most likely raised during interpreter shutdown):
```

This is a known issue with Paramiko/Fabric. You can safely disregard this message. This issue was resolved in Anaconda for cluster management 1.3.1.

## Release notes

Below is a summary of features, bug fixes, and improvements for each Anaconda for cluster management release.

### Anaconda for cluster management 1.4.4

Note: This is the last feature release of Anaconda for cluster management. Anaconda for cluster management has been replaced by [Anaconda Scale](#).

Backend improvements:

- Use full paths for system commands

### Anaconda for cluster management 1.4.3

Backend improvements:

- Fix license check and support information

### Anaconda for cluster management 1.4.2

Features:

- Updates to examples in documentation

Backend improvements:

- Improved group configuration/detection on RHEL/CentOS
- Enabled configuration of `anaconda` group name

### Anaconda for cluster management 1.4.1

Features:

- Renamed `distributed` plugin to `dask`
- Enabled `notebook` and `dask` plugins to be installed alongside existing Hadoop installations

- Added `conda` profile plugin setting for `ssl_verify`

### Anaconda for cluster management 1.4.0

Features:

- Added setting for `channel_alias` for improved integration with Anaconda Repository

Bug Fixes:

- Fixed provisioning on Windows client machines
- Fixed issue with profile setting for `conda` access control lists
- Fixed issue with certain plugin status checks
- Fixed issue with Storm plugin installation

Backend improvements:

- Improved management and configurability of `distributed` plugin
- Updated version of Apache Libcloud dependency (0.20.1)
- Updated to accept new license format (backwards compatible with existing licenses)
- Removed deprecated `acluster submit` command due to inconsistencies with environments
- Removed `acluster defaultenv` and `acluster setenv` commands due to inconsistencies with environments
- Consolidated sample profile to a single profile

### Anaconda for cluster management 1.3.3

Bug Fixes:

- Fixed SSH private key permissions check

Backend improvements:

- Implemented Salt ACL functionality
- Implemented Salt PAM authentication
- Removed sudo requirement after install

### Anaconda for cluster management 1.3.2

Bug Fixes:

- Fixed installation prefix and default channel documentation and tests

Backend improvements:

- Improved detection of plugin installations and plugin status messages

### Anaconda for cluster management 1.3.1

Features:

- Updated plugin: Spark 1.6
- Added option to disable creation of `/etc/profile.d/conda.sh` on cluster nodes

Bug Fixes:

- Fixed R path for Jupyter Notebook
- Fixed issue with Amazon EC2 block device mapping

- Fixed issue with configuration of default conda channels
- Improved warnings for misconfigured SSH keys
- Improved error message when AWS Key Pair is missing

Backend improvements:

- Added configurable download URLs for plugins (used for airgap installations): Elasticsearch, Logstash, Kibana, Storm
- Added deprecated warning for `acluster submit` command due to inconsistencies with environments
- Added detection for enterprise Hadoop installations and warns before installing conflicting services
- Configured HDFS for short-circuit reads by default
- Pinned versions of dependencies in conda recipe

### Anaconda for cluster management 1.3.0

Features:

- Simplified bare-metal cluster setup using profile/provider instead of clusters.d
- Added ability to specify conda packages and environments in profile plugin settings
- Switched to system-wide `.condarc` file for users on cluster nodes
- Added centralized logging via Elasticsearch, Logstash, and Kibana plugins
- Added `--no-browser` option for `acluster open` command
- Added license information to `acluster info`
- Removed optional `security_group` setting from `providers.yaml` template and documentation
- Added `vpc_id` setting for Amazon EC2 to use with default security group
- Improved documentation for bare-metal and cloud-based cluster creation
- Added more information about requirements, FAQs, and known issues to documentation

Bug Fixes:

- Improved error messages for cloud providers, security groups, and when no clusters are defined
- Fixed error when command output contained Unicode characters
- Fixed repeated prompts when installing multiple plugins

Backend improvements:

- Added test for SSH connectivity during bare-metal cluster creation
- Added detection/removal of orphaned clusters upon `acluster destroy`
- Added detection/installation of missing `sudo/bzip2` packages upon cluster creation

### Anaconda for cluster management 1.2.2

Features:

- Moved bare metal cluster setup to profile and provider files
- Ability to specify private IPs for VPC clusters on Amazon EC2

### Anaconda for cluster management 1.2.1

Features:

- Updated plugin: Spark 1.5.1
- Consistent output when listing clusters and profiles
- New blog post and updated documentation

### Bug Fixes:

- Removed duplicate error messages
- Fixed notebook plugin formulas

### Anaconda for cluster management 1.2.0

#### Features:

- Dedicated salt/supervisor environments
- New cluster profile (no nesting)
- Documentation updates
- Improvements to CLI output

#### Bug Fixes:

- Storm plugin
- Notebook plugin
- Logstash plugin
- Kibana plugin
- Elasticsearch plugin
- Windows Fixes: push/submit

#### Backend improvements:

- Refactor status/stop/restart and plugin loading
- Refactor connection object
- Multiple backends (initial work)

### Anaconda for cluster management 1.1.0

- Improved Jenkins testing
- Added Storm plugin
- Added Elasticsearch/Logstash/Kibana plugins (ELK stack)
- Added Dask plugin
- Fixes for single-node installations
- Profile updates
- Add setting for AWS Tags
- Added security options (SELinux/iptables)
- Added setting for notebook password

### Anaconda for cluster management 1.0.0

- CLI rewrite
- Aggregated and improved CLI messaging

- Backend library refactoring
- Salt-packaging refactoring
- Easier bare-metal installation
- Added option for streaming output
- Fixed issue with Ganglia on Ubuntu
- Windows/libcloud Compatibility
- Added licensing with new CLI
- Conda remote fixes
- Install Anaconda/Miniconda from custom url

## Glossary

**Anaconda** A downloadable free, open source, high performance, optimized Python and R distribution with 100+ packages plus access to easily installing an additional 620+ popular open source packages for data science including advanced and scientific analytics. It also includes `conda`, an open source package, dependency and environment manager. Thousands more open source packages can be installed with the `conda` command. Available for Windows, OS X and Linux, all versions are supported by the community.

**Bare-metal cluster** On-site or in-house machines, collections of virtual machines (Vagrant, Docker, etc.), or previously instantiated cloud nodes.

**Cloud-based cluster** A cluster that consists of machines in a cloud provider such as Amazon EC2.

**Cluster** A group of computers that work in parallel to perform a single task. Also called “parallel computing” since the compute nodes can perform their operations in parallel.

**Client machine** The laptop or workstation that contains Anaconda for cluster management and manages the cluster nodes.

**Cluster file** The file that defines the configuration including the location of the head node, compute nodes, and authentication/configuration information.

**Compute node** The machines managed by the head node that all work together to complete a single task.

**Conda** Conda is an open source package management system and environment management system for installing multiple versions of software packages and their dependencies and switching easily between them. It works on Windows, Mac, and Linux. It was created for Python packages, but is able to package and distribute any software. Conda is included in all versions of Anaconda, Anaconda Server, and Miniconda.

**Head node** A system configured to act as the intermediary between the cluster and the outside network. Can also be referred to as the master or edge node.

**Miniconda** A minimal or “bootstrap” version of Anaconda. Installs only what you need to get conda running, including Python, conda, and its dependencies.

**PEM key** Privacy enhanced electronic mail file, originally for email and now a general file format for cryptographic keys. In Anaconda for cluster management, this is used for cloud-based clusters and can be obtained from the cloud provider.

**Plugin** In Anaconda for cluster management, plugins are analytics engines and management services that can be installed on a cluster.

**Profile** A configuration file that defines how a cluster should be configured. It contains information about the number and types of cluster nodes, plugins, and other settings.

**Provider** Configuration file that defines settings for cloud or bare metal providers. A provider is referenced by a profile and used to provision resources.

### 3.4.4 Anaconda Launcher

---

**Note:** This product is discontinued. This archived copy of the product documentation is provided for those customers who are still using it.

---

#### Anaconda Launcher is now deprecated

As of Anaconda 4.0, Anaconda Launcher has been replaced by *Anaconda Navigator*. This section has been left in place as a reference for users of earlier versions of Anaconda. Some users who have upgraded from an earlier version may have both Navigator and Launcher installed, which is harmless.

Launcher can be uninstalled with a single command:

```
conda remove launcher
```

#### Anaconda Launcher commands

##### Refresh Application List

Click on **Launcher** to refresh the apps display.

##### Install Listed Application

Click on the green **Install** button to install the desired app.

##### Launch Application

Click on the **Launch** button to launch the application.

## Update Application

Click on the **Update** button to update the application.

## Change Environments

To change the current Environment, click on the **Environment:** pull down menu item and select the desired environment to make it active.

## Environment Information

To get a summary of the current environment, click on the **Environment:** menu item and select info.

You can also get a summary of the environment by click on the **Python version** menu item.

### Create New Environment

To create a new environment, click on the **Environment:** menu item and select **New Environment**.

When the **Create New Environment** dialog appears, enter the name of the new environment, select the desired **Python Version**, and click **Submit**.

### Clone Environment

To clone an environment, click on the **Environment:** menu item and select **Clone Environment**.

When the **Clone Environment** dialog appears, enter the name of the new environment and click **Submit**.

## Clone Environment root

x

New Environment Name

Cancel

Submit

### Delete Environment

To delete an environment, click on the **Environment:** menu item and select **Delete Environment**.  
When the **Confirm Delete Environment** dialog appears, click **Yes** to delete the environment.

## Confirm Delete Environment

Are you sure you want to delete environment alpuq?

Cancel

Yes

### Manage Channels

To manage your current package channels, click on the **Manage Channels** menu item.

## Manage Conda Channels x

Enter a Binstar username or a URL. Conda will search these channels for packages. If the channel `defaults` is not present, Conda will not search the default channels.

[Online configuration help](#)

Add Channel

defaultsx

tpowellx

CancelSubmit

### Add Channel

Enter your channel into the text field to the left of the **Add Channel** button.

Click on the **Add Channel** to add your channel to your `.condarc` file.

### Remove Channel

Click on the **x** button to the right of the channel name you would like to remove.

Click **Cancel** to removed the changes to your channels.

Click **Submit** to save the channel updates.

### Anaconda Launcher Info

For Anaconda Launcher details, click on the version number in the upper right hand corner of the Anaconda Launcher Window.

## Other Helpful Links

Along the right side of the launcher are some helpful links to additional documentation and various Anaconda and Anaconda Sponsored websites.

### 3.4.5 Anaconda Scale

#### *Distributed Computing*

---

**Note:** This product is discontinued. This archived copy of the product documentation is provided for those customers who are still using it.

---

Anaconda Scale provides functionality to easily deploy Anaconda® packages and a distributed computation framework across a cluster. It helps you manage multiple conda environments and packages—including Python and R—on cluster nodes.

Anaconda Scale provides different options for deploying Anaconda on a cluster, including:

- Centrally managed installation of Anaconda, including multiple environments such as Python and R
- Anaconda parcel for Cloudera CDH, including custom-generated parcels
- Deployment of conda packages and environments with Spark jobs

#### Features

- Easily install Anaconda—including [Anaconda Accelerate](#)—across multiple cluster nodes
- Provision distributed compute services with Dask
- Perform interactive, distributed computations with single-user Jupyter Notebook
- Easily launch and configure a cloud-based cluster on Amazon EC2

#### Compatibility

Anaconda Scale can be used with distributed computation frameworks such as Spark or Dask and works alongside enterprise Hadoop distributions such as Cloudera CDH or Hortonworks HDP. Anaconda Scale has been tested with the following Hadoop distributions and Spark versions:

- Cloudera CDH 5.3.x through 5.11.x
- Hortonworks HDP 2.2.x through 2.6.x (with Apache Ambari 2.2.x and 2.4.x)
- Spark 1.3.x through 2.0.x

#### License

Anaconda Scale is available with [Anaconda Enterprise](#). If you would like to use Anaconda Scale with a cluster on a bare-metal, on-premises, or cloud-based cluster, please [contact us](#).

#### Using Scale

##### Installation

Anaconda Scale is installed and managed using the Anaconda platform installer, Anaconda Adam. For more information on installation, security, account, network and other Anaconda Scale requirements, see the [system requirements for Anaconda Adam](#). For more information about the installation process, see [the Anaconda Adam installation instructions](#).

After installing Anaconda Adam and provisioning a cluster, you can install a centrally managed version of Anaconda—including [Anaconda Accelerate](#)—on all of the cluster nodes using:

```
$ adam scale -n <cluster-name> cluster install
```

To install Dask and Distributed and then start Distributed workers on all of the cluster nodes, use:

```
$ adam scale -n <cluster-name> dask install
```

To install a single-user Jupyter Notebook server on the head node of the cluster, use:

```
$ adam scale -n <cluster-name> notebook install
```

## User guide

Using Anaconda Scale with Anaconda Adam, you can create and manage conda packages, including Python and R, in multiple conda environments across your nodes. You can prepend `adam scale` to a subset of familiar conda commands to install and manage conda packages and environments across a cluster.

```
$ adam scale -n cluster conda --help
Usage: adam conda [OPTIONS] COMMAND [ARGS]...

Options:
  -h, --help            Show this message and exit.

Commands:
  create  Create conda environment
  info    Get information about conda installation
  install Install package(s)
  list    List conda packages
  remove  Remove package(s)
  update  Update package(s)
```

By default, the root conda environment is installed in `/opt/continuum/anaconda` on all of the cluster nodes, which can be configured for a different location. You can manage multiple conda environments across the same cluster, such as Python 2, Python 3 and R, without affecting the framework installation of Python on the cluster nodes.

## Getting started

You can get started with Anaconda Scale by using Anaconda Adam, the Anaconda platform installer. See the [Anaconda Adam documentation](#) for more information.

With Anaconda Adam, you can install Anaconda Scale on a bare-metal cluster or existing cloud-based cluster. You can also use Anaconda Scale to easily launch and provision a cloud-based cluster with Anaconda. See the [Anaconda Adam installation instructions](#) for more information.

## Tasks

- [General functions](#)
- [Using Anaconda with Cloudera CDH](#)
- [Configuring Anaconda with Spark](#)

### Cheatsheet

Download the `Scale cheatsheet` (48 KB PDF) for a quick guide to using Anaconda Scale.

### General functions

#### Installing conda packages

Install conda packages on the cluster nodes using `adam scale conda install`.

EXAMPLE: To install NumPy and pandas and their dependencies into the root conda environment on a cluster named `cluster`:

```
$ adam scale -n cluster conda install numpy pandas
All nodes (x4) response:
{
  "actions": {
    "LINK": [
      "mkl-11.3.3-0 /opt/continuum/anaconda/pkgs 1",
      "openssl-1.0.2h-1 /opt/continuum/anaconda/pkgs 1",
      "sqlite-3.13.0-0 /opt/continuum/anaconda/pkgs 1",
      "zlib-1.2.8-3 /opt/continuum/anaconda/pkgs 1",
      "python-2.7.11-5 /opt/continuum/anaconda/pkgs 1",
      "conda-env-2.5.1-py27_0 /opt/continuum/anaconda/pkgs 1",
      "numpy-1.11.0-py27_2 /opt/continuum/anaconda/pkgs 1",
      "pycosat-0.6.1-py27_1 /opt/continuum/anaconda/pkgs 1",
      "pytz-2016.4-py27_0 /opt/continuum/anaconda/pkgs 1",
      "pyyaml-3.11-py27_4 /opt/continuum/anaconda/pkgs 1",
      "requests-2.10.0-py27_0 /opt/continuum/anaconda/pkgs 1",
      "ruamel_yaml-0.11.7-py27_0 /opt/continuum/anaconda/pkgs 1",
      "setuptools-23.0.0-py27_0 /opt/continuum/anaconda/pkgs 1",
      "six-1.10.0-py27_0 /opt/continuum/anaconda/pkgs 1",
      "wheel-0.29.0-py27_0 /opt/continuum/anaconda/pkgs 1",
      "conda-4.1.4-py27_0 /opt/continuum/anaconda/pkgs 1",
      "pip-8.1.2-py27_0 /opt/continuum/anaconda/pkgs 1",
      "python-dateutil-2.5.3-py27_0 /opt/continuum/anaconda/pkgs 1",
      "pandas-0.18.1-np111py27_0 /opt/continuum/anaconda/pkgs 1"
    ],
    "PREFIX": "/opt/continuum/anaconda",
  },
  "success": true
}
```

#### Creating conda environments

Create multiple conda environments on the cluster nodes using `adam scale conda create`.

EXAMPLE: To create a conda environment called `py3` with Python 3 on a cluster named `cluster`:

```
$ adam scale -n cluster conda create -n py3 python=3
All nodes (x4) response:
{
  "actions": {
    "LINK": [
```

(continues on next page)

(continued from previous page)

```

    "openssl-1.0.2h-1 1 None",
    "readline-6.2-2 1 None",
    "sqlite-3.13.0-0 1 None",
    "tk-8.5.18-0 1 None",
    "xz-5.2.2-0 1 None",
    "zlib-1.2.8-3 1 None",
    "python-3.5.1-5 1 None",
    "setuptools-23.0.0-py35_0 1 None",
    "wheel-0.29.0-py35_0 1 None",
    "pip-8.1.2-py35_0 1 None"
  ],
  "PREFIX": "/opt/continuum/anaconda/envs/py3",
  "SYMLINK_CONDA": [
    "/opt/continuum/anaconda"
  ],
},
"success": true
}

```

## Updating conda packages

Update conda packages on the cluster nodes using `adam scale conda update`.

**EXAMPLE:** To update pandas and its dependencies in the root conda environment on a cluster named `cluster`:

```

$ adam scale -n cluster conda update pandas
All nodes (x4) response:
{
  "actions": {
    "LINK": [
      "pandas-0.18.1-np111py27_0 1 None"
    ],
    "PREFIX": "/opt/continuum/anaconda",
    "SYMLINK_CONDA": [
      "/opt/continuum/anaconda"
    ],
    "UNLINK": [
      "pandas-0.18.0-np111py27_0"
    ],
  },
  "success": true
}

```

## Removing conda packages or environments

Remove conda packages on the cluster nodes using `adam scale conda remove`.

**EXAMPLE:** To remove pandas from the root conda environment on a cluster named `cluster`:

```

$ adam scale -n cluster conda remove pandas
All nodes (x4) response:
{
  "actions": {
    "PREFIX": "/opt/continuum/anaconda",

```

(continues on next page)

(continued from previous page)

```

    "UNLINK": [
        "pandas-0.18.1-np111py27_0"
    ],
},
"success": true
}

```

Remove conda environments on the cluster nodes using `adam scale conda remove`.

EXAMPLE: To remove an environment called `py3` on a cluster named `cluster`:

```

$ adam scale -n cluster conda remove -n py3 --all
All nodes (x4) response:
{
  "actions": {
    "PREFIX": "/opt/continuum/anaconda/envs/py3",
    "UNLINK": [
      "openssl-1.0.2j-0",
      "pip-8.1.2-py35_0",
      "python-3.5.2-0",
      "readline-6.2-2",
      "setuptools-27.2.0-py35_0",
      "sqlite-3.13.0-0",
      "tk-8.5.18-0",
      "wheel-0.29.0-py35_0",
      "xz-5.2.2-0",
      "zlib-1.2.8-3"
    ]
  },
  "success": true
}

```

## Listing conda packages

List conda packages on the cluster nodes using `adam scale conda list`.

EXAMPLE: To list conda packages in the root conda environment on a cluster named `cluster`:

```

$ adam scale -n cluster conda list
All nodes (x4) response:
+-----+-----+-----+
| Package      | Version | Build  |
+-----+-----+-----+
| numpy         | 1.11.0  | py27_2 |
| conda-env     | 2.5.1   | py27_0 |
| tk            | 8.5.18  | 0      |
| pip           | 8.1.2   | py27_0 |
| readline      | 6.2     | 2      |
| setuptools    | 23.0.0  | py27_0 |
| openssl       | 1.0.2h  | 1      |
| pycosat       | 0.6.1   | py27_1 |
| python-dateutil | 2.5.3   | py27_0 |
| sqlite        | 3.13.0  | 0      |
| pytz          | 2016.4  | py27_0 |
| mkl           | 11.3.3  | 0      |

```

(continues on next page)

(continued from previous page)

|             |         |         |         |
|-------------|---------|---------|---------|
| yaml        | 0.1.6   | 0       |         |
| ruamel_yaml | 0.11.7  | py27_0  |         |
| zlib        | 1.2.8   | 3       |         |
| pyyaml      | 3.11    | py27_4  |         |
| requests    | 2.10.0  | py27_0  |         |
| wheel       | 0.29.0  | py27_0  |         |
| python      | 2.7.11  | 5       |         |
| conda       | 4.1.4   | py27_0  |         |
| pycrypto    | 2.6.1   | py27_0  |         |
| six         | 1.10.0  | py27_0  |         |
| +-----+     | +-----+ | +-----+ | +-----+ |

## Getting conda information

View information about the conda installation on the cluster nodes using `adam scale conda info`.

**EXAMPLE:** To view information about the root conda environment on a cluster named `cluster`:

```
$ adam scale -n cluster conda info
All nodes (x4) response:
Current conda install:

    platform : linux-64
    conda version : 4.1.4
    conda-env version : 2.5.1
    conda-build version : not installed
    python version : 2.7.11.final.0
    requests version : 2.10.0
    root environment : /opt/continuum/anaconda (writable)
    default environment : /opt/continuum/anaconda
    envs directories : /opt/continuum/anaconda/envs
    package cache : /opt/continuum/anaconda/pkgs
    channel URLs : https://repo.anaconda.com/pkgs/free/linux-64/
                  https://repo.anaconda.com/pkgs/free/noarch/
                  https://repo.anaconda.com/pkgs/pro/linux-64/
                  https://repo.anaconda.com/pkgs/pro/noarch/
    config file : None
    offline mode : False
    is foreign system : False
```

Or to view a list of conda environments on the cluster nodes:

```
$ adam scale -n cluster conda info -e
All nodes (x4) response:
# conda environments:
#
py27                /opt/continuum/anaconda/envs/py27
py35                /opt/continuum/anaconda/envs/py35
r                  /opt/continuum/anaconda/envs/r
root                * /opt/continuum/anaconda
```

## Managing conda with environment definition files

Manage conda environments on the cluster nodes using `adam scale env`:

```
$ adam scale -n cluster env
Usage: adam scale env [OPTIONS] COMMAND [ARGS]...
```

**Options:**

```
-h, --help Show this message and exit.
```

**Commands:**

```
create Create conda environment
list List conda environments
remove Remove conda environment
update Update conda environment
```

This functionality uses `conda-env` and conda environment environment definition–YAML–files.

EXAMPLE: The following `environment.yml` file describes a conda environment named `my-env` with Python 2.7 and additional packages:

```
name: my-env
channels:
- defaults
dependencies:
- python=2.7.*
- bokeh
- dask
- distributed
- pandas
```

Use `adam scale env create` to create a conda environment based on the above conda environment definition file `environment.yml`:

```
$ adam scale -n cluster env create -f environment.yml
All nodes (x4) response:
```

```
{
  "actions": {

    "/opt/continuum/anaconda"
],
"op_order": [
    "RM_FETCHED",
    "FETCH",
    "RM_EXTRACTED",
    "EXTRACT",
    "UNLINK",

```

(continues on next page)

(continued from previous page)

```
    "LINK",
    "SYMLINK_CONDA"
  ],
  "success": true
}
```

**NOTE:** The command `adam scale env create` is compatible only with conda dependencies and ignores any pip or other non-conda dependencies that are specified in the conda environment definition file.

Use `adam scale env list` to list conda environments on the cluster:

```
$ adam scale -n cluster env list
All nodes (x4) response:
# conda environments:
#
my-env          /opt/continuum/anaconda/envs/my-env
root            * /opt/continuum/anaconda
```

Use `adam scale env update` to update packages in an existing conda environment based on a conda environment definition file:

```
$ adam scale -n cluster env update -f environment.yml
All nodes (x4) response:
{
  "message": "All requested packages already installed.",
  "success": true
}
```

Use `adam scale env remove` to remove a conda environment from the cluster:

```
$ adam scale -n cluster env remove -n my-env
All nodes (x4) response:
{
  "actions": {
    "PREFIX": "/opt/continuum/anaconda/envs/my-env",
    "UNLINK": [
      "mkl-11.3.3-0",
      "numpy-1.11.2-py27_0",
      "openssl-1.0.2j-0",
      "pandas-0.18.0-np111py27_0",
      "pip-9.0.1-py27_0",
      "python-2.7.12-1",
      "python-dateutil-2.6.0-py27_0",
      "pytz-2016.7-py27_0",
      "readline-6.2-2",
      "setuptools-27.2.0-py27_0",
      "six-1.10.0-py27_0",
      "sqlite-3.13.0-0",
      "tk-8.5.18-0",
      "wheel-0.29.0-py27_0",
      "zlib-1.2.8-3"
    ]
  },
  "success": true
}
```

## Using Anaconda with Cloudera CDH

There are different methods of using Anaconda Scale on a cluster with [Cloudera CDH](#):

- The freely available Anaconda parcel for Cloudera CDH.
- Custom [Anaconda parcels for Cloudera CDH](#)
- A dynamic, managed version of Anaconda on all of the nodes using Anaconda Scale

The freely available Anaconda parcel is based on Python 2.7 and includes the default conda packages that are available in the free Anaconda distribution.

Anaconda Enterprise users can also leverage Anaconda Repository to *create and distribute their own custom Anaconda parcels for Cloudera Manager*.

If you need more dynamic functionality than the Anaconda parcels offer, Anaconda Scale lets you dynamically install and manage multiple conda environments—such as Python 2, Python 3, and R environments—and packages across a cluster.

### Using the Anaconda parcel

For more information about installing the Anaconda parcel on a CDH cluster using Cloudera Manager, see the [Anaconda parcel documentation](#).

### Transitioning to the dynamic, managed version of Anaconda Scale

To transition from the Anaconda parcel for CDH to the dynamic, managed version of Anaconda Scale, follow the instructions below to uninstall the Anaconda parcel on a CDH cluster and then transition to a centrally managed version of Anaconda.

### Uninstalling the Anaconda parcel

If the Anaconda parcel is installed on the CDH cluster, uninstall the parcel:

1. From the Cloudera Manager Admin Console, in the top navigation bar, click the Parcels indicator.
2. To the right of the Anaconda parcel listing, click the Deactivate button.
3. When prompted, click OK to deactivate the Anaconda parcel and restart Spark and related services.
4. Click the arrow to the right of the Anaconda parcel listing and select Remove From Hosts.
5. In the confirmation dialog box, confirm removal of the Anaconda parcel from the cluster nodes.

For more information about managing Cloudera parcels, see the [Cloudera documentation](#).

### Transitioning to a centrally managed Anaconda installation

Once you've uninstalled the Anaconda parcel, see the [Anaconda Scale installation instructions](#) for more information about installing a centrally managed version of Anaconda.

### Using Anaconda with Spark

[Apache Spark](#) is an analytics engine and parallel computation framework with Scala, Python and R interfaces. Spark can load data directly from disk, memory and other data storage technologies such as Amazon S3, Hadoop Distributed File System (HDFS), HBase, Cassandra and others.

Anaconda Scale can be used with a cluster that already has a managed Spark/Hadoop stack. Anaconda Scale can be installed alongside existing enterprise Hadoop distributions such as [Cloudera CDH](#) or [Hortonworks HDP](#) and can be used to manage Python and R conda packages and environments across a cluster.

To run a script on the head node, simply execute `python example.py` on the cluster. Alternatively, you can install Jupyter Notebook on the cluster using Anaconda Scale. See the [Installation](#) documentation for more information.

### Different ways to use Spark with Anaconda

You can develop Spark scripts interactively, and you can write them as Python scripts or in a Jupyter Notebook.

You can submit a PySpark script to a Spark cluster using various methods:

- Run the script directly on the head node by executing `python example.py` on the cluster.
- Use the `spark-submit` command either in Standalone mode or with the YARN resource manager.
- Submit the script interactively in an IPython shell or Jupyter Notebook on the cluster. For information on using Anaconda Scale to install Jupyter Notebook on the cluster, see [Installation](#).

You can also use Anaconda Scale with enterprise Hadoop distributions such as Cloudera CDH or Hortonworks HDP.

### Using Anaconda Scale with Spark

The topics listed below describe how to:

- Use Anaconda and Anaconda Scale with Apache Spark and PySpark
- Interact with data stored within the Hadoop Distributed File System (HDFS) on the cluster

While these tasks are independent and can be performed in any order, we recommend that you begin with [Configuring Anaconda with Spark](#).

### Configuring Anaconda with Spark

You can configure Anaconda to work with Spark jobs in three ways: *with the “`spark-submit`” command*, or *with Jupyter Notebooks and Cloudera CDH*, or *with Jupyter Notebooks and Hortonworks HDP*.

After you configure Anaconda with one of those three methods, then you can *create and initialize a SparkContext*.

### Configuring Anaconda with the `spark-submit` command

You can submit Spark jobs using the `PYSPARK_PYTHON` environment variable that refers to the location of the Python executable in Anaconda.

EXAMPLE:

```
PYSPARK_PYTHON=/opt/continuum/anaconda/bin/python spark-submit pyspark_script.py
```

## Configuring Anaconda with Jupyter Notebooks and Cloudera CDH

Configure Jupyter Notebooks to use Anaconda Scale with Cloudera CDH using the following Python code at the top of your notebook:

```
import os
import sys
os.environ["PYSPARK_PYTHON"] = "/opt/continuum/anaconda/bin/python"
os.environ["JAVA_HOME"] = "/usr/java/jdk1.7.0_67-cloudera/jre"
os.environ["SPARK_HOME"] = "/opt/cloudera/parcels/CDH/lib/spark"
os.environ["PYLIB"] = os.environ["SPARK_HOME"] + "/python/lib"
sys.path.insert(0, os.environ["PYLIB"] + "/py4j-0.9-src.zip")
sys.path.insert(0, os.environ["PYLIB"] + "/pyspark.zip")
```

The above configuration was tested with Cloudera CDH 5.11 and Spark 1.6. Depending on the version of Cloudera CDH that you have installed, you might need to customize these paths according to the location of Java, Spark and Anaconda on your cluster.

If you've installed a custom Anaconda parcel, the path for PYSPARK\_PYTHON will be /opt/cloudera/parcels/PARCEL\_NAME/bin/python, where PARCEL\_NAME is the name of the custom parcel you created.

## Configuring Anaconda with Jupyter Notebooks and Hortonworks HDP

Configure Jupyter Notebooks to use Anaconda Scale with Hortonworks HDP using the following Python code at the top of your notebook:

```
import os
import sys
os.environ["PYSPARK_PYTHON"] = "/opt/continuum/anaconda/bin/python"
os.environ["SPARK_HOME"] = "/usr/hdp/current/spark-client"
os.environ["PYLIB"] = os.environ["SPARK_HOME"] + "/python/lib"
sys.path.insert(0, os.environ["PYLIB"] + "/py4j-0.9-src.zip")
sys.path.insert(0, os.environ["PYLIB"] + "/pyspark.zip")
```

The above configuration was tested with Hortonworks HDP 2.6, Apache Ambari 2.4 and Spark 1.6. Depending on the version of Hortonworks HDP that you have installed, you might need to customize these paths according to the location of Spark and Anaconda on your cluster.

If you've installed a custom Anaconda management pack, the path for PYSPARK\_PYTHON will be /opt/continuum/PARCEL\_NAME/bin/python, where PARCEL\_NAME is the name of the custom parcel you created.

## Creating a SparkContext

Once you have configured the appropriate environment variables, you can initialize a SparkContext—in yarn-client client mode in this example—using:

```
from pyspark import SparkConf
from pyspark import SparkContext
conf = SparkConf()
conf.setMaster('yarn-client')
conf.setAppName('anaconda-pyspark')
sc = SparkContext(conf=conf)
```

For more information about configuring Spark settings, see the [PySpark documentation](#).

Once you've initialized a `SparkContext`, you can start using Anaconda with Spark jobs. For examples of Spark jobs that use libraries from Anaconda, see *Using Anaconda with Spark*.

### Running PySpark as a Spark standalone job

This example runs a minimal Spark script that imports PySpark, initializes a `SparkContext` and performs a distributed calculation on a Spark cluster in standalone mode.

#### Who is this for?

This example is for users of a Spark cluster that has been configured in standalone mode who wish to run a PySpark job.

#### Before you start

Download the `spark-basic.py` example script to the cluster node where you submit Spark jobs.

You need Spark running with the standalone scheduler. You can install Spark using an enterprise Hadoop distribution such as [Cloudera CDH](#) or [Hortonworks HDP](#). Some additional configuration might be necessary to use Spark in standalone mode.

#### Modifying the script

After downloading the `spark-basic.py` example script, open the file in a text editor on your cluster. Replace `HEAD_NODE_HOSTNAME` with the hostname or IP address of the Spark master as defined in your Hadoop configuration.

```
# spark-basic.py
from pyspark import SparkConf
from pyspark import SparkContext

conf = SparkConf()
conf.setMaster('spark://HEAD_NODE_HOSTNAME:7077')
conf.setAppName('spark-basic')
sc = SparkContext(conf=conf)

def mod(x):
    import numpy as np
    return (x, np.mod(x, 2))

rdd = sc.parallelize(range(1000)).map(mod).take(10)
print rdd
```

Examine the contents of the `spark-basic.py` example script.

The first code block contains imports from PySpark.

The second code block initializes the `SparkContext` and sets the application name.

The third code block contains the analysis code that uses the NumPy package to calculate the modulus of a range of numbers up to 1000, then returns and prints the first 10 results.

The fourth code block runs the calculation on the Spark cluster and prints the results. The code uses the NumPy library from Anaconda on each Spark worker.

NOTE: You may need to install NumPy on the cluster nodes using `adam scale -n cluster conda install numpy`.

## Running the job

Run the script by submitting it to your cluster for execution using `spark-submit` or by running this command:

```
$ python spark-basic.py
```

The output from the above command shows the first 10 values returned from the `spark-basic.py` script:

```
16/05/05 22:26:53 INFO spark.SparkContext: Running Spark version 1.6.0

[...]

16/05/05 22:27:03 INFO scheduler.TaskSetManager: Starting task 0.0 in stage 0.0 (TID_
↪0, localhost, partition 0,PROCESS_LOCAL, 3242 bytes)
16/05/05 22:27:04 INFO storage.BlockManagerInfo: Added broadcast_0_piece0 in memory_
↪on localhost:46587 (size: 2.6 KB, free: 530.3 MB)
16/05/05 22:27:04 INFO scheduler.TaskSetManager: Finished task 0.0 in stage 0.0 (TID_
↪0) in 652 ms on localhost (1/1)
16/05/05 22:27:04 INFO cluster.YarnScheduler: Removed TaskSet 0.0, whose tasks have_
↪all completed, from pool
16/05/05 22:27:04 INFO scheduler.DAGScheduler: ResultStage 0 (runJob at PythonRDD.
↪scala:393) finished in 4.558 s

```

## Troubleshooting

If something goes wrong, see [Help and support](#).

## Further information

See the [Spark](#) and [PySpark](#) documentation:

## Running PySpark with the YARN resource manager

This example runs a script on the Spark cluster with the YARN resource manager and returns the hostname of each node in the cluster.

## Who is this for?

This example is for users of a Spark cluster who wish to run a PySpark job using the YARN resource manager.

## Before you start

Download the `spark-yarn.py` example script to your cluster.

You need Spark running with the YARN resource manager. You can install Spark and YARN using an enterprise Hadoop distribution such as [Cloudera CDH](#) or [Hortonworks HDP](#).

## Running the job

This code is almost the same as the code on the page [Running PySpark as a Spark standalone job](#), which describes the code in more detail.

Here is the complete script to run the Spark + YARN example in PySpark:

```
# spark-yarn.py
from pyspark import SparkConf
from pyspark import SparkContext

conf = SparkConf()
conf.setMaster('yarn-client')
conf.setAppName('spark-yarn')
sc = SparkContext(conf=conf)

def mod(x):
    import numpy as np
    return (x, np.mod(x, 2))

rdd = sc.parallelize(range(1000)).map(mod).take(10)
print rdd
```

NOTE: You may need to install NumPy on the cluster nodes using `adam scale -n cluster conda install numpy`.

Run the script on the Spark cluster with `spark-submit`. The output shows the first 10 values that were returned from the `spark-basic.py` script.

```
16/05/05 22:26:53 INFO spark.SparkContext: Running Spark version 1.6.0

[...]

```

## Troubleshooting

If something goes wrong, see [Help and support](#).

## Further information

See the [Spark](#) and [PySpark](#) documentation pages for more information.

## Performing a word count on text data in HDFS

This example counts the number of words in text files that are stored in HDFS.

### Who is this for?

This example is for users of a Spark cluster who wish to run a PySpark job—with the YARN resource manager—that reads and processes text files stored in HDFS.

### Before you start

Download the `spark-wordcount.py` example script and the `download-data.py` script.

You need Spark running with the YARN resource manager and the Hadoop Distributed File System (HDFS). You can install Spark, YARN and HDFS using an enterprise Hadoop distribution such as [Cloudera CDH](#) or [Hortonworks HDP](#).

You also need valid [Amazon Web Services \(AWS\)](#) credentials.

### Load HDFS data

Load the sample text data into HDFS. The following script transfers sample text data (approximately 6.4 GB) from a public Amazon S3 bucket to the HDFS data store on the cluster.

Download the `download-data.py` script to your cluster and insert your Amazon AWS credentials in the `AWS_KEY` and `AWS_SECRET` variables.

```
import subprocess

AWS_KEY = ''
AWS_SECRET = ''

s3_path = 's3n://{0}:{1}@blaze-data/enron-email'.format(AWS_KEY, AWS_SECRET)
cmd = ['hadoop', 'distcp', s3_path, 'hdfs:///tmp/enron']
subprocess.call(cmd)
```

**NOTE:** The `hadoop distcp` command might fail to run on smaller Amazon EC2 instance sizes due to memory limits.

Run the `download-data.py` script on the Spark cluster:

```
$ python download-data.py
```

After a few minutes, the text data is loaded into HDFS and ready for analysis.

## Running the job

The following script reads the text files downloaded in the previous step and counts all of the words. Download the `spark-wordcount.py` example script to your cluster, and then replace `HEAD_NODE_IP` with the IP address of the head node.

```
# spark-wordcount.py
from pyspark import SparkConf
from pyspark import SparkContext

HDFS_MASTER = 'HEAD_NODE_IP'

conf = SparkConf()
conf.setMaster('yarn-client')
conf.setAppName('spark-wordcount')
conf.set('spark.executor.instances', 10)
sc = SparkContext(conf=conf)

distFile = sc.textFile('hdfs://{0}:9000/tmp/enron/*/*.txt'.format(HDFS_MASTER))

nonempty_lines = distFile.filter(lambda x: len(x) > 0)
print 'Nonempty lines', nonempty_lines.count()

words = nonempty_lines.flatMap(lambda x: x.split(' '))

wordcounts = words.map(lambda x: (x, 1)) \
    .reduceByKey(lambda x, y: x+y) \
    .map(lambda x: (x[1], x[0])).sortByKey(False)

print 'Top 100 words:'
print wordcounts.take(100)
```

Run the script on your Spark cluster using `spark-submit`. The output shows the 100 most frequently occurring words from the sample text data:

```
54.237.100.240: Using Spark's default log4j profile: org/apache/spark/log4j-defaults.
↳properties

```

## Troubleshooting

If something goes wrong, see [Help and support](#).

## Further information

See the [Spark](#) and [PySpark](#) documentation:

## Distributed natural language processing

This example provides a simple PySpark job that utilizes the [NLTK library](#). NLTK is a popular Python package for natural language processing. This example shows you how to integrate third-party Python libraries with Spark. This example demonstrates the installation of Python libraries on the cluster, the usage of Spark with the YARN resource manager and execution of the PySpark job.

## Who is this for?

This example is for users of a Spark cluster who wish to run a PySpark job with the YARN resource manager.

## Before you start

Download the `spark-nltk.py` example script or `spark-nltk.ipynb` example notebook.

You need Spark running with the YARN resource manager. You can install Spark and YARN using an enterprise Hadoop distribution such as [Cloudera CDH](#) or [Hortonworks HDP](#).

### Install NLTK

Install NLTK on all of the cluster nodes using the `adam scale` command:

```
$ adam scale -n cluster conda install nltk
```

You should see output similar to this from each node, which indicates that the package was successfully installed across the cluster:

```
All nodes (x4) response:
{
  "actions": {
    "EXTRACT": [
      "conda-env-2.5.2-py27_0",
      "conda-4.1.11-py27_0"
    ],
    "FETCH": [
      "conda-env-2.5.2-py27_0",
      "conda-4.1.11-py27_0"
    ],
    "LINK": [
      "conda-env-2.5.2-py27_0 1 None",
      "conda-4.1.11-py27_0 1 None"
    ],
    "PREFIX": "/opt/continuum/anaconda",
    "SYMLINK_CONDA": [
      "/opt/continuum/anaconda"
    ],
    "UNLINK": [
      "conda-4.1.6-py27_0",
      "conda-env-2.5.1-py27_0"
    ],
    "op_order": [
      "RM_FETCHED",
      "FETCH",
      "RM_EXTRACTED",
      "EXTRACT",
      "UNLINK",
      "LINK",
      "SYMLINK_CONDA"
    ]
  },
  "success": true
}
```

For this example, you need to download the NLTK sample data. Download the data on all cluster nodes by using the `adam cmd` command:

```
$ adam cmd 'sudo /opt/continuum/anaconda/bin/python -m nltk.downloader -d /usr/share/
↪nltk_data all'
```

The sample data is downloaded over a few minutes. After the download completes, you should see output similar to:

```

All nodes (x4) response: [nltk_data] Downloading collection 'all'
[nltk_data] |
[nltk_data] | Downloading package abc to /usr/share/nltk_data...
[nltk_data] | Unzipping corpora/abc.zip.
[nltk_data] | Downloading package alpino to /usr/share/nltk_data...
[nltk_data] | Unzipping corpora/alpino.zip.
[nltk_data] | Downloading package biocreative_ppi to
[nltk_data] | /usr/share/nltk_data...
....
[nltk_data] | Unzipping models/bllip_wsj_no_aux.zip.
[nltk_data] | Downloading package word2vec_sample to
[nltk_data] | /usr/share/nltk_data...
[nltk_data] | Unzipping models/word2vec_sample.zip.
[nltk_data] |
[nltk_data] Done downloading collection all

```

## Running the job

Here is the complete script to run the Spark + NLTK example in PySpark:

```

# spark-nltk.py
from pyspark import SparkConf
from pyspark import SparkContext

conf = SparkConf()
conf.setMaster('yarn-client')
conf.setAppName('spark-nltk')
sc = SparkContext(conf=conf)

data = sc.textFile('file:///usr/share/nltk_data/corpora/state_union/1972-Nixon.txt')

def word_tokenize(x):
    import nltk
    return nltk.word_tokenize(x)

def pos_tag(x):
    import nltk
    return nltk.pos_tag([x])

words = data.flatMap(word_tokenize)
print words.take(10)

pos_word = words.map(pos_tag)
print pos_word.take(5)

```

Examine the above code example. First, it imports PySpark and creates a SparkContext:

```

from pyspark import SparkConf
from pyspark import SparkContext

conf = SparkConf()
conf.setMaster('yarn-client')
conf.setAppName('spark-nltk')
sc = SparkContext(conf=conf)

```

After a `SparkContext` is created, we can load some data into Spark. In this case, the data file is from one of the example documents provided by NLTK.

NOTE: You could also copy the data to HDFS and load it from Spark.

```
data = sc.textFile('file:///usr/share/nltk_data/corpora/state_union/1972-Nixon.txt')
```

Next is a function called `word_tokenize` that imports `nltk` on the Spark worker nodes and calls `nltk.word_tokenize`. The function is mapped to the text file that was read in the previous step:

```
def word_tokenize(x):
    import nltk
    return nltk.word_tokenize(x)

words = data.flatMap(word_tokenize)
```

You can confirm that the `flatMap` operation worked by returning some of the words in the dataset:

```
print words.take(10)
```

Finally, you can use NLTK's [part-of-speech tagger](#) to attach the part of speech to each word in the data set:

```
def pos_tag(x):
    import nltk
    return nltk.pos_tag([x])

pos_word = words.map(pos_tag)
print pos_word.take(5)
```

Run the script on the Spark cluster using the `spark-submit` script. The output shows the words that were returned from the Spark script, including the results from the `flatMap` operation and the POS-tagger:

```
Using Spark's default log4j profile: org/apache/spark/log4j-defaults.properties
15/06/13 05:14:29 INFO SparkContext: Running Spark version 1.4.0

[...]
```

```
[ 'Address',
  'on',
  'the',
  'State',
  'of',
  'the',
  'Union',
  'Delivered',
  'Before',
  'a' ]

[...]
```

```
[ ('Address', 'NN') ],
[ ('on', 'IN') ],
[ ('the', 'DT') ],
[ ('State', 'NNP') ],
[ ('of', 'IN') ]
```

## Troubleshooting

If something goes wrong, consult *Help and support*.

## Further information

See the [Spark](#) and [PySpark](#) documentation:

For more information on NLTK, see the [NLTK book](#).

## Help and support

Support is included with the purchase of an Anaconda subscription. Visit the [support section of our website](#) for documentation and contact information for priority support.

## Training and consulting

Training and consulting is available for Anaconda Scale. For more information, please [contact us](#).

### 3.4.6 NumbaPro

---

**Note:** This product is discontinued. This archived copy of the product documentation is provided for those customers who are still using it.

---

NumbaPro has been deprecated, and its code generation features have been moved into open-source [Numba](#). The CUDA library functions have been moved into [Accelerate](#), along with some Intel MKL functionality. High-level functions and access to additional native library implementations will be added in future releases of [Accelerate](#), and there will be no further updates to NumbaPro.

A NumbaPro compatibility layer (listed as release 0.22.0 of NumbaPro) provides access to the new [Accelerate](#) packages through the old NumbaPro package names. This avoids the need to change any existing code immediately for use with [Accelerate](#). A warning will be generated upon import of the compatibility layer, to highlight the deprecation of the NumbaPro package.

*Archived NumbaPro documentation* is still available.

## NumbaPro

[Get started with the NumbaPro Quick Start \[pdf\]](#)

*NumbaPro* is an enhanced version of [Numba](#) which adds premium features and functionality that allow developers to rapidly create optimized code that integrates well with [NumPy](#).

With NumbaPro, Python developers can define NumPy [ufuncs](#) and [generalized ufuncs](#) (gufuncs) in Python, which are compiled to machine code dynamically and loaded on the fly. Additionally, NumbaPro offers developers the ability to target multicore and GPU architectures with Python code for both [ufuncs](#) and general-purpose code.

For targeting the GPU, NumbaPro can either do the work automatically, doing its best to optimize the code for the GPU architecture. Alternatively, CUDA-based API is provided for writing [CUDA](#) code specifically in Python for ultimate control of the hardware (with thread and block identities).

### Getting Started

Let's start with a simple function to add together all the pairwise values in two NumPy arrays. Asking NumbaPro to compile this Python function to vectorized machine code for execution on the CPU is as simple as adding a single line of code (invoked via a decorator on the function):

Similarly, one can instead target the GPU for execution of the same Python function by modifying a single line in the above example:

```
@vectorize(['float32(float32, float32)'], target='gpu')
```

Targeting the GPU for execution introduces the potential for numerous GPU-specific optimizations so as a starting point for more complex scenarios, one can also target the GPU with NumbaPro via its *Just-In-Time* (JIT) compiler:

### Features

Here's a list of highlighted features:

- Portable data-parallel programming through ufuncs and gufuncs for single core CPU, multicore CPU and GPU
- Bindings to CUDA libraries: cuRAND, cuBLAS, cuFFT
- Python CUDA programming for maximum control of hardware resources

### User Guide

New users should first read the installation manual:

### Installation

NumbaPro is part of the *Anaconda Accelerate* product. Please refer to the [Anaconda Accelerate Documentation](#) for instructions on downloading and installation.

### Purchasing a License

Accelerate is included with [Anaconda Workgroup](#) and [Anaconda Enterprise](#) subscriptions.

To start a 30-day free trial just download and install the Anaconda Accelerate package.

If you already have [Anaconda](#) (free Python distribution) installed:

```
conda update conda
conda install accelerate
```

If you do not have Anaconda installed, you can download it [here](#).

Anaconda Accelerate can also be installed into your own (non-Anaconda) Python environment. For more information about Accelerate please contact [sales@anaconda.com](mailto:sales@anaconda.com).

## Update Instructions

With Anaconda Accelerate already installed, first update the `conda` package management tool to the latest version, then use `conda` to update the NumbaPro module. In the terminal:

```
$ conda update conda
$ conda update numbapro
```

## CUDA GPUs Setup

### CUDA Driver

NumbaPro does not ship the CUDA driver. It is users responsibility to ensure their systems are using the **latest driver**. Currently, users should use the driver shipped with [CUDA 5.5 SDK](#).

### CUDA Support & Detection

NumbaPro GPU support currently requires [NVIDIA CUDA GPUs](#) with **compute-capability 2.0 or above**. Users should check their hardware with the following:

```
import numbapro
numbapro.check_cuda()
```

A sample output looks like:

```
-----libraries detection-----
Finding cublas
  located at /Users/.../lib/libcublas.dylib
Finding cusparse
  located at /Users/.../lib/libcusparse.dylib
Finding cufft
  located at /Users/.../lib/libcufft.dylib
Finding curand
  located at /Users/.../lib/libcurand.dylib
Finding nvvm
  located at /Users/.../lib/libnvvm.dylib
In /Users/.../lib
  finding libdevice.compute_20.bc      ok
  finding libdevice.compute_30.bc      ok
  finding libdevice.compute_35.bc      ok
-----hardware detection-----
Found 1 CUDA devices
id 0      GeForce GT 650M                [SUPPORTED]
        compute capability: 3.0
        pci device id: 0
        pci bus id: 1
Summary:
  1/1 devices are supported
```

This performs CUDA library and GPU detection. Discovered GPUs are listed with information for compute capability and whether it is supported by NumbaPro.

The message “cuda disabled by user” means that either the environment variable `NUMBA_DISABLE_CUDA` is set to 1 and must be set to 0, or the system is 32-bit. CUDA does not support 32-bit systems.

Basics:

## Quick Start

Numba/NumbaPro uses decorators extensively to annotate function for compilation. This document explains the major decorators: `jit`, `autojit`, `vectorize` and `guvectorize`.

## Types

Numba/NumbaPro decorators specializes generic python function to typed native function. All decorators except `autojit` requires type information to be supplied. Here is a table of common Numba type objects:

| Kind             | Numba Types                   |
|------------------|-------------------------------|
| signed integer   | int8, int16, int32, int64     |
| unsigned integer | uint8, uint16, uint32, uint64 |
| float-points     | float32, float64              |
| complex numbers  | complex64, complex128         |
| boolean          | bool_                         |
| others           | void                          |

## Compiler Target `target="..."`

All decorators, `jit`, `autojit`, `vectorize` and `guvectorize`, have a `target` keyword argument to select the code generation target. User provides a string to name the target. Numba supports only the `"cpu"` target. NumbaPro adds `"parallel"` and `"gpu"`. The `"parallel"` target is only available for `vectorize`, which will distributes the work across CPU threads. The `"gpu"` offloads the computation to a Nvidia CUDA GPU.

High-level APIs for CPU/GPU:

## Universal Functions

With NumbaPro, [universal functions](#) (ufuncs) can be created by applying the `vectorize` decorator on to simple scalar functions. A ufunc can operates on scalars or NumPy arrays. When used on arrays, the ufunc apply the core scalar function to every group of elements from each arguments in an element-wise fashion. NumPy [Broadcasting](#) is applied to every argument with mismatching dimensions.

## Example: Basic

Here is a simple example to perform element-wise addition:

The ufunc is compiled to operate on `float32` and `float64` arrays. It is used to compute element-wise addition of array *a* and *b* which are arrays of `numpy.float64` with 10 elements. The output

## Usage

A generalization of the usage of the `vectorize` decorator is described in this section.

**`vectorize`** (*type\_signatures*`[, target='cpu']`)  
Returns a vectorizer object to be applied to python functions.

**Parameters**

- **type\_signatures** – an iterable of type signatures, which are either function type object or a string describing the function type.
- **target** – a string for hardware target; e.g. “cpu”, “parallel”, “gpu”.

**Returns** a vectorizers object.

To use multithreaded version, change the target to “parallel”:

For CUDA target, use “gpu” for target:

```
from numba import vectorize
```

**Performance Guideline**

A general guideline is to choose different targets for different data sizes and algorithms. The “cpu” target works well for small data sizes (approx. less than 1KB) and low compute intensity algorithms. It has the least amount of overhead. The “parallel” target works well for medium data sizes (approx. less than 1MB). Threading adds a small delay. The “gpu” target works well for big data sizes (approx. greater than 1MB) and high compute intensity algorithms. Transferring memory to and from the GPU adds significant overhead.

**Universal Function Targets**

There are several vectorizer versions available. The different options are listed below:

| Target   | Description   |
|----------|---|
| cpu      | Single-threaded CPU   |
| parallel | Multi-core CPU  |
| stream   | Optimize for CPU cache  |
|          | <b>Note:</b> Experimental. Computation speeds may vary.   |
| gpu      | CUDA GPU  |
|          | <b>Note:</b> This creates an <i>ufunc-like</i> object. See <a href="#">documentation for CUDA ufunc</a> for detail. |

**Generalized Ufuncs****GPU Reduction**

Python CUDA Programming

## CUDA Programming Introduction

NumbaPro provides multiple entry points for programmers of different levels of expertise on CUDA. For expert CUDA-C programmers, NumbaPro provides a Python dialect [<CUDAjit.html>](#) for low-level programming on the CUDA hardware. It provides full control over the hardware for fine tuning the performance of CUDA kernels. For new CUDA programmers, the high-level API such as the [universal functions \(ufunc\)](#) and [generalized ufuncs \(gufunc\)](#) are the easiest way to write array operations for the GPU.

## A Very Brief Introduction to CUDA

A [CUDA GPU](#) contains one or more *streaming multiprocessors* (SMs). Each SM is a manycore processor that is optimized for high throughput. The *manycore* architecture is very different from the common multicore CPU architecture. Instead of having a large cache and complex logic for instruction level optimization, a manycore processor achieves high throughput by executing many threads in parallel on many simpler cores. It overcomes latency due to cache miss or long operations by using zero-cost context switching. It is common to launch a CUDA kernel with hundreds or thousands of threads to keep the GPU busy.

The CUDA programming model is similar to the SIMD vector model in modern CPUs. A CUDA SM schedules the same instruction from a *warp* of 32-threads at each issuing cycle. The advantage of CUDA is that the programmer does not need to handle the divergence of execution path in a warp, whereas a SIMD programmer would be required to properly mask and shuffle the vectors. The CUDA model decouples the data structure from the program logic.

To know more about CUDA, please refer to [NVIDIA CUDA-C Programming Guide](#).

## CUDA Ufuncs and Generalized Ufuncs

This page describes the CUDA ufunc-like object.

To support the programming pattern of CUDA programs, CUDA Vectorize and GUVectorize cannot produce a conventional ufunc. Instead, a ufunc-like object is returned. This object is a close analog but not fully compatible with a regular NumPy ufunc. The CUDA ufunc adds support for passing intra-device arrays (already on the GPU device) to reduce traffic over the PCI-express bus. It also accepts a *stream* keyword for launching in asynchronous mode.

## Example: Calling Device Functions

All CUDA ufunc kernels have the ability to call other CUDA device functions:

```
from numbapro import vectorize, cuda

# define a device function
@cuda.jit('float32(float32, float32, float32)', device=True, inline=True)
def cu_device_fn(x, y, z):
    return x ** y / z

# define a ufunc that calls our device function
@vectorize(['float32(float32, float32, float32)'], target='gpu')
def cu_ufunc(x, y, z):
    return cu_device_fn(x, y, z)
```

## Generalized CUDA ufuncs

Generalized ufuncs may be executed on the GPU using CUDA, analogous to the CUDA ufunc functionality. This may be accomplished as follows:

```
from numbaipro import guvectorize

@guvectorize(['void(float32[:, :], float32[:, :], float32[:, :])'],
             '(m,n), (n,p)->(m,p)', target='gpu')
def matmulcore(A, B, C):
    ...
```

There are times when the gufunc kernel uses too many of a GPU's resources, which can cause the kernel launch to fail. The user can explicitly control the maximum size of the thread block by setting the `max_blocksize` attribute on the compiled gufunc object.

```
from numbaipro import guvectorize

@guvectorize(..., target='gpu')
def very_complex_kernel(A, B, C):
    ...

very_complex_kernel.max_blocksize = 32  # limits to 32 threads per block
```

## Writing CUDA-Python

### CUDA Libraries Host API

### CUDA Device Management

### CUDA Support

---

**Note:** Platforms supported: Linux, Windows and Mac OSX 32/64-bit. Only support CUDA devices with **compute capability 2.0 and above**. Please see [CUDA GPUs](#) for a list of CUDA GPUs and their compute capability.

---

---

**Note:** As of version 0.12.2, [Anaconda](#) is distributing a subset of CUDA toolkit 5.5 libraries. The following information is no longer necessary for most users.

---

NumbaPro searches in the system shared library path for the CUDA drivers and CUDA libraries (e.g. cuRAND, cuBLAS). Users can set environment variable **LD\_LIBRARY\_PATH** to the directory of the CUDA drivers to ensure that NumbaPro can find them. The instruction to do so is printed at the end of the CUDA SDK installation.

User can override the search path with the following environment variables:

- **NUMBAPRO\_CUDA\_DRIVER** path to CUDA driver shared library file
- **NUMBAPRO\_NVVM** path to CUDA libNVVM shared library file
- **NUMBAPRO\_LIBDEVICE** path to CUDA libNVVM libdevice directory which contains .bc files.

## CUDA Python Specification (v0.2)

(This document reflects the implementation of CUDA Python in NumbaPro 0.12. In time, we may refine the specification.)

As usage of Python on CUDA GPUs is becoming more mature, it has become necessary to define a formal specification for a dialect and its mapping to the [PTX ISA](#). There are places where the semantic of this dialect differs from the Python semantic. The change in semantic is necessary for us to generate high-performance code that is otherwise hard to achieve.

### No-Python Mode (NPM)

CUDA Python is a superset of the *No-Python mode* (NPM). NPM is a statically typed subset of the Python language. It does not use the Python runtime; thus, it only supports lower level types; such as booleans, ints, floats, complex numbers and arrays. It does not support Python objects. Since we drop the support for objects entirely, many basic language constructs must be handled differently. For instance, a simple for-loop is:

```
for i in range(10):  
    ...
```

where `range` returns an iterable. NPM restricts the language so that only `range` or `xrange` can be used.

For array support, NPM models the NumPy `ndarray`. An array is a structure with a pointer to the data, an array of shape and an array of strides. Valid attributes are `shape`, `strides`, `size` and `ndim`. Arrays cannot be unpacked. The only way to access array elements is through the `__getitem__` and `__setitem__` operators (e.g. `ary[i, j]`). Slicing is not supported. When indexing into an array, a N-dimension array must be provided with N indices.

Tuples are minimally supported for unpacking array `shape` and `strides` attributes and some return value of calls.

In time, we aim to enhance NPM to expand the supported subset and recognize more idiomatic Python patterns.

#### Summary:

- no object;
- no exception;
- for-loop only works on `range` or `xrange`;
- supported types: ints, floats, complex numbers, and arrays.

### Type Inference

The type inference algorithm for CUDA Python differs from Numba as we recognize that its users require stronger typing to better predict code performance. This is a summary of the type inference rules:

- Implicit coercion for all ints and floats only.
- Variable type is assigned at definition but a variable can be redefined; thus its type can be modified at the next assignment.
- Inside a loop, the variable type remains unchanged even at redefinition. The type assigned at the preloop block (the dominator of the basic-block) is assumed. This greatly differs from Python semantic.

User can force the type of any value by using the type object defined in `numbapro` namespace:

```

from numbapro import cuda, int16, float32

@cuda.autojit
def a_cuda_kernel(arg):
    must_be_int16 = int16(123)
    must_be_float32 = float32(321)

```

## Basic Arithmetic Operations

For binary operators `+` `-` `*`, the operands are coerced to the most generic type of the two before the computation. The result type is the coerced type.

**For `floordiv //`, the coercion rule on operands for basic binary operators** applies. But, the result type is always coerced to an integer of the same bitwidth and at least has 32-bits.

For `truediv /`, the operands are promoted to a floating point representation with bitwidth equals to the maximum of the two operands before the computation and at least has 32-bits. The result type is the coerced type.

For binary bitwise `&` `|` `^` `>>` `<<`, the operands must be of integer types and they are coerced to the most generic type of the two before the computation. The result type is the coerced type.

For complex numbers, only `+` `-` `*` are defined.

Please refer to the [CUDA-C Programming Guide: Arithmetic Instructions](#) for the precision each operation.

## Intp

`intp` is used to represent the integer whose width equals the address width.

## Array Operations

Array attributes are read-only:

- `shape` contains the number of elements for each dimension. It can be indexed or unpacked like a tuple. It is a tuple of `intp`.
- `strides` contains the number of bytes skip to move forward to the next element for a given dimension. It can be indexed or unpacked like a tuple. It is a tuple of `intp`.
- `size` contains the number of elements in the array but may not be correspond to the actual size of the data buffer since strides can be zero or negative. It is an `intp`.
- `ndim` contains the number of dimension in the array. It is an `intp`.

`__getitem__` returns the element at the given index. Slicing or fancy indexing are not supported. The result type is always the same as the element type of the array.

`__setitem__` stores a value into the array at an index. The value is coerced if necessary.

## CUDA Intrinsics

All intrinsics are defined under the `numbapro.cuda` namespace.

Thread ID intrinsics:

- `cuda.threadIdx.x`, `cuda.threadIdx.y`, `cuda.threadIdx.z` are the X, Y and Z IDs of the thread.

- `cuda.blockIdx.x`, `cuda.blockIdx.y` are the X and Y ID of the block.
- `cuda.blockDim.x`, `cuda.blockDim.y`, `cuda.blockDim.z` are the X, Y and Z width of the thread block.
- `cuda.gridDim.x`, `cuda.gridDim.y` are the X and Y width of the grid.

Barrier intrinsics:

- `cuda.syncthreads()` equivalent to `__syncthreads()` in CUDA-C. It is a thread block level barrier.

Shared memory intrinsics

- `cuda.shared.array(shape, dtype)` constructs a statically allocated array in the shared memory of kernel. `dtype` argument must be a type object defined in the `NumbaPro` namespace. It must be declared in the entry block of the kernel.

## Math

Python Dialect for CUDA translates math functions defined in the `math` module of the Python standard library. All the functions use the semantic of the CUDA-C definition. Please refer to the [CUDA-C Programming Guide: Math Function](#).

Supported functions:

```
math.acos
math.asin
math.atan
math.arctan
math.acosh
math.asinh
math.atanh
math.cos
math.sin
math.tan
math.cosh
math.sinh
math.tanh
math.atan2
math.exp
math.expm1           # not available in Python 2.6
math.fabs
math.log
math.log10
math.log1p
math.sqrt
math.pow
math.ceil
math.floor
math.copysign
math.fmod
math.isnan
math.isinf
```

## Fast Math

*coming soon in the next release...*

## Learn by Examples

The developer team maintains a public [GitHub repository of examples](#). Many examples are designed to show off the potential performance gain by using GPUs.

## Requirements

Base:

- Python 2.6, 2.7, 3.3, 3.4
- LLVM 3.3

For CUDA GPU features:

- Latest NVIDIA CUDA driver
- CUDA Toolkit 5.5 or above
- At least one CUDA GPU with compute capability 2.0 or above

Python modules:

- llvmpy 0.12.7 or above
- numba 0.14.0 or above

## Release Notes

### Version (0.21.0)

NumbaPro will be deprecated with most code generation features moved into the opensource Numba and the CUDA bindings moved into a new commercial package called “Accelerate”. The new package will feature more high-level API functions from the CUDA libraries as well as MKL.

The next release of NumbaPro will provide aliases to the features that are moved to Numba and Accelerate. There will not be any new feature added to NumbaPro. In the future, there may be bug fix releases for maintaining the aliases to the moved features.

Changes:

- Depends on numba 0.21.0
- Fix auto thread-per-block tuning support for CUDA CC 3.7 devices
- `Blas.dotu` is deprecated. A warning is generated when it is used. `Blas.dot` is an alias to it and is preferred.

### Version (0.20.0)

This release depends on numba 0.20, which has upgraded to CUDA 7 for GPU support. CUDA 7 has deprecated the support for all 32-bit platforms. The oldest supported Windows version is Windows 7.0. This does not affect CPU features.

### Version (0.19.0)

- Depends on numba 0.19
- Fixes issue with GPU ufunc broadcasting
- Improves GPU ufunc implementation

### Version (0.18.0)

- Depends on numba 0.18.1
- **Improve CUDA gufunc implementation**
  - Simplified code generation
  - Smarter blocksize selection

### Version (0.17.1)

- Depends on numba 0.17.0
- Warns about incompatible numba version at import time
- Fixes some CUDA library APIs on windows

### Version (0.17.0)

- Depends on numba 0.16.0
- Replaces llvmpy with llvmlite, which also upgrades to llvm3.5
- Update occupancy autotuner for CC 5.0 and CC 5.2 devices
- Fix handling of empty array in GPU reduction
- Fix occupancy autotuner that may pick invalid blocksize

### Version (0.16.0)

- Add *numbapro.cuda.reduce* for autogeneration of CUDA reduce kernels and driver.
- Fix device to host auto transfer logic in some ufunc function.
- Upgrades to Numba 0.15

### Version (0.15.0)

- **Add *numbapro.cudalib.sorting*:**
  - Added GPU radixsort and radixselect using implementation from <http://nvlabs.github.io/cub>
  - Added GPU segmented sort from <http://nvlabs.github.io/moderngpu>
- Fix GPU *print()* when there are multiple arguments

### Version (0.14.3)

- CUDA driver is initialized lazily
- Improved stability of CUDA ufunc machinery
- Improved stability of parallel ufunc

### Version (0.14.2)

- Unify numba.cuda and numbapro.cuda backend
- Enable Python 3 support
- Fixes workqueue module import for embedded python usecase

### Version (0.14.1)

Fixes:

- UnboundReferenceError due to mishandling of incompatible driver (pre CUDA5.5 driver). The fix relaxes the driver requirement by allowing some features to fail on use.
- numbapro.cuda.\* symbols are still exported when CUDA is not available. They would raise exception on use.

### Version (0.14.0)

Features:

- Add cuSparse API
- Improve CUDA driver and resource management
- Some of CUDA-python language feature is now opensourced as numba.cuda

Fixes:

- New CUDA driver system prevents freezing OSX on kernel launch error

### Version (0.13.2)

- Fix problem with numpy 18 array scalar contiguousness
- Fix CUDA target auto initialization on *import numbapro*
- Fix an access violation error on Windows 8 due to mishandling by LLVM.
- Add non-public API for profiler control.

### Version (0.13.1)

- Guard error due to mishandling of interleaved memory buffer (#60)
- Update to use Numba 0.12.1
- Fix powi bug

**Version (0.13)**

- Add print statement for strings and scalar numeric types for debugging on GPU
- Add constant and local memory array allocation on GPU
- Add debug mode for GPU
- Allow raising exception classes on GPU
- Update CUDA toolkit libraries
- Fix boolean mapping

**Version (0.12.7)**

- Fix major bug that mistreats py2 division as inplace floor-division for real numbers.
- Fix using of array as argument of a CUDA device function.
- Delay initialization the CUDA subsystem upon first import of the cuda package.
- Add docstrings.

**Version (0.12.6)**

- Fix major bug that mistreats py2 division as floor-division for real numbers.

**Version (0.12.5)**

- Update to Numba 0.10.2
- Update to LLVM 3.3
- Various bug fixes

**Version (0.12.4)**

- Update to Numba 0.10.0
- Minor bug fixes

**Version (0.12.3)**

- Accept older driver by deferring driver error to first use of specific API
- Report incompatible GPU at context creation
- Improve device information reporting
- Autotuning base on compiler info and occupancy calculator
- Add basic support for ravel and reshape

**Version (0.12.2)**

- Distribute CUDA toolkit in Anaconda
- Better error message
- Fix gufunc signature parsing to accept trailing comma.
- Fix CUDA driver log info bug
- Support JIT linking

**Version (0.12.1)**

- Fix libNVVM search path (now accept directory path)
- Fix sign-extension error in forloop precondition
- Fix support for true-division

**Version (0.12.0)**

- Use CUDA 5.5rc
- Expand math support through CUDA NVVM libdevice
- Rewritten nopython mode for CUDA-Python
- Removed experimental CU API
- Removed minivectorize

**Version (0.11.0)**

- Add cuBlas binding
- Improve CUDA ndarray and memory management
- Add CUDA mapped host memory
- Add CUDA event

**Version (0.10.1)**

- Fix CU memory leak
- Fix CU hanging on some GPU
- Improve error message for unsupported GPU devices
- Add cuFFT

### Version (0.10)

- Added Compute Unit (CU) API
- Added cuRAND binding
- Added CUDA device array
- Various improvements to CUDA support

### Version (0.9)

- Improve CUDA driver discovery.

### Version 0.8

- Update for SSA types inference in Numba
- Allow user to select CUDA device
- Add support for pinned and mapped CUDA memory
- Improvement on small memory allocation in CUDA
- Default to use libNVVM from Anaconda
- Bug fixes

### Version 0.7

- Prange: parallel for-range
- Array slicing
- Refactor CUDA dispatch mechanisms
- Migrate to NVVM instead of PTX for CUDA codegen

### Version 0.6 and earlier

- Array expressions
- Fast ufuncs and generalized-ufunc (gufunc) with single-core, multi-core and CUDA
- CUDA JIT.

## License Agreement

### NumbaPro EULA

### END USER LICENSE AGREEMENT

NumbaPro (“the Software Product”) and accompanying documentation is licensed and not sold. The Software Product is protected by copyright laws and treaties, as well as laws and treaties related to other forms of intellectual property.

Continuum Analytics, Inc. (dba Anaconda, Inc.) or its subsidiaries, affiliates, and suppliers (collectively “Continuum”) own intellectual property rights in the Software Product. The Licensee’s (“you” or “your”) license to download, use, copy, or change the Software Product is subject to these rights and to all the terms and conditions of this End User License Agreement (“Agreement”).

## Acceptance

YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS AGREEMENT BY SELECTING THE “ACCEPT” OPTION AND DOWNLOADING THE SOFTWARE PRODUCT OR BY INSTALLING, USING, OR COPYING THE SOFTWARE PRODUCT. YOU MUST AGREE TO ALL OF THE TERMS OF THIS AGREEMENT BEFORE YOU WILL BE ALLOWED TO DOWNLOAD THE SOFTWARE PRODUCT. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THIS AGREEMENT, YOU MUST SELECT “DECLINE” AND YOU MUST NOT INSTALL, USE, OR COPY THE SOFTWARE PRODUCT.

## Trial Period

You have the right to use NumbaPro on a single computer or group of computers for 30 days with no license. After 30 days you must purchase an appropriate license to use the software on one or more machines or stop using the software and remove it from all of your machines on which you installed the software.

## License Grant

This Agreement entitles you to install and use one copy of the Software Product on as many machines as you will personally use. The Software Product is licensed to a particular user. Only the user to whom the software is licensed may use the software. You must obtain a license for as many users as you wish to use the software. In addition, you may make archival copies of the Software Product Installer.

## Restrictions on Transfer

Without first obtaining the express written consent of Continuum, you may not assign your rights and obligations under this Agreement, or redistribute, encumber, sell, rent, lease, sublicense, or otherwise transfer your rights to the Software Product.

## Restrictions on Use

You may not use, copy, or install the Software Product on any system where more than one user will be able to use the software unless you have purchased a license for each user of the system. You may not decompile, “reverse-engineer”, disassemble, or otherwise attempt to derive the source code for the Software Product.

## Restrictions on Alteration

You may not modify the Software Product or create any derivative work of the Software Product or its accompanying documentation. Derivative works include but are not limited to translations. You may not alter any files or libraries in any portion of the Software Product.

## **Restrictions on Copying**

You may not copy any part of the Software Product except to the extent that licensed use inherently demands the creation of a temporary copy stored in computer memory and not permanently affixed on storage medium. You may make archival copies of the Software Product installer.

## **Limited Software Product Warranty**

For a period of 60 days from the date of shipment or from the date that you download the Software Product, as applicable, Continuum warrants that when properly installed and used under normal conditions, the Software Product will perform substantially as advertised.

## **Disclaimer of Warranties and Limitation of Liability**

UNLESS OTHERWISE EXPLICITLY AGREED TO IN WRITING BY CONTINUUM, CONTINUUM MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, IN FACT OR IN LAW, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OTHER THAN AS SET FORTH IN THIS AGREEMENT OR IN THE LIMITED WARRANTY DOCUMENTS PROVIDED WITH THE SOFTWARE PRODUCT.

Continuum makes no warranty that the Software Product will meet your requirements or operate under your specific conditions of use. Continuum makes no warranty that operation of the Software Product will be secure, error free, or free from interruption. YOU MUST DETERMINE WHETHER THE SOFTWARE PRODUCT SUFFICIENTLY MEETS YOUR REQUIREMENTS FOR SECURITY AND UNINTERRUPTABILITY. YOU BEAR SOLE RESPONSIBILITY AND ALL LIABILITY FOR ANY LOSS INCURRED DUE TO FAILURE OF THE SOFTWARE PRODUCT TO MEET YOUR REQUIREMENTS. CONTINUUM WILL NOT, UNDER ANY CIRCUMSTANCES, BE RESPONSIBLE OR LIABLE FOR THE LOSS OF DATA ON ANY COMPUTER OR INFORMATION STORAGE DEVICE. UNDER NO CIRCUMSTANCES SHALL CONTINUUM, ITS DIRECTORS, OFFICERS, EMPLOYEES OR AGENTS BE LIABLE TO YOU OR ANY OTHER PARTY FOR INDIRECT, CONSEQUENTIAL, SPECIAL, INCIDENTAL, PUNITIVE, OR EXEMPLARY DAMAGES OF ANY KIND (INCLUDING LOST REVENUES OR PROFITS OR LOSS OF BUSINESS) RESULTING FROM THIS AGREEMENT, OR FROM THE FURNISHING, PERFORMANCE, INSTALLATION, OR USE OF THE SOFTWARE PRODUCT, WHETHER DUE TO A BREACH OF CONTRACT, BREACH OF WARRANTY, OR THE NEGLIGENCE OF CONTINUUM OR ANY OTHER PARTY, EVEN IF CONTINUUM IS ADVISED BEFOREHAND OF THE POSSIBILITY OF SUCH DAMAGES. TO THE EXTENT THAT THE APPLICABLE JURISDICTION LIMITS CONTINUUM'S ABILITY TO DISCLAIM ANY IMPLIED WARRANTIES, THIS DISCLAIMER SHALL BE EFFECTIVE TO THE MAXIMUM EXTENT PERMITTED.

## **Limitation of Remedies and Damages**

Your remedy for a breach of this Agreement or of any warranty included in this Agreement is the correction or replacement of the Software Product. Selection of whether to correct or replace shall be solely at the discretion of Continuum. Continuum reserves the right to substitute a functionally equivalent copy of the Software Product as a replacement. If Continuum is unable to provide a replacement or substitute Software Product or corrections to the Software Product, your sole alternate remedy shall be a refund of the purchase price for the Software Product exclusive of any costs for shipping and handling. Any claim must be made within the applicable warranty period. All warranties cover only defects arising under normal use and do not include malfunctions or failure resulting from misuse, abuse, neglect, alteration, problems with electrical power, acts of nature, unusual temperatures or humidity, improper installation, or damage determined by Continuum to have been caused by you. All limited warranties on the Software Product are granted only to you and are non-transferable. You agree to indemnify and hold Continuum

harmless from all claims, judgments, liabilities, expenses, or costs arising from your breach of this Agreement and/or acts or omissions.

## Governing Law, Jurisdiction and Costs

This Agreement is governed by the laws of Texas, without regard to Texas's conflict or choice of law provisions.

## Severability

If any provision of this Agreement shall be held to be invalid or unenforceable, the remainder of this Agreement shall remain in full force and effect. To the extent any express or implied restrictions are not permitted by applicable laws, these express or implied restrictions shall remain in force and effect to the maximum extent permitted by such applicable laws.

## Third Party Dependencies

The following sections enumerate NumbaPro thirdparty dependencies and their license information.

### CUDA Toolkit Redistributable Libraries

The `cuda-toolkit` conda package contains redistributable binaries from the CUDA toolkit. See CUDA toolkit EULA at <http://docs.nvidia.com/cuda/eula/index.html>

### CUB

The `nbpro_radixsort.so` library (shipped in `numbapro_cudalib` conda package) uses CUB (<http://nvlabs.github.io/cub>) which has the following license:

```
Copyright (c) 2011, Duane Merrill. All rights reserved.
Copyright (c) 2011-2014, NVIDIA CORPORATION. All rights reserved.
Redistribution and use in source and binary forms, with or without
modification, are permitted provided that the following conditions are met:
    Redistributions of source code must retain the above copyright
        notice, this list of conditions and the following disclaimer.
    Redistributions in binary form must reproduce the above copyright
        notice, this list of conditions and the following disclaimer in the
        documentation and/or other materials provided with the distribution.
    Neither the name of the NVIDIA CORPORATION nor the
        names of its contributors may be used to endorse or promote products
        derived from this software without specific prior written permission.
THIS SOFTWARE IS PROVIDED BY THE COPYRIGHT HOLDERS AND CONTRIBUTORS "AS IS" AND
ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED
WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE
DISCLAIMED. IN NO EVENT SHALL NVIDIA CORPORATION BE LIABLE FOR ANY
DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES
(INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES;
LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND
ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT
(INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS
SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.
```

## ModernGPU

The `nbpro_segsort.so` library (shipped in `numbapro_cudalib` conda package) uses ModernGPU (<http://nvlabs.github.io/moderngpu>) which has the following license:

```
Copyright (c) 2013, NVIDIA CORPORATION. All rights reserved.
```

```
Redistribution and use in source and binary forms, with or without  
modification, are permitted provided that the following conditions are met:
```

- \* Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.
- \* Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
- \* Neither the name of the NVIDIA CORPORATION nor the names of its contributors may be used to endorse or promote products derived from this software without specific prior written permission.

```
THIS SOFTWARE IS PROVIDED BY THE COPYRIGHT HOLDERS AND CONTRIBUTORS "AS IS"

DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES  
(INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES;  
LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND  
ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT  
(INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS  
SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.
```

### 3.4.7 MKL Optimizations

Developed specifically for science, engineering, and financial computations, Intel™ Math Kernel Library (MKL) is a set of threaded and vectorized math routines that work to accelerate various math functions and applications. Anaconda has packaged MKL-powered binary versions of some of the most popular numerical/scientific Python libraries into MKL Optimizations for improved performance.

**MKL Optimizations includes:**

- Speed-boosted NumPy, SciPy, scikit-learn, and NumExpr
- The packaging of MKL with redistributable binaries in Anaconda for easy access to the MKL runtime library.
- Python bindings to the low level MKL service functions, which allow for the modification of the number of threads being used during runtime.

#### Included Packages

##### Packages upgraded to use MKL

- NumPy
- NumExpr
- SciPy
- Scikit-Learn

## mkl-service

This package exposes a few functions which are declared in `mkl_service.h`. The main purpose of the package is to allow the user to change the number of CPU's MKL is using at runtime.

### Example:

In this small example, we first query how many CPU are being used, and then change this number.

```
>>> import mkl
>>> mkl.get_max_threads()
2
>>> mkl.set_num_threads(1)
>>> mkl.get_max_threads()
1
```

## Reference

### mkl service functions:

**mkl.get\_cpu\_clocks()** -> int Return the CPU clocks as an integer.

**mkl.get\_cpu\_frequency()** -> float Return CPU frequency in GHz as a float.

**mkl.get\_max\_threads()** -> int Return the number of threads Intel MKL is targeting for parallelism.

**mkl.get\_version\_string()** -> str Return the MKL library version information as a string.

**mkl.mem\_stat(n)** -> int Returns an amount of memory, allocated by the MKL Memory Allocator.

**mkl.set\_num\_threads(n)** Set the number of threads MKL should use. This is only a hint, and no guaranteed is made this number of threads will actually be used. This function takes precedence over the environment variable `MKL_NUM_THREADS`.

## Installation

In Anaconda versions 2.5 and later, MKL is [freely available by default in Anaconda](#).

If you already have the free [Anaconda](#) Python distribution installed, get MKL by upgrading to the latest version:

```
conda update conda
conda update anaconda
```

If you do not have Anaconda installed, you can download it [here](#).

Existing MKL licenses can be viewed and removed with the graphical Anaconda Navigator license manager or manually with your operating system. For more information please see the [License installation](#) page.

## Configuration

Anaconda now also includes a small utility package called `mkl-service` which provides a Python interface to some useful MKL functions that are declared in `mkl_service.h`, such as setting the number of threads to use.

## Uninstalling MKL

MKL takes roughly 100MB and some use cases do not need it, so users can opt out of MKL and instead use [OpenBLAS](#) for Linux or the native Accelerate Framework for MacOSX. To opt out, run `conda install nomkl` and then use `conda install` to install packages that would normally include MKL or depend on packages that include MKL, such as `scipy`, `numpy`, and `pandas`. Conda will install the non-MKL versions of these packages together with their dependencies. If you are using OS X or Linux, have already installed these packages or already installed all of Anaconda, and wish to switch away from MKL, use the command `conda install nomkl numpy scipy scikit-learn numexpr` followed by `conda remove mkl mkl-service`.

## Updating

If you already have the free Anaconda Python distribution installed and wish to update MKL:

```
conda update conda
conda update mkl
```

## Dismissing MKL Trial warnings

Because past versions of Anaconda did not include MKL linked binaries by default, some users who have used `conda update --all` may see an MKL Trial warning or a license expiration error, even though MKL linked packages are now free and installed by default. A license expiration error message may read, “You cannot run MKL without a license any longer.”

To resolve this, set your installation to use the mkl-linked libraries that do not require a license:

```
conda remove mkl-rt
conda install -f mkl
```

Then run `conda install` with the specific packages you choose:

```
conda install numpy scipy scikit-learn numexpr
```

or with all of Anaconda:

```
conda install anaconda
```

## Resolving MKL shared library “permission denied” errors

On Linux platforms that have SELinux enabled, you may encounter security errors like the following:

```
error while loading shared libraries: <libmkl_intel.so>: cannot restore segment prot_
↪after reloc: Permission denied
```

This is because MKL requires text relocation permissions, which SELinux denies by default. This prevents MKL from being loaded by Numpy, preventing Numpy from being imported.

There are two known solutions to this issue:

1. Does not require root privileges. Replace MKL with OpenBLAS by issuing the command:

```
conda install nomkl numpy scipy scikit-learn numexpr
```

You may revert back to the MKL default versions at any time by using:

```
conda remove nomkl
conda install mkl
```

2. Requires root privileges. Temporarily disable SELinux enforcement. From a root-privileged terminal enter:

```
/usr/sbin/setenforce 0
```

NOTE: If you prefer to make this change permanent, in the file `/etc/selinux/config` change “enforcing” to “disabled” and then reboot.

## License Agreement

The MKL Optimizations are included in the free Anaconda python distribution, and have been made available by the terms of the *End User License Agreement*.

Past versions of MKL Optimizations were not freely available in Anaconda, and have been made available separately by the terms of the *MKL Optimizations End User License Agreement*.

## MKL Optimizations End User License Agreement

MKL Optimizations (“the Software Product” or “MKL Optimizations”) and accompanying documentation is licensed and not sold. The Software Product is protected by copyright laws and treaties, as well as laws and treaties related to other forms of intellectual property. Continuum Analytics, Inc. (dba Anaconda, Inc.) or its subsidiaries, affiliates, and suppliers (collectively “Continuum”) own intellectual property rights in the Software Product. The Licensee’s (“you” or “your”) license to download, use, copy, or change the Software Product is subject to these rights and to all the terms and conditions of this End User License Agreement (“Agreement”).

## Acceptance

YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS AGREEMENT BY SELECTING THE “ACCEPT” OPTION AND DOWNLOADING THE SOFTWARE PRODUCT OR BY INSTALLING, USING, OR COPYING THE SOFTWARE PRODUCT. YOU MUST AGREE TO ALL OF THE TERMS OF THIS AGREEMENT BEFORE YOU WILL BE ALLOWED TO DOWNLOAD THE SOFTWARE PRODUCT. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THIS AGREEMENT, YOU MUST SELECT “DECLINE” AND YOU MUST NOT INSTALL, USE, OR COPY THE SOFTWARE PRODUCT.

## Other Vendor Tools

In addition to Continuum’s proprietary software, the Software product may contain other software packages from other sources (“Other Vendor Tools”). These are available on an “as is” basis and subject to their individual license agreements. These licenses are available either in the package distributed with the Software Product or via request to [info@anaconda.com](mailto:info@anaconda.com). Any binary packages of Other Vendor Tools you obtain via MKL Optimizations are subject to their individual licenses as well as the terms of this EULA. Continuum reserves the right to change which Other Vendor Tools are provided in MKL Optimizations.

## Trial Period

You have the right to use MKL Optimizations on a single computer or group of computers for 30 days with no license. After 30 days you must purchase an appropriate license to use the software on one or more machines or stop using the software and remove it from all of your machines on which you installed the software.

### License Grant

This Agreement entitles you to install and use one copy of the Software Product on as many machines as you will personally use. The Software Product is licensed to a particular user. Only the user to whom the software is licensed may use the software. You must obtain a license for as many users as you wish to use the software. In addition, you may make archival copies of the Software Product Installer.

### Right to Updates

This license entitles you to updates to the Software Product for one year from the time of payment. The Software Product will continue to function and you may continue to use The Software Product and any updates you have received for as long as you would like however you will no longer be able to receive updates from Continuum unless this License is renewed. Please contact [sales@anaconda.com](mailto:sales@anaconda.com) with any questions or concerns.

### Restrictions on Transfer

Without first obtaining the express written consent of Continuum, you may not assign your rights and obligations under this Agreement, or redistribute, encumber, sell, rent, lease, sublicense, or otherwise transfer your rights to the Software Product.

### Restrictions on Use

You may not use, copy, or install the Software Product on any system where more than one user will be able to use the software unless you have purchased a license for each user of the system. You may not decompile, “reverse-engineer”, disassemble, or otherwise attempt to derive the source code for the Software Product.

### Restrictions on Alteration

You may not modify the Software Product or create any derivative work of the Software Product or its accompanying documentation. Derivative works include but are not limited to translations. You may not alter any files or libraries in any portion of the Software Product.

### Restrictions on Copying

You may not copy any part of the Software Product except to the extent that licensed use inherently demands the creation of a temporary copy stored in computer memory and not permanently affixed on storage medium. You may make archival copies of the Software Product installer.

### Limited Software Product Warranty

For a period of 60 days from the date of shipment or from the date that you download the Software Product, as applicable, Continuum warrants that when properly installed and used under normal conditions, the Software Product will perform substantially as advertised.

## Disclaimer of Warranties and Limitation of Liability

UNLESS OTHERWISE EXPLICITLY AGREED TO IN WRITING BY CONTINUUM, CONTINUUM MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, IN FACT OR IN LAW, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OTHER THAN AS SET FORTH IN THIS AGREEMENT OR IN THE LIMITED WARRANTY DOCUMENTS PROVIDED WITH THE SOFTWARE PRODUCT.

Continuum makes no warranty that the Software Product will meet your requirements or operate under your specific conditions of use. Continuum makes no warranty that operation of the Software Product will be secure, error free, or free from interruption. YOU MUST DETERMINE WHETHER THE SOFTWARE PRODUCT SUFFICIENTLY MEETS YOUR REQUIREMENTS FOR SECURITY AND UNINTERRUPTABILITY. YOU BEAR SOLE RESPONSIBILITY AND ALL LIABILITY FOR ANY LOSS INCURRED DUE TO FAILURE OF THE SOFTWARE PRODUCT TO MEET YOUR REQUIREMENTS. CONTINUUM WILL NOT, UNDER ANY CIRCUMSTANCES, BE RESPONSIBLE OR LIABLE FOR THE LOSS OF DATA ON ANY COMPUTER OR INFORMATION STORAGE DEVICE. UNDER NO CIRCUMSTANCES SHALL CONTINUUM, ITS DIRECTORS, OFFICERS, EMPLOYEES OR AGENTS BE LIABLE TO YOU OR ANY OTHER PARTY FOR INDIRECT, CONSEQUENTIAL, SPECIAL, INCIDENTAL, PUNITIVE, OR EXEMPLARY DAMAGES OF ANY KIND (INCLUDING LOST REVENUES OR PROFITS OR LOSS OF BUSINESS) RESULTING FROM THIS AGREEMENT, OR FROM THE FURNISHING, PERFORMANCE, INSTALLATION, OR USE OF THE SOFTWARE PRODUCT, WHETHER DUE TO A BREACH OF CONTRACT, BREACH OF WARRANTY, OR THE NEGLIGENCE OF CONTINUUM OR ANY OTHER PARTY, EVEN IF CONTINUUM IS ADVISED BEFOREHAND OF THE POSSIBILITY OF SUCH DAMAGES. TO THE EXTENT THAT THE APPLICABLE JURISDICTION LIMITS CONTINUUM'S ABILITY TO DISCLAIM ANY IMPLIED WARRANTIES, THIS DISCLAIMER SHALL BE EFFECTIVE TO THE MAXIMUM EXTENT PERMITTED.

## Limitation of Remedies and Damages

Your remedy for a breach of this Agreement or of any warranty included in this Agreement is the correction or replacement of the Software Product. Selection of whether to correct or replace shall be solely at the discretion of Continuum. Continuum reserves the right to substitute a functionally equivalent copy of the Software Product as a replacement. If Continuum is unable to provide a replacement or substitute Software Product or corrections to the Software Product, your sole alternate remedy shall be a refund of the purchase price for the Software Product exclusive of any costs for shipping and handling. Any claim must be made within the applicable warranty period. All warranties cover only defects arising under normal use and do not include malfunctions or failure resulting from misuse, abuse, neglect, alteration, problems with electrical power, acts of nature, unusual temperatures or humidity, improper installation, or damage determined by Continuum to have been caused by you. All limited warranties on the Software Product are granted only to you and are non-transferable. You agree to indemnify and hold Continuum harmless from all claims, judgments, liabilities, expenses, or costs arising from your breach of this Agreement and/or acts or omissions.

## Governing Law, Jurisdiction and Costs

This Agreement is governed by the laws of Texas, without regard to Texas's conflict or choice of law provisions.

## Export Regulations

Any use or distribution of MKL Optimizations is made under conditions that the user and/or distributor is in full compliance with all export and other governing laws of the United States of America, including full and ongoing compliance with the Export Administration Regulations (EAR) of the United States Department of Commerce. See [www.commerce.gov/](http://www.commerce.gov/) and <http://www.bis.doc.gov/index.php/regulations/export-administration-regulations-ear>. Use

or distribution of Continuum software products to any persons, entities or countries currently under US sanctions is strictly prohibited. MKL Optimizations is classified with an ECCN of 5D992 with no license required for export to non-embargoed countries.

The United States currently has embargoes against Cuba, Iran, North Korea, Sudan and Syria. The exportation, re-exportation, sale or supply, directly or indirectly, from the United States, or by a U.S. person wherever located, of any Continuum software to any of these countries is strictly prohibited without prior authorization by the United States Government. By accepting this Agreement, you represent to Continuum that you will comply with all applicable export regulations for MKL Optimizations.

### Severability

If any provision of this Agreement shall be held to be invalid or unenforceable, the remainder of this Agreement shall remain in full force and effect. To the extent any express or implied restrictions are not permitted by applicable laws, these express or implied restrictions shall remain in force and effect to the maximum extent permitted by such applicable laws.

### 3.4.8 IOPro

IOPro loads NumPy arrays (and Pandas DataFrames) directly from files, SQL databases, and NoSQL stores—including ones with millions of rows—without creating millions of temporary, intermediate Python objects, or requiring expensive array resizing operations.

IOPro provides a drop-in replacement for the NumPy functions `loadtxt()` and `genfromtxt()`, but dramatically improves performance and reduces memory overhead.

The current (and final) version of IOPro 1.9.1 was released on March 1, 2017.

### The open source successors to IOPro

All of the code in IOPro was released in 2017 under a BSD open source license. As part of that release, the code was refactored into its several component libraries, and version numbers of each were set to 2.0.0 to indicate they supersede the code under the IOPro name.

The several libraries are available on GitHub at:

- [TextAdapter](#) (CSV, JSON, etc)
- [DBAdapter](#) (SQL derivatives)
- [PostgresAdapter](#) (PostgreSQL)
- [AccumuloAdapter](#) (Apache Accumulo)
- [MongoAdapter](#) (MongoDB)

These various packages may be available as conda packages (using lowercase versions of their names) in the conda-forge channel. Maintenance, improvements, and packaging will be a community-led project.

### How to get IOPro

To get IOPro just download and install the IOPro package.

If you already have [Anaconda](#) (free Python platform) or [Miniconda](#) installed:

```
conda update conda
conda install -c pkgs/pro iopro=1.9.1
```

If you do not have Anaconda installed, you can [download it](#).

## Requirements

- Python 2.7 or 3.4+
- NumPy 1.10+

Optional Python modules:

- Boto (for S3 support)
- Pandas (to use DataFrames)

## What's new in version 1.9?

The documentation has been substantially updated for version 1.9.0. Numba has been removed and the code has been cleaned up, but no other features were added or removed. Some refactoring was done that didn't change functionality. We recommend that users not use older versions. See [Release notes](#) for additional detail.

## Getting started

Some of the basic usage patterns look like these. Create TextAdapter object for data source:

```
>>> import iopro
>>> adapter = iopro.text_adapter('data.csv', parser='csv')
```

Define field dtypes (example: set field 0 to unsigned int and field 4 to float):

```
>>> adapter.set_field_types({0: 'u4', 4: 'f4'})
```

Parse text and store records in NumPy array using slicing notation:

```
>>> # read all records
>>> array = adapter[:]

>>> # read first ten records
>>> array = adapter[0:10]

>>> # read last record
>>> array = adapter[-1]

>>> # read every other record
>>> array = adapter[::2]
```

## User guide

### Installation

If you do not already have Anaconda installed, please download it via the [downloads page](#) and install it.

IOPro is included with [Anaconda Workgroup](#) and [Anaconda Enterprise](#) subscriptions.

To start a 30-day free trial just download and install the IOPro package.

If you already have [Anaconda](#) (free Python platform) or [Miniconda](#) <<http://conda.io/miniconda.html>> installed:

```
conda update conda
conda install iopro
```

If you do not have Anaconda installed, you can [download it](#).

For more information about IOPro please contact [sales@anaconda.com](mailto:sales@anaconda.com).

### IOPro Update Instructions

If you have Anaconda (free Python platform) installed, first update the conda package management tool to the latest version, then use conda to update the IOPro product installation:

```
conda update conda
conda update iopro
```

### Uninstall

To uninstall using conda:

```
conda remove iopro
```

### Installing license

The IOPro license can be installed with the graphical Anaconda Navigator license manager or manually with your operating system. In your organization this may be handled by your site administrator or IT department. Both installation methods are explained in the License installation page.

### TextAdapter First Steps

#### Basic Usage

IOPro works by attaching to a data source, such as a local CSV file. Before we get started, let's create a sample CSV file to work with:

```
from random import random, randint, shuffle
import string

NUMROWS = 10
with open('data/table.csv', 'w') as data:
    # Header
    for n in range(1,5):
        print("f%d" % n, end=",", file=data)
    print("comment", file=data)

    # Body
```

(continues on next page)

(continued from previous page)

```

letters = list(string.ascii_letters)
for n in range(NUMROWS):
    shuffle(letters)
    s = "".join(letters[:randint(5,20)])
    vals = (n, randint(1000,2000), random(), random()*100, s)
    print("%d,%d,%f,%f,%s" % vals, file=data)

```

Let's read in the local CSV file created here. Because this small file easily fits in memory it would work to use the csv or pandas modules, but we will demonstrate the interfaces and capabilities that will apply to much larger data.

```

>>> import iopro
>>> adapter = iopro.text_adapter('data/table.csv', parser='csv')
>>> adapter.get_field_names()
['f1', 'f2', 'f3', 'f4', 'comment']

```

We can specify the data types for values in the columns of the CSV file being read; but first we look at the ability of IOPro's TextAdapter to auto-discover the data types used.

We can ask IOPro's TextAdapter to parse text and return records in NumPy arrays from selected portions of the CSV file using slicing notation:

```

>>> # the inferred datatypes
>>> array = adapter[:]
>>> array.dtype
dtype([('f1', '<u8'), ('f2', '<u8'), ('f3', '<f8'), ('f4', '<f8'),
      ('comment', '<O')])

```

Let's define field dtypes (example: set field 0 to a 16-bit unsigned int and field 3 to a 32-bit float).

Message the datatypes:

```

>>> adapter.set_field_types({0: 'u2', 3: 'f4'})
>>> array = adapter[:]
>>> array.dtype
dtype([('f1', '<u2'), ('f2', '<u8'), ('f3', '<f8'), ('f4', '<f4'),
      ('comment', '<O')])

```

The first five records:

```

>>> array = adapter[0:5]
>>> print(array)
[(0, 1222, 0.926116, 84.44437408447266, 'MlzvBRyquns')
 (1, 1350, 0.553585, 81.03726959228516, 'ikgEauJeTZvd')
 (2, 1932, 0.710919, 31.59865951538086, 'uUQmHJFZhniRecAvx')
 (3, 1494, 0.622391, 57.90607452392578, 'iWQBAZodkfHODtI')
 (4, 1981, 0.820246, 40.848018646240234, 'igxeXdBpqE')]

```

Read last five records:

```

>>> array = adapter[-5:]
>>> print(array)
[(5, 1267, 0.694631, 6.999039173126221, 'bRSrwithHeY')
 (6, 1166, 0.37465, 38.7022705078125, 'qzbMgVThXtHpFDNrd')
 (7, 1229, 0.390566, 55.338134765625, 'hyarmvWi')
 (8, 1816, 0.201106, 59.74718475341797, 'DcHymelRusO')
 (9, 1416, 0.725697, 42.50992965698242, 'QMUGRAwe')]

```

Read every other record:

```
>>> array = adapter[:,2]
>>> print(array)
[(0, 1222, 0.926116, 84.44437408447266, 'MlzvBRyquns'),
 (2, 1932, 0.710919, 31.59865951538086, 'uUQmHJFZhnirecAvx'),
 (4, 1981, 0.820246, 40.848018646240234, 'igxeXdBpqE'),
 (6, 1166, 0.37465, 38.7022705078125, 'qzbMgVThXtHpFDNr'),
 (8, 1816, 0.201106, 59.74718475341797, 'DcHymelRusO')]
```

Read first and second, third fields only:

```
>>> array = adapter[[0,1,2]][:,]
>>> list(array)
[(0, 1222, 0.926116),
 (1, 1350, 0.553585),
 (2, 1932, 0.710919),
 (3, 1494, 0.622391),
 (4, 1981, 0.820246),
 (5, 1267, 0.694631),
 (6, 1166, 0.37465),
 (7, 1229, 0.390566),
 (8, 1816, 0.201106),
 (9, 1416, 0.725697)]
```

Read fields named 'f2' and 'comment' only:

```
>>> array = adapter[['f2', 'comment']][:,]
>>> list(array)
[(1222, 'MlzvBRyquns'),
 (1350, 'ikgEauJeTZvd'),
 (1932, 'uUQmHJFZhnirecAvx'),
 (1494, 'iWQBAZodkfHODtI'),
 (1981, 'igxeXdBpqE'),
 (1267, 'bRSrwitHeY'),
 (1166, 'qzbMgVThXtHpFDNr'),
 (1229, 'hyarmvWi'),
 (1816, 'DcHymelRusO'),
 (1416, 'QMUGRAwe')]
```

## JSON Support

Text data in JSON format can be parsed by specifying 'json' for the parser argument:

Content of file data/one.json:

```
{ "id":123, "name":"xxx" }
```

Single JSON object:

```
>>> adapter = iopro.text_adapter('data/one.json', parser='json')
>>> adapter[:,]
array([(123, 'xxx')],
      dtype=[('id', '<u8'), ('name', 'O')])
```

Currently, each JSON object at the root level is interpreted as a single NumPy record. Each JSON object can be part of an array, or separated by a newline. Examples of valid JSON documents that can be parsed by IOPro, with the NumPy array result:

Content of file data/two.json:

```
[{"id":123, "name":"xxx"}, {"id":456, "name":"yyy"}]
```

Array of two JSON objects:

```
>>> iopro.text_adapter('data/two.json', parser='json')[:]
array([(123, 'xxx'), (456, 'yyy')],
      dtype=[('id', '<u8'), ('name', 'O')])
```

Content of file data/three.json:

```
{"id":123, "name":"xxx"}
{"id":456, "name":"yyy"}
```

Two JSON objects separated by newline:

```
>>> iopro.text_adapter('data/three.json', parser='json')[:]
array([(123, 'xxx'), (456, 'yyy')],
      dtype=[('id', '<u8'), ('name', 'O')])
```

## Massaging data in the adapter

A custom function can be used to modify values as they are read.

```
>>> import iopro, io, math
>>> stream = io.StringIO('3,abc,3.3\n7,xxx,9.9\n4,,')
>>> adapter = iopro.text_adapter(stream, parser='csv', field_names=False)
```

Override default converter for first field:

```
>>> adapter.set_converter(0, lambda x: math.factorial(int(x)))
>>> adapter[:]
array([(6, 'abc', 3.3), (5040, 'xxx', 9.9), (24, '', nan)],
      dtype=[('f0', '<u8'), ('f1', 'O'), ('f2', '<f8')])
```

We can also force data types and set fill values for missing data.

Apply data types to columns:

```
>>> stream = io.StringIO('3,abc,3.3\n7,xxx,9.9\n4,,')
>>> adapter = iopro.text_adapter(stream, parser='csv', field_names=False)
>>> adapter.set_field_types({1:'S3', 2:'f4'})
>>> adapter[:]
array([(3, b'abc', 3.299999952316284), (7, b'xxx', 9.899999618530273),
      (4, b'', nan)],
      dtype=[('f0', '<u8'), ('f1', 'S3'), ('f2', '<f4')])
```

Set fill value for missing values in each field:

```
>>> adapter.set_fill_values({1:'ZZZ', 2:999.999})
>>> adapter[:]
array([(3, b'abc', 3.299999952316284), (7, b'xxx', 9.899999618530273),
      (4, b'ZZZ', 999.9990234375)],
      dtype=[('f0', '<u8'), ('f1', 'S3'), ('f2', '<f4')])
```

## Combining regular expressions and typecasting

A later section discusses regular expressions in more detail. This example is a quick peek into using them with IOPro.

Content of the file `data/transactions.csv`:

```
$2.56, 50%, September 20 1978
$1.23, 23%, April 5 1981
```

Combining features:

```
>>> import iopro
>>> regex_string = '\$(\d)\.(\d{2}),\s*([0-9]+)\%,\s*([A-Za-z]+) '
>>> adapter = iopro.text_adapter('data/transactions.csv',
...                             parser='regex',
...                             regex_string=regex_string,
...                             field_names=False,
...                             infer_types=False)
```

Set dtype of fields and their names:

```
>>> adapter.set_field_types({0:'i2', 1:'u2', 2:'f4', 3:'S10'})
>>> adapter.set_field_names(['dollars', 'cents', 'percentage', 'month'])
>>> adapter[:]
array([(2, 56, 50.0, b'September'), (1, 23, 23.0, b'April')],
      dtype=[('dollars', '<i2'), ('cents', '<u2'),
              ('percentage', '<f4'), ('month', 'S10')])
```

## Advanced TextAdapter

### `iopro.loadtxt()` versus `iopro.genfromtxt()`

Within IOPro there are two closely related functions. `loadtxt()`, which we have been looking at, makes a more optimistic assumption that your data is well-formatted. `genfromtxt()` has a number of arguments for handling messier data, and special behaviors for dealing with missing data.

`loadtxt()` is already highly configurable for dealing with data under many CSV and other delimited formats. `genfromtxt()` contains a superset of these arguments.

## Gzip Support

IOPro can decompress gzip'd data on the fly, simply by indicating a `compression` keyword argument.

```
>>> adapter = iopro.text_adapter('data.gz', parser='csv', compression='gzip')
>>> array = adapter[:]
```

As well as being able to store and work with your compressed data without having to decompress it first, you also do not need to sacrifice any performance in doing so. For example, with one test 419 MB CSV file of numerical data, and a 105 MB file of the same data compressed with gzip, the following are run times on a test machine for loading the entire contents of each file into a NumPy array. Exact performance will vary between machines, especially between machines with HDD and SSD architecture.:

```
- uncompressed: 13.38 sec
- gzip compressed: 14.54 sec
```

In the test, the compressed file takes slightly longer, but consider having to uncompress the file to disk before loading with IOPro:

- uncompressed: 13.38 sec
- gzip compressed: 14.54 sec
- gzip compressed (decompress to disk, then load): 21.56 sec

## Indexing CSV Data

One of the most useful features of IOPro is the ability to index data to allow for fast random lookup.

For example, to retrieve the last record of the compressed 109 MB dataset we used above:

```
>>> adapter = iopro.text_adapter('data.gz', parser='csv', compression='gzip')
>>> array = adapter[-1]
```

Retrieving the last record into a NumPy array takes 14.82 sec. This is about the same as the time to read the entire array, because the entire dataset has to be parsed to get to the last record.

To make seeking faster, we can build an index:

```
>>> adapter.create_index('index_file')
```

The above method creates an index in memory and saves it to disk, taking 9.48 sec. Now when seeking to and reading the last record again, it takes a mere 0.02 sec.

Reloading the index only takes 0.18 sec. If you build an index once, you get near instant random access to your data forever (assuming the data remains static):

```
>>> adapter = iopro.text_adapter('data.gz', parser='csv',
...                               compression='gzip',
...                               index_name='index_file')
```

Let's try it with a moderate sized example. You can download this data from the [Exoplanets Data Explorer](#) site.

```
>>> adapter = iopro.text_adapter('data/exoplanets.csv.gz',
...                               parser='csv', compression='gzip')
>>> print(len(adapter[:]), "rows")
>>> print(' '.join(adapter.field_names[:3]),
...       '...%d more...\n' % (adapter.field_count-6),
...       ' '.join(adapter.field_names[-3:]))
2042 rows
name, mass, mass_error_min ...73 more...
    star_teff, star_detected_disc, star_magnetic_field
```

```
>>> adapter.field_types
{0: dtype('O'),
 1: dtype('float64'),
 2: dtype('float64'),
 3: dtype('O'),
 4: dtype('float64'),
 5: dtype('float64'),
 6: dtype('float64'),
 7: dtype('float64'),
 8: dtype('O'),
 9: dtype('float64'),
```

(continues on next page)

(continued from previous page)

```
[... more fields ...]
69: dtype('float64'),
70: dtype('float64'),
71: dtype('float64'),
72: dtype('float64'),
73: dtype('float64'),
74: dtype('O'),
75: dtype('float64'),
76: dtype('float64'),
77: dtype('O'),
78: dtype('uint64')}
```

Do some timing (using an IPython magic):

```
>>> %time row = adapter[-1]
CPU times: user 35 ms, sys: 471 µs, total: 35.5 ms
Wall time: 35.5 ms
```

```
>>> %time adapter.create_index('data/exoplanets.index')
CPU times: user 15.7 ms, sys: 3.35 ms, total: 19.1 ms
Wall time: 18.6 ms
```

```
>>> %time row = adapter[-1]
CPU times: user 18.3 ms, sys: 1.96 ms, total: 20.3 ms
Wall time: 20.1 ms
```

```
>>> new_adapter = iopro.text_adapter('data/exoplanets.csv.gz', parser='csv',
...                                 compression='gzip',
...                                 index_name='data/exoplanets.index')
```

```
>>> %time row = new_adapter[-1]
CPU times: user 17.3 ms, sys: 2.12 ms, total: 19.4 ms
Wall time: 19.4 ms
```

## Regular Expressions

Some people, when confronted with a problem, think “I know, I’ll use regular expressions.” Now they have two problems. –Jamie Zawinski

IOPro supports using regular expressions to help parse messy data. Take for example the following snippet of actual NASDAQ stock data found on the Internet:

The content of the file `data/stocks.csv`:

```
Name,Symbol,Exchange,Range
Apple,AAPL,NasdaqNM,363.32 - 705.07
Google,GOOG,NasdaqNM,523.20 - 774.38
Microsoft,MSFT,NasdaqNM,24.30 - 32.95
```

The first three fields are easy enough: name, symbol, and exchange. The fourth field presents a bit of a problem. Let’s try IOPro’s regular expression based parser:

```
>>> regex_string = '([A-Za-z]+),([A-Z]{1,4}),([A-Za-z]+),'\
...               '(\d+.\d{2})\s*\-\s*(\d+.\d{2})'\
>>> adapter = iopro.text_adapter('data/stocks.csv', parser='regex',
...                             regex_string=regex_string)
```

```
>>> # Notice that header does not now match the regex
>>> print(adapter.field_names)
['Name', 'Symbol', 'Exchange', 'Range', ' ', ' ', ' ', ' ']
```

```
>>> # We can massage the headers to reflect our match pattern
>>> info = adapter.field_names[0].split(',')[3]
>>> adapter.field_names = info + ["Low", "High"]
>>> adapter[:]
array([('Apple', 'AAPL', 'NasdaqNM', 363.32, 705.07),
      ('Google', 'GOOG', 'NasdaqNM', 523.2, 774.38),
      ('Microsoft', 'MSFT', 'NasdaqNM', 24.3, 32.95)],
      dtype=[('Name', 'O'), ('Symbol', 'O'),
            ('Exchange', 'O'), ('Low', '<f8'), ('High', '<f8')])
```

Regular expressions are compact and often difficult to read, but they are also very powerful. By using the above regular expression with the grouping operators ‘(’ and ‘)’ , we can define exactly how each record should be parsed into fields. Let’s break it down into individual fields:

- ([A-Za-z]+) defines the first field (stock name) in our output array
- ([A-Z]{1-4}) defines the second (stock symbol)
- ([A-Za-z]+) defines the third (exchange name)
- (\d+.\d{2}) defines the fourth field (low price)
- \s\*\-\s\* is skipped because it is not part of a group
- (\d+.\d{2}) defines the fifth field (high price)

The output array contains five fields: three string fields and two float fields. Exactly what we want.

### S3 Support

IOPro can parse CSV data stored in Amazon’s S3 cloud storage service. In order to access S3 files, you need to specify some credentials along with the resource you are accessing.

The first two parameters are your AWS access key and secret key, followed by the S3 bucket name and key name. The S3 CSV data is downloaded in 128K chunks and parsed directly from memory, bypassing the need to save the entire S3 data set to local disk.

Let’s take a look at what we have stored from the Health Insurance Marketplace data. There’s a little bit of code with BeautifulSoup just to prettify the raw XML query results.

```
>>> import urllib.request
>>> url = 'http://s3.amazonaws.com/product-training/'
>>> xml = urllib.request.urlopen(url).read()
```

```
>>> import bs4, re
>>> r = re.compile(r'^(\s*)', re.MULTILINE)
>>> def display(bs, encoding=None, formatter="minimal", indent=4):
...     print(r.sub(r'\1' * indent, bs.prettify(encoding, formatter)))
```

(continues on next page)

(continued from previous page)

```

>>> display(bs4.BeautifulSoup(xml, "xml"))
<?xml version="1.0" encoding="utf-8"?>
<ListBucketResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Name>
    product-training
  </Name>
  <Prefix/>
  <Marker/>
  <MaxKeys>
    1000
  </MaxKeys>
  <IsTruncated>
    false
  </IsTruncated>
  <Contents>
    <Key>
      BusinessRules.csv
    </Key>
    <LastModified>
      2016-06-25T00:03:20.000Z
    </LastModified>
    <ETag>
      "a565ebede6a7e6e060cd4526a7ae4345"
    </ETag>
    <Size>
      8262590
    </Size>
    <StorageClass>
      STANDARD
    </StorageClass>
  </Contents>
  <Contents>
    [... more files ...]
  </Contents>
</ListBucketResult>

```

In simple form, we see details about some S3 resources. Let's access one of them. Note that you will need to fill in your actual AWS access key and secret key.

```

>>> user_name = "class1"
>>> aws_access_key = "ABCD"
>>> aws_secret_key = "EFGH/IJK"
>>> bucket = 'product-training'
>>> key_name = 'BusinessRules.csv' # 21k lines, 8MB
>>> # key_name = 'PlanAttributes.csv' # 77k lines, 95MB
>>> # key_name = 'Rate.csv.gz' # 13M lines, 2GB raw, 110MB compressed
>>> adapter = iopro.s3_text_adapter(aws_access_key, aws_secret_key,
...                                bucket, key_name)
>>> # Don't try with the really large datasets, works with the default one
>>> df = adapter.to_dataframe()
>>> df.iloc[:6,:6]

```

IOPro can also build an index for S3 data just as with disk based CSV data, and use the index for fast random access lookup. If an index file is created with IOPro and stored with the S3 dataset in the cloud, IOPro can use this remote index to download and parse just the subset of records requested. This allows you to generate an index file once and share it on the cloud along with the data set, and does not require others to download the entire index file to use it.

## iopro.pyodbc First Steps

iopro.pyodbc extends pyodbc with methods that allow data to be fetched directly into numpy containers. These functions are faster than regular fetch calls in pyodbc, providing also the convenience of being returned in a container appropriate to fast analysis.

This notebook is intended to be a tutorial on iopro.pyodbc. Most of the material is applicable to pyodbc (and based on pyodbc tutorials). There will be some examples specific to iopro.pyodbc. When that's the case, it will be noted.

## Concepts

In pyodbc there are two main classes to understand:

- connection
- cursor

A connection is, as its name says, a connection to a datasource. A datasource is your database. It may be a database handled by a DBMS or just a plain file. A cursor allows you to interface with statements. Interaction with queries and other commands is performed through a cursor. A cursor is associated to a connection and commands over a cursor are performed over that connection to the datasource. In order to use iopro.pyodbc you must import it:

```
>>> import iopro.pyodbc as pyodbc
```

## Connection to a datasource

In order to operate with pyodbc you need to connect to a datasource. Typically this will be a database. This is done by creating a connection object. To create a connection object you need a connection string. This string describes the datasource to use as well as some extra parameters. You can learn more about connection strings here.:

```
>>> connection_string = '''DSN=SQLServerTest;DATABASE=Test'''
>>> connection = pyodbc.connect(connection_string)
```

pyodbc.connect supports a keyword parameter autocommit. This controls the way the connection is handle. The default value (False) means that the commands that modify the database statements need to be committed explicitly. All commands between commits will form a single transaction. If autocommit is enabled every command will be issued and committed. It is also possible to change autocommit status after the connection is established.:

```
>>> connection.autocommit = True #enable autocommit
>>> connection.autocommit = False # disable autocommit
```

When not in autocommit mode, you can end a transaction by either committing it or rolling it back.:

```
In[6]: connection.commit() # commit the transaction
In[7]: connection.rollback() # rollback the transaction
```

Note that commit/rollback is always performed at the connection level. pyodbc provides a commit/rollback method in the cursor objects, but they will act on the associated connection.

## Working with cursors

Command execution in pyodbc is handled through cursors. You can create a cursor from a connection using the cursor() method. The first step is creating a cursor:

```
In[8]: cursor = connection.cursor()
```

With a cursor created, we can start issuing SQL commands using the execute method.

### Creating a sample table

First, create a sample table in the database. The following code will create a sample table with three columns of different types.:

```
>>> def create_test_table(cursor):
...     try:
...         cursor.execute('drop table test_table')
...     except:
...         pass
...     cursor.execute('''create table test_table (
...                         name varchar(10),
...                         fval float(24),
...                         ival int)''')
...     cursor.commit()
>>> create_test_table(cursor)
```

### Filling the sample table with sample data

After creating the table, rows can be inserted by executing insert into the table. Note you can pass parameters by placing a ? into the SQL statement. The parameters will be taken in order for the sequence appears in the next parameter.:

```
>>> cursor.execute('''insert into test_table values (?, ?, ?)''', ('foo', 3.0, 2))
>>> cursor.rowcount
1
```

Using executemany a sequence of parameters to the SQL statement can be passed and the statement will be executed many times, each time with a different parameter set. This allows us to easily insert several rows into the database so that we have a small test set:

```
>>> cursor.executemany('''insert into test_table values (?, ?, ?)''', [
...     ('several', 2.1, 3),
...     ('tuples', -1.0, 2),
...     ('can', 3.0, 1),
...     ('be', 12.0, -3),
...     ('inserted', 0.0, -2),
...     ('at', 33.0, 0),
...     ('once', 0.0, 0)
... ])
```

Remember that if autocommit is turned off the changes won't be visible to any other connection unless we commit.:

```
>>> cursor.commit() # remember this is a shortcut to connection.commit() method
```

### Querying the sample data from the sample table

Having populated our sample database, we can retrieve the inserted data by executing select statements::

```
>>> cursor.execute('''select * from test_table''')
<pyodbc.Cursor at 0x6803510>
```

After calling execute with the select statement we need to retrieve the data. This can be achieved by calling fetch methods in the cursor. fetchone fetches the next row in the cursor, returning it in a tuple:

```
>>> cursor.fetchone()
('foo', 3.0, 2)
```

fetchmany retrieves several rows at a time in a list of tuples:

```
>>> cursor.fetchmany(3)
[('several', 2.0999999046325684, 3), ('tuples', -1.0, 2), ('can', 3.0, 1)]
```

fetchall retrieves all the remaining rows in a list of tuples:

```
>>> cursor.fetchall()
[('be', 12.0, -3), ('inserted', 0.0, -2), ('at', 33.0, 0), ('once', 0.0, 0)]
```

All the calls to any kind of fetch advances the cursor, so the next fetch starts in the row after the last row fetched. execute returns the cursor object. This is handy to retrieve the full query by chaining fetchall. This results in a one-liner::

```
>>> cursor.execute('''select * from test_table''').fetchall()
[('foo', 3.0, 2),
 ('several', 2.0999999046325684, 3),
 ('tuples', -1.0, 2),
 ('can', 3.0, 1),
 ('be', 12.0, -3),
 ('inserted', 0.0, -2),
 ('at', 33.0, 0),
 ('once', 0.0, 0)]
```

## iopro.pyodbc extensions

When using iopro.pyodbc it is possible to retrieve the results from queries directly into numpy containers. This is accomplished by using the new cursor methods fetchdictarray and fetchsarray.

### fetchdictarray

fetchdictarray fetches the results of a query in a dictionary. By default fetchdictarray fetches all remaining rows in the cursor::

```
>>> cursor.execute('''select * from test_table''')
>>> dictarray = cursor.fetchdictarray()
>>> type(dictarray)
dict
```

The keys in the dictionary are the column names::

```
>>> dictarray.keys()
['ival', 'name', 'fval']
```

Each column name is mapped to a numpy array (ndarray) as its value::

```
>>> ', '.join([type(dictarray[i]).__name__ for i in dictarray.keys()])
'ndarray, ndarray, ndarray'
```

The types of the numpy arrays are inferred from the database column information. So for our columns we get an appropriate numpy type. Note that in the case of name the type is a string of 11 characters even if in test\_table is defined as varchar(10). The extra parameter is there to null-terminate the string::

```
>>> ', '.join([repr(dictarray[i].dtype) for i in dictarray.keys()])
"dtype('int32'), dtype('|S11'), dtype('float32')"
```

The numpy arrays will have a shape containing a single dimension with the number of rows fetched::

```
>>> ', '.join([repr(dictarray[i].shape) for i in dictarray.keys()])
'(8L,), (8L,), (8L,)'
```

The values in the different column arrays are index coherent. So in order to get the values associated to a given row it suffices to access each column using the appropriate index. The following snippet shows this correspondence::

```
>>> print '\n'.join(
...     [' ', '.join(
...         [repr(dictarray[i][j]) for i in dictarray.keys()])
...         for j in range(dictarray['name'].shape[0])])
2, 'foo', 3.0
3, 'several', 2.0999999
2, 'tuples', -1.0
1, 'can', 3.0
-3, 'be', 12.0
-2, 'inserted', 0.0
0, 'at', 33.0
0, 'once', 0.0
```

Having the results in numpy containers makes it easy to use numpy to analyze the data::

```
>>> import numpy as np
>>> np.mean(dictarray['fval'])
6.5124998092651367
```

fetchdictarray accepts an optional parameter that places an upper bound to the number of rows to fetch. If there are not enough elements left to be fetched in the cursor the arrays resulting will be sized accordingly. This way it is possible to work with big tables in chunks of rows::

```
>>> cursor.execute('select * from test_table')
>>> dictarray = cursor.fetchdictarray(6)
>>> print dictarray['name'].shape
(6L,)
>>> dictarray = cursor.fetchdictarray(6)
>>> print dictarray['name'].shape
(2L,)
```

## fetchsarray

fetchsarray fetches the result of a query in a numpy structured array::

```
>>> cursor.execute('select * from test_table')
>>> sarray = cursor.fetchsarray()
```

(continues on next page)

(continued from previous page)

```
>>> print sarray
[('foo', 3.0, 2) ('several', 2.09999999046325684, 3) ('tuples', -1.0, 2)
 ('can', 3.0, 1) ('be', 12.0, -3) ('inserted', 0.0, -2) ('at', 33.0, 0)
 ('once', 0.0, 0)]
```

The type of the result is a numpy array (ndarray)::

```
>>> type(sarray)
numpy.ndarray
```

The dtype of the numpy array contains the description of the columns and their types::

```
>>> sarray.dtype
dtype([('name', '<S11'), ('fval', '<f4'), ('ival', '<i4')])
```

The shape of the array will be one-dimensional, with cardinality equal to the number of rows fetched::

```
>>> sarray.shape
(8L,)
```

It is also possible to get the shape of a column. In this way it will look similar to the code needed when using dictarrays:

```
>>> sarray['name'].shape
(8L,)
```

In a structured array it is as easy to access data by row or by column::

```
>>> sarray['name']
array(['foo', 'several', 'tuples', 'can', 'be', 'inserted', 'at', 'once'],
      dtype='<S11')

>>> sarray[0]
('foo', 3.0, 2)
```

It is also very easy and efficient to feed data into numpy functions::

```
>>> np.mean(sarray['fval'])
6.5124998092651367
```

### fetchdictarray vs fetchsarray

Both methods provide ways to input data from a database into a numpy-friendly container. The structured array version provides more flexibility extracting rows in an easier way. The main difference is in the memory layout of the resulting object. An in-depth analysis of this is beyond the scope of this notebook. Suffice it to say that you can view the dictarray laid out in memory as a structure of arrays (in fact, a dictionary or arrays), while the structured array would be laid out in memory like an array of structures. This can make a lot of difference performance-wise when working with large chunks of data.

## iopro.pyodbc Enhanced Capabilities

### Demo code showing the enhanced capabilities of iopro.pyodbc submodule

This demo shows the basic capabilities for the iopro.pyodbc module. It first will connect with the database of your choice by ODBC, create and fill a new table (market) and then retrieve data with different methods (fetchall(), fetchdictarray() and fetchsarray()).

Author: Francesc Altet, Anaconda

```
>>> import iopro.pyodbc as pyodbc
>>> # Open the database (use the most appropriate for you)
>>> connect_string = 'DSN=odbcsqlite;DATABASE=market.sqlite' # SQLite
>>> #connect_string = 'Driver={SQL Server};SERVER=MyWinBox;DATABASE=Test;USER=Devel;
↳PWD=XXX' # SQL Server
>>> #connect_string = 'DSN=myodbc3;UID=devel;PWD=XXX;DATABASE=test' # MySQL
>>> #connect_string = 'DSN=PSQL;UID=devel;PWD=XXX;DATABASE=test' # PostgreSQL
>>> connection = pyodbc.connect(connect_string)
>>> cursor = connection.cursor()
```

### Create the test table (optional if already done)

```
>>> try:
...     cursor.execute('drop table market')
... except:
...     pass
>>> cursor.execute('create table market (symbol_ varchar(5), open_ float, low_ float,
↳high_ float, close_ float, volume_ int)')
```

### Fill the test table (optional if already done)

```
>>> from time import time
>>> t0 = time()
>>> N = 1000*1000
>>> for i in xrange(N):
...     cursor.execute(
...         "insert into market(symbol_, open_, low_, high_, close_, volume_)"
...         " values (?, ?, ?, ?, ?, ?)",
...         (str(i), float(i), float(2*i), None, float(4*i), i))
>>> cursor.execute("commit") # not supported by SQLite
>>> t1 = time() - t0
>>> print "Stored %d rows in %.3fs" % (N, t1)
```

### Do the query in the traditional way

```
>>> # Query of the full table using the traditional fetchall
>>> query = "select * from market"
>>> cursor.execute(query)
>>> %time all = cursor.fetchall()
CPU times: user 5.23 s, sys: 0.56 s, total: 5.79 s
Wall time: 7.09 s
```

## Do the query and get a dictionary of NumPy arrays

```
>>> # Query of the full table using the fetchdictarray (retrieve a dictionary of
↳ arrays)
>>> cursor.execute(query)
>>> %time dictarray = cursor.fetchdictarray()
CPU times: user 0.92 s, sys: 0.10 s, total: 1.02 s
Wall time: 1.44 s
```

## Peek into the retrieved data

```
>>> dictarray.keys()
['high_', 'close_', 'open_', 'low_', 'volume_', 'symbol_']
>>> dictarray['high_']
array([ nan,  nan,  nan, ...,  nan,  nan,  nan])
>>> dictarray['symbol_']
array(['0', '1', '2', ..., '99999', '99999', '99999'], dtype='|S6')
```

## Do the query and get a NumPy structured array

```
>>> # Query of the full table using the fetchsarray (retrieve a structured array)
>>> cursor.execute(query)
>>> %time sarray = cursor.fetchsarray()
CPU times: user 1.08 s, sys: 0.11 s, total: 1.20 s
Wall time: 1.99 s
```

## Peek into retrieved data

```
>>> sarray.dtype
dtype([('symbol_', 'S6'), ('open_', '<f8'), ('low_', '<f8'), ('high_', '<f8
↳ '), ('close_', '<f8'), ('volume_', '<i4')])
>>> sarray[0:10]
array([('0', 0.0, 0.0, nan, 0.0, 0), ('1', 1.0, 2.0, nan, 4.0, 1),
      ('2', 2.0, 4.0, nan, 8.0, 2), ('3', 3.0, 6.0, nan, 12.0, 3),
      ('4', 4.0, 8.0, nan, 16.0, 4), ('5', 5.0, 10.0, nan, 20.0, 5),
      ('6', 6.0, 12.0, nan, 24.0, 6), ('7', 7.0, 14.0, nan, 28.0, 7),
      ('8', 8.0, 16.0, nan, 32.0, 8), ('9', 9.0, 18.0, nan, 36.0, 9)],
      dtype=[('symbol_', 'S6'), ('open_', '<f8'), ('low_', '<f8'), ('high_', '&
↳ lt;f8'), ('close_', '<f8'), ('volume_', '<i4')])
>>> sarray['symbol_']
array(['0', '1', '2', ..., '99999', '99999', '99999'], dtype='|S6')
```

## ioopro.pyodbc Cancelling Queries

Starting with version 1.5, the pyodbc submodule of IOPro makes it possible to cancel operations. This is done by exposing the SQLCancel ODBC function as a cancel method in the Cursor object.

## A Simple Example

A very simple example would be:

```
conn = iopro.pyodbc.connect(conn_str)
cursor = conn.cursor()
cursor.execute('SELECT something FROM sample_table')
result = cursor.fetchone()
cursor.cancel()
```

This is not very interesting, and it doesn't add much to the functionality of pyodbc.

What makes the cancel method more interesting is that it is possible to cancel running statements that are blocking another thread.

## A Sample With Threading

Having access to the cancel method it is possible to stop running queries following different criteria. For example, it would be possible to execute queries with a time-out. If the time runs out, the query gets cancelled.

```
import iopro.pyodbc
import time
import threading

def query_with_time_out(conn, query, timeout):
    def watchdog(cursor, time_out):
        time.sleep(wait_time)
        cursor.cancel()

    cursor = conn.cursor()

    t = threading.Thread(target=watchdog, args=(cursor, timeout))
    t.start()
    try:
        cursor.execute(query)

        result = cursor.fetchall()
    except iopro.pyodbc.Error:
        result = 'timed out'

    return result
```

This is just one possibility. As cursor exposes directly the SQLCancel, many opportunities open in implementing policies to cancel running queries.

## Finishing notes

In order for this to work, the underlying ODBC driver must support SQLCancel.

The pyodbc submodule of IOPro releases the Python GIL when it calls ODBC, so while queries are being executed other Python threads continue to execute while the thread that performed the query is blocked. This allows for cancel to be called by another thread. Coupled with threading, the cancel method is a very useful primitive.

## IOPro END USER LICENSE AGREEMENT

IOPro (“the Software Product”) and accompanying documentation is licensed and not sold. The Software Product is protected by copyright laws and treaties, as well as laws and treaties related to other forms of intellectual property. Continuum Analytics, Inc. (dba Anaconda, Inc.) or its subsidiaries, affiliates, and suppliers (collectively “Continuum”) own intellectual property rights in the Software Product. The Licensee’s (“you” or “your”) license to download, use, copy, or change the Software Product is subject to these rights and to all the terms and conditions of this End User License Agreement (“Agreement”).

### Acceptance

YOU ACCEPT AND AGREE TO BE BOUND BY THE TERMS OF THIS AGREEMENT BY SELECTING THE “ACCEPT” OPTION AND DOWNLOADING THE SOFTWARE PRODUCT OR BY INSTALLING, USING, OR COPYING THE SOFTWARE PRODUCT. YOU MUST AGREE TO ALL OF THE TERMS OF THIS AGREEMENT BEFORE YOU WILL BE ALLOWED TO DOWNLOAD THE SOFTWARE PRODUCT. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THIS AGREEMENT, YOU MUST SELECT “DECLINE” AND YOU MUST NOT INSTALL, USE, OR COPY THE SOFTWARE PRODUCT.

### Trial Period

You have the right to use IOPro on a single computer or group of computers for 30 days with no license. After 30 days you must purchase an appropriate license to use the software on one or more machines or stop using the software and remove it from all of your machines on which you installed the software.

### License Grant

This Agreement entitles you to install and use one copy of the Software Product on as many machines as you will personally use. The Software Product is licensed to a particular user. Only the user to whom the software is licensed may use the software. You must obtain a license for as many users as you wish to use the software. In addition, you may make archival copies of the Software Product Installer.

### Right to Updates

This license entitles you to updates to the Software Product for one year from the time of payment. The Software Product will continue to function and you may continue to use The Software Product and any updates you have received for as long as you would like however you will no longer be able to receive updates from Continuum unless this License is renewed. Please contact [sales@anaconda.com](mailto:sales@anaconda.com) with any questions or concerns.

### Restrictions on Transfer

Without first obtaining the express written consent of Continuum, you may not assign your rights and obligations under this Agreement, or redistribute, encumber, sell, rent, lease, sublicense, or otherwise transfer your rights to the Software Product.

### Restrictions on Use

You may not use, copy, or install the Software Product on any system where more than one user will be able to use the software unless you have purchased a license for each user of the system. You may not decompile, “reverse-engineer”,

disassemble, or otherwise attempt to derive the source code for the Software Product.

### Restrictions on Alteration

You may not modify the Software Product or create any derivative work of the Software Product or its accompanying documentation. Derivative works include but are not limited to translations. You may not alter any files or libraries in any portion of the Software Product.

### Restrictions on Copying

You may not copy any part of the Software Product except to the extent that licensed use inherently demands the creation of a temporary copy stored in computer memory and not permanently affixed on storage medium. You may make archival copies of the Software Product installer.

### Limited Software Product Warranty

For a period of 60 days from the date of shipment or from the date that you download the Software Product, as applicable, Continuum warrants that when properly installed and used under normal conditions, the Software Product will perform substantially as advertised.

### Disclaimer of Warranties and Limitation of Liability

UNLESS OTHERWISE EXPLICITLY AGREED TO IN WRITING BY CONTINUUM, CONTINUUM MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, IN FACT OR IN LAW, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OTHER THAN AS SET FORTH IN THIS AGREEMENT OR IN THE LIMITED WARRANTY DOCUMENTS PROVIDED WITH THE SOFTWARE PRODUCT.

Continuum makes no warranty that the Software Product will meet your requirements or operate under your specific conditions of use. Continuum makes no warranty that operation of the Software Product will be secure, error free, or free from interruption. YOU MUST DETERMINE WHETHER THE SOFTWARE PRODUCT SUFFICIENTLY MEETS YOUR REQUIREMENTS FOR SECURITY AND UNINTERRUPTABILITY. YOU BEAR SOLE RESPONSIBILITY AND ALL LIABILITY FOR ANY LOSS INCURRED DUE TO FAILURE OF THE SOFTWARE PRODUCT TO MEET YOUR REQUIREMENTS. CONTINUUM WILL NOT, UNDER ANY CIRCUMSTANCES, BE RESPONSIBLE OR LIABLE FOR THE LOSS OF DATA ON ANY COMPUTER OR INFORMATION STORAGE DEVICE. UNDER NO CIRCUMSTANCES SHALL CONTINUUM, ITS DIRECTORS, OFFICERS, EMPLOYEES OR AGENTS BE LIABLE TO YOU OR ANY OTHER PARTY FOR INDIRECT, CONSEQUENTIAL, SPECIAL, INCIDENTAL, PUNITIVE, OR EXEMPLARY DAMAGES OF ANY KIND (INCLUDING LOST REVENUES OR PROFITS OR LOSS OF BUSINESS) RESULTING FROM THIS AGREEMENT, OR FROM THE FURNISHING, PERFORMANCE, INSTALLATION, OR USE OF THE SOFTWARE PRODUCT, WHETHER DUE TO A BREACH OF CONTRACT, BREACH OF WARRANTY, OR THE NEGLIGENCE OF CONTINUUM OR ANY OTHER PARTY, EVEN IF CONTINUUM IS ADVISED BEFOREHAND OF THE POSSIBILITY OF SUCH DAMAGES. TO THE EXTENT THAT THE APPLICABLE JURISDICTION LIMITS CONTINUUM'S ABILITY TO DISCLAIM ANY IMPLIED WARRANTIES, THIS DISCLAIMER SHALL BE EFFECTIVE TO THE MAXIMUM EXTENT PERMITTED.

### Limitation of Remedies and Damages

Your remedy for a breach of this Agreement or of any warranty included in this Agreement is the correction or replacement of the Software Product. Selection of whether to correct or replace shall be solely at the discretion of

Continuum. Continuum reserves the right to substitute a functionally equivalent copy of the Software Product as a replacement. If Continuum is unable to provide a replacement or substitute Software Product or corrections to the Software Product, your sole alternate remedy shall be a refund of the purchase price for the Software Product exclusive of any costs for shipping and handling. Any claim must be made within the applicable warranty period. All warranties cover only defects arising under normal use and do not include malfunctions or failure resulting from misuse, abuse, neglect, alteration, problems with electrical power, acts of nature, unusual temperatures or humidity, improper installation, or damage determined by Continuum to have been caused by you. All limited warranties on the Software Product are granted only to you and are non-transferable. You agree to indemnify and hold Continuum harmless from all claims, judgments, liabilities, expenses, or costs arising from your breach of this Agreement and/or acts or omissions.

## Governing Law, Jurisdiction and Costs

This Agreement is governed by the laws of Texas, without regard to Texas's conflict or choice of law provisions.

## Export Regulations

Any use or distribution of IOPro is made under conditions that the user and/or distributor is in full compliance with all export and other governing laws of the United States of America, including full and ongoing compliance with the Export Administration Regulations (EAR) of the United States Department of Commerce. See [www.commerce.gov/](http://www.commerce.gov/) and <http://www.bis.doc.gov/index.php/regulations/export-administration-regulations-ear>. Use or distribution of Continuum software products to any persons, entities or countries currently under US sanctions is strictly prohibited. IOPro is classified with an ECCN of 5D992 with no license required for export to non-embargoed countries.

The United States currently has embargoes against Cuba, Iran, North Korea, Sudan and Syria. The exportation, re-exportation, sale or supply, directly or indirectly, from the United States, or by a U.S. person wherever located, of any Continuum software to any of these countries is strictly prohibited without prior authorization by the United States Government. By accepting this Agreement, you represent to Continuum that you will comply with all applicable export regulations for IOPro.

## Severability

If any provision of this Agreement shall be held to be invalid or unenforceable, the remainder of this Agreement shall remain in full force and effect. To the extent any express or implied restrictions are not permitted by applicable laws, these express or implied restrictions shall remain in force and effect to the maximum extent permitted by such applicable laws.

## IOPro Release Notes

### 2016-07-30: 1.9.0

- Remove warnings and documentation for unsupported Numba use
- Rewrite most documentation for clarity and accuracy
- Improve unit tests

### 2016-04-05: 1.8.0:

- Add PostgresAdapter for reading data from PostgreSQL databases

- Add AccumuloAdapter for reading data from Accumulo databases

### 2015-10-09: 1.7.2:

- Fix an issue with pyodbc where result NumPy arrays could return uninitialized data after the actual data null character. Now it pads the results with nulls.

### 2015-05-04: 1.7.1

- Properly cache output string objects for better performance

### 2015-03-02: 1.7.0

- Add Python 3 support
- Add support for parsing utf8 text files
- Add ability to set/get field types in MongoAdapter

### 2015-02-02: 1.6.11

- Fix issue with escape char not being parsed correctly inside quoted strings

### 2014-12-17: 1.6.10

- Fix issue with using field filters with json parser

### 2014-12-02: 1.6.9

- Fix issue with json field names getting mixed up

### 2014-11-20: 1.6.8

- Fix issue with return nulls returning wrong “null” for large queries (more than 10000 rows) in some circumstances.
- Fix issue with reading slices of json data
- Change json parser so that strings fields of numbers do not get converted to number type by default
- Allow json field names to be specified with field\_names constructor argument
- If user does not specify json field names, use json attribute names as field names in array result

### 2014-07-03: 1.6.7

- Fix issue when reading more than 10000 rows containing unicode strings in platform where ODBC uses UTF-16/UCS2 encoding (notably Windows and unixODBC). The resulting data could be corrupt.

**2014-06-16: 1.6.6**

- Fix possible segfault when dealing with unicode strings in platforms where ODBC uses UTF-16/UCS2 encoding (notably Windows and unixODBC)
- Add `iopro_set_text_limit` function to `iopro`. It globally limits the size of text fields read by `fetchdictarray` and `fetchsarray`. By default it is set to 1024 characters.
- Fix possible segfault in `fetchdictarray` and `fetchsarray` when failing to allocate some NumPy array. This could notably happen in the presence of “TEXT” fields. Now it will raise an `OutOfMemory` error.
- Add lazy loading of submodules in `IOPro`. This reduces upfront import time of `IOPro`. Features are imported as they are used for the first time.

**2014-05-07: 1.6.5**

- Fix crash when building textadapter index

**2014-04-29: 1.6.4**

- Fix default value for null strings in `IOPro/pyodbc` changed to be an empty string instead of ‘NA’. NA was not appropriate as it can collide with valid data (Namibia country code is ‘NA’, for example), and it failed with single character columns.
- Ignore `SQLRowCount` when performing queries with `fetchsarray` and `fetchdictarray`, since `SQLRowCount` sometimes returns incorrect number of rows.

**2014-03-25: 1.6.3**

- Fix SQL `TINYINT` is now returned as an unsigned 8 bit integer in `fetchdictarray`/`fetchsarray`. This is to match the range specified in SQL (0..255). It was being returned as a signed 8 bit integer before (range -128..127)
- Add Preliminary unicode string support in `fetchdictarray`/`fetchsarray`.

**2014-02-12: 1.6.2**

- Disable Numba support for version 0.12 due to lack of string support.

**2014-01-30: 1.6.1**

- Fix a regression that made possible some garbage in string fields when using `fetchdictarray`/`fetchsarray`.
- Fix a problem where heap corruption could happen in `IOPro.pyodbc` `fetchdictarray`/`fetchsarray` related to nullable string fields.
- Fix the allocation guard debugging code: `iopro.pyodbc.enable_mem_guards(True|False)` should no longer crash.
- Merge Vertica fix for cancelling queries

**2013-10-30: 1.6.0**

- Add JSON support
- Misc bug fixes
- Fix crash in IOPro.pyodbc when dealing with nullable datetimes in `fetch_dictarray` and `fetch_sarray`.

**2013-06-12: 1.5.5**

- Fix issue parsing negative ints with leading whitespace in csv data.

**2013-06-10: 1.5.4**

- Allow delimiter to be set to None for csv files with single field.
- Fill in missing csv fields with fill values.
- Fill in blank csv lines with fill values for pandas dataframe output.
- Allow list of field names for TextAdapter `field_names` parameter.
- Change default missing fill value to empty string for string fields.

**2013-06-05: 1.5.3**

- Temporary fix for IndexError exception in TextAdapter.`__read_slice` method.

**2013-05-28: 1.5.2**

- Add ability to specify escape character in csv data

**2013-05-23: 1.5.1**

- fixed coredump when using datetime with numpy < 1.7

**2013-05-22: 1.5.0**

- Added a cancel method to the Cursor object in `iopro.pyodbc`. This method wraps ODBC `SQLCancel`.
- DECIMAL and NUMERIC types are now working on `iopro.pyodbc` on regular fetch functions. They are still unsupported in `fetchsarray` and `fetchdict` and `fetchsarray`
- Add ftp support
- Performance improvements to S3 support
- Misc bug fixes

**2013-04-05: 1.4.3**

- Update loadtxt and genfromtxt to reflect numpy versions' behavior for dealing with whitespace (default to any whitespace as delimiter, and treat multiple whitespace as one delimiter)
- Add read/write field\_names property
- Add support for pandas dataframes as output
- Misc bug fixes

**Reference guide****TextAdapter****Contents**

- *TextAdapter*
  - *Methods*
  - *Basic Usage*
  - *Advanced Usage*

The TextAdapter module reads CSV data and produces a NumPy array containing the parsed data. The following features are currently implemented:

- The TextAdapter engine is written in C to ensure text is parsed as fast as data can be read from the source. Text is read and parsed in small chunks instead of reading entire data into memory at once, which enables very large files to be read and parsed without running out of memory.
- Python slicing notation can be used to specify a subset of records to be read from the data source, as well as a subset of fields.
- Fields can be specified in any one of three ways: by a delimiter character, using fixed field widths, or by a regular expression. This enables a larger variety of CSV-like and other types of text files to be parsed.
- A gzipped file can be parsed without having to uncompress it first. Parsing speed is about the same as an uncompressed version of same file.
- An index of record offsets in a file can be built to allow fast random access to records. This index can be saved to disk and loaded again later.
- Converter functions can be specified for converting parsed text to proper dtype for storing in NumPy array.
- The TextAdapter engine has automatic type inference so the user does not have to specify dtypes of the output array. The user can still specify dtypes manually if desired.
- Remote data stored in Amazon S3 can be read. An index can be built and stored with S3 data. Index can be read remotely, allowing for random access to S3 data.

**Methods**

The TextAdapter module contains the following factory methods for creating TextAdapter objects:

**text\_adapter** (source, parser='csv', compression=None, comment='#',

```
quote='\"', num_records=0, header=0, field_names=True, indexing=False, index_name=None,
encoding='utf-8')
```

Create a text adapter for reading CSV, JSON, or fixed width text files, or a text file defined by regular expressions.

source - filename, file object, StringIO object, BytesIO object, S3 key, http url, or python generator  
parser - Type of parser for parsing text. Valid parser types are 'csv', 'fixed width', 'regex', and 'json'.  
encoding - type of character encoding (current ascii and utf8 are supported)  
compression - type of data compression (currently only gzip is supported)  
comment - character used to indicate comment line  
quote - character used to quote fields  
num\_records - limits parsing to specified number of records; defaults to all records  
header - number of lines in file header; these lines are skipped when parsing  
footer - number of lines in file footer; these lines are skipped when parsing  
indexing - create record index on the fly as characters are read  
index\_name - name of file to write index to  
output - type of output object (numpy array or pandas dataframe)

**If parser is set to 'csv', additional parameters include:**

delimiter - Delimiter character used to define fields in data source. Default is ','.

**If parser is set to 'fixed\_width', additional parameters include:**

field\_widths - List of field widths

**If parser is set to 'regex', additional parameters include:**

regex - Regular expression used to define records and fields in data source. See the regular expression example in the Advanced Usage section.

**s3\_text\_adapter (access\_key, secret\_key, bucket\_name, key\_name, remote\_s3\_index=False)**

```
parser='csv', compression=None, comment='#', quote='\"', num_records=0, header=0,
field_names=True, indexing=False, index_name=None, encoding='utf-8')
```

Create a text adapter for reading a text file from S3. Text file can be CSV, JSON, fixed width, or defined by regular expressions

In addition to the arguments described for the text\_adapter function above, the s3\_text\_adapter function also has the following parameters:

access\_key - AWS access key  
secret\_key - AWS secret key  
bucket\_name - name of S3 bucket  
key\_name - name of key in S3 bucket  
remote\_s3\_index - use remote S3 index (index name must be key name + '.idx' extension)

The TextAdapter object returned by the text\_adapter factory method contains the following methods:

**set\_converter (field, converter)**

Set converter function for field

field - field to apply converter function

converter - python function object

**set\_missing\_values (missing\_values)**

Set strings for each field that represents a missing value

missing\_values - dict of field name or number, and list of missing value strings

Default missing values: 'NA', 'NaN', 'inf', '-inf', 'None', 'none', ''

**set\_fill\_values (fill\_values, loose=False)**

Set fill values for each field

fill\_values - dict of field name or number, and fill value

loose - If value cannot be converted, and value does not match any of the missing values, replace with fill value anyway.

Default fill values for each data type: | int - 0 | float - numpy.nan | char - 0 | bool - False | object - numpy.nan | string - numpy.nan

**create\_index (index\_name=None, density=1)**

Create an index of record offsets in file

index\_name - Name of file on disk used to store index. If None, index will be created in memory but not saved.

density - density of index. Value of 1 will index every record, value of 2 will index every other record, etc.

**to\_array ()**

Parses entire data source and returns data as NumPy array object

**to\_dataframe ()**

Parses entire data source and returns data as Pandas DataFrame object

The TextAdapter object contains the following properties:

**size (readonly)**

Number of records in data source. This value is only set if entire data source has been read or indexed, or number of records was specified in text\_adapter factory method when creating object.

**field\_count (readonly)**

Number of fields in each record

**field\_names**

Field names to use when creating output NumPy array. Field names can be set here before reading data or in `text_adapter` function with `field_names` parameter.

**field\_types**

NumPy dtypes for each field, specified as a dict of fields and associated dtype. (Example: `{0:'u4', 1:'f8', 2:'S10'}`)

**field\_filter**

Fields in data source to parse, specified as a list of field numbers or names (Examples: `[0, 1, 2]` or `['f1', 'f3', 'f5']`). This filter stays in effect until it is reset to empty list, or is overridden with array slicing (Example: `adapter[[0, 1, 3, 4]][:]`).

**See the NumPy data types documentation for more details:** <http://docs.continuum.io/anaconda/numpy/reference/arrays.dtypes.html>

The TextAdapter object supports array slicing:

Read all records: `adapter[:]`

Read first 100 records: `adapter[0:100]`

Read last record (only if data has been indexed or entire dataset has been read once before): `adapter[-1]`

Read first field in all records by specifying field number: `adapter[0][:]`

Read first field in all records by specifying field name: `adapter['f0'][:]`

Read first and third fields in all records: `adapter[[0, 2]][:]`

**Basic Usage**

Create TextAdapter object for data source:

```
>>> import iopro
>>> adapter = iopro.text_adapter('data.csv', parser='csv')
```

Parse text and store records in NumPy array using slicing notation:

```
>>> # read all records
>>> array = adapter[:]

>>> # read first ten records
>>> array = adapter[0:10]

>>> # read last record
>>> array = adapter[-1]

>>> # read every other record
>>> array = adapter[::2]
```

## Advanced Usage

user defined converter function for field 0:

```
>>> import iopro
>>> import io

>>> data = '1, abc, 3.3\n2, xxx, 9.9'
>>> adapter = iopro.text_adapter(io.StringIO(data), parser='csv', field_names=False)

>>> # Override default converter for first field
>>> adapter.set_converter(0, lambda x: int(x)*2)
>>> adapter[:]
array([(2L, ' abc', 3.3), (4L, ' xxx', 9.9)],
      dtype=[('f0', '<u8'), ('f1', 'S4'), ('f2', '<f8')])
```

overriding default missing and fill values:

```
>>> import iopro
>>> import io

>>> data = '1,abc,inf\n2,NA,9.9'
>>> adapter = iopro.text_adapter(io.StringIO(data), parser='csv', field_names=False)

>>> # Define field dtypes (example: set field 1 to string object and field 2 to float)
>>> adapter.field_types = {1:'O', 2:'f4'}

>>> # Define list of strings for each field that represent missing values
>>> adapter.set_missing_values({1:['NA'], 2:['inf']})

>>> # Set fill value for missing values in each field
>>> adapter.set_fill_values({1:'xxx', 2:999.999})
>>> adapter[:]
array([(' abc', 999.9990234375), ('xxx', 9.8999999618530273)],
      dtype=[('f0', 'O'), ('f1', '<f4')])
```

creating and saving tuple of index arrays for gzip file, and reloading indices:

```
>>> import iopro
>>> adapter = iopro.text_adapter('data.gz', parser='csv', compression='gzip')

>>> # Build index of records and save index to disk.
>>> adapter.create_index(index_name='index_file')

>>> # Create new adapter object and load index from disk.
>>> adapter = iopro.text_adapter('data.gz', parser='csv', compression='gzip',
↳ indexing=True, index_name='index_file')

>>> # Read last record
>>> adapter[-1]
array([(100, 101, 102)], dtype=[('f0', '<u4'), ('f1', '<u4'), ('f2', '<u4')])
```

Use regular expression for finer control of extracting data:

```
>>> import iopro
>>> import io
```

(continues on next page)

(continued from previous page)

```

>>> # Define regular expression to extract dollar amount, percentage, and month.
>>> # Each set of parentheses defines a field.
>>> data = '$2.56, 50%, September 20 1978\n$1.23, 23%, April 5 1981'
>>> regex_string = '([0-9]\.[0-9][0-9]+)\,\s ([0-9]+)\%\,\s ([A-Za-z]+)'
>>> adapter = iopro.text_adapter(io.StringIO(data), parser='regex', regex_
↳ string=regex_string, field_names=False, infer_types=False)

>>> # set dtype of field to float
>>> adapter.field_types = {0:'f4', 1:'u4', 2:'S10'}
>>> adapter[:]
array([(2.56, 50L, 'September'), (1.23, 23L, 'April')],
      dtype=[('f0', '<f8'), ('f1', '<u8'), ('f2', 'S9')])

```

## iopro.pyodbc

This project is an enhancement of the Python database module for ODBC that implements the Python DB API 2.0 specification. You can see the original project here:

**homepage** <http://code.google.com/p/pyodbc>

**source** <http://github.com/mkleehammer/pyodbc>

**source** <http://code.google.com/p/pyodbc/source/list>

The enhancements are documented in this file. For general info about the pyodbc package, please refer to the original project documentation.

This module enhancement requires:

- Python 2.4 or greater
- ODBC 3.0 or greater
- NumPy 1.5 or greater (1.7 is required for datetime64 support)

The enhancements in this module consist mainly in the addition of some new methods for fetching the data after a query and put it in a variety of NumPy containers.

Using NumPy as data containers instead of the classical list of tuples has a couple of advantages:

- 1) The NumPy container is much more compact, and hence, it requires much less memory, than the original approach.
- 2) As a NumPy container can hold arbitrarily large arrays, it requires much less object creation than the original approach (one Python object per datum retrieved).

This means that this enhancements will allow to fetch data out of relational databases in a much faster way, while consuming significantly less resources.

## API additions

### Variables

- *pyodbc.npversion* The version for the NumPy additions

## Methods

### **Cursor.fetchdictarray** (size=cursor.arraysize)

This is similar to the original *Cursor.fetchmany(size)*, but the data is returned in a dictionary where the keys are the names of the columns and the values are NumPy containers.

For example, if a SELECT is returning 3 columns with names 'a', 'b' and 'c' and types *varchar(10)*, *integer* and *timestamp*, the returned object will be something similar to:

```
{'a': array(..., dtype='S11'),
 'b': array(..., dtype=int32),
 'c': array(..., dtype=datetime64[us])}
```

Note that the *varchar(10)* type is translated automatically to a string type of 11 elements ('S11'). This is because the ODBC driver needs one additional space to put the trailing '0' in strings, and NumPy needs to provide the room for this.

Also, it is important to stress that all the *timestamp* types are translated into a NumPy *datetime64* type with a resolution of microseconds by default.

### **Cursor.fetchsarray** (size=cursor.arraysize)

This is similar to the original *Cursor.fetchmany(size)*, but the data is returned in a NumPy structured array, where the name and type of the fields matches to those resulting from the SELECT.

Here it is an example of the output for the SELECT above:

```
array([(...),
      (...)],
      dtype=[('a', '<S11'), ('b', '<i4'), ('c', '<M8[us]', {})])
```

Note that, due to efficiency considerations, this method is calling the *fetchdictarray()* behind the scenes, and then doing a conversion to get an structured array. So, in general, this is a bit slower than its *fetchdictarray()* counterpart.

## Data types supported

The new methods listed above have support for a subset of the standard ODBC. In particular:

- String support (SQL\_VARCHAR) is supported.
- Numerical types, be them integers or floats (single and double precision) are fully supported. Here it is the complete list: SQL\_INTEGER, SQL\_TINYINT, SQL\_SMALLINT, SQL\_FLOAT and SQL\_DOUBLE.
- Dates, times, and timestamps are mapped to the *datetime64* and *timedelta* NumPy types. The list of supported data types are: SQL\_DATE, SQL\_TIME and SQL\_TIMESTAMP,
- Binary data is not supported yet.
- Unicode strings are not supported yet.

## NULL values

As there is not (yet) a definitive support for missing values (NA) in NumPy, this module represents NA data as particular values depending on the data type. Here it is the current table of the particular values:

```
int8: -128 (-2**7)
uint8: 255 (2**8-1)
int16: -32768 (-2**15)
uint16: 65535 (2**16-1)
int32: -2147483648 (-2**31)
uint32: 4294967295 (2**32-1)
int64: -9223372036854775808 (-2**63)
uint64: 18446744073709551615 (2**64-1)
float32: NaN
float64: NaN
datetime64: NaT
timedelta64: NaT (or -2**63)
string: 'NA'
```

## Improvements for 1.1 release

- The rowcount is not trusted anymore for the *fetchdict()* and *fetchsarray()* methods. Now the NumPy containers are built incrementally, using realloc for a better use of resources.
- The Python interpreter does not exit anymore when fetching an exotic datatype not supported by NumPy.
- The docsstrings for *fetchdict()* and *fetchsarray()* have been improved.

## MongoAdapter

### Contents

- *MongoAdapter*
  - *Methods*
  - *Basic Usage*

The MongoAdapter module reads data from a Mongo database collection and produces a NumPy array containing the loaded. The following features are currently implemented:

- The MongoAdapter engine is written in C to ensure data is loaded fast with minimal memory usage.
- Python slicing notation can be used to specify the subset of records to be read from the data source.
- The MongoAdapter engine has automatic type inference so the user does not have to specify dtypes of the output array.

## Methods

The MongoAdapter module contains the following constructor for creating MongoAdapter objects:

### MongoAdapter (host, port, database, collection)

MongoAdapter constructor

host - Host name where Mongo database is running.

port - Port number where Mongo database is running.

database - Mongo database to connect to

collection - Mongo database collection

### **set\_field\_names (names)**

Set field names to read when creating output NumPy array.

### **get\_field\_names ()**

Returns names of fields that will be read when reading data from Mongo database.

### **set\_field\_types (types=None)**

Set NumPy dtypes for each field, specified as a dict of field names/indices and associated dtype. (Example: {0:'u4', 1:'f8', 2:'S10'})

### **get\_field\_types ()**

Returns dict of field names/indices and associated NumPy dtype.

The MongoAdapter object contains the following properties:

### **size (readonly)**

Number of documents in the Mongo database + collection specified in constructor.

## **Basic Usage**

1. Create MongoAdapter object for data source

```
>>> import iopro
>>> adapter = iopro.MongoAdapter('localhost', 27017, 'database_name', 'collection_
↳name')
```

2. Load Mongo collection documents into NumPy array using slicing notation

```
>>> # read all records for 'field0' field
>>> array = adapter['field0'][:]
```

```
>>> # read first ten records for 'field0' and 'field1' fields
>>> array = adapter[['field0', 'field1']][0:10]
```

```
>>> # read last record
>>> array = adapter['field0'][-1]
```

```
>>> # read every other record
>>> array = adapter['field0'][:,2]
```

## **Accumulo Adapter**

### **Contents**

- *Accumulo Adapter*

- *Adapter Methods*
- *Adapter Properties*
- *Basic Usage*

The AccumuloAdapter module reads data from Accumulo key/value stores and produces a NumPy array containing the parsed values.

- The AccumuloAdapter engine is written in C to ensure returned data is parsed as fast as data can be read from the source. Data is read and parsed in small chunks instead of reading entire data into memory at once.
- Python slicing notation can be used to specify a subset of records to be read from the data source.

### Adapter Methods

Accumulo Adapter Constructor:

**AccumuloAdapter** (server='localhost', port=42424, username='', password='', table=None, field\_type='f8', start\_key=None, stop\_key=None, start\_key\_inclusive=True, stop\_key\_inclusive=False, missing\_values=None, fill\_value=None):

Create an adaptor for connecting to an Accumulo key/value store.

server: Accumulo server address

port: Accumulo port

username: Accumulo user name

password: Accumulo user password

table: Accumulo table to read data from

field\_type: str, NumPy dtype to interpret table values as

start\_key: str, key of record where scanning will start from

stop\_key: str, key of record where scanning will stop at

start\_key\_inclusive: If True, start\_key is inclusive (default is True)

stop\_key\_inclusive: If True, stop\_key is inclusive (default is False)

missing\_values: list, missing value strings. Any values in table equal to one of these strings will be replaced with fill\_value.

fill\_value: fill value used to replace missing value when scanning

**close ()**

Close connection to the database.

The AccumuloAdapter object supports array slicing:

Read all records: adapter[:]

Read first ten records: adapter[0:10]

Read last record: adapter[-1]

Read every other record: adapter[::2]

## Adapter Properties

### field\_type (readonly)

Get dtype of output NumPy array

### start\_key

Get/set key of record where reading/scanning will start.

The start\_key\_inclusive property specifies whether this key is inclusive (default is inclusive).

### stop\_key

Get/set key of record where reading/scanning will stop.

The stop\_key\_inclusive property specifies whether this key is inclusive (default is exclusive).

### start\_key\_inclusive

Toggle whether start key is inclusive. Default is true.

### stop\_key\_inclusive

Toggle whether stop key is inclusive. Default is False.

### missing\_values

Get/Set missing value strings. Any values in Accumulo table matching one of these strings will be replaced with fill\_value.

### fill\_value

Fill value used to replace missing\_values. Fill value type should match specified output type.

## Basic Usage

Create AccumuloAdapter object for data source:

```
>>> import iopro
>>> adapter = iopro.AccumuloAdapter(server='172.17.0.1',
                                   port=42424,
                                   username='root',
                                   password='password',
                                   field_type='f4',
                                   table='iopro_tutorial_data')
```

IOPro adapters use slicing to retrieve data. To retrieve records from the table or query, the standard NumPy slicing notation can be used:

```
>>> # read all records
>>> array = adapter[:]
array([ 0.5,  1.5,  2.5,  3.5,  4.5], dtype=float32)
```

```
>>> # read first three records
>>> array = adapter[0:3]
array([ 0.5,  1.5,  2.5], dtype=float32)
```

```
>>> # read every other record from the first four records
>>> array = adapter[:4:2]
array([ 0.5,  2.5], dtype=float32)
```

The Accumulo adapter does not support seeking from the last record.

The `field_types` property can be used to see what type the output NumPy array will have:

```
>>> adapter.field_type
'f4'
```

Since Accumulo is essentially a key/value store, results can be filtered based on key. For example, a start key using the `start_key` property. This will retrieve all values with a key equal to or greater than the start key.

```
>>> adapter.start_key = 'row02'
>>> adapter[:]
array([ 1.5,  2.5,  3.5,  4.5], dtype=float32)
```

Likewise, a stop key. This will retrieve all values with a key less than the stop key but equal to or greater than the start key.

```
>>> adapter.stop_key = 'row04'
>>> adapter[:]
array([ 1.5,  2.5], dtype=float32)
```

By default, the start key is inclusive. This can be changed by setting the `start_key_inclusive` property to `False`.

```
>>> adapter.start_key_inclusive = False
>>> adapter[:]
array([ 2.5], dtype=float32)
```

By default, the stop key is exclusive. This can be changed by setting the `stop_key_inclusive` property to `True`.

```
>>> adapter.stop_key_inclusive = True
>>> adapter[:]
array([ 2.5,  3.5], dtype=float32)
```

The Accumulo adapter can handle missing values. If it is known that the strings 'NA' and 'nan' signify missing float values, the `missing_values` property can be used to tell the adapter to treat these strings as missing values: Also, the `fill_value` property can be used to specify what value to replace missing values with.

```
>>> adapter = iopro.AccumuloAdapter('172.17.0.1', 42424, 'root', 'password', 'iopro_
↳tutorial_missing_data', field_type='S10')
>>> adapter[:]
array([b'NA', b'nan'], dtype='<S10')
```

```
>>> adapter = iopro.AccumuloAdapter('172.17.0.1', 42424, 'root', 'secret', 'iopro_
↳tutorial_missing_data', field_type='f8')
>>> adapter.missing_values = ['NA', 'nan']
>>> adapter.fill_value = np.nan
>>> adapter[:]
array([ nan,  nan])
```

**Close database connection:**

```
>>> adapter.close()
```

## PostgresAdapter, PostGIS, and GreenPlum

### Contents

- *PostgresAdapter, PostGIS, and GreenPlum*
  - *Adapter Methods*
  - *Adapter Properties*
  - *Basic Usage*

The PostgresAdapter module reads data from PostgreSQL based databases and produces a NumPy array or a Pandas Dataframe containing the parsed data. The PostgresAdapter can be used to access data from PostgreSQL and GreenPlum, and has enhancements to support PostGIS points, lines, multilines, polygons, and multipolygons. The following features are currently implemented:

- The PostgresAdapter engine is written in C to ensure returned data is parsed as fast as data can be read from the source. Data is read and parsed in small chunks instead of reading entire data into memory at once.
- Python slicing notation can be used to specify a subset of records to be read from the data source.
- A subset of columns can be specified to be returned instead of returning all columns for the records.

### Adapter Methods

PostgreSQL Adapter Constructor:

**PostgresAdapter** (connection\_uri, table=None, query=None, field\_filter=None, dataframe=False, field\_names=None, field\_types=None, field\_shapes=None):

Create an adaptor for connecting to a PostgreSQL based database.

connection\_uri: string URI describing how to connect to database

table: string, name of table to read records from. Only table parameter or query parameter can be set, but not both.

query: string, custom query to use for reading records. Only query parameter or table parameter can be set, but not both. field\_filter parameter cannot be set when query parameter is set (since it is trivial to specify fields in query string).

field\_filter: names of fields include in query (only valid when table parameter is specified)

dataframe: bool, return results as dataframe instead of array

field\_names: list, names of fields in output array or dataframe. Defaults to database table column names.

field\_types: list, NumPy dtype for each field in output array or dataframe. Defaults to database table column types.

field\_shapes: list, shape of each field value for geometry field types with variable length data. For example, for a 'path' database column with 2d points, the points of the path will be stored in a list object by default. If a field shape of '10' is specified, the points will be stored in a 2x10 float subarray (2 floats per point\* 10 points max). A field shape of the form (x,y) should be specified for types like multipolygon where x is the max number of polygons and y is the max length of each polygon (the size of the point is inferred).

close ()

Close connection to the database.

The PostgresAdapter object supports array slicing:

Read all records: `adapter[:]`

Read first 100 records: `adapter[0:100]`

Read last record: `adapter[-1]`

Read every other record: `adapter[::2]`

### Adapter Properties

#### **num\_records (readonly)**

Get number of records that will be returned from table or custom query.

#### **num\_fields (readonly)**

Get number of fields in records that will be returned from table or custom query

#### **field\_names**

Get/set names of fields in final array or dataframe. Field names can be set by specifying a list of names, or dict mapping of field number to field name. If names is a list, the length of list must match the number of fields in data set. If names is a dict, the field name from the database will be used if no name in dict is specified for that field.

#### **field\_types**

Get/set field types in final array or dataframe. Field types can be set by specifying a list of NumPy dtypes, or a dict mapping of field number or name to field type. If types is a list, the length of list must match the number of fields in data set. If types is a dict, the field type from the database will be used if type is not specified in dict.

#### **field\_shapes**

Get/set field shapes for variable length fields. Field shapes can be set by specifying a list of shape tuples (or a single integer if shape has one dimension), or a dict mapping of field number or name to field shape. If shapes is a list, the length of the list must match the number of fields in data set. A value of None or zero for a field, or an unspecified shape, means that an infinite length value will be allowed for field, and value will be stored in Python list object if field is PostgreSQL geometry type, or as Well Known Text string objects if field is PostGIS type.

### Basic Usage

Create PostgresAdapter object for data source:

```
>>> import iopro
>>> adapter = iopro.PostgresAdapter('host=localhost dbname=db_name user=user_
↳table=table_name')
```

IOPro adapters use slicing to retrieve data. To retrieve records from the table or query, the standard NumPy slicing notation can be used:

```
>>> # read all records
>>> array = adapter[:]
```

```
>>> # read first ten records
>>> array = adapter[0:10]
```

```
>>> # read last record
>>> array = adapter[-1]
```

```
>>> # read every other record
>>> array = adapter[::2]
```

The PostgreSQL adapter has a few properties that we can use to find out more about our data. To get the number of records in our dataset:

```
>>> adapter.num_records
5
```

or the number of fields:

```
>>> adapter.num_fields
5
```

To find the names of each field:

```
>>> adapter.field_names
['field1', 'real', 'name', 'point2d', 'multipoint3d']
```

These names come from the names of the columns in the database and are used by default for the field names in the NumPy array result. These names can be changed by setting the field names property using a list of field names:

```
>>> adapter.field_names = ['field1', 'field2', 'field3', 'field4', 'field5']
>>> adapter[:].dtype
dtype([('field1', '<i4'), ('field2', '<f4'), ('field3', '<U10'), ('field4', '<f8', (2,
↪)), ('field5', 'O'))]
```

Individual fields can also be set by using a dict, where the key is the field number and the value is the field name we want:

```
>>> adapter.field_names = {1: 'AAA'}
>>> adapter[:].dtype
dtype([('integer', '<i4'), ('AAA', '<f4'), ('string', '<U10'), ('point2d', '<f8', (2,
↪)), ('multipoint3d', 'O')])
```

To find out the NumPy dtype of each field:

```
>>> adapter.field_types
['i4', 'f4', 'U10', 'f8', 'O']
```

Similar to the field names property, the types property can be set using a list or dict to force a field to be cast to a specific type:

```
>>> adapter.field_types = {0: 'f4', 1: 'i4', 2: 'U3', 4: 'O'}
```

To filter the fields returned by passing a list of field names to the constructor:

```
>>> adapter = iopro.PostgresAdapter('host=localhost dbname=db_name user=user',
                                     table='data',
                                     field_filter=['field1', 'field2'])
```

For fields like path or multipoint3d with a variable length, the adapter will return values as a list of tuples containing the float components of each point (if a PostgreSQL geometric type) or as string objects in Well Known Text format (if a PostGIS type). For improved performance, a field shape can be specified which will set the max dimensions of the field values. For example, a multipoint3d field can be set to have a maximum of two points so that each set of 3d points will be stored in a 2x3 subarray of floats:

```
>>> adapter = iopro.PostgresAdapter('host=localhost dbname=db_name user=user'
                                     table='data',
                                     field_filter=['multipoint3d'],
                                     field_shapes={'multipoint3d': 2})

>>> adapter[:]
array([([[0.0, 1.0, 2.0], [3.0, 4.0, 5.0]]),
       ([[6.0, 7.0, 8.0], [9.0, 10.0, 11.0]]),
       ([[12.0, 13.0, 14.0], [15.0, 16.0, 17.0]]),
       ([[18.0, 19.0, 20.0], [21.0, 22.0, 23.0]]),
       ([[24.0, 25.0, 26.0], [27.0, 28.0, 29.0]])],
      dtype=[('multipoint3d', '<f8', (2, 3))])
```

For more advanced queries, a custom select query can be passed to the constructor. Either a table name or a custom query can be passed to the constructor, but not both.

```
>>> adapter = iopro.PostgresAdapter('host=localhost dbname=db_name user=user',
                                     query='select integer, string from data where_
↳ data.integer > 2')
>>> adapter[:]
```

Data can also be returned as a pandas dataframe using the adapter constructor's dataframe' argument:

```
>>> adapter = iopro.PostgresAdapter('host=localhost dbname=iopro_tutorial user=jayvius
↳ ',
                                     table='data',
                                     dataframe=True)
```

To retrieve some PostGIS data that falls within a given bounding box:

```
>>> adapter = iopro.PostgresAdapter('host=localhost dbname=db_name user=user',
                                     query='select integer, point2d from data '
↳ 'where data.point2d @ ST_MakeEnvelope(0, 0,
↳ 4, 4) ')
```

**Close database connection:**

```
>>> adapter.close()
```

## iopro.loadtxt

Load data from a text file.

Each row in the text file must have the same number of values.

## Parameters

**fname** [file or str] File, filename, or generator to read. If the filename extension is `.gz` or `.bz2`, the file is first decompressed. Note that generators should return byte strings for Python 3k.

**dtype** [data-type, optional] Data-type of the resulting array; default: float. If this is a record data-type, the resulting array will be 1-dimensional, and each row will be interpreted as an element of the array. In this case, the number of columns used must match the number of fields in the data-type.

**comments** [str, optional] The character used to indicate the start of a comment; default: `#`.

**delimiter** [str, optional] The string used to separate values. By default, this is any whitespace.

**converters** [dict, optional] A dictionary mapping column number to a function that will convert that column to a float. E.g., if column 0 is a date string: `converters = {0: datestr2num}`. Converters can also be used to provide a default value for missing data (but see also `iopro.genfromtxt`): `converters = {3: lambda s: float(s.strip() or 0)}`. Default: None.

**skiprows** [int, optional] Skip the first *skiprows* lines; default: 0.

**usecols** [sequence, optional] Which columns to read, with 0 being the first. For example, `usecols = (1, 4, 5)` will extract the 2nd, 5th and 6th columns. The default, None, results in all columns being read.

**unpack** [bool, optional] If True, the returned array is transposed, so that arguments may be unpacked using `x, y, z = iopro.loadtxt(...)`. When used with a record data-type, arrays are returned for each field. Default is False.

**ndmin** [int, optional] The returned array will have at least *ndmin* dimensions. Otherwise mono-dimensional axes will be squeezed. Legal values: 0 (default), 1 or 2. .. versionadded:: 1.6.0

## Returns

**out** [ndarray] Data read from the text file.

## See Also

`iopro.genfromtxt` : Load data with missing values handled as specified.

## Examples

### simple parse of StringIO object data

```
>>> import iopro
>>> from io import StringIO # StringIO behaves like a file object
>>> c = StringIO("0 1\n2 3")
>>> iopro.loadtxt(c)
>>> array([[ 0.,  1.],
          [ 2.,  3.]])
```

### set dtype of output array

```
>>> d = StringIO("M 21 72\nF 35 58")
>>> iopro.loadtxt(d, dtype={'names': ('gender', 'age', 'weight'),
...                          'formats': ('S1', 'i4', 'f4')})
>>> array([('M', 21, 72.0), ('F', 35, 58.0)],
          dtype=[('gender', '<S1'), ('age', '<i4'), ('weight', '<f4')])
```

**set delimiter and columns to parse**

```
>>> c = StringIO("1,0,2\\n3,0,4")
>>> x, y = iopro.loadtxt(c, delimiter=',', usecols=(0, 2), unpack=True)
>>> x
array([ 1.,  3.])
>>> y
array([ 2.,  4.])
```

**iopro.genfromtxt**

Load data from a text file, with missing values handled as specified.

Each line past the first *skip\_header* lines is split at the *delimiter* character, and characters following the *comments* character are discarded.

**Parameters**

**fname** [file or str] File, filename, or generator to read. If the filename extension is *.gz* or *.bz2*, the file is first decompressed. Note that generators must return byte strings in Python 3k.

**dtype** [dtype, optional] Data type of the resulting array. If *None*, the dtypes will be determined by the contents of each column, individually.

**comments** [str, optional] The character used to indicate the start of a comment. All the characters occurring on a line after a comment are discarded

**delimiter** [str, int, or sequence, optional] The string used to separate values. By default, any consecutive whitespaces act as delimiter. An integer or sequence of integers can also be provided as width(s) of each field.

**skip\_header** [int, optional] The numbers of lines to skip at the beginning of the file.

**skip\_footer** [int, optional] The numbers of lines to skip at the end of the file

**converters** [variable, optional] The set of functions that convert the data of a column to a value. The converters can also be used to provide a default value for missing data: `converters = {3: lambda s: float(s or 0)}`.

**missing\_values** [variable, optional] The set of strings corresponding to missing data.

**filling\_values** [variable, optional] The set of values to be used as default when the data are missing.

**usecols** [sequence, optional] Which columns to read, with 0 being the first. For example, `usecols = (1, 4, 5)` will extract the 2nd, 5th and 6th columns.

**names** [{None, True, str, sequence}, optional] If *names* is *True*, the field names are read from the first valid line after the first *skip\_header* lines. If *names* is a sequence or a single-string of comma-separated names, the names will be used to define the field names in a structured dtype. If *names* is *None*, the names of the dtype fields will be used, if any.

**excludelist** [sequence, optional] A list of names to exclude. This list is appended to the default list ['return', 'file', 'print']. Excluded names are appended an underscore: for example, *file* would become *file\_*.

**deletechars** [str, optional] A string combining invalid characters that must be deleted from the names.

**defaultfmt** [str, optional] A format used to define default field names, such as “f%i” or “f\_%02i”.

**autostrip** [bool, optional] Whether to automatically strip white spaces from the variables.

**replace\_space** [char, optional] Character(s) used in replacement of white spaces in the variables names. By default, use a `'_'`.

**case\_sensitive** [{True, False, 'upper', 'lower'}, optional] If True, field names are case sensitive. If False or 'upper', field names are converted to upper case. If 'lower', field names are converted to lower case.

**unpack** [bool, optional] If True, the returned array is transposed, so that arguments may be unpacked using `x, y, z = loadtxt(...)`

**usemask** [bool, optional] If True, return a masked array. If False, return a regular array.

**invalid\_raise** [bool, optional] If True, an exception is raised if an inconsistency is detected in the number of columns. If False, a warning is emitted and the offending lines are skipped.

## Returns

**out** [ndarray] Data read from the text file. If *usemask* is True, this is a masked array.

## See Also

`iopro.loadtxt` : equivalent function when no data is missing.

## Notes

- When spaces are used as delimiters, or when no delimiter has been given as input, there should not be any missing data between two fields.
- When the variables are named (either by a flexible dtype or with *names*, there must not be any header in the file (else a `ValueError` exception is raised).
- Individual values are not stripped of spaces by default. When using a custom converter, make sure the function does remove spaces.

## Examples

```
>>> import iopro
>>> from io import StringIO
```

Comma delimited file with mixed dtype

```
>>> s = StringIO("1,1.3,abcde")
>>> data = iopro.genfromtxt(s, dtype=[('myint', 'i8'), ('myfloat', 'f8'),
... ('mystring', 'S5')], delimiter=",")
>>> data
array((1, 1.3, 'abcde'),
      dtype=[('myint', '<i8'), ('myfloat', '<f8'), ('mystring', '|S5')])
```

Using `dtype = None`

```
>>> s.seek(0) # needed for StringIO example only
>>> data = iopro.genfromtxt(s, dtype=None,
... names = ['myint', 'myfloat', 'mystring'], delimiter=",")
>>> data
```

(continues on next page)

(continued from previous page)

```
array((1, 1.3, 'abcde'),
      dtype=[('myint', '<i8'), ('myfloat', '<f8'), ('mystring', '|S5')])
```

### Specifying dtype and names

```
>>> s.seek(0)
>>> data = iopro.genfromtxt(s, dtype="i8,f8,S5",
... names=['myint','myfloat','mystring'], delimiter=",")
>>> data
array((1, 1.3, 'abcde'),
      dtype=[('myint', '<i8'), ('myfloat', '<f8'), ('mystring', '|S5')])
```

### An example with fixed-width columns

```
>>> s = StringIO("11.3abcde")
>>> data = iopro.genfromtxt(s, dtype=None, names=['intvar','fltvar','strvar'],
... delimiter=[1,3,5])
>>> data
array((1, 1.3, 'abcde'),
      dtype=[('intvar', '<i8'), ('fltvar', '<f8'), ('strvar', '|S5')])
```
