

The `fibnum` package

Heiko Oberdiek
<heiko.oberdiek at gmail.com>

2012/04/08 v1.0

Abstract

The package `fibnum` provides expandable fibonacci numbers for both \LaTeX and plain \TeX .

1 Documentation

In the mailing list `texhax` Jan Abraham asked the question, how to get Fibonacci numbers in \TeX [1]:

Write a Macro in \TeX that compute the function `\fib{m}` All fibonacci numbers from 1 to m ($m < 40$).

This packages provides an expandable implementation for the calculation of these numbers for a much larger set of indexes. For practical reasons the index is restricted to the same limitations that apply for \TeX integer numbers. The range

of the Fibonacci numbers, however, are not limited by the algorithm. They are only restricted to memory limitations, if they are hit.

The package is loaded as L^AT_EX package in L^AT_EX:

```
\usepackage{fibnum}
```

and as file in plain T_EX:

```
\input fibnum.sty
```

The package does not know any options and it provides the macros `\fibnum` and `\fibnumPreCalc`.

`\fibnum {⟨index⟩}`

Macro `\fibnum` expects a T_EX number as $\langle index \rangle$ in the official T_EX number range from $-(2^{31}-1)$ up to $2^{31}-1$. In exact two expansion steps the macro expands to the Fibnoacci number $F_{\langle index \rangle}$. In case of a negative $\langle index \rangle$, the “negafibonacci” number [2] is used. Formally the Fibonacci number F_n with integer index n , $n \in \mathbb{Z}$ and $n \in [-2\,147\,483\,647, 2\,147\,483\,647]$ that is returned by macro `\fibnum` with numerical argument n is defined the following way:

$$F_n = \begin{cases} 0 & \text{for } n = 0 \\ 1 & \text{for } n = 1 \\ F_{n-1} + F_{n-2} & \text{for } n > 1 \\ (-1)^{n+1} F_n & \text{for } n < 0 \end{cases} \quad (1)$$

Examples:

```
\fibnum{-6}    → -8
\fibnum{-5}    →  5
\fibnum{-4}    → -3
\fibnum{-3}    →  2
\fibnum{-2}    → -1
\fibnum{-1}    →  1
\fibnum{0}     →  0
\fibnum{1}     →  1
\fibnum{2}     →  1
\fibnum{3}     →  2
\fibnum{4}     →  3
\fibnum{5}     →  5
\fibnum{6}     →  8
⋮
\fibnum{10}    →  55
⋮
\fibnum{46}    → 1836311903
⋮
\fibnum{100}   → 354224848179261915075
⋮
\fibnum{200}   → 280571172992510140037611932413038677189525
⋮
\fibnum{1000}  → 434665576869374564356885276750406258025646
                  605173717804024817290895365554179490518904
                  038798400792551692959225930803226347752096

```

`\fibnumPreCalc {⟨index⟩}`

The package already provides precalculated Fibonacci numbers up to index 46. That means that calculations are not necessary for Fibonacci numbers that fit into the range of \TeX numbers. Because macro `\fibnum` is expandable, it cannot store calculated Fibonacci numbers for later use. Macro definitions are forbidden in expandable contexts. If larger Fibonacci numbers are used more than once, then the compilation time can be shortened by calculating and storing the Fibonacci numbers beforehand. The argument $\langle index \rangle$ is a \TeX number and macro `\fibnumPreCalc` ensures that the Fibonacci numbers F_0 up to $F_{|\langle index \rangle|}$ that are not already known are calculated and stored in internal macros. Internally only non-negative Fibonacci numbers are stored. If $\langle index \rangle$ is negative, then the needed positive Fibonacci numbers are calculated and stored. Example:

```
\fibnumPreCalc{50}
% calculates and stores the values for indexes 47..50.
% (Values for 0..46 are already stored by the package.)
\fibnum{49} % uses the stored value
\fibnum{51} % only calculates  $F_{51}$  from stored values  $F_{49}$  and  $F_{50}$ 
\fibnumPreCalc{100}
% calculates and stores the values for indexes 51..100
\fibnum{100} % uses the stored value for  $F_{100}$ 
\fibnum{-100} % uses the stored value for  $F_{100}$ 
%  $F_{-100} = -F_{100}$  according to equation (1).
```

2 Implementation

2.1 Identification

```

4 Installation

4.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/fibnum.dtx](#) The source file.

[CTAN:macros/latex/contrib/oberdiek/fibnum.pdf](#) Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

TDS refers to the standard “A Directory Structure for \TeX Files” ([CTAN:tds/tds.pdf](#)). Directories with `texmf` in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory `TDS:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```

chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/

```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting docstrip archive. The files are extracted by running the `.dtx` through plain \TeX :

```
tex fibnum.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

<code>fibnum.sty</code>	→ <code>tex/generic/oberdiek/fibnum.sty</code>
<code>fibnum.pdf</code>	→ <code>doc/latex/oberdiek/fibnum.pdf</code>
<code>test/fibnum-test1.tex</code>	→ <code>doc/latex/oberdiek/test/fibnum-test1.tex</code>
<code>test/fibnum-test-calc.tex</code>	→ <code>doc/latex/oberdiek/test/fibnum-test-calc.tex</code>
<code>fibnum.dtx</code>	→ <code>source/latex/oberdiek/fibnum.dtx</code>

¹<http://ftp.ctan.org/tex-archive/>

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your \TeX distribution (`te\TeX`, `mik\TeX`, ...) relies on file name databases, you must refresh these. For example, `te\TeX` users run `texhash` or `mktextlsr`.

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk fibnum.pdf unpack_files output .
```

Unpacking with \LaTeX . The `.dtx` chooses its action depending on the format:

plain \TeX : Run `docstrip` and extract the files.

\LaTeX : Generate the documentation.

If you insist on using \LaTeX for `docstrip` (really, `docstrip` does not need \LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{fibnum.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with `pdf\LaTeX`:

```
pdflatex fibnum.dtx
bibtex fibnum.aux
makeindex -s gind.ist fibnum.idx
pdflatex fibnum.dtx
makeindex -s gind.ist fibnum.idx
pdflatex fibnum.dtx
```
